The orangery, or green-house, is a master-piece in its kind. It has a southern exposure, and contains first a large gallery, four hundred and eight feet long, with twelve arched windows in the front; and on each side are two others, each three hundred and sixty feet long. These galleries are adorned on the outside with fine rows of columns. Before this green-house is a beautiful parterre, with a fine bason in the middle, from which a spout of water rises forty feet high. It is embellished with four rows of columns, of the Tuscan order, groupes of stone figures beautifully carved, vases, statues of white marble, &c. In summer this parterre seems a forest of orange and lemon trees, myrtles, &c.

The labyrinth is a fine grove, the several walks of which are so interwoven with each other, that it is very difficult for a person who enters it without a guide, not to lose himself. At the entrance are two statues, the one of Æsop, the other of Cupid holding a clue of thread in his hand. At every turning of the alleys you meet with a beautiful fountain, in a bason of fine shell-work, where one of Æsop's fables is very naturally represented; the subject of which is expressed in four lines, engraved in gold letters on a brass plate with a black ground.

Here are a great number of other groves, all beautifully adorned, and at one end of the garden is the place where they breed a variety of foreign beasts and birds.

In the park of Versailles is another palace, called Trianon, situated at one end of the canal which crosses the large one. This is both genteel and magnificent; the architecture and ornaments are in an exquisite taste, and the front about sixty-four fathoms broad. The court before it is adorned with a fine peristyle, supported by marble columns and pilasters. The two wings are terminated by two pavilions, and over the whole building is a balustrade adorned with statues, urns, &c. In the apartments are fine pictures, and the furniture is very sumptuous. The gardens are here also embellished with fine basons, cascades, and groupes of figures, done by the best masters.

In a park contiguous to Versailles is another royal seat, called Marly, delightfully situated in a little valley, with a very fine prospect of the castle of St. Germain, and of the neighbouring country. On coming from St. Germain to this palace, you enter first a round court, three hundred feet in diameter, where stands the guard room, and where terminate the several courts for stables, coach-houses, &c. The palace consists of a large pavillion, standing detached from any other, as also of twelve smaller ones, six on each side: the outside of the great one is adorned with paintings in fresco. The steps are embellished with figures of sphinxes, groups of children, vases, and the like.

In

In the great hall are sixteen pilasters, fine looking-glasses, and pictures; and in the king's apartments, and those of the royal family, are beautiful pieces of painting, representing the sieges which Lewis XIV. carried on in person. The small pavilions are joined to each other by arches, through each of which you enter a little arbour. In these small pavilions are apartments for persons of quality.

In the gardens is a large cascade, which is properly a river falling from a very high place, and forming very beautiful sheets of water. At the bottom are several basons, adorned with groupes, statues, &c. The side of the parterre, fronting the large pavilion, presents a most extensive and beautiful prospect. From this parterre you descend to another, adorned with marble statues, and a bason in the middle, which has a number of water-spouts, forming a wheat-sheaf. Beyond this is a large bason surrounded with walks and grass-plats. In going still farther down, you meet with two other basons, embellished with shell-work and groupes of figures, in white marble. The water falling out of these basons, forms several sheets, and enters another below. Among the other pieces of water, is another cascade, which falls from a steep hill into a large bason, in the middle of which is a small one of gilt brass, supported by three Tritons of the same metal.

The hydraulic engine of Marly for raising of water, stands on the river Seine, and is composed of fourteen wheels turned by the current, which set two hundred and twenty-five pumps going at once, throwing up the water into a tower at the distance of six hundred and ten fathoms from the river. Thence the water runs into an aqueduct three hundred and thirty fathoms in length, and from thence is conveyed through iron pipes of eighteen inches bore into the reservoirs of Marly, which are three hundred and fifty fathoms farther, and these again supply all the water-works of Marly and Versailles.

Fontainebleau is but a mean town, though it has a particular sub-governor, a royal prevoté, and a forest court. It is thirty-five miles to the south-east of Paris, and is solely remarkable for its royal palace, in which the French kings have taken great delight, it being well situated for a hunting seat. Though it consists of several sets of buildings added to one another at different times, without any order or symmetry, which constitute a confused mass of various kinds of architecture, yet this very confusion has an air of grandeur, which strikes the eye. Its situation is in a bottom, and it is surrounded by a large forest; but the neighbouring hills are crowned with bare rocks. As the forest abounds with game, the court frequently takes the diversion of hunting in it.

The largest room of this palace is that where plays are acted when the court is here. In this room is a large chimney built by Henry IV. twenty-three feet high, and twenty wide, adorned with four lofty Corinthian columns of spotted marble, with the bases and capitals of white marble. In the midst of the chimney-piece is a table of black marble, on which stands the equestrian statue of the last mentioned prince; underneath are two basso relievos, one representing the battle of Ivry, and the other the surrender of the city of Mante. Two marble statues, representing Loyalty and Peace, stand on each side of this figure, and facing the chimney is a noble theatre for the acting of plays.

The room in which the king dines in public has a very fine ceiling, and noble pictures representing Fortitude, Temperance, Justice, and Prudence, with several other subjects. The other rooms are also adorned with paintings.

The galleries of this palace are likewise very fine. Among the rest the stag-gallery, along the orangery, is particularly worthy of notice, it being adorned with paintings of all the royal palaces, between which are flags heads set off with branches of a very uncommon size. Under each stag's head is an inscription, shewing in what wood, and by what king the stag was killed. Thus many of them are introduced speaking, and very politely saying, king Charles, or Lewis, did me the honour of taking me. In the gallery of Diana is the pic-

ture of Henry the Great in a hunting-dress; and the different kinds of hunting in which he delighted, are represented in several paintings twelve feet high, and twenty broad.

Near this gallery is the aviary, which is extremely large and beautiful, it being ninety feet in length, and nine in breadth. In the middle is a large dome, under which is an artificial rock, made of shell-work, from which issue several springs, the water running through many little channels made in the stone pavement along the whole aviary.

The gardens are adorned with statues and fountains, the largest of which stands in the middle of the garden, and is called the fountain of the Tiber, from that river being represented in brass. Beyond it are a grotto and cascades, and at the entrance of the park is a fine canal six hundred fathoms long, and twenty broad; it is all lined with stone, and has a fountain at each end. Nothing can be more rural and delightful than the alleys of this park, they being all of a vast length.

Mudon, in Latin Moldunum, a market town, five miles to the south-east of Paris, remarkable for the royal palace erected there, the favourite residence of the only son of Lewis XIV. It stands in the middle of a forest, and has a noble avenue leading to it, three quarters of a mile in length, on the right of which is a fine convent belonging to the Capuchins, and on the left the vineyards of Mudon. At the entrance of the court of the palace is a large pile of buildings on the right, and another on the left, which open in the form of a semicircle; but are disjoined from the body of the house. In the middle of the front is a lofty advanced building, entered by three doors. Above it runs an order of architecture, consisting of arches and columns finely designed. Above them is another order accompanied with pilasters; over all is a fountain containing two statues in a cumbent posture, admirably well finished. The wings are not so high as the principal building, and each of them is terminated by a square pavilion.

The inside of this palace was adorned with the richest furniture, and a fine collection of statues, paintings, medals, and other antiquities. The front towards the garden also consists of a lofty advanced building, with wings considerably lower, which terminate on the right and left in two pavilions of the same height as the body of the building. The gardens are much admired for their fine walks, parterres, and water-works, and adjoining to them is a spacious park encompassed with a brick wall, and adorned with woods, basons, and reservoirs of water; the woods being cut through, and divided by beautiful avenues, among which is one distinguished by the name of the Dauphin, which leads to the gates of Paris.

Near Mudon are some excellent stone quarries.

St. Cloud, a borough, seated four miles from Paris, on an eminence near the Seine, and belonging to the archbishop of Paris. This place is a duchy and peerage, the archbishop bearing the title of duke and peer of St. Cloud. In it is a collegiate church, one convent, and a fine palace belonging to the duke of Orleans, adorned with very beautiful galleries, containing fine paintings and sculptures, and the garden belonging to it abounds with fountains, cascades, delightful parterres, with every thing that can please the eye. This place is much resorted to by the inhabitants of Paris, on account of its extraordinary pleasantness. It has a manufactory of porcelain, and a fine bridge of stone over the Seine. Here Henry III. was murdered in 1589.

Senlis, a city seated on an eminence on the little river Nonett, twenty miles to the north-west of Paris, in a district called Valois. It is the residence of a governor, a district court, and a salt office. In this city and its three suburbs are six parish churches; among which is the cathedral, which has a steeple that is one of the highest in France, and the figures which adorn the front of the right wing of this church are very curious. Here are also a collegiate church, and a royal chapel. Its bishop is subject to the archbishop of Rheims, and has within his diocese one hundred and seventy-seven parishes, forty-four chapels of ease, three abbies, nine priories with nineteen infirmaries, and his annual revenue

amounts

amounts to eighteen thousand livres, out of which he pays to the court of Rome one thousand two hundred and fifty-four florins. The city has its own laws, and is defended by a wall, a dry moat, and bastions.

Soissons, the capital of a district called the Soissonnois, and of the whole government, is seated in a pleasant and fruitful valley, on the river Aisne, sixty miles to the north-east of Paris. It is a pretty large well built town, and gives the title of Count. It is the residence of a governor-general, and the seat of a generalité, an intendant, a board of the finances, a salt-office, a court of justice, a forest-court, &c. In this city, besides the cathedral, which has one of the most considerable chapters in the kingdom, are three collegiate churches, one college of the fathers of the Oratory, six abbeys, several convents, a French academy, and an ancient castle. Its bishop is subject to the archbishop of Rheims, in whose absence he performs the ceremony of the king's coronation; he has three hundred and ninety-seven parishes, and twenty-three abbeys within his diocese, which produces a revenue of eighteen thousand livres, out of which he pays the court of Rome's taxation of two thousand four hundred florins. Several councils have been held here.

St. Denis, a town seated in a fruitful level country, in the isle of France Proper, five miles to the north-west of Paris, owes its origin to a celebrated abbey of Benedictines, founded there by king Clotaire, in honour of St. Denis, so early as the year 600, but greatly improved by his son Dagobert. The abbey is now rebuilt with the finest free-stone, and has a garden laid out in a most elegant taste. The church, though Gothic, is a handsome structure, and not only contains a very rich treasury, in which are kept the crown jewels; but is likewise the place of interment for the kings of France and their families; but no tombs have been erected here, for Henry IV. or any of the succeeding kings. The famous marshal de Turenne has a noble monument here erected by the king's order, in a marble chapel built on purpose, where his effigy lies at full length, surrounded with laurels and trophies, and a Roman eagle retreating backwards at the sight of so formidable an enemy. Immortality, with a radiant crown on her head, holds in one hand a crown of laurel, while she supports with the other the dying hero. Wisdom and Valour are also represented in their proper attitudes: the former seems astonished at the stroke which deprives France of that great man, and the latter appears in consternation. On the altar in this abbey is a cross, said to be of massy gold, seven feet high, set with diamonds and rich pearls, and by it a table of gold; the altar is plated over with silver. The present income of the abbey is sixty thousand livres, together with the lordship of the town, and appeals from his court lie only to the parliament of Paris. Besides this church here are thirteen others, among which is the collegiate church of St. Paul, and five convents.

Noyon, a very ancient, pretty large, and well built city, in the district called Noyonnois, on the little river Verre, twenty-two miles to the north-west of Soissons. It is the residence of a governor, and has a salt-office, a forest-court, &c. Besides its cathedral and a royal chapel, it has ten parish churches, two abbeys, two convents, one community, one seminary, and two hospitals. Its bishop, who is also suffragan to the archbishop of Rheims, is a count and a peer of France: his diocese consists of four hundred and fifty parishes, and seventeen abbeys; and his revenue amounts to twenty-five thousand livres, out of which he pays three thousand florins to the court of Rome. The principal trade of this city consists in corn. Here the celebrated Calvin was born. This city has been several times destroyed by fire.

Laon, a city in the district called the Laonnois, stands on a steep eminence in the midst of a large plain twenty miles to the north-east of Soissons. It is well built, and has an old castle, and beautiful streets. It has a governor, a salt-office, a forest-manor, and a court of justice. Besides its cathedral, it has three collegiate churches, five abbeys, two convents, a college maintained at the expence of the city, one general hospital, and an alms-house. Its bishop, who is subject to the archbishop of Rheims, is the second duke and peer of France. Within

his diocese are three hundred parishes, and twenty-four abbeys. His revenue amounts to thirty thousand livres, out of which he pays four thousand florins to the court of Rome. The neighbouring country produces excellent wine.

Beauvais, a city in the district of Beauvaisis, is seated on the river Teraine, sixteen leagues to the north of Paris, and is almost surrounded with hills. Cæsar having besieged and taken this town, is said to have given it the name of Cæsaromagnus. It is fortified, but is of no great strength, it being commanded by the neighbouring mountains. Its cathedral, dedicated to St. Peter, is a magnificent building; it has also six collegiate churches, thirteen parish-churches, three abbeys, a general hospital, and an alms-house. It has likewise a manor-court, which, together with the forest-court, are dependent on the bishop. It has likewise a province-court, and a salt-house. The bishop, who is suffragan to the archbishop of Rheims, is a count and peer of France, and has a diocese consisting of twelve chapters, fourteen abbeys, forty-eight priories, four hundred and forty-two parishes, and three hundred chapels, with an annual revenue amounting to fifty-five thousand livres, out of which he pays a taxation of four thousand six hundred florins to the court of Rome. In this city is a considerable manufacture of tapestry, and in it are also made great quantities of serge and woollen cloth.

The English besieged this city in vain in 1443, and in 1472 it made a brave defence against Charles duke of Burgundy, when the women signalized their courage under the conduct of a brave heroine named Joan Hachet, whose picture they preserve in the town-house; and in memory of this action the women are allowed to march first in a procession annually observed on the tenth of July. The adjacent country abounds in corn, pasture, and fruit, and affords some of the best mutton in France.

St. Germain's, or St. Germain en Laye, a well inhabited town, is seated on an eminence along the Seine, ten miles to the north-west of Paris, and has very good air and water. The English destroyed a palace which stood here in 1346; but a new building being raised by Francis I. it afterwards received the name of the Old Palace, to distinguish it from one built there by Henry IV. which was called the New. Lewis XIII. added some considerable embellishments to it, and Lewis XIV. enlarged it by the addition of five stately pavilions, whence, though it is no regular building, it makes a grand appearance. The New Palace, as it is called, fronts the Old, and stands on the brow of a hill, with a garden of six beds of earth supported by arches sloping into the valley. This building is a true image of the transitoriness of all sublunary things, the galleries in it being turned into granaries, and the paintings scarce distinguishable for filth. The very alcove in which Lewis XIV. was born is now a dust-hole, and the grand stair-case leading into the garden is wholly in ruins, while the arches for the beds in the garden are in many places sunk into the ground. The Old Palace was the residence of James II. after his flight from England, and here too he died. The streets of the town are well paved, the houses are lofty and handsome, with some large squares and hôtels, though it has only one parish-church, three convents, and an hospital.

St. Cyr, a convent of nuns of the order of St. Augustine founded in 1686 by madame de Maintenon, mistress, if not the secret consort of Lewis XIV. of which she herself was abbess till the fifteenth of April, 1719, when she died. It contains fifty ladies of quality, thirty-six lay-sisters, and two hundred and fifty pupils, who must be between the age of seven and twelve; but must prove their nobility for four generations, and have no defect in body or mind. Here they continue till they are twenty years of age, when such of them as are disposed to be nuns are distributed among the royal abbeys, where they are admitted gratis: the others are married to gentlemen, with a portion of four hundred pistoles, besides a certainty of preferment to the bridegroom; or else they are sent back to their parents. On the death of any one of the fifty ladies, her place is filled up by election from among the young ladies. The thirty-six lay-sisters instruct them in every branch of education becoming their sex. This foundation

foundation has an annual revenue of a hundred and eighty thousand livres, a hundred thousand of which arise from the extinction of the abbey of St. Denis, exclusive of its lands and immoveables. The convent is a very spacious and splendid structure.

S E C T. XXXI.

Of the Government of Brittany; its Situation, Extent, History, Produce, and principal Cities, namely Rennes, Nantz, St. Malo's, and Brest; with a concise Description of Belleisle.

THE province of Brittany, called by the French Bretagne, is a kind of peninsula surrounded on the south and west by the Atlantic ocean; on the north by the British channel; but towards the east it joins Normandy, Maine, Anjou, and Poitou. Its greatest length from east to west is sixty leagues, and its greatest breadth forty-five, but in many places it is very narrow. It received its name from the old Britons, who being driven out of Britain about the middle of the fifth century, by the Angles and Saxons, crossed the Channel into Gaul, and, after wandering about for some time, settled in this province, to which they at length gave their name. In succeeding times the Britons were obliged to submit to the kings of the Franks. Charles the Great had a fleet here to act against the Normans, and under his successors, Numenius, a chief of the Britons, created himself king; but his second successor was taken off by some conspirators, who made themselves masters of the country under the title of counts. The Normans afterwards reduced the country, but were unable to keep the quiet possession of it; but at length Conan, count of Brittany, married his only daughter Constantia to Gottfried, count of Anjou, the son of Henry II. of England, and duke of Normandy; and the daughter and heiress of this Constantia marrying Peter of Dreux, Brittany fell to the royal family of France, Peter being a prince of the blood. It was then governed by the dukes of Brittany, and at length, by marrying their daughters to the kings of France, it became united to that crown in the year 1532.

This province contains some very good harbours, but has few navigable rivers, except the Loire and Villaine. The country is in some parts level, and in others mountainous, particularly in Upper Brittany, through which runs a chain of mountains called Mont Acre. It produces little corn and wine, but its extensive and fruitful pastures enable the inhabitants to carry on a profitable trade in butter. It also produces hemp and flax, of which are made great quantities of linen and sail cloth. At Carnot is a lead mine; but the lead found in it is not near so good as that of England. Some places in the diocese of Nantes also yield pit-coal; but that also is much inferior to the English. Horses likewise are another branch of the trade of this country. On the coast are taken great numbers of sardines and other fish.

The inhabitants on the sea-shore are excellent mariners. In Upper Brittany they speak French; but in Lower Brittany Welsh.

This country has its own parliament, which is held at Rennes; as also its own laws and particular states, the latter of which consist of the clergy, nobility, burghers, and peasants, who are summoned by the king every two years. The governor is likewise admiral of Brittany, and under him are two lieutenant-generals, one of whom has the superintendency of eight dioceses, and the other only of the earldom and bishopric of Nantes. Besides these there are three sub-governors. In the meeting of the states, and assessments of taxes, the country is divided according to its nine bishoprics, five of which belong to Upper and four to Lower Brittany. We shall begin with the former, the principal places in which are the following:

Rennes, the ancient Condate, the capital of the province, is seated on the river Villaine, about fifty-five miles to the northward of Nantes, and forty-five to the south of St. Malo's. It is divided by the river into two parts, which have a communication by three bridges. It is pretty large, populous, and the see of a bishop: here is

also held the parliament of the whole country, an intendancy, a country court, a forest court, and a consulate. It contains many well-built houses; but the streets are narrow, dark, and dirty. Besides the cathedral, it has eight parish-churches, and seventeen convents; the Jesuits had here a fine college, and the states of the province have erected in this city a noble statue of Lewis XV. The bishop, who is suffragan to the archbishop of Tours, has a diocese consisting of two hundred and thirty-six parishes, with an income of fourteen thousand livres, out of which he pays a thousand florins to the court of Rome.

The bishopric of Nantes, or Nantz, includes the earldom of Nantois; which is divided by the Loire into two parts. This country is fruitful in wine, corn, good pastures, and cattle: it likewise yields salt and pit-coal, and enjoys a flourishing trade.

Nantes, or Nantz, the ancient Condivium, is in rank the second city in Brittany. It is seated on the Loire, in the forty-seventh degree twenty minutes north latitude, and in the first degree thirty-two minutes west longitude, thirty-two miles to the east of the sea, and is one of the greatest trading cities in the kingdom, it being pretty large, populous, well situated, and containing four suburbs. It is surrounded with ramparts and very deep ditches. Among its other fortifications is an old castle, flanked with large round towers towards the city, and with some half-moons towards the suburbs of St. Clement. This was formerly the seat of the dukes of Brittany, to whose eldest son it gave the title of count. It is the see of a bishop, who is suffragan to the archbishop of Tours, and by virtue of his dignity is a counsellor in the parliament of Rennes. Here is also a chamber of accounts, a board of finances, a mint-office, a country court, an admiralty, and a forest court. The diocese of the bishop consists of two hundred and twelve parishes, besides chapels of ease, and he enjoys a revenue of thirty thousand livres, out of which he pays two thousand florins to the court of Rome. The cathedral dedicated to St. Peter is a large antique structure, adorned with high towers. In it are the tombs of several dukes of Brittany: here is also a collegiate church of the Virgin Mary, with eleven parish-churches, fourteen convents, a college, an university founded about the year 1460, and two hospitals. The town-house is built in the modern taste.

Near the city of Nantz is a famous hermitage, in which the hermits have hewn a handsome chapel out of the rock with their own hands, with cells for their lodging, and other conveniences, to which they have with great labour added a pretty garden; from this retreat they have a fine prospect of the city, the Loire, and the adjacent country.

The trade of this city to the French colonies in America, and also to Spain and Portugal, is considerable, without mentioning other European shipping which frequent its port; though ships of burthen can come no farther up the Loire than to Paimboeuf, a market-town, where the cargoes are put into smaller vessels, and carried up to Nantes. An excellent sort of brandy, commonly distinguished by the name of this city, is exported from thence into foreign countries. One of the suburbs called the Fosse lies near the harbour, and is inhabited by rich merchants. Here is a large quay, along which stand very fine houses, and spacious ware-houses.

In this city is a very particular kind of society, which has been established above a hundred years between the merchants of Nantes and those of Bilboa in Spain. This society is called the Contractation, and has in each of these cities a reciprocal tribunal in the manner of a consular jurisdiction: so that a merchant of Nantes, who happens to be at Bilboa, has a right to sit and vote in that tribunal; and the merchants of Bilboa have the same privilege when they are at Nantes. It is on account of this society that Spanish wool pays only a small duty at Nantes; and that, in return, the linens of Brittany are upon the same footing at Bilboa. These two cities had even formerly ships in common, which traded for the profit of the partnership. They have established at Nantes a manufacture of cottons, which succeeds as well as that which has been long since set up at Rouen, and

may in time even exceed it, since cotton and indigo are much cheaper here than in the latter city.

Here Henry IV. surnamed the Great, by the famous edict in 1598, commonly known by the edict of Nantz, granted the Huguenots, or reformed of France, the public exercise of their religion throughout the whole kingdom; and though it had been registered in the parliament of Paris, and also confirmed and sworn to by his successors Lewis XIII. and XIV. the latter most perfidiously revoked it in 1685, cruelly persecuting his Protestant subjects, and driving them out of the kingdom. But, notwithstanding this cruel and impolitic step, there are still many Protestants, as hath been already said, though they keep themselves as much concealed as possible.

St. Malo, or St. Malo's, in Latin *Maclovium*, and *Maclopolis*, is a small but populous city, seated on a little rocky island, formerly called St. Aaron in the English Channel, in forty-eight degrees thirty minutes north latitude, and in the second degree fifteen minutes west longitude; but is joined to the continent by a long mole, not above thirty fathoms broad, at the head of which is a strong castle flanked with large towers. The harbour is spacious, and one of the best on the coast, but of difficult entrance, it being surrounded with several rocks, and at tide of ebb left almost dry, so that it will not admit large vessels, though it is very easy to build or refit such ships as can enter it. On the neighbouring rocks are ten different forts, and the town is surrounded with walls, deep ditches, and always guarded by a sufficient garrison. As soon as the gates are shut, they let loose upon the ramparts twelve or thirteen very fierce bulldogs, which would infallibly tear in pieces any person that ventured to come near them, whence it is commonly said that St. Malo is guarded by dogs, though these are only designed to prevent the garrison from being surprised. This city is also secured towards the sea by a shoal of sand that encompasses it, and, besides the rocks, by small islands; so that the harbour is esteemed one of the keys of France.

This city is very considerable, not only for its strength, but also for its trade. The inhabitants, who are sea-faring people, are famous for their skill in maritime affairs, on which account a great number of privateers are fitted out from hence in time of war, which very much disturb the trade of the Channel, and accordingly made many English captures during the reign of king William, which brought a bombardment upon the town, though it received but little damage.

But in 1758 a select body of above twenty thousand British troops under the command of the late duke of Marlborough, and a powerful squadron under commodore Howe, having landed at Cuncalle bay between the sixth and seventh of June, they burnt all the ships in the harbour to the number of a hundred, great and small; after which, finding the town impracticable, they re-embarked, and arrived soon after at Spithead, with little or no loss.

This city is the see of a bishop suffragan to the archbishop of Tours; his diocese consists of a hundred and sixty parishes; he is lord of the city, and his income amounts to thirty-five thousand livres per annum, out of which he pays a thousand florins to the court of Rome. The cathedral of St. Vincent is one of the most ancient in all France; here are also several fine monasteries, and other considerable public buildings.

Brest, in Latin *Brescia*, a famous sea-port in the bishopric of St. Pol de Leon, situated on the north side of a large and commodious harbour, which opens to the ocean in the most western part of the continent of France, about fifty miles to the north-west of Belleisle, in the forty-eighth degree twenty-five minutes north latitude, and in the fourth degree thirty minutes west longitude. It is a small fortified city; the streets are narrow, and it is defended by a strong castle which stands on a rock, very steep towards the sea; and likewise by a tower opposite to the castle, which guards the entrance into the port on that side. 'Tis encompassed on the land-side with a broad ditch, and some other works. It has a spacious fine road and harbour, the latter being surrounded with very good quays, upon which are built ware-houses filled

with naval-stores of all kinds. The harbour lies between the city and the suburb of Recouvrance, which is half as big as the city. The road is extremely spacious, and might contain five hundred men of war; but the entrance to it on account of its narrowness is exceeding difficult, and particularly from the blind rocks which lie under water at high tide. This port is the most secure retreat for the French ships of war, and is the best possessed by this nation on this side the Mediterranean; whence this city is one of the grand magazines of the admiralty of France, the other being at Toulon, in the Mediterranean; and therefore in this harbour the greatest number of the French navy are fitted out. It is said that naval-stores and necessary provisions for seventy sail of men of war are constantly laid up at Brest, and ships of eighty or ninety guns are built here, which renders the place rich and populous. Here is always a strong garrison in the castle, commanded by staff-officers. Lewis XIV. caused an arsenal to be built here, and erected an academy for the marine. There is here a court of admiralty and bailiwick, with only two parish-churches, and a convent. The Jesuits, before their being expelled from France, had also a seminary here.

In the year 1694 the English made an attempt upon Brest, but the design perished; so that the avenues being defended by a numerous train of artillery, and an army superior to that of the invaders, general Talmash, who commanded the English, was mortally wounded in making the descent, and the forces were obliged to retire with loss.

Belleisle is an island about six leagues from the coast of Brittany, in the forty-fifth degree twenty minutes north latitude, and in the third degree five minutes west longitude. The ancients called it *Colonesus*, or the Beautiful Island, which is the signification of its present name. It is about six leagues long, two broad, and confers the title of marquis. It is surrounded on all sides with rocks, and has only three landing-places, Palais, Sauzon, and Goulsard; every one of which labours under some capital defect, either in being exposed, shallow, or dangerous at the entrance. It contains only one little city, called Palais, three country towns, a hundred and three villages, and about five thousand inhabitants. Palais, the capital, takes its name from a castle in its neighbourhood belonging to the duke of Belleisle, afterwards converted into a citadel. This fortification is strong and regular; it fronts the sea, and is composed principally of horn-works, and provided with two dry ditches, the one next the counterscarp, and the other so contrived as to secure the interior fortifications. The citadel is divided from the largest part of the town by an inlet of the sea, over which is a bridge of communication.

In the year 1759 admiral Hawke, with a squadron of English ships, off the south coast of this island, burnt, sunk, and destroyed most of the French fleet from Brest under Conflans, who was himself either mortally wounded, or lost in making his escape in his boat to shore. Two of the enemy's ships sunk to the bottom with all the men, and the shattered remains of his fleet, to the number of seven sail, ran up for shelter, after throwing their guns over-board into the river Villaine, in Brittany, and there continued disabled on account of the shallowness of the water. The English indeed lost two of their men of war by too eager a pursuit of the enemy; but though they run aground, all the crew were saved, and their loss was otherwise inconsiderable.

In April 1761, this island was attacked by an English fleet under the command of commodore Keppel, and the land forces under general Hodgson. The English fleet after landing their troops and their cannon, which was accomplished with the greatest difficulty, by dragging them up the rocks, laid siege to the city; and the garrison, commanded by the chevalier de St. Croix, a brave and experienced officer, threatened a long and obstinate defence. The enemy made some sallies, which only animated the English troops by the difficulties with which they had to contend; but at length, a furious attack being made upon the enemy's lines which covered the town, they were carried with no great loss; this was principally owing to the uncommon intrepidity of a body of new-raised marines. No action of greater spirit

and gallantry had been performed during the whole war. However, the garrison held out till the seventh of June, when they capitulated, and marched out with the honours of war. This island was kept by the English till the late peace, when it was restored to France.

S E C T. XXXII.

Of the Government of Normandy; its Situation, Extent, Produce, and Rivers. A concise History of the Country, and of the principal Towns, as Caudebec, Dieppe, Rouen, Bayeux, Cherbourg, and Havre de Grace.

Normandy, which derives its name from the ancient Normans, is bounded on the east by Picardy and the isle of France; on the south by Beaufle, Perche, and Maine; on the west by Brittany; and on the north by the British Channel; extending from east to west upwards of sixty leagues, and from north to south thirty.

This is one of the most fruitful provinces in the whole kingdom, and one of the most profitable to the king. It abounds in corn, flax, hemp, and vegetables for dyeing, but the little wine it produces is very indifferent; it however yields great quantities of apples and pears, of which the natives make cyder and perry for their usual drink. It is also a fine country for cattle, it being full of excellent pastures. The sea supplies it with plenty of fish, and from its water are extracted great quantities of salt. The many iron works here are of no small advantage to the country; it has likewise some mines of copper, and is not without mineral waters.

The principal rivers in this province are the Eure, the Andelle, which rises in this province, and falling into the Seine, is of great advantage in conveying to Paris wood for firing; the Rille or Risle, which rises here, and also falls into the Seine; the Dive, which rises here, and after receiving the Vie, becomes navigable, and discharges itself into the British Channel; the Lezon which rises here, and being joined by the Orbiquet is afterwards called the Tonques, and becoming navigable, loses itself in the Channel; the Carentone, which has also its source in this province, falls into the Rille; and the Orne, which rises here, and after receiving several smaller rivers, falls into the British Channel.

The ancient dukes of this province rose to great power, both here and in foreign countries, and William, in the year 1066, became king of England. In 1135 the male line of this king became extinct in the person of Henry I. and his daughter Matilda marrying Godfrey, count of Anjou, the fruit of this marriage was Henry II. king of England, duke of Normandy, lord of Guienne, Poitou, and Saintonge. He leaving three sons, Richard, Godfrey, and John; the last of them seized on the dominions of both his brothers, and even caused Arthur, the son of Godfrey, to be taken off; for which he was deprived of most of his territories in France, and in 1203 Normandy was annexed to that crown. Henry III. of England ceded to Lewis the Pious and his successors all his claim to this province; which afterwards, to the end of the fourteenth century, some kings bestowed on their eldest sons, with the title of duke of Normandy, till that of Dauphiné was instituted. At length the animosities between the houses of Orleans and Burgundy afforded the English an opportunity of conquering not only Normandy, but a great part of France. This province was subject to England about thirty years, till at last the English were driven out by Charles VII. during the minority of that unhappy prince Henry VI.

This country is governed by its own law, which is called the *Wife*, and on this account Normandy is styled *La Pais de la Sapience*, that is, The Land of Wisdom. Rouen has a parliament, on which all the other courts of the province are dependent. With respect to its finances, it has three generalities, namely, at Rouen, Caen, and Alençon, from which the king is said to have drawn twenty millions of livres a year. Hence the government of Normandy is one of the most considerable in the whole kingdom. Under the governor are two lieutenant-generals, one for Upper and the other for

Lower Normandy; and each of the seven great districts into which the country is divided has a deputy-governor of its own. Under the archbishop of Rouen are the six bishoprics of Normandy, and these seven dioceses contain eighty abbeys and four thousand two hundred and ninety-nine parishes. The principal places in this province are the following, beginning with Upper Normandy.

Caudebec, in Latin *Calidum Beccum*, that is, the Hot Bee, is a small but populous town, seated on the river Seine, into which, near this place, falls a rivulet which runs through the town, and gives name to it. It is closely built, and has walls flanked with towers, and surrounded with deep ditches. It has three suburbs, and the small river Caudebec being divided into several canals in the town, turns a considerable number of mills, that are very serviceable to the tanners and leather-dressers settled here. In this town is a salt and treasurer's office, with a provincial, an admiralty, and a forest court. It contains two convents, one parish-church, and an hospital. Among other manufactures, the inhabitants make hats, which were formerly in great repute, on account of their not letting in the rain; but this branch of trade has greatly declined. This place is a considerable thorough-fare for such as go from Rouen to Havre de Grace, and other parts of the country of Caux, of which it is the capital.

Dieppe, a sea-port town on the shore of the British Channel, opposite to Rye, in England, and much resorted to, particularly with vessels from Scotland. It stands thirty miles to the north of Rouen, on a level spot, between two rocks, or mountains, and the mouth of the river Betune, called at this town the river of Arques, which falling into the sea forms the harbour. It is fortified with bulwarks next the sea, with a fortress at the suburb called Pollet, and a castle, which, together with the craggy rocks that lie on the south, render it a place of considerable strength, though its fortifications are very irregular. Its natural strength induced Henry the Great to choose it for his head-quarters, when opposed by the League at his accession to the throne. It has a good harbour, which is long, but narrow, and on this account of difficult access. In time of war it is generally a station for privateers; but has not a sufficient quantity of water for large ships. The town is pretty large and well built; and the parish church of St. James is a very fine structure, and has a tower from which, in fine weather, the coast of England may be seen. It contains two suburbs, and has both a salt office and a court of admiralty. It is chiefly inhabited by sea-faring men, who are esteemed very expert in maritime affairs, as also by mechanics who make curious works in ivory, and by merchants who carry on a considerable trade to foreign parts. The inhabitants were mostly Protestants till the persecution which ensued upon the revocation of the edict of Nantes.

This town has been frequently taken and retaken in the wars between England and France. In 1694 it was almost totally destroyed by bombs fired into it from the English fleet commanded by lord Berkeley; and in the wars of queen Anne it was also roughly treated, after which the court sent thither an architect and engineer who rebuilt it in a regular manner: this indeed gives the town an external air of beauty, but is attended with very great inconvenience to the inhabitants.

The chief trade of Dieppe consists in herrings, with which they furnish Paris and the province of Normandy; they also fish for whittings, mackerel, and oysters, which they sell in the neighbouring provinces; together with their ivory works and laces made here. The sea-compasses made in this town were formerly much esteemed: but its trade is not so considerable as it was formerly.

Rouen, the *Rothomagus* of the antients, afterwards called *Rothomum*, the capital of Normandy, is seated in a district called *Le Vexin Normand*, and is environed on three sides by high hills covered with trees, and on the fourth is seated on the north bank of the Seine, in the forty ninth degree thirty-six minutes north latitude, and in the first degree ten minutes east longitude. It is also watered by two little rivers called *Aubette* and *Robec*. The tide flows so high up the Seine, that vessels of above

two hundred tons burthen can come up hither, and load and unload at a large quay, which is built along the city. Its situation is so very commodious for trade, that Rouen is considered as the center of it in the north of France. It had formerly a stately stone bridge over the Seine, of thirteen arches, but it is now ruined; and there is another of boats of a very artificial structure built near it, and extending two hundred and seventy paces in length; it rises and falls with the tide, and is paved like the streets. This bridge, however, costs a great deal of money to keep it in repair; and they are obliged in winter to take it in pieces, lest the ice should damage or carry some part of it away. The city has no other fortifications but a wall, with round towers in the antique taste, and irregular bastions to defend the gates on the land-side, except an old castle which was begun in the year 1419, as soon as king Henry V. of England had made himself master of Rouen, and finished in the reign of Henry VI. in 1443. It is an antique building of little strength, flanked with five large round towers, and having a draw-bridge, the whole being encompassed with a wet ditch. In this city there is, however, no garrison, though it has a particular governor.

Rouen is very populous, for it contains seven thousand two hundred houses, in which are sixty thousand persons; but is not very spacious. The streets in general are very close and narrow, and the houses mostly of wood and plaster; it has, however, six large suburbs, in which are five parishes, and thirty in the city: it has also fifty convents, and four abbeys; the Jesuits had also a college here. Its archbishop has six suffragans, and a province of thirteen hundred and eighty-eight parish-churches, besides chapels, and his annual revenue amounts to eighty thousand livres, out of which he pays twelve thousand florins to the court of Rome. He styles himself primate of Normandy, though he has no archbishop in his province suffragan to him; but from this title he has no superior in France, and he depends immediately on the holy see. The city is adorned with many stately piles of building, among which is the cathedral dedicated to the Virgin Mary, the choir of which is lined round with copper. It has three very lofty towers, particularly that of the pyramid, the spire of which is only made of wood and covered with lead gilt. It has two hundred steps, and the whole edifice upwards of six hundred to the top. In this cathedral are to be seen the monuments of several kings, lords, and prelates; and likewise the monument of John duke of Bedford, who was regent of France under our Henry VI. In the butter tower, as it is called, which is that just mentioned, is a great bell ten feet in height, the same in diameter, and weighs thirty-six thousand pounds. On the great gate is a triumphal arch in honour of king Henry the Great, with emblems of his conquest over the holy league. The body of the church is supported by twenty pillars, and, upon the whole, this church exceeds in beauty and regularity that of Notre Dame at Paris. The other remarkable structures are the church of St. Toin, a very lofty building, chiefly famous for its great bell; the convent of the Cordeliers; the church which lately belonged to the Jesuits; the church and abbey of St. Owen; and the parliament-house; which are all beautiful structures. The archbishop's palace is also a fine building, adorned with elegant paintings and pleasant gardens. In the veal market stands the image of the celebrated maid of Orleans, whom the English had the cruelty to burn as a witch, and is represented kneeling before Charles VII. And in the New-market is the statue of Lewis XV. erected in 1721; but this is a very ordinary piece of workmanship.

The trade carried on in the city and district of Rouen is very extensive, consisting of woollen and linen cloths, leather, hats, paper, and many other merchandizes. The woollen manufactures, which employ several thousand workmen, are particularly advantageous to the whole province; but they are only so far profitable to the nation in general, as they prevent the money from being sent abroad; but the linen manufactures of various sorts exported to Spain are highly beneficial, and the returns generally made in cash.

Rouen has undergone various calamities and vicissitudes of fortune: it has been almost entirely burnt thirteen or

fourteen different times. In 841 it was taken by the Normans; the English made themselves masters of it in 1418, and in 1449 it was surrendered to Charles VII. the French king. It was afterwards stormed and taken by the French Protestants, and re-taken and plundered in 1562 under Charles IX. Anthony of Bourbon, king of Navarre, received a mortal wound before it; but his son Henry IV. took it in 1592. In this city died William I. king of England, commonly surnamed the Conqueror.

Caen, in Latin Cadomus, is situated in a district of the same name, thirty miles to the south of Havre de Grace, sixty-five to the west-by-south of Rouen, and a hundred and twenty-five to the west of Paris. It stands in a valley between two large meadows, at the confluence of the rivers Orne and Odon, by the united stream of which it is divided into the Upper and Lower Towns, that have a communication by means of the bridges of St. James and St. Peter, on the latter of which is erected a stately town-house, adorned with four large towers. The Upper Town is defended by a castle built upon a rock and very well fortified, and the Lower is entirely surrounded with water. It is a place of good trade, vessels of some burthen being able to come up from the sea to St. James's bridge, and its inhabitants are supposed to amount to forty thousand souls. It is the second town in Normandy, and contains an intendancy, an admiralty, a provincial and forest court, with a salt-office. It has twelve parish-churches, one collegiate church, two abbeys, fourteen convents, with a house which till lately belonged to the Jesuits, and two hospitals. King Charles VII. founded an university here about the year 1430, and likewise a mint. An academy of sciences and belles lettres was also established in this city by Lewis XIV. and in the Royal square, which is both spacious and regular, with fine houses on three sides of it, stands a marble equestrian statue of that prince, surrounded with an iron balustrade. The principal trade of this town and its district consists in cloth and fine linen.

Bayeux, the capital of the country of Bessin, is seated on the river Aure, fifteen miles to the north-west of Caen, and contains an admiralty, a salt office, a forest and district court, &c. It has seventeen parish-churches, nine convents, two hospitals, and a college and seminary, which lately belonged to the Jesuits. The bishop, who is suffragan to the archbishop of Rouen, has a diocese of six hundred and fifteen parishes, with a revenue of sixty thousand livres, out of which he pays four thousand four hundred and thirty-three florins to the court of Rome. The cathedral, dedicated to the Virgin Mary, is a very stately structure, beautified with a tower and two lofty spires. The city is divided into Upper and Lower, and manufactures of cloths, serges, and stockings, were set up here, which succeeded very well; but the high taxes imposed on them, which the merchants were forced to pay, obliged them not only to abandon those manufactures, but likewise to quit the city.

Cherbourg, in Latin Cæsar's Burgus, a sea-port town in the English Channel opposite to Hampshire, is situated fifty miles to the north-west of Caen, in a district called the Coutantin, and lies between Cape La Hogue and Barfleur. It contains an admiralty, a bailiwick, and a viscounty court: it has also one abbey, and a general hospital. Here they formerly made very fine glass, which, for clearness and beauty, even excelled that of Venice; but, for certain political reasons, the work has been removed to Auxerre, in Burgundy. It was a very strong place, from the fortifications that have been lately erected there, before they were destroyed, together with the famous bason, by the English in the year 1758. The port is small but pretty good, for vessels of three hundred tons can come into it, and some merchant ships are built here.

Off this place the confederate fleet, under admiral Russel, obtained a signal victory over that of the French, commanded by M. de Tourville, in 1692, and afterwards burnt, took, or sunk about twenty of their ships of war, near Cape La Hogue; among which was le Soleil Royal, or the Royal Sun, the French admiral's ship.

Long. W. from London

landed here and took the town, which they entered without the least opposition in August, 1758, together with the ships in the basin; demolished the fortifications, and ruined the other works, particularly the basin and harbour, with the sluice, and all the forts, carrying away twenty-one fine pieces of brass cannon and two mortars, which were brought to England.

The district of Havre de Grace constitutes the western part of the country of the Caux, in Upper Normandy, and, though a particular military government, is subject to the civil and ecclesiastical government of this province. The principal places it contains are the following:

Havre de Grace, a strong sea-port at the mouth of the river Seine, forty-five miles to the west of Rouen, was built by Francis I. who also called it, after his own name, Ville François, whence it has been also called Franciscopolis; but this name is now superseded by the other. This is the capital and seat of its little government, and contains a naval intendant, a viscounty, an admiralty, a royal court of justice, and a salt-office; with one parish-church, one seminary, and two convents. It has a good harbour between the town and citadel, which is small but regularly fortified, and an arsenal. It is a pleasant well built town, and a place of good trade, several mer-

chants residing here. In the reign of Charles IX. it was seized by the Protestants, who in 1562 delivered it to queen Elizabeth, in consideration of the assistance that princess had given them; but the following year it was vigorously besieged by the French, and with equal courage defended by the English, under the earl of Warwick; but a pestilence, which raged in the town, forced them to surrender in July, 1563. Afterwards, in 1694, this city was almost entirely destroyed by a bombardment from an English fleet.

Harfleur, a sea-port town, forty miles to the north-west of Rouen, and about five to the west of Havre de Grace, between two hills, the one on the east, and the other on the west. It contains an admiralty court, and a salt-office: it is also the seat of a royal justice, and has a small magazine; but has only one parish church, and one convent. It was formerly a considerable port; but that of Havre being found more convenient, it has been neglected, and is now only capable of receiving small vessels. It was twice taken by the English, namely, in the years 1415 and 1440.

We shall treat of the islands on the coast of Normandy, as Alderney, Guernsey, and Jersey, in describing the opposite coast of England.

CHAP. XXIX.

OF GREAT BRITAIN.

SECT. I.

Of GREAT BRITAIN in general.

Its Situation, Extent, Climate, and Face of the Country; the Plants, Fruits, Beasts, Birds, and Minerals.

GREAT Britain is the largest island in Europe, and one of the most populous, rich, and fruitful. It includes England and Scotland, which were united in 1707; only the latter reserved their peculiar laws. The whole island is of a triangular form, the Lands-end, the Dover-head, and Caithness shooting out into so many promontories, and forming the three corners. The sea its boundary has several names adapted to the several coasts; on the north it is called the Northern sea; on the east the German ocean; on the south the British Channel; and on the west the Irish sea, or St. George's Channel. Its latitude at the Lizard-point, in Cornwall, is, according to Moll, in the fiftieth degree north, and at the Headland at Caithness, or Dungsbyhead, in Scotland, in the fifty-eighth degree thirty minutes; so that, according to the geometrical measure of English statute miles, which is sixty-nine miles and eight hundred and sixty-four feet to a degree, the true length of the island, measured in a straight line, without attending to the hills and winding of the roads, is five hundred and eighty-seven miles; and the longitude, placing the first meridian at Teneriffe, is nine degrees forty-five minutes, at the Land's-end, in Cornwall, and at the South Foreland, in Kent, seventeen degrees fifteen minutes, in all seven degrees thirty minutes: the parallel there giving thirty-eight miles to a degree of longitude, the true distance from east to west in a straight line is two hundred and eighty-five miles.

The sea, which surrounds it, is not only a security against an enemy, but against the violent cold to which the climate would otherwise be exposed; for the tides and constant motion of the sea send us a kindly vapour, which qualifies the natural sharpness of the air, even to such a degree, that in some parts of France and Italy more severe weather is felt in winter than in England. The climate is indeed infinitely preferable to that of any part of the continent in the same latitude, the summers being neither so hot, nor the winters so cold. The har-

bours in Holland, Germany, and Denmark, are blocked up with ice, while ours which lie in the same latitude are open. If we pursue this observation still farther, and consider the same latitudes in America, we shall find there that in winter the very seas are constantly frozen, and that even brandy itself will freeze.

The air is generally very good and wholesome, except in the hundreds of Essex and Kent, the fens in Lincolnshire and Cambridgeshire, and some other low marshes near the sea. Though the winters are rainy and subject to thick fogs, and the weather to great variations, these do not impair the health of the inhabitants, who are accustomed to them; for they generally live as long as those of any other countries, and some die every year at above a hundred years of age. We have instances of some living even to a much longer period; thus Thomas Parr, of Shropshire, was a hundred and fifty-two years of age when he died, and Henry Jenkins, a Yorkshireman, a hundred and sixty-eight. Though the frequent rains sometimes damage the hay and corn, yet even these have their advantages, as they generally occasion our having good pastures throughout the year.

The soil, indeed, in a great measure owes its fertility to the mild vapours just mentioned, which, by mollifying the air, nourish the vegetable world, and furnish us with gentle showers in their proper season. We have, indeed, as well as other countries, storms of thunder, lightning, and tempests; but they are less frequent and much less violent than in hotter climates.

That part of Great Britain which lies towards the Western ocean is mountainous, as Cornwall, Wales, and many large tracts of Scotland; but the inner parts are generally a plain champaign country, intermixed with hills of easy ascent and gentle acclivities. The most remarkable mountain, or rather chain of mountains, as it may be termed, is a continued ridge which extends from north to south, dividing as it were the whole island into the east and west parts, and is by writers called the English Appennines. The southern and eastern parts of the country chiefly consist of little fruitful hills and vallies, champaign fields, inclosed grounds of arable, pasture, and meadow lands, agreeably intermixed with woods, forests, parks, and chaces. The highest mountains in England are the Wrekin in Shropshire, the Plinlimmon

and Snowden in Wales, the Cheviot hills on the borders of Scotland, those of the Peak in Derbyshire, the Pendle, &c. in Lancashire, the Wolds in Yorkshire, Cotswold in Gloucestershire, the Chiltern in Bucks, and Malvern in Worcestershire.

This great island is surrounded by many smaller ones, as the Isle of Wight, the Isle of Man, the cluster of islands called the Cassiterides, or Scilly islands of Cornwall, the Orcades, the Shetland islands, and Æbrides islands in Scotland.

Great Britain has on all sides very convenient harbours, and abundance of navigable rivers that convey the riches of all the nations in the known world into the very heart of the kingdom: the most considerable of these are the Thames, the Severn, and the Trent, in England; the Clyde, the Forth, the Tay, &c. in Scotland.

The country is for the most part level, and uncommonly fertile. One favourable year for corn is sufficient to supply three years of plenty to the inhabitants; and even at such times when the seasons prove unfavourable, there is generally a sufficiency, for after immoderate rains the corn sown on the hills produce great abundance, and in a time of the greatest drought the low and fenny parts produce most plentiful crops. Hence nothing can prevent that plenty which Providence has been graciously disposed to pour out on this happy country, but that immoderate thirst of gain which excites the avaricious to export so great a quantity of corn as to distress the inhabitants.

This country likewise abounds in excellent vegetables and fruits, both of which are excellent. Our kitchen gardens abound with colly-flowers, artichokes, asparagus, lettuces of various sorts, cabbages, peas and beans of different kinds, broccoli, kidney-beans, cucumbers, spinage, and pot-herbs of all sorts; mushrooms, carrots, potatoes, turnips, onions, beets, &c.

Kent is famous for its orchards of cherries and apples; but none of the countries afford such plenty of apples for cyder as Herefordshire and Devonshire. Besides apples, pears, and cherries, we have a great variety of excellent fruit, as quinces, peaches, apricots, nectarines, plums, grapes, strawberries, raspberries, currants, gooseberries, barberries, cranberries, bilberries, walnuts, hazle-nuts, &c. but it must be acknowledged, that some of our fruits have not that delicious flavour which is only to be found in warmer climates. Great quantities of cyder and perry are made from the apples and pears of England. Among its products are excellent saffron, said to be superior to any in the world, liquorice, woad, and great plantations of hops; but it produces little flax and hemp.

This country was formerly plentifully provided with timber, and particularly with large oaks fit for ship-building; but timber now has become scarce, and for want of planting in time we are obliged to be supplied with great quantities from abroad. The timber growing in this island, besides oak, are ash, elm, and beech; we have also poplar, maple, walnut-tree, sycamores, hornbeam, arbores, hazle, willow, fallow, and other species of wood not distinguished with the name of timber, but ornamental and exceeding useful.

The pastures of England are excellent, and consequently the grazing of this country very considerable. Here are bred excellent horned cattle; the oxen are the largest and best that are any where to be met with, and the smaller sort bred in Wales and the north are good for present spending. The breeding of sheep is a very principal article; it is computed that there are no less than twelve millions of fleeces shorn annually; and that the fine English wool, next to that of Spain and Portugal, is the best in the known world; which, with the working of it, amounts to near one-fifth of the revenues of the whole country. King Edward IV. received a present of three thousand sheep from the king of Spain, some of the breed of which are still in being. Our sheep are indeed valued both for their fleeces and their flesh; those of Lincolnshire are remarkably large; but the flesh of the small down mutton is no less admired.

The horses for the chace and saddle are very beautiful, and generally about fifteen hands high, swift, and extremely well proportioned. Those of our cavalry are

remarkable for their size, strength, and spirit; and those for draught, either for coaches or waggons, can scarcely be paralleled.

This kingdom also produces asses, some mules, but these last are greatly inferior to those of Spain and Portugal; goats, red and fallow deer, hares, rabbits, dogs, foxes, squirrels, ferrets, otters, badgers, weazels, cats, pole-cats, moles, rats, mice, &c.

Our tame-fowl are swans, geese, turkeys, peacocks, common poultry, ducks, and tame pigeons. The wild are woodcocks, pheasants, partridges, plover, wigeon, teal, wild-geese, wild-ducks, bustards, snipes, wood-pigeons, grouse, quails, eagles, hawks of various kinds, blackbirds, starlings, thrushes, nightingales, goldfinches, bullfinches, linnets, larks, &c.

We have a great variety of river-fish, as salmon, carp, tench, pike, trouts, perch, bream, haddock, dace, eels, roach, barbels, flounders, plaice, smelts, gudgeons, &c. The seas produce cod, mackarel, herrings, pilchards, lobsters, crabs, oysters, muscles, cockles, shrimps, prawns, &c.

With respect to minerals, the copper-mines in Cumberland and Somersetshire, and those of iron in Sussex and Surry, are of no great importance; but this is made up by the vast tin and lead-mines in Cornwall, Derbyshire, and Wales, &c. whose metals are so far from being surpassed, that they have not their equal in any other country. The mountains are found to contain marble, and near Plymouth there is marble that nearly resembles the Egyptian granite; we have also alabaster, fire-stone, crystal, alum, and vitriol. Our fullers-earth is of singular use in the cloathing trade. Among other minerals coals ought not to be omitted, since the quantity produced in this island is greater than in any other country in Europe, and the coals much better. Great Britain also produces very considerable quantities of salt, both from salt-springs and sea-water.

SECT. II.

Of the Manners and Dispositions of the English. Of the English Tongue, and the Manner in which it received its various Changes, till it arrived at its present Degree of Perfection. Of the Religions of the Inhabitants; with a particular Account of the Church of England; the Convocations and the Ecclesiastical Courts.

THE number of inhabitants in Great Britain was a considerable time ago computed at nine millions; and if the great increase of many of the cities and towns in this kingdom be considered, it can scarcely be doubted that the number at present exceeds ten millions, of which it is said there are near ten thousand Jews. With respect to the character of the English, they have always been allowed to be brave and naturally jealous of their liberties; they are industrious, fitted for labour, lovers of the liberal arts, and capable of carrying them to the greatest perfection. They are also generally humane and friendly; but at the same time blunt, artless, and not fond of compliment; and particularly averse to servility and cringing. Their generosity and humanity has been frequently shewn even to their enemies, in such a manner as to do honour even to human nature: the greatest fault observable amongst them is, that the lower sort of people particularly have too contemptible an idea of foreign nations, and are apt to treat the strangers who visit this country with rudeness. As the English are a mixture of various nations, there is not here that dull uniformity of character that is to be found in other countries; but, on the contrary, the greatest diversity appears in their dispositions and manners, which serves to enliven conversation, and to render it more agreeable.

The inhabitants of the several parts are of a different original. Those of Cornwall and Wales are in general the posterity of the ancient Britons, who, upon the invasion of the Picts and Saxons, retired to those mountainous borders in the west of England, which they have ever since retained. The Scots are not without a mixture of the Picts, particularly in the Lowlands, which they possessed before the former had totally subdued them.

But the Highlands, particularly the western, are said by some authors to be peopled from Ireland.

The ancient language of Great Britain is generally allowed to have been the same with the Gaulic, the island being probably first peopled from Gallia, as both Cæsar and Tacitus affirm, and prove by their religion, manners, customs, and the nearness of their situation; but we have now very small remains of the ancient British tongue, except in Wales, Cornwall, the islands and highlands of Scotland. Some time before the birth of our Saviour Julius Cæsar made a descent upon Britain, though he may be said rather to have discovered than conquered it; but about the year of Christ 45, in the reign of Claudius, Aulus Plautius was sent over with some Roman forces, by whom Codigunus and the brave Caractacus, two British kings, being overcome in battle, a Roman colony was planted at Malden, in Essex, and the southern parts of the island reduced to the form of a Roman province; afterwards the island was conquered as far north as the firths of Dumbarton and Edinburgh, by Agricola, in the time of Domitian; upon which a great number of the Britons retiring from the conquered countries to the mountains of Wales, carried their language with them.

Thus the greatest part of Britain becoming a Roman province, the Roman legions who resided here for above two hundred years undoubtedly disseminated the Latin tongue; and the people being governed by laws written in Latin, must necessarily introduce a mixture of languages. The British tongue thus continued mingled only with the provincial Latin, till the Roman legions being called home, the Scots and Picts seized that opportunity to attack and harass England; upon which king Vortigern, about the year 440, called the Saxons to his assistance, who coming over, repulsed the Scots and Picts, and were rewarded with the isle of Thanet, and the whole country of Kent; but growing too powerful, they dispossessed the inhabitants of all the country to the south of the Severn, and thus the British tongue was in a great measure destroyed, and the Saxon introduced in its stead.

In the beginning of the ninth century the Danes invading England, got a footing in the northern and eastern parts of the country, their power gradually increased, and, in about two hundred years, they became sole masters of it. By this means the ancient British obtained also a tincture of the Danish language; but their government was of no long continuance; for they being driven out, and the Saxons again possessing the throne, did not make so great an alteration in the Anglo-Saxon as the next revolution, when the whole island, in the year 1067, was subdued by William the Conqueror, duke of Normandy; for the Normans endeavoured to make their language generally received. Thus was the ancient British tongue in a manner extirpated by the Romans, Saxons, Danes, and after that blended with the Norman French.

But a change in the language has also been effected by two other causes: the first is that of commerce; for as the inhabitants of Great Britain have long applied themselves to trade, the names of offices, dignities, wares, and terms of traffic, have been introduced and formed according to the genius of our own tongue. The second is that of learning, from which it has received no small improvement; for as to the Greek and Latin, the learned have, together with the arts and sciences, introduced almost all the terms of art in the mathematics, philosophy, physic, and anatomy; and we have entertained many more from the French, &c. so that at this day our language, which about eighteen hundred years ago was the antient British, is now a mixture of Saxon, Teutonic, Dutch, Danish, Norman, and modern French, embellished with the Greek and Latin: yet this is undoubtedly so far from being a disadvantage to the English tongue, as it is now spoke, for all languages have undergone changes, that it has so enriched it, that it is now become, perhaps, the most copious, significant, fluent, and masculine language in Europe.

The Reformation in England, begun in the reign of Henry VIII. was greatly promoted under his son Edward VI. It was, however, checked by queen Mary, but completed by queen Elizabeth, her sister. This Reforma-

tion being conducted by the bishops, the established church of England became episcopal. Calvin indeed used many endeavours to obtain a share in the advancement and direction of this ecclesiastical reformation; but being desirous of depriving the bishops of their temporal grandeur, of banishing all external ornaments and pomp from divine worship, and introducing the Geneva constitution, the bishops declined his offers of assistance. Many, however, approving of Calvin's doctrine, formed an ecclesiastical government on his plan. These were afterwards termed Puritans, from their avowed desire of freeing the church from the impurities still retained in it, and Nonconformists, from their not conforming to the rules of the established church. Many of these instituted presbyters without bishops, from whence they obtained the name of Presbyterians, instituting also church laws among themselves, and being governed by synods composed of the ministers of several different churches. Others maintaining, that every Christian congregation ought to be free, and subject neither to bishops nor synods, these were termed Independents.

The Episcopalians and Presbyterians are the two principal parties, and differ the least from each other; the first form the established religion of England and Ireland, and the latter of Scotland. The most numerous of the other religious sects are the Baptists, who do not believe that infants are the proper subjects of baptism, and in the baptism of adults practise immersion. It is here proper to observe, that the English Presbyterians differ almost as much from the church of Scotland, as from the church of England; synods growing gradually out of use, each separate congregation is become in a manner independent of the rest. They have most of them forsaken the opinions of Calvin, and believing universal redemption, maintain that the Universal Parent has excluded none of his offspring from a possibility of salvation; while the Independents, and many congregations of the Baptists, agree with the church of Scotland in the doctrines of particular election and reprobation. It must also be added, that the Presbyterians, with the church of England, receive the Sacrament of the Lord's Supper at noon, while the Independents and Baptists receive it after the conclusion of the afternoon service.

One of the principal of the other sects is the Quakers, who profess to be guided by an internal revelation dictated by the Spirit of God; they have no regular ministers, and neither practise baptism, nor commemorate the death of Christ in the Lord's Supper.

The Methodists have lately arisen, and now form a very numerous body; most of them are also members of the church of England, and profess to adhere more closely than the other members of that church to the thirty-nine articles, and the greatest part of them are rigid Calvinists.

The number of Papists here is also very considerable, and in Ireland it even greatly exceeds that of the Protestants.

Many authors have exclaimed with great heat of the many sects in England; but let it be considered, that civil and religious liberty are closely connected, and that it does not become any church who makes no pretensions to infallibility to set up the standard of persecution. May the minds of Britons ever be free, and in affairs which solely relate to another life, may they be accountable only to their conscience and their God! May candor and charity, a love of truth and of liberty, unite those who differ in sentiment, and then nothing will result from diversity of opinion but peace, order, and harmony.

But to return: the church of England is under the government of two archbishops and twenty-five bishops, who are subject to the king as supreme temporal head of the church. The archbishop of Canterbury is styled the first peer and metropolitan of the kingdom; he takes place immediately after the royal family, and consequently precedes not only all dukes, but likewise the great officers of state. In addresses to him he enjoys the title of Your Grace, in common with dukes, and also that of Most Reverend father in God. He has the power of holding juridical courts in church affairs, with many other privileges relating to the granting of licenses and dispensations,

fations, in all cases formerly sued for at the court of Rome, where they are not repugnant to the law of God, or the king's prerogative. He has also within his province, by common law, the probate of all wills, where the party dying is worth upwards of five pounds. He has under him twenty-one bishops, besides his own particular diocese; these are the bishops of London, Winchester, Ely, Lincoln, Rochester, Litchfield and Coventry, Hereford, Worcester, Bath and Wells, Salisbury, Exeter, Chichester, Norwich, Gloucester, Oxford, Peterborough, Bristol; and in Wales, St. David's, Landaff, St. Asaph, and Bangor.

The archbishop of York likewise takes the precedence of all dukes who are not of the blood royal; as also of all the great officers of state, except the lord chancellor, who is immediately next in rank to the archbishop of Canterbury. In his diocese he is styled Primate of England and Metropolitan; he also enjoys the title of his Grace, and Most Reverend father in God. Exclusive of his own diocese, in his province are Durham, Carlisle, Chester, and Sodor and Man; but the last bishop has no seat in the house of peers. In Northumberland he has the power of a palatine, and jurisdiction in all criminal proceedings.

The twenty-five bishops are styled Right Reverend and Your Lordship; all these, except the bishop of Sodor and Man, walk next after the viscounts, and precede the barons. In parliament they sit in a double capacity as bishops and barons; they also enjoy many other privileges, as freedom from arrests, out-lawries, &c. The principal of these bishops is that of London, next to him is Durham, who being invested with a temporal jurisdiction, and the power of hunting, may be esteemed a temporal prince. The third is the bishop of Winchester, and the rest take place according to seniority of consecration. These several bishops are subordinate to their metropolitan, and in spiritual affairs subject only to his jurisdiction. Each has also a kind of jurisdiction in his own diocese, but from their courts lies an appeal to their metropolitan; but criminal causes do not fall under their cognizance. They live in great state; their revenues are also considerable; but where the income is not very large, some other lucrative preferment, as a deanery, is generally annexed to it.

The business of a bishop is to examine and ordain priests and deacons, to consecrate churches and burying-places, and to administer the rite of consecration. The jurisdiction of a bishop relates to the probate of wills; he is to grant administration of goods to such as die intestate; to take care of perishable goods, when no one will administer; to collate to benefices; to grant institutions to livings; to defend the liberties of the church; and to visit his own diocese once in three years.

Next to the bishops are the deans and prebends of cathedrals, out of whom the bishops are chosen. After these are the archdeacons, of which every diocese has one or more, the whole number in the kingdom of England amounting to sixty. Their office is to visit the churches twice or thrice every year. The archdeacons are followed by the rural deans, who were formerly styled arch-presbyters, and signify the bishop's pleasure to his clergy, the lower class of which consists of priests and deacons.

Scotland is divided into thirteen provincial synods, which consist of sixty-eight presbyteries, and these again of a number of parishes.

With respect to the ecclesiastical government and courts, it is proper to observe, that the principal part of the ecclesiastical government was formerly lodged in the convocation, which is a national synod of the clergy, assembled to consider of the state of the church, and to call those to an account who have advanced new opinions inconsistent with the doctrines of the church of England; but in the reign of his late majesty they being thought to proceed with too much heat and severity against some learned divines, and to be too great a check upon free enquiry, they have not been permitted to sit for any long time since. However, they are assembled at the same time with the parliament by the authority of the king, who directs his writs to the archbishop of each province to summon all bishops, deans, archdeacons, &c. to meet at a certain time and place.

The convocation consists of one proctor, sent from each cathedral and collegiate church, and two from the body of the inferior clergy of each diocese. The upper-house in the province of Canterbury consists of the archbishop, who is president, and twenty-two bishops; and the lower house of all the deans, archdeacons, and proctors, in all a hundred and sixty-six. They usually meet in king Henry the seventh's chapel in Westminster. The archbishop of York holds his convocation at the same time in the city of York. The first business of the lower house is to choose a prolocutor, who is presented to the upper house by two of the members; one of whom makes a speech in Latin, and the prolocutor they have chosen another, to which the archbishop returns an answer in the same language.

The court of arches is the most ancient consistory of the province of Canterbury, and all appeals in church matters from the judgment of the inferior courts are directed to this. The processes run in the name of the judge, who is called dean of the arches, and the advocates who plead in this court must be doctors of the civil law. The court of audience has the same authority with this, to which the archbishop's chancery was formerly joined.

The prerogative court is that wherein wills are proved and administrations taken out.

The court of peculiars relating to certain parishes have a jurisdiction among themselves for the probate of wills, and are therefore exempt from the bishops courts. The see of Canterbury has no less than fifteen of these peculiars.

The court of delegates receives its name from its consisting of commoners delegated or appointed by the royal commission; but it is no standing court.

Every bishop has also a court of his own called the consistory court. Every archdeacon has likewise his court, as well as the dean and chapter of every cathedral.

S E C T. III.

Of the Learning, Arts, Sciences, Manufactures, Trades, Commerce, and Coin of the English.

IN the beginning of the last section we gave a concise account of the manners and dispositions of the English; and we shall here consider their learning and skill in the arts. Great Britain has produced a number of persons eminent for their learning and their improvement in the sciences; and among these England will ever boast a Friar Bacon, a Lord Verulam, a Sir Isaac Newton, and a Locke. The sciences are here highly esteemed, encouraged, and cultivated. With respect to seminaries of learning, we have indeed only two universities in England; but these are noble ones: in that of Oxford there are generally two thousand students, and in Cambridge fifteen thousand. As these universities are entirely of the established church, the Dissenters have instituted several academies, where the students go through a course of studies, to prepare them for the ministry. In Scotland there are four universities, those of Edinburgh, Glasgow, St. Andrew, and Aberdeen; and there is scarce a great town in England where there is not a free-school founded for the instruction of the sons of the citizens, or burghesses, in the learned languages.

With respect to the polite arts, the English have long been famous for their skill in portrait painting; but we have not yet equalled the Italians in history painting, or the French in engraving: we have, however, at present some admirable sculptors that would do honour to any nation; and both engraving and painting in all its branches are making speedy advances towards perfection. The English have a good genius for civil architecture, and in ship-building are inferior to no nation upon earth. In other elegant and useful arts England has also produced many able masters. As this country has produced the greatest philosophers, so the several arts dependent on the sciences have here been greatly improved; the orrery, the air-pump, the wonderful machine for raising a perfect river of water from the bottom of coal-pits by means of fire, the vast improvement made in the engines formed

for extinguishing of fires, were all invented by the English; and, to the honour of England, the ingenious Mr. Harrison has lately invented an easy method of discovering the longitude at sea.

The English, says Dr. Busching, were the first who set on foot that noble manufacture of silk and woollen tapestry, in which life and nature are imitated with admirable skill. Our broad-cloths are the finest and most beautiful in the world, and are admired and purchased in every quarter of the globe; indeed the woollen manufacture is in so flourishing a condition, that the value of cloths and stuffs annually exported amounts to two millions sterling. The manufactures of flowered silk have been greatly improved, and in the beauty of the patterns they excel those of France or any other country. We have lately invented a method of printing on plain silk figures in gold. Our printers of linen too greatly excel those of other nations, from the superior skill of the pattern-drawers.

In short, there is scarce a manufacture in Europe but what is brought to great perfection in England; our locks, edge-tools, guns, swords, and other arms, are said to exceed any thing of the kind; household utensils of brass, iron, and pewter, are very great articles; and our clocks and watches of price are very much esteemed; though the miserable cheap work bought up and sent abroad has dishonoured the nation. There are but few manufactures in which we are defective; but in those of bone lace and paper we do not excel. With respect to the last, an astonishing improvement has been made in England in writing and printing paper; but the French paper for copper-plate prints is still superior to ours.

Great Britain enjoys a fine situation with respect to commerce, and is surrounded with excellent harbours. Its trade and navigation is greatly superior to what they were formerly, and the inhabitants at present carry on an extensive trade to every part of the globe.

In time of peace we export to France tin, lead, horn plates, great quantities of tobacco, with some flannel, and in time of scarcity we send them corn; and from thence we import brandy, wine, laces, linen, cambrics, lawn. This trade is of very great disadvantage to England. Our smugglers also, to the great detriment of Great Britain, convey thither gold, silver, and wool.

To Holland we send almost all sorts of commodities and manufactured goods, either of our own produce or imported from abroad, and receive from thence spices, drugs for dying, vast quantities of fine linen, tapes, whale fins, and toys.

To Flanders we send tin, lead, hard-ware, sugar, flannels, a few stuffs, serges, and tobacco; for which we receive fine laces, linen, cambrics, tapes, and other goods.

To Germany we send woollen manufactories of every kind, all sorts of East India goods, tin, lead, ginger, sugar, and tobacco. In return we have from thence linen, thread, goat skins, and many other commodities. In many places, however, several of our manufactories are prohibited; and yet it is thought that the balance of trade is considerably in our favour.

We have very little trade with Denmark and Norway, except for a few coarse woollen goods and tobacco; but we receive from them timber, planks, firs, deer skins, and many other articles of commerce, for the greatest part of which we are obliged to pay ready money. The Swedes also buy little of us, and we purchase of them copper, iron, deals, timber, and naval stores; but not so much iron as formerly, since its being allowed to be imported from our own plantations in America.

To Russia we send tin, lead, worsted stuffs, long ells, coarse cloths, cottons, fustians, perpetuanas, lace, thread, allum, copper, and a great quantity of tobacco. From thence we import pot-ashes, hemp, flax, linen, cable-yarn, bees-wax, isinglass, hides of several sorts, and leather; with linseed, train-oil, flax, hemp, hogs bristles, caviare, &c. This trade is carried on by a particular company.

We send to Italy various kinds of East India goods, broad-cloth, long ells, bays, druggets, camblets, leather, tin, lead, pilchards, herrings, salmon, cod, and various

other articles. From thence we import wine, oil, soap, olives, dying drugs, anchovies, and raw, thrown, and wrought silk. From the king of Sardinia's dominions we have the fine silk called organzine, which is thrown here by an engine, of which a very curious one has been many years at Derby, and for some time in two or three towns in Cheshire.

To Spain we send nearly the same commodities as to Italy, many of which are exported from thence to their American dominions. In return we have wine, oil, fruit, wool, indigo, cochineal, and other drugs, with gold and silver in specie or bullion.

Portugal takes from us almost all kinds of our commodities, and from thence we receive wine, oil, fruit, and salt. Though the balance of trade with Portugal is supposed to be greatly in our favour, yet it is of no little advantage to them, as they would be unable to sell what we take from them at other markets; and as they send great quantities of our goods to Brazil, they are enabled to draw from thence immense treasures.

The African trade is of very great advantage, as we not only send many of our own and the East India manufactures for the purchase of slaves; but with these last supply our plantations in America, and have also from Africa gold dust, gum seneca, malagueta, ivory, red wood, and many other valuable commodities.

To the East Indies we export some woollen cloths, lead, and other English manufactures, with a very great quantity of silver; and import from thence great quantities of tea, china ware, raw and wrought silks, calicoe, chintz, cabinets, &c. all the wrought silks, calicoes, and chintz, being exported again.

The Hudson's bay company export woollen goods, haberdashery wares, hatchets, arms, and other hard-ware, and import great quantities of skins and furs of different kinds.

To the sugar islands in America we export all manner of clothing, both linen and woollen, furniture for their houses, and hard-ware; and take the produce of those islands in return, which beside sugar, yield ginger, indigo, rum, molasses, coffee, cacao, or the chocolate nut, and pimento, or Jamaica pepper.

To the tobacco plantations on the continent of America, we also export clothing, tools, hard-ware, and furniture, receiving tobacco in return, a great part of which is re-exported.

We export the same species of goods to Carolina, and receive from thence vast quantities of rice and skins, pitch and tar.

To Pennsylvania, the Jerseys, New-York, and New-England, we send the same articles, and receive in return log-wood, and the produce of Spanish America, with which they frequently carry on a clandestine trade, and also ships ready built, mahogany, cedar, drugs, and furs.

In short, to Ireland the merchants export fine broad-cloth, silk, ribbons, gold and silver lace, hard-ware, pewter, hops, coals, tobacco, sugar, East India goods, and from thence import great quantities of linen, linen yarn, and wool, together with beef, butter, pork, and tallow.

The annual exports of English and foreign goods amount to between six and seven millions sterling, and our imports do not exceed five millions. As a considerable part of this is again exported, the annual issues from England for foreign merchandize, has been estimated at four millions. Yet our foreign trade does not amount to one sixth part of the inland; the annual produce of the natural products and manufactures of England amounting to above forty-two millions. The gold and silver of England is received from Portugal, Spain, Jamaica, the American colonies, and Africa; but great part of this gold and silver we again export to Holland, and the East-Indies; and it is supposed that two-thirds of all the foreign traffic of England is carried on in the port of London.

In Great Britain money is computed by pounds, shillings, and pence, twelve pence making a shilling, and twenty shillings one pound, which is only an imaginary coin. The gold pieces consist only of guineas, halves, and

and quarters; the silver of crowns, half-crowns, shillings, six-pences, groats, and even down to a silver penny; and the copper money only of half-pence and farthings.

SECT. IV.

A concise View of the History of England; the Titles of the King, his Arms, and Forces by Sea and Land.

THE Britons, the ancient inhabitants of this island, were first invaded, as hath been already observed, by Julius Cæsar, and afterwards subdued by the Romans. In the reign of Valentinian III. they quitted the island, and taking with them all the Roman and British forces, left the kingdom exposed to the excursions of the Picts and Scots. The Britons successively elected several monarchs, who were deposed almost as soon as they were advanced to the throne, till they made choice of Vortigern, who finding it difficult to contend with the Picts and Scots who invaded his dominions, solicited succours from abroad, and accordingly in 449, a large body of Anglo-Saxons arrived, under the conduct of two leaders, Hengist and Horsa, who having obtained a victory over the enemy, settled here; and other bodies of Saxons coming over, extended their dominions, and at length conquered England, which received its name from the Angles. They erected seven monarchies, those of Kent, Suffex, the East-Angles, the West-Saxons, the East Saxons, Northumberland, and Mercia. Egbert, king of the West-Saxons, at length united all the other kings under him. In the ninth century the Danes passed over to England, and proved so troublesome to the Saxon princes, that they were at length obliged to share the kingdom with them. This division lasted till the year 1041, when the Saxons again recovered the whole country. Upon the death of this prince, he was succeeded by Harold; but William duke of Normandy invaded the kingdom, and coming to a battle with Harold near Hastings in Suffex, defeated his rival, who was slain in the engagement, and agreeing to observe the Saxon laws was proclaimed king.

After his decease, and that of his two sons, his descendants of the female line contended for the throne, which Henry II. surnamed Plantagenet, at last ascended in 1154, and transmitted it to his descendants. This prince was by inheritance earl of Anjou, Maine, and Touraine; by marriage, duke of Guienne; and by the success of his arms, lord of Ireland. John, the youngest son of Henry II. was obliged to grant the Magna Charta. Edward I. subdued the principality of Wales, and endeavoured to maintain his superiority in Scotland. Edward III. the eldest son of Edward II. succeeded to the crown in the life-time of his father; the queen and Mortimer during his minority, usurping the administration, governed in his name, and murdered Edward II. But Edward III. afterwards caused Mortimer to be seized in the queen's apartment, and executed. This prince invaded France, and in 1346 obtained the glorious victory of Cressy, and about the same time David king of the Scots was made prisoner. John the French king, and his son Philip were taken prisoners at the battle of Poitiers, by Edward the Black Prince. Richard II. the son of Edward the Black Prince, and grandson of Edward III. succeeded to the throne. He suppressed a rebellion raised by Wat Tyler; but the parliament, disgusted at his administration, raised an army against him and made him prisoner. The duke of Lancaster, the king's uncle, claimed the crown of Castile in right of his wife, and invaded Spain. His son the duke of Lancaster dethroned Richard II. and usurping the crown was styled Henry IV. and being confirmed in the throne by the parliament, Richard was soon after murdered.

Henry V. gained several victories over the French, took many of their towns, and having married Catharine, daughter to Charles VI. king of France, by the convention of Troyes, obtained the reversion of that crown, but died in the midst of all his expectations. His infant son, Henry VI. who was crowned at Paris, inherited

both kingdoms; but under him the English arms in France met with a sad reverse, by his losing that kingdom. At this time disputes arose concerning the crown between the houses of York and Lancaster, both which were of the royal blood, and were commonly called, in allusion to their arms, the White and Red Rose; and these disputes soon broke out into a bloody civil war, which was frequently renewed. Edward IV. the eldest son of Richard duke of York, was at length established on the throne, while Henry VI. was confined in the Tower, and at last murdered. Edward V. the eldest son of Edward IV. with his brother Richard duke of York, were also murdered in the Tower, by their uncle Richard duke of Gloucester, who ascended the throne by the name of Richard III. but Henry earl of Richmond defeating that unnatural monster at Bosworth, and that murderer, who was the last male of the house of York, being killed in the battle, Henry in 1485, obtained the crown. This was Henry VII. who being of the house of Lancaster, and marrying Elizabeth of the house of York, in him both roses were united. Henry VIII. the son of Henry VII. was remarkable for his numerous marriages, his manner of living, government, and power. On account of his book on the seven sacraments, which was written against Luther, he was dignified by the pope with the title of Defender of the Faith, a title which the kings of England had long before assumed, as appears from several charters granted to the university of Oxford. This king soon quarrelled with the pontiff, and under him the happy reformation of religion began in England; and the parliament enacted an oath of supremacy, by which all ecclesiastics were compelled to acknowledge the king as supreme in all causes both ecclesiastical and civil. Under Edward VI. the Reformation was promoted; but his sister and successor Mary again introduced popery, lighted the fire of persecution, and lost Calais, the only place in France belonging to the crown of England. Under her sister Elizabeth the Reformation was completed, and very considerable improvements made in trade and navigation. She appointed for her successor James I. king of Scotland, who endeavoured to unite both kingdoms, under the name of Great Britain. This weak and pusillanimous prince paid little regard to the constitution of England. His example was followed by his son Charles I. The people rose in defence of their liberties, and that unhappy prince lost his head on the block. The Scots proclaimed his son Charles II. but were defeated therein by Oliver Cromwell, who governed these kingdoms under the title of protector of England, Scotland, and Ireland. In his time the English made themselves masters of Jamaica and Dunkirk. His son Richard was afterwards chosen protector; but being averse to the cares of government, he made little or no opposition to the return of Charles II. who was restored to his throne by his ancestors.

This last prince sold Dunkirk to the French; under his reign a dreadful pestilence ravaged England, and London was destroyed by fire. James, duke of York, married his eldest daughter Mary to William prince of Orange, and Anne his second daughter to prince George of Denmark, and on Charles's decease ascended the throne; he then openly declared himself a Papist, and strenuously endeavoured to bring this kingdom again into subjection to the see of Rome. In the year 1688 was born James the present pretender, whom some affirm to be the lawful son of king James II. by his second spouse, while others deny it. Against this prince the church of England united with the Dissenters, and both applying to his son-in-law the prince of Orange, invited him to assist in the defence of their liberties: on which behalf landed in England, and the king fled to France; whence the crown, which he had thus abdicated, was in a national convention offered, with certain restrictions, to the prince of Orange and his consort Mary. This prince, who assumed the title of William III. was succeeded by Anne, king James's youngest daughter, and under her, in 1706, was accomplished the union of the kingdoms of England and Scotland, under the general name of Great Britain. On her decease, in 1714, the crown devolved to George Lewis, elector of Hanover, and duke of Brunswick Lunenburg. His reign began with a rebellion, which

was soon suppressed. That prince was peaceably succeeded by his son George II. in whose reign another rebellion broke out, and was quelled by the bravery of his son William, duke of Cumberland. His reign was distinguished by a number of victories that will do honour to the British annals, and on the twenty-fifth of October, 1760, he was succeeded by his grandson George III. his present majesty.

The titles of this prince are, George III. by the grace of God king of Great Britain, France, and Ireland, defender of the faith, arch-treasurer and elector of the holy Roman empire, &c. In addressing him he is stiled Your Majesty, or Sir: the eldest son is from his birth stiled duke of Cornwall; but receives the title of prince of Wales by creation, and in both those provinces certain revenues are annexed to these titles. All the king's children are stiled their royal highnesses.

The arms of Great Britain are, in the first grand quarter gules, three lions passant guardant in pale or; the imperial ensigns of England, impaled with the royal arms of Scotland, which are or, a lion rampant with a double tressure flowered and counter-flowered, with fleurs-de-lis gules. The second quarter is the royal arms of France, azure three fleur-de-lis or. The third, the ensign of Ireland, which is azure, a harp or, stringed argent. The fourth grand quarter is his present majesty's own coat gules, two lions passant guardant or, for Brunswic, impaled with Lunenburg, which is or, semee of hearts, proper, a lion rampant azure, having ancient Saxony, viz. gules, a horse current argent, grafted in base, and in a shield sur tout gules, the diadem or crown of Charlemagne. The whole within a garter, as sovereign of that most noble order of knighthood, inscribed with the motto *HONI SOIT QUI MAL Y PENSE*, that is, "Evil be to him that evil thinks," given by Edward III. the founder of the order. The crest is a helmet full faced and grated, mantled with cloth of gold, double ermine, and surmounted by an imperial crown, on the top of which is a lion passant guardant or, crowned. The supporter on the dexter side is a lion guardant or, crowned, the proper supporter of the English ensign; on the sinister a unicorn argent horned and hooped or, gorged with a collar of crosses, pattee, and fleur-de-lis, a gold chain fixed to it; both standing on a compartment, from whence issue from one stem the two royal badges of his majesty's chief dominions, namely, on the right a rose party per pale, argent, and gules, stalked and leafed vert, for England; and on the left a thistle for Scotland, being so adorned by James I. whose supporters, as king of Scotland, were two unicorns; and England being under him united to that nation, gave occasion to our carrying one of them on the sinister side; and in 1614, as king of Ireland, he caused the harp to be marshalled with the arms of Great Britain.

The land-forces of these kingdoms in time of peace amount to about forty thousand national men, including troops and garrisons in Ireland, Gibraltar, Minorca, and in America; but in time of war there have been in British pay, natives and foreigners, above a hundred and fifty thousand. We have also a registered militia, consisting of near two hundred thousand men.

The complement of seamen in time of peace usually amounts to twelve or fifteen thousand. In time of war they have amounted to no less than sixty thousand men.

The men of war of the line of battle, from a hundred down to fifty guns, amount to no less than a hundred and fifty sail; and the total of the royal navy, including fifth and sixth rates, with sloops of war, amount to three hundred and ten; besides bomb-vessels, fire-ships, and royal yachts.

This navy is commonly divided into three squadrons, namely, the red, white, and blue, which are so termed from the difference of their colours. Each squadron has its admiral; but the admiral of the red squadron has the principal command of the whole, and is stiled vice-admiral of Great Britain. Subject to each admiral is also a vice and a rear-admiral. But the supreme command of our naval force is, next to the king, in the lords commissioners of the admiralty.

S E C T. V.

Of the Civil Government of the King's Court; the great Officers of State; and the Orders of Knighthood.

THE civil government of the court is committed to the lord steward of the household, who has authority over all the officers and servants of the palace, except those of the king's chapel, chambers, and stables. He also attends the king at the meeting of parliaments, administers the oaths of allegiance and supremacy to all the members of the house of commons, and, at the end of the parliament, adjusts the parliamentary expences, &c. In the king's presence he carries a white wand; but at other times it is carried by a footman bare-headed.

The next is the lord chamberlain, who presides over all the affairs belonging to the king's chamber, and all above stairs, except the precinct of the king's bed-chamber, which is wholly under the groom of the stole. He has also the oversight of the serjeant at arms; of the chaplains, though he himself is a layman; of the physicians, surgeons, barbers, &c. of the wardrobe, the beds, music, comedians, hunting, messengers, handicrafts, and artizans, retained in the king's service.

The master of the great wardrobe is an officer of considerable dignity; he has therefore a salary of sixteen hundred pounds a year, and a deputy under him of four hundred pounds, with other officers. To his office also belong several tradesmen and artificers, who furnish such things as are necessary for the coronations, marriages, and funerals of the royal family; provide robes for the knights and officers of the garter; coats for the king's heralds and pursuivants at arms.

And lastly, the master of the horse, who has the management of the king's stables and breed of horses, and presides over the equeries, pages, footmen, grooms, farriers, smiths, coachmen, saddlers, and other trades working for the king's stables. He has also the care of the lands and revenues appointed for the king's breed of horses, litters, coaches, chairs, &c. The master of the horse has the peculiar privilege of making use of the king's coaches, horses, pages, and footmen, when he goes abroad; and upon any solemn cavalcade he rides next the king, leading a horse of state.

There are also sixteen lords of the king's bed-chamber, including the groom of the stole.

Most of the other officers and servants are under the above four principal officers of his majesty's household.

The great officers of the crown were originally nine, namely, the lord high steward, lord chancellor, lord high treasurer, lord president, lord privy-seal, lord great chamberlain, lord high constable, and lord high admiral. But these have been greatly mutilated and changed, as will appear from the following account:

I. The lord high steward is appointed by the king as judge, when a peer is to be tried for high treason. This office was anciently the highest in the government, and its power so extensive, that it was thought unsafe to trust it any longer in the hands of a subject. The last who enjoyed this office by inheritance was Henry of Bolingbroke, afterwards king of England. Since his time it has been revived only upon particular occasions; as at the king's coronation, or the arraignment of a peer, after which he publicly breaks the white staff, which he bears in his hand as a badge of his office, to shew that it is expired.

II. The lord high chancellor, or keeper of the great seal, is esteemed the first minister of state, and takes place immediately after the archbishop of Canterbury; and, by virtue of his office, he is a member of the privy-council. He keeps the great seal, and causes are referred to him from the other courts, he having the power of judging according to equity, and of moderating the rigour of the common law. His decrees can only be reversed by the house of Lords. Out of this office the lord high steward is usually chosen.

III. The lord high treasurer was formerly an officer of great power and authority; but ever since the Revolution

It has been under the direction of several commissioners, styled lords of the treasury.

IV. The lord president of the privy-council lays before that body such business as is to be transacted there, and, if the king be absent, makes a report to his majesty of what has passed in council.

V. The lord privy-seal, through whose hands pass all grants, charters, and pardons signed by the king, before they come to the great seal; together with bounties and such other things as do not require the great seal. He is, by virtue of his office, a privy counsellor.

VI. The lord high chamberlain of England, whose office is to carry the king's coif and gloves at his coronation, with the sword, scabbard, &c. to dress the king that day in his royal robes, to serve him with water, to wash his hands, and to undress him. To him belongs the care of providing every thing necessary in the house of Lords during the session of parliament. When the king goes to the house, he gives the sword of state to whatever lord he pleases, walks on the right hand of it, next the king's person; has under his direction the gentleman usher of the black rod, with the yeoman usher and door-keeper; and upon solemn occasions, when he enters Westminster-hall, has the keys of that hall and the several courts in it delivered to him.

VII. The lord high constable had such an extensive power, that it has been long abolished, except at coronations, when an officer is created to assist at the ceremony, and his power ends with it.

VIII. The earl marshal on particular occasions takes cognizance of affairs relative to war, regulates ceremonies, and presides over the herald's office. This post has long been hereditary in the family of the dukes of Norfolk.

IX. The lord high admiral had formerly the superintendence of all maritime affairs; but the office is at present, as we have already observed, executed by commission, the directors of which are styled the lords of the admiralty.

The orders of knighthood in Great Britain are three, two English and one Scots, and of all these the king is grand master. The order of the Garter, or St. George, was instituted in 1350, by Edward III. and contains twenty-six knights, including the king. Its insignia or badge is St. George on horse-back, with a dragon of enamelled gold, bearing the motto, *HONI SOIT QUI MAL Y PENSE*. This George is worn at a blue ribbon, and this motto is likewise embroidered with gold on a blue garter worn on the left leg.

The order of the Bath was constituted by Henry IV. and revived with some improvements in 1725, by George I. It derives its name from a very ancient custom of instituting knights by bathing. This order consists of thirty-five knights, exclusive of the sovereign. Its ensigns are three crowns in a field or, with this inscription, *TRIA JUNCTA IN UNO*, that is, three joined in one; and is worn pendant at a red ribbon.

The order of the Thistle, instituted in Scotland, was revived in 1703 by queen Anne, and its statutes were enlarged in 1725 by George I. The knights of this order are but twelve in number, besides the sovereign, who presides as grand master. Its ensigns are the image of St. Andrew worn pendant to a green ribbon, and the motto *NEMO ME IMPUNE LACESSET*. The collar is composed of thistles interwoven with sprigs and leaves of rue, which are all of gold.

SECT. VI.

Of both Houses of Parliament; the civil Liberties of the People, the Courts of Justice, and the Manner in which the Laws are executed.

THAT august body the parliament of Great Britain consists of two houses, one of which is called the house of Lords, and the other that of the Commons. Before the Union the house of Lords consisted only of the spiritual and temporal peers of England, and the house of Commons of five hundred and thirteen knights, burgesses, and citizens: but at the Union sixteen peers of

Scotland were added to the house of Lords, and forty-five Scots commoners to the house of Commons. The first of these are chosen before the sitting of every new parliament by the peers of Scotland out of their own body.

The use of parliaments is to maintain the constitution, and keep inviolable the privileges of the people; they also raise subsidies, make laws, and redress all the public grievances. The power of calling a parliament, and of adjourning and proroguing it, is entirely lodged in the sovereign.

The sitting of the parliament is appointed by the king's proclamation, with the advice of the privy council, and in choosing a new one writs are issued out by the Lord Chancellor to the Lords, to appear at the time and place appointed. Writs are also sent to the sheriffs of every county, commanding them to summon the electors to choose as many knights, citizens, and burgesses in their respective counties as are to sit in the house of Commons. The writs for Scotland are directed to the Privy Council for summoning the sixteen peers, and for electing the forty-five members. No judge, sheriff, or clergyman, can be elected; and no gentleman, except he has six hundred a year. They always assemble in St. Stephen's chapel by Westminster-hall.

The house of Lords is also situated near Westminster-hall, by the painted chamber and court of requests. It is a spacious and lofty room, hung with tapestry, representing the defeat of the Spanish armada. At the upper end of the room is the throne, upon which on solemn occasions the king is seated in his robes, with the crown on his head, and adorned with all the ensigns of majesty. On the right hand of the throne is a seat for the prince of Wales, and on the left another for the next person of the royal family. Behind the throne are places for the young peers who have no votes in the house. At a small distance below the throne on the king's right hand, are the seats of the two archbishops, and a little below them the bench of bishops. On the opposite side of the house sit those peers who rank above barons. Just before the throne are the wool-packs across the room, on which are seated the dignitaries of the law. The lord high chancellor, who is speaker of the house of Lords, sits on that nearest the throne, with the great seal and mace by him. On the other two wool-packs placed parallel to this, sit the lord chief justice, the master of the Rolls, and the other judges, who have no vote in the house; and are only advised with in points of law. They are supposed to be placed on wool-packs to remind them of the great importance of the woollen manufacture to this nation. When the king is present with the crown on his head the lords sit uncovered, and the judges stand till his majesty gives them leave to sit. A stranger cannot form a more just notion of the dignity of this nation, than by attending this august assembly when the king is present with the crown upon his head, and not only his majesty, but the Lords are in their robes, and the Commons attending without the bar.

The Commons, as we have already observed, meet in a spacious room called St. Stephen's chapel. It is wainscoted up to the ceiling, and accommodated with galleries supported by slender iron columns, adorned with Corinthian capitals and sconces. At the upper end the speaker is placed on a raised seat ornamented with Corinthian columns, and the king's arms carved and placed on a pediment; before him is a table, at which the clerk and his assistant sit near him at each hand just below the chair; and on each side, as well below as in the galleries, the members are placed promiscuously. The speaker and clerks always wear gowns in the house, but no other of the members, except the four representatives for the city of London, who the first day of every new parliament are dressed in scarlet gowns, and sit all together on the right hand of the chair next the speaker.

No act is valid without the concurrence of both houses, and the king's approbation. Any bill for making a new law, or altering an old one, may be brought first into the house of Peers, except a money bill; but no bill relating to the revenues or public taxes can be brought into the house of Peers first, or altered when it comes up from the Commons, though it may be totally rejected

by the Lords. Thus, where the Lords might be tempted to pursue their own interest to the prejudice of the public, and might receive the greatest pecuniary advantages from being corrupt, in granting supplies, they have only the power of refusing, while the Commons alone have that of enacting.

It will be proper here to give in one view a sketch of the constitution of Great Britain. The king has all the honours, and all the splendor of majesty; he has the power of doing good in its fullest extent, and it is surely no diminution to his glory, that he is confined from doing what would render him hated and despised by his contemporaries, and infamous to posterity. Though he has not the power of making laws, yet no law can be enacted without his consent; and though the execution of them is always entrusted to his care, he cannot seize the property of the most inconsiderable man in his dominions, except it be forfeited by law: the subject may without the least danger sue his sovereign, or those who act in his name, and under his authority; he may do this in open court, where the king may be cast, and obliged to pay damages to his subject. He cannot take away the liberty of the least individual, unless he has by some illegal act forfeited his right to liberty, or except when the state is in danger, and the representatives of the people think the public safety makes it necessary that he should have the power of confining persons and seizing their papers on a suspicion of guilt; and this power is never given but for a limited time.

The king may pardon, but neither he nor the judges to whom he delegates his authority, can condemn a man as a criminal, except he be first found guilty by twelve men, who must be his peers or equals. That the judges may not be influenced by the king, or his ministers, they have their salaries for life, and not during the sovereign's pleasure. No person can be deprived of his liberty even for the highest crime, till some presumptive proof be given upon oath before a magistrate. If a person be charged with a capital offence, he must not undergo the ignominy of being tried for his life, till the evidences of his guilt are laid before the grand jury of the town or county in which the fact is alledged to be committed, and not without twelve of them agreeing to find a bill of indictment against him. If they do this, he is to stand a second trial before twelve other men; he is therefore furnished with a pannel or list of the jury, who are his true and proper judges, that he may learn their characters, and discover whether they want abilities, are bribed, or are prejudiced against him. He may in open court object to twenty of the number, and to as many more as he can shew any cause why they should not be admitted as his judges, till at last twelve unexceptionable men are sworn to give a true verdict according to the evidence produced in court. These only are the judges from whose sentence the prisoner is to expect life or death; and as from their judgment there lies no appeal, they are to be all of one mind, and after they have fully heard the evidence, are confined without meat, drink, or candle, till they are unanimous in acquitting or condemning the prisoner. Our freedom consists in its being out of the power of the judge on the bench to injure us. Indeed juries have always been considered as giving the most effectual check to tyranny; for in a nation like this, where a king can do nothing against law, they are a security that he shall never make the laws, by a bad administration, the instruments of cruelty and oppression. Nothing is here wanting to clear up the cause of innocence, and to prevent the sufferers sinking under the power of corrupt judges, and the oppression of the great. The racks and tortures that are cruelly used in other parts of Europe to make a man accuse himself, are here unknown, and none punished without conviction, but he who refuses to plead in his own defence.

But as the nobility are always exposed to popular envy, were they to be judged by the people, they might be in the greatest danger from their judges, and would want the privilege of being tried by their peers, a privilege enjoyed by the meanest subject; they are therefore not to be tried by the ordinary courts of judicature, but by that part of the legislature of which each is a member.

On the other hand, the house of Commons can search into the conduct of the highest peer in the realm, and in the name of the people impeach the favourite or minister of the king. They can call the judges to an account for the mal-administration of their office. Thus the Commons are the grand jury of the nation; but as it would be improper that those who are impeached in so high a court should be tried by a lower, which might be overawed by the power of the house of Commons, therefore, to preserve the dignity of the peers, and the security of the subject, those whom they impeach are tried by the Lords, whose superior dignity ought to set them above all influence, and who are influenced neither by the same interests nor moved by the same passions.

The courts of justice sitting at Westminster are open four times a year; that is, at Easter, Trinity, Michaelmas, and Hillary terms. There are four courts, the court of chancery, the king's bench, common pleas, and the court of exchequer; besides that of the duchy of Lancaster, which takes cognizance of all the causes relating to the revenue of that duchy, which has been long annexed to the crown; the chief judge of that court is called the chancellor of the duchy of Lancaster.

The court of chancery, which is a court of equity, is next in dignity to the high court of parliament, and is designed to relieve the subject against frauds, breaches of trust, and other oppressions; and to moderate the rigour of the law. The chief judge is the lord chancellor, or lord keeper; and the form of proceeding is by bills, answers, and decrees, the witnesses being examined in private: however, the decrees of this court are only binding to the persons of those concerned in them, for they do not affect their lands and goods; and consequently, if a man refuses to comply with the terms, they can do nothing more than send him to the prison of the Fleet. This court is not like the others, which have no power except in term-time, this being always open; and if a man be sent to prison, the lord chancellor, in any vacation, can, if he sees reason for it, grant a habeas corpus. At these times he may also grant prohibitions.

The lord chancellor has twelve assistants, called masters in chancery, who take depositions upon oath, for which they have an office in Chancery-lane: they also examine accompts depending in that court, and decide disputes referred to them by the lord chancellor in their separate offices. Besides these there are several masters extraordinary to take affidavits in the country.

The principal of the twelve is the master of the rolls, who has the custody of all charters, customs, commissions, deeds, and recognizances; which being made on rolls of parchment, gave occasion to his name. In his office are kept all the rolls since the beginning of the reign of Richard III: This officer usually hears causes in chancery in the absence of the chancellor, and in his court hears and determines the causes brought before him; he has the gift of the offices of the six clerks, who enrol all patents, commissions, licences, pardons, and other instruments that pass the great seal. Under the six clerks there were formerly sixty, but now there are ninety, and these, with their under clerks, perform the business of their office.

The court of king's bench is the highest court in England at common law, except the house of Lords; it takes cognizance of treason, felony, breaches of the peace, oppression, &c. and can examine and correct the judgments and proceedings of all the inferior courts, except that of the exchequer, not only in pleas of the crown, but in those that are personal; errors committed by justices of the peace come also under its cognizance. In this court are four judges, who hold their places for life; the principal of whom is stiled the lord chief justice of the king's bench. His jurisdiction is very extensive, and his warrant is of force in any part of the kingdom. This court grants prohibitions to other courts, both ecclesiastical and civil, when they exceed the bounds of their jurisdiction.

The court of common-pleas is so called because the pleas usually here debated are between subject and subject. Here all civil causes are tried, and real actions are pleadable in no other court. There are four judges belonging

ing to it, the first of whom is called lord chief justice of the common-pleas. None but serjeants at law can plead in this court, and all facts are tried by a jury.

The court of exchequer formerly received its name from a striped or chequered cloth spread over the table; it consists of two courts, one of which tries causes according to law, and the other according to equity. The court of equity is held in the exchequer-chamber before the lord treasurer, the chancellor of the exchequer, the lord chief baron, and the three barons of the exchequer; besides a curfitor baron: but the two first sit very seldom, and the five last almost always. Here are tried all causes relating to the king's revenue. All judicial proceedings, according to law are tried only before the barons.

In the different counties in England assizes and sessions are held twice a year for the more regular distribution of justice; and for this purpose the twelve judges are commissioned by the king to go the circuits. At these assizes all civil and criminal causes are determined. The first is called Lent assizes, and begins soon after Hillary term; and the other, called the summer assizes, after Trinity term. There are six of these circuits, besides those in Wales, in which principality two distinct judges are appointed; and both in England and Wales all causes are determined by a jury.

The commitment of malefactors is made by a justice of the peace, who examines witnesses to the fact upon oath; and if the evidence appears plain, he makes a mittimus, and sends the malefactor to prison, where he continues till the next assizes.

There are justices of the peace in every county, and such in whom the king is supposed to have a greater confidence are stiled justices of the quorum, because in their dedimus there are these words, *quorum A. B. unum esse volumus*; which signifies, that no business of consequence must be transacted unless with the concurrence of one of these. Their office is to call before them, examine, and commit to prison all murderers, thieves, vagabonds, and all disturbers of the peace.

Every city and corporation in England choose their own magistrates, who regulate all affairs belonging to their respective corporations, and try persons supposed guilty of small crimes, but cannot exercise their power out of their own liberties.

Besides the above courts, there are court leets and court barons, which properly belong to the lords of the manors, who appoints stewards to hold them in their name. The first is a court of record; it being reputed the king's court, because its authority is derived from the crown. It is kept twice a year, and in it enquiry may be made of riots and other criminal matters; but all great offences must be certified to the justices of assize.

A court baron is held in every manor, though the other is not, and is thus called from the lord of the manor, who was anciently stiled baron. All tenants belonging to the manor are summoned to this court, part of whom are sworn for a jury, and the steward sits as judge. The jury is directed to enquire after the decease of copy-holders and free-holders, and to bring in their next heir, and also of the encroachments of any tenant. They likewise make orders and laws among themselves, with a penalty for transgressions, payable to the lord of the manor.

There are also sheriff-courts, and hundred courts, held every month in all parts of England, where small causes are determined.

The laws of England are esteemed more merciful with respect to offenders, than those which at present subsist in any other part of the known world. However, the punishment of such who at their trial refuse to plead guilty or not guilty, is very cruel. In this case the prisoner is laid upon his back, and his arms and legs being extended with cords, and a considerable weight laid upon his breast, he is allowed only three morsels of barley-bread, which is given him the next day without drink, after which he is allowed nothing but foul water till he expires. This punishment is however seldom inflicted; but some offenders have chose it, in order to preserve their estates for their children. Those guilty of this crime are not now suffered to undergo such a length

of torture; but have so great a weight placed on them, that they soon expire. In case of high treason, though the criminal stands mute, judgment is given against him, as if he had been convicted, and his estate is confiscated.

All capital crimes are in England included under high treason, petty treason, and felony; the first consists in plotting, conspiring, or rising up in arms against the sovereign; or in counterfeiting the coin. The traitor is punished by being drawn on a sledge to the place of execution, when after being hanged on the gallows for some minutes, the body is cut down alive, the heart taken out and exposed to public view, and the entrails burnt: the head is then cut off, and the body quartered, after which the head is usually fixed on some conspicuous place. All the criminal's lands and goods are forfeited, his wife loses her dowry, and his children both their estates and nobility. But though the sentence passed upon all traitors is the same, yet with respect to persons of quality, it is generally changed into beheading. Though coining of money is adjudged high treason, the criminal is only drawn upon a sledge to the place of execution, and there hanged.

The punishment for misprision of treason, that is, for neglecting, or concealing it, is imprisonment for life, the forfeiture of all the offender's goods, and the profits arising from his lands.

Petty treason, which includes a child's killing his father, a wife her husband, a clergyman his bishop, or a servant his master or mistress, is punished by being drawn on a sledge to the place of execution, and there hanged. Women guilty either of this crime or high treason, are sentenced to be burnt alive; but instead of suffering the full rigour of the law, they are strangled at the stake, before the fire takes hold of them.

Felony, which includes murders, robberies, forging notes, bonds, &c. is punished by hanging, only murderers are to be executed soon after the sentence is passed, and then delivered to the surgeons, in order to be publicly dissected, or their body hung up in chains. Persons guilty of robbery, when there are some alleviating circumstances, are frequently transported for a term of years to his majesty's plantations; and in such cases where the benefit of the clergy is allowed, the criminal is burnt in the hand with a hot iron.

Manlaughter is the unlawful killing a person without premeditated malice, but with a present intent to kill; as when two persons quarrelling, one kills the other; in this case the criminal is allowed the benefit of the clergy for the first time, and only burnt in the hand.

Chance-medley is the accidental killing of a man, without an evil intent, for which the offender is also to be burnt in the hand, unless he was doing an unlawful act, which last circumstance makes the punishment death.

Shop-lifting and receiving goods knowing them to be stolen, are punished with transportation, or burning in the hand.

Perjury and keeping disorderly houses are punished with the pillory and imprisonment.

Petty-larceny, or small theft, under the value of twelve-pence, is punished with whipping.

Striking, so as to draw blood, in the king's court, subjects the criminal to the loss of his right hand.

Striking in Westminster hall while the courts of justice are sitting, is imprisonment for life, and the forfeiture of all the offender's estate.

Drunkards, vagabonds, and loose, idle, disorderly persons, are punished by being set in the stocks, or by paying a small fine.

Formerly in several parts of England scolding women were set in a vehicle called a ducking-stool, where they were placed on high, and drawn through the town to some deep water, into which they were three times plunged, and then again carried about and exposed to the derision and contempt of the populace.

With respect to the courts of justice and the punishments of Scotland, we shall give an account of them when we come to give a more particular description of that

that country; and shall conclude this section with the divisions of the whole island, and the representatives they send to parliament.

In England there are forty counties, which send up to parliament eighty knights.

Twenty-five cities, of which London sends four and Ely none, fifty citizens.

A hundred and sixty-seven boroughs, who send two each, three hundred and thirty-four burgesses.

Five boroughs, which are Abingdon, Banbury, Bewdley, Higham Ferrars, and Monmouth, one each, five burgesses.

Two Universities, who send four representatives.

Eight Cinque ports, as Hastings, Dover, Sandwich, Romney, Hythe, and their three dependents, Rye, Winchelsea, and Seaford, two each, sixteen barons.

In Wales are twelve counties, which send twelve knights.

Twelve boroughs, which send twelve burgesses.

In Scotland, thirty shires, which send thirty knights.

And fifteen boroughs, who send fifteen burgesses.

In all five hundred and fifty-eight representatives.

We shall now proceed to give a particular description of the counties of England, beginning at the south-east.

S E C T. VII.

Of E N G L A N D.

Of the County of Kent; its Name, Situation, Extent, Air, Produce, and principal Rivers. The Inhabitants have particular Privileges. A Description of Canterbury, Rochester, Chatham, Maidstone, Dover, Tunbridge, Deal, Isle of Thanet, Gravesend, Woolwich, Greenwich, and Deptford.

AS this part of the island lies nearest the continent, it was first invaded by the Romans from thence, when it was called by Cæsar Cantium, which it is thought they derived from the British word Caine, a green leaf, to express the verdure of the woods, or to shew the situation of the country, which projects into a point eastward. The county of Kent is bounded on the north by the river Thames, which divides it from Essex and Middlesex; on the east by the Downs; on the south-east by the English Channel; on the south by Sussex; and on the west by Surry. Its extent from the utmost point in the east to its western extremity is sixty miles, its breadth from Rye in Sussex to the mouth of the Thames is thirty-six, and it is a hundred and sixty-six miles in circumference.

The air of this county is subject to be unhealthy; however, the higher parts enjoy a very healthful air, but are not so rich as the lower. As the county lies much upon the sea, the air, though generally thick and foggy, is pretty warm, and often purified by south and south-west winds. The whole shore, from Woolwich to Gravesend, is low, and spread with marshes and unhealthy grounds, except some places where the chalk-hills almost join the river.

The county in general abounds with plantations of hops, fields of corn, pastures, fine orchards of cherries, and pippins; woods of oak, beech, and chefnuts; and in several places are woods of birch, from whence the broom-makers in Kent-street, Southwark, are supplied. Here are mines of iron, pits of marl and chalk, and the cattle here are larger than in the neighbouring counties. Here are several parks of fallow deer, and warrens of grey rabbits. The chief commodities are corn, fruit, particularly pippins and cherries, woad and madder for dying, hops, flax, saintfoin, samphire, cattle, fowl, and fish, especially trout, for which the town of Fordwich on the river Medway is famous.

The chief river of Kent is the Medway, which rises in the weald of Sussex, and enters Kent near Penshurst, running chiefly to the north-east by Tunbridge, Maidstone, and Rochester, below which, being of proper breadth and depth, it forms the noble dock of Chatham, where it is navigable for the largest men of war, and then falls into the mouth of the Thames. In this county is also the famous medicinal springs of Tunbridge.

The inhabitants justly value themselves on their courage and resolution in defending their liberties against the several invaders of Britain; they in particular surprised William the Conqueror, and with the utmost bravery offered him battle, unless he consented to confirm their ancient privileges; on which he prudently chose the latter. The principal of these privileges is, that of gavelkind; which consists in the following particulars: 1. The heirs-male share all the lands equally. 2. The heir at fifteen is at full age to sell or alienate. 3. When a man is convicted of treason, his son cannot on that account be deprived of his birth-right. and 4. The lands of a brother, if he has no issue, shall be shared by all the surviving brethren.

This county contains a hundred and sixty-three vicarages, four hundred and eight parishes, and above eleven hundred and seventy villages. It is divided into five lathes, under each of which are several hundreds, in which are said to be about forty thousand houses, and two hundred thousand inhabitants. It sends sixteen members to parliament, two knights for the shire, and two for each of the following cities and boroughs, Canterbury, Rochester, Maidstone, Queenborough, Dover, Romney, and Sandwich. The principal places in this county are the following:

Canterbury, the metropolitan see of all England, situated fifty-six miles to the south-east of London, and fifteen to the north-west-by-west of Dover. It is said, with little appearance of truth, to have been built nine hundred years before the birth of our Saviour: however, it is probable that it was a place of some note at the landing of Julius Cæsar, as it has several marks of antiquity of about that time. After the Romans left Britain, Vortigern, king of the Britons, resided here, till he surrendered it up to the Saxons, who made it the capital of the kingdom of Kent, in the Saxon heptarchy. In this condition it was when St. Augustine, the monk, being sent from Rome, first preached the Christian faith to the English. It was then made an archiepiscopal see, and flourished greatly, from its being the source from whence the doctrines of the church of Rome were spread to the rest of the Saxon kingdoms.

This city is a county of itself, and the corporation consists of a mayor, a recorder, twelve aldermen, a sheriff, twenty-four common-council-men, a mace-bearer, a sword-bearer, and four serjeants at mace. A court is held every Monday in the guild-hall for civil and criminal causes, and every other Tuesday for the government of this city.

The cathedral has been twice burnt down; the present structure, which was begun in the reign of king Stephen, and finished in that of Henry V. is a noble Gothic pile, five hundred and fourteen feet in length, seventy-four in breadth, and eighty in height, from the nave to the roof: its middle tower, which may be seen at a great distance, is two hundred and thirty-five feet in height. In this church are interred the bodies of seven kings and seven archbishops of Canterbury, including Augustine, whom they immediately succeeded, and who lie buried in one vault. The immense wealth offered by votaries and pilgrims from all parts for several ages to Becket's shrine was so great, that, according to Erasmus, his chapel shone with the richest jewels, and gold was one of the meanest things that adorned his shrine. King Henry VIII. seized all this wealth, with the lands and revenues both of the monastery and church, except those he annexed for the maintenance of a dean, an archdeacon, twelve prebendaries, and six preachers, whom he placed in it on his turning out the monks.

Under the cathedral is a large church of foreign Protestants, given by queen Elizabeth to the Walloons who fled hither from the Netherlands on the persecution raised against them by the duke of Alva, and their congregation has been since much increased by the Protestants who fled from France in the reign of Lewis XIV. so that it is computed that here are no less than two or three thousand French Protestants. The houses of the prebendaries, with many other good buildings, stand in a very spacious close, where are several ruins of religious houses.

This city has undergone many changes, both by war and fire: it had strong walls, built chiefly of flint, with many towers, a deep ditch, and a great rampart. The castle, whose decayed bulwarks appear on the south side of the city, is supposed to have been built by the Saxons. The two gates of St. Augustine's monastery that were next the town are remaining, and are both very stately. The site of this monastery, which took up a great compass of ground, is encompassed with a very high wall.

The city has six wards, denominated from its six gates, and, besides the cathedral, has fifteen parish churches, two charity-schools, and seven hospitals, with a jail for criminals. Here is also a sumptuous conduit, that is of great benefit to the inhabitants. Though this city appears round at a distance, it is an exact cross, and consists of four streets, which center at St. Andrew's church in the middle, and is about three miles in circumference, including the gardens and cathedral. Its buildings are not very grand; but there is a good market-house, over which are rooms where the mayor, aldermen, &c. transact the affairs of the corporation. What has added most to the advantage of the city are the hop-grounds round it, which cover several thousand acres; so that till it was equalled by Farnham, it was esteemed the only great plantation of hops in the whole island. This city and Shrewsbury are the two most noted places in England for collars of brawn.

Rochester, an ancient city, stands in a valley on the banks of the river Medway, which washes its west side, twenty-seven miles to the north-west-by-west of Canterbury, and thirty to the south-east-by-east of London. It is the see of the most ancient bishopric of England, next to Canterbury; and to its cathedral belong a dean and six prebendaries. The city is governed by a mayor, recorder, and eleven aldermen, twelve-common councilmen, a town-clerk, three serjeants at mace, and a water-bailiff. The stone bridge of twenty-one arches over the river is a very fine one, and has strong iron-work on the copings; it being built by Sir John Cobham and Sir Robert Knowles, who employed the rich spoils they had acquired by their valour in France in this noble work. It has only three parish-churches, besides the cathedral; the town-house and charity school are two of the best buildings: in the town here is also a mathematical school, founded by Sir Joseph Williamson, and an alms-house founded by Sir Richard Watts, for the relief of six poor travellers, who are supplied with a supper, a bed, and breakfast, with four-pence to carry them forward on their journey. The town, which chiefly consists of one broad, but ill-built street, is encompassed on some of its sides with walls, but they are not very strong. The ancient military-way called the Watling-street, runs directly through it to Dover.

In several of the creeks and branches of the Medway, within the jurisdiction of this city, there is an oyster-fishery, which is free to every one who has served seven years apprenticeship to any fisherman, or dredger, that is free of that fishery. The mayor and citizens hold what is called an admiralty-court once a year, or oftener, for regulating the fishery, at which courts they appoint when oysters shall and shall not be dredged and taken, which they term *opening and shutting the grounds*. Persons who dredge for oysters without being free of the fishery are called cablehangers, and are tried and punished by that court.

Chatham may be considered as a suburb to Rochester, it lying on the other side of the river, and is famous for its being a station of the royal navy. The dock was begun by queen Elizabeth, and improved by her successors, who have added new docks, mast houses, boat-houses, and several store-houses, one of which is six hundred and sixty feet in length, boat-yards, anchor-yards, forges, foundries, canals, and ditches for preserving the masts and yards in the water; so that there is not a more complete arsenal; and the ware-houses and store-houses are formed into streets of great length. Here are two commissioners, with other officers, to take care of the navy, the store-houses, rope-yards, &c. and all the places set apart for the works belonging to the shipping resemble a well ordered city; so that with all the appearance of hur-

ry there is not the least confusion. The private buildings, as the houses of the sea-officers, directors, inspectors, and workmen of the royal navy, are well built, and some of them very stately. This place gives the title of baron to his grace the duke of Argyle and Greenwich. The chest of Chatham is supplied by a portion of each man's pay in the navy, which furnishes a fund, out of which such disabled seamen as receive no benefit from Greenwich hospital have a small annual annuity. An hospital has been also erected here for the relief of ten or more aged and maimed mariners or shipwrights.

It ought not to be omitted that the entrance into the river Medway is defended by Sheerness and other forts, and that in the year 1757, by the late duke of Cumberland's direction, several additional fortifications were begun at Chatham; so that now the ships are in no danger of an insult either by land or water. This town has a church, a chapel of ease, and a ship used as a church for the sailors. The houses, which are mostly low, amount to only about five hundred. The streets are narrow and paved, and it contains about three thousand inhabitants.

Maidstone received its name from the river Medway, which is navigable hither by large barges and hoys of about fifty or sixty tons burthen, and is a large, populous, and neat town, twenty-four miles to the west of Canterbury, and thirty-six south-east-by-east of London. From its situation in the center of Kent, it is very proper for the county business, which is all transacted here. It sends two members to parliament, and is governed by a mayor, twelve assistants called jurats, and twenty-four commoners. Its chief trade is in linen-thread, and in hops, of which there are large plantations about the town, as well as orchards of cherries. It gives the title of viscount to the earl of Winchelsea and Nottingham, who is lord of the manor. It has a fine stone bridge, and four charity-schools. The town and the adjacent country enjoys such plenty of provisions, that London is supplied from hence with more commodities than from any single market-town in England, particularly with large Kentish bullocks, wheat, great quantities of hops, apples, and cherries, timber, a sort of paving-stone about eight or ten inches square, and the fine white sand for glass-houses and stationers.

Dover, which is situated fifteen miles to the south east of Canterbury, and seventy-one from London, has for many ages been a famous passage between this island and France, and still subsists chiefly on that account. It was anciently rendered a place of great importance by a strong castle built on the high cliff, said to be begun by Julius Cæsar, and completed by Arviragus, a British king, in the reign of the emperor Claudius. The additions made to this fortress were so remarkable, and its situation so secure by nature, that before the Conquest it was esteemed the bulwark and key to the whole island. When this place was at the height of its magnificence it had seven churches, which are now reduced to two, and twenty-one wards, each of which furnished a ship of war, and maintained it forty days at its own expence. In consideration of this service each ward had a licence packet-boat, and the fare, according to the Tower records, was settled in the reign of Edward II. for a single person in summer six-pence, in winter one shilling: for a horse in summer eighteen pence, and in winter two shillings. Dover is likewise famous as a cinque-port, in which the business of the other four, and their dependencies, is transacted: their privileges are very extensive, and were granted them in consideration of the ships of war they were obliged to furnish. The other cinque-ports are Hastings, Hythe, Romney, and Sandwich. Among other privileges the burgesses of the cinque-ports are stiled barons; they carry the canopy at the coronation, which they have afterwards for their fee; and at the feast have a table at the king's right hand. This town consists of one street a mile long, very ill paved. One of the other streets is called Snare-gate, from the dreadful rocks of chalk which hang over it. A well in the castle is sixty fathoms deep, and is round, large, and lined to the bottom with free-stone. The remains of the royal palace, the chapel, stables, and offices, shew the whole

whole to have been very magnificent. Here is a brass gun of excellent workmanship, said to be the longest in the world, it being no less than twenty-two feet in length. It was presented by the states of Utrecht to queen Elizabeth, and is called her pocket-pistol; it requires fifteen pounds of powder, and the people here say will carry a ball seven miles.

Tunbridge received its name from the stone bridges over the five branches of the Medway, of which the Tun is one, and is seated twenty-nine miles south-east-by south of London. This place is remarkable for its wells, which are four or five miles south of the town, but in the same parish, and are resorted to by the nobility and gentry in June, July, and August; and which are situated for the most part in the parish of Tunbridge, between two hills, named Mount Sinai and Mount Ephraim, both covered with good houses, and gardens abounding in fruit. The principal well is walled in, and neatly paved like a cistern. From it run two paved walks, one of which forms a long gallery covered over, in which the band of music play, and here the company walk in bad weather. Here is also a row of shops and coffee-rooms, where is card-playing and the like, and also a dancing-room. On the other side is a good market, and behind the wells is a large chapel, where divine service is performed twice a day, during the season of drinking the water. When the company have taken their draught at the wells they go home about nine o'clock to dress, and at ten some of the company resort to the chapel, and others to the coffee-houses; but after prayers they all appear on the walks in the greatest gaiety and splendor, the music playing all the time, while the gentlemen and ladies divert themselves with raffling, hazard, drinking of tea, and walking till dinner-time: in the afternoon the bowlers divert themselves on the green. At night the company return to the shops on the walks, where many play till midnight: there are also balls four times a week, and any gentleman that pleases may dance. In the chapel just mentioned seventy poor children are taught and maintained by the contributions of the company at the wells. The water is a chalybeate, which operates by urine and perspiration, and is of great efficacy in cold, chronical diseases, weak nerves, and bad digestion. The air is here excellent, and provisions of all sorts very reasonable. There is plenty of wild-fowl, as pheasants, partridges, woodcocks, snipes, quails, and particularly the little delicious bird called the wheat-ear; and as for fish they have excellent of almost every kind.

Deal, called Dola by Julius Cæsar, who landed here in his second descent upon Britain, is a handsome large town, seated near the sea, and a member of the cinque-port of Sandwich, from which it is seven miles distant, and seventy-five to the east-by-south of London. Here almost all ships bound from foreign parts to London, or from thence to foreign parts, by way of the Channel, generally stop. The town carries on some foreign trade, and is defended by two castles; that of Sandown on the north is composed of four lunettes of very thick arched work of stone, with many port-holes for great guns. In the middle is a great round tower, with a cistern at the top, and underneath it an arched cavern bomb-proof. It has a church, a chapel, and about a thousand houses, which are mostly low and built with brick; these form three long but narrow streets, and the inhabitants amount to about four thousand five hundred. Here is a charity-school for twenty-seven boys and girls, who are taught and clothed at the expence of the inhabitants.

As no manufacture is carried on here, the trades-people chiefly depend on the sea-faring men who resort thither.

The Isle of Thanet is on the north and east bounded by the sea, and on the south and west by a branch of the Stour. It is eight miles in length, and four in breadth. The soil is chalk, and is very fruitful in corn and grass; it is therefore a fine country, and has the title of an earldom. It contains several villages, with the sea-port towns of Margate and Ramsgate; but though it has fifteen or sixteen hundred families, it has hardly any gentlemen's houses. On the north-east point of this island is the promontory of the North Foreland, which, by a line drawn due north to the Naze in Essex, makes the mouth of the river Thames, and all the towns and har-

bours from hence, whether on the Kentish or Essex shore, are called members of the port of London.

Gravesend, a town twenty-two miles to the east of London, is situated on the Thames opposite to Tilbury fort, about six miles to the east of Dartford, and about the same distance from Rochester. In the reign of Richard II. the French and Spaniards sailed up the Thames to this town, and having plundered and burnt it, carried away most of the inhabitants. To remedy this loss the natives of Gravesend and Milton were allowed the sole privilege of carrying passengers, by water from hence to London at two-pence per head, or four shillings the whole fare; but the fare is now raised to nine-pence per head in the tilt-boat, and one shilling in the wherry. The former must not take in above forty passengers, and the latter no more than ten. The watermen's company of London are obliged to provide officers at Billingsgate and Gravesend, who at every time of high water, by night and day, are, at their respective places, to ring publicly a bell set up for that purpose, during fifteen minutes, to give notice to the tilt-boats and wherries to put off; and coaches ply at Gravesend at the landing of people from London to carry them to Rochester. King Henry VIII. raised a platform here, and at Milton, and these towns were incorporated by queen Elizabeth by the name of the portreeve, the jurors, and inhabitants of Gravesend and Milton; but the name of portreeve has been changed to that of mayor. The whole town being burnt down in 1727, the parliament granted five thousand pounds for rebuilding its church. This parish, with that of Milton, contains about seven hundred houses, which are mostly small and built with brick; the streets are also narrow, but paved with flints, and it has a great number of houses of entertainment. Here is a handsome charitable foundation, Mr. Henry Pinnock having, in 1624, given twenty-one dwelling-houses, and a house for a master weaver to employ the poor, and a good estate is also settled for the repairs.

Great improvements have been made in the lands near this town, by turning them into kitchen-gardens, with the produce of which Gravesend not only supplies the neighbouring places for several miles round, but also sends great quantities to the London markets, particularly of asparagus, that of Gravesend being preferred to that of Battersea. As all outward-bound ships are obliged to anchor in this road till they have been visited by the custom-house officers, and as they generally stay here to take in provisions, the town is full of seamen, and in a constant hurry.

Woolwich, a town situated on the Thames, nine miles to the east of London, is famous for its fine docks and yards, where men of war are built, as also for its vast magazines of great guns, mortars, bombs, cannon-balls, powder, and other warlike stores. The docks are encompassed with a high wall, and there is a long rope-walk, where the largest cables are made for the men of war. On the lower part of the town is the warren, where between seven and eight thousand pieces of ordnance have been laid up at one time for ships and batteries; besides innumerable mortars and bomb-shells. Here is also the house where the fire-men and engineers prepare their fire-works, charge bombs, carcasses, and grenades for the public service. The town has been of late years much beautified and enlarged with fine docks, rope-yards, and spacious magazines. It has an academy where the mathematics are taught, and young officers instructed in the art of navigation. The parish-church has been rebuilt in a handsome manner, as one of the fifty new churches erected in pursuance of the bounty of queen Anne for that purpose.

Greenwich, a very pleasant town, is situated on the Thames, five miles from London, and has been the birth-place of several of our monarchs, particularly queen Mary and queen Elizabeth, and here king Edward VI. died. Their palace was first erected by Humphrey duke of Gloucester, who named it Placentia: this palace was enlarged by Henry VII. and completed by Henry VIII. but was afterwards pulled down by king Charles II. who began another, a most magnificent edifice, and lived to see the first wing of it finished. Of this palace

we shall soon give a particular description in treating of the hospital, of which it is a part. The same prince also enlarged the park, walled it round, planted it, and caused a royal observatory to be erected on the top of a steep hill. This structure was erected for the use of the celebrated Mr. Flamsteed, and it still retains the name of that great astronomer. King Charles also furnished it with mathematical instruments for astronomical observations, and a deep dry well for observing the stars in the day-time. That which is at present called the palace, is an edifice of no great extent, and is now converted into apartments for the governor of the royal hospital, and the ranger of the park. The park is well stocked with deer, and affords a noble and delightful view of the fine hospital, the river Thames, and the city of London.

Greenwich is said to contain one thousand three hundred and fifty houses, and its parish church, which was rebuilt by the commissioners for erecting the fifty new churches, is a very handsome structure dedicated to St. Alphage: at the end of the town is a college fronting the Thames, for the maintenance of twenty decayed house-keepers, twelve out of Greenwich, and eight who are to be alternately chosen from Snottisham and Castle-Rising in Norfolk. It is called the duke of Norfolk's college, though founded and endowed by Henry earl of Northampton, the duke of Norfolk's brother, and by him committed to the care of the Mercers company. The pensioners, besides meat, drink, and lodging, are allowed eighteen-pence a week, with a gown every year, linen every two years, and hats once in four. Here is also an hospital called queen Elizabeth's college, which was built and founded by Mr. Lambard; and in this parish are two charity schools, one founded by Sir William Boreman, knt. for twenty boys, who are clothed, boarded, and taught; they wear green coats and caps; and the other by Mr. John Roan, who left his estate for teaching also twenty boys reading, writing, and arithmetic, and allowed two pounds per annum for each of the boy's cloaths. These wear grey coats.

The first wing of the noble and superb edifice called Greenwich hospital was, as hath been observed, erected by king Charles II. for a palace, and indeed the whole can scarcely be taken for any thing less than the palace of a great monarch. King William III. however, being very desirous of promoting the trade, navigation, and naval strength of this kingdom, by inviting great numbers of his subjects to betake themselves to the sea, gave this noble structure, and several others, with a considerable spot of ground, for the use of those English seamen and their children, who by age, wounds, or other accidents, should be disabled for farther service at sea, and for the widows and children of such as were slain in fighting at sea against the enemies of their country. The same prince also appointed commissioners for carrying on his noble views, and desired the assistance of his good subjects to enable him to carry them on. In conformity to this request, many benefactions were made to this noble charity, which, according to the tables hung up at the entrance of the hall, amount to fifty-eight thousand two hundred and nine pounds, and afterwards the estates of the earl of Derwentwater, who bore a principal part in the rebellion in 1715, amounting to six thousand pound per annum, were given by parliament to this hospital. The first range had cost king Charles II. thirty-six thousand pounds, and another was ordered to be built on the same model opposite to it: this has been completed with equal magnificence.

The front facing the Thames consists of these two ranges of stone buildings, with the governor's house in the back part in the center, behind which the park, well planted with trees, rises with a noble ascent. These buildings, between which is a large area, perfectly correspond with each other, and each range is terminated by a very noble dome. In each front to the Thames two ranges of coupled Corinthian columns finely wrought, support their pediments, and the same order is continued in pilasters along the building. In the center of each part between these ranges of columns is the door, which is of the Doric order, and adorned above with a tablet

and pediment. Within the height of these lofty columns are two series of windows enlightning two floors. The undermost, which are the smallest, have rustic cases, crowned with pediments; while the upper series, which are larger and more lofty, are adorned with the orders, and with upright pointed pediments. Over these is an Attic story; for the entablature of the Corinthian columns and pilasters supports a regular Attic course, in which the windows are regularly disposed, and the top is crowned with a handsome balustrade. The buildings continued from these, and facing the area, correspond with them, though in a finer and more elegant manner. In the center of both is a range of columns supporting a pediment, and at each corner a range of Corinthian pilasters, the front is rusticated, and there are two series of windows. The domes at the end, which are one hundred and twenty feet high, are supported on coupled columns, as are the porticos below, and under one of these is the chapel, which is adorned on the inside with the greatest elegance and beauty. In the center of the area is a statue of his late majesty fixed on a pedestal; and on the sides of the gate which opens to these buildings from the park, are placed a large celestial and terrestrial globe, in which the stars are gilt.

The hall of this hospital is finely painted by Sir James Thornhill, particularly the ceiling and upper end; on the latter are represented in an alcove, the late princess Sophia, king George I. king George II. queen Caroline, the queen dowager of Prussia, Frederic prince of Wales, the duke of Cumberland, and the five daughters of his late majesty. On the ceiling of the alcove are king William and queen Mary, with several fine emblematical figures. All strangers who see this fine hall pay two-pence each, and this income is applied to the support of the mathematical school for the sons of sailors.

For the better support of this hospital, every seaman, both in the royal navy and in the merchants service, pays six-pence per month, which is stopped out of the pay of all sailors, and delivered in at the six-penny receiver's office on Tower-hill; whence any seaman who can produce an authentic certificate of his being disabled by defending any ship belonging to his majesty's British subjects, or in taking any ship from the enemy, has a right of being admitted into this hospital, and receive the same benefit from it, as if he had been in the king's immediate service. There are at present near two thousand old or disabled seamen, and an hundred boys, the sons of seamen, instructed in navigation, and bred up for the service of the royal navy; but there are no out-pensioners as at Chelsea. Each of the mariners has a weekly allowance of seven loaves, weighing sixteen ounces each, three pounds of beef, two of mutton; a pint of pease, twenty ounces of cheese, two ounces of butter, fourteen quarts of beer, and one shilling a week tobacco money; the tobacco money of the boatwains is two shillings and six-pence a week each; that of their mates eighteen-pence, and that of other officers in proportion to their rank. Besides which, each common pensioner receives once in two years a suit of blue clothes, a hat, three pair of stockings, two pair of shoes, five neck-cloths, three shirts, and two night caps. The hospital has about one hundred governors, composed of the nobility and great officers of state.

Deptford, anciently called West-Greenwich, is said to have derived its name from its having a deep ford over the little river Ravensborne, near its influx into the Thames, where it has now a bridge. It is a large and populous town four miles east of London, and is divided into Upper and Lower Deptford, which together contain two churches, several meeting houses, and about one thousand nine hundred dwelling houses. It is mostly remarkable for its noble dock, where most of the royal navy were formerly built and repaired, till it was found more convenient to build the larger ships at Woolwich, Chatham, and Portsmouth; there is a greater depth of water: yet the yard is enlarged to more than double its former dimensions, and a great number of men are constantly employed. It has a wet dock of two acres for ships, and another of an acre and an half; with vast quantities of timber and other stores. There are also extensive buildings, as store-houses and offices, besides dwelling

dwelling houses, for those officers who are obliged to live upon the spot, in order to superintend the works. It had a victualling house built in 1745, which in 1749 was burnt down, with great quantities of provisions and naval stores. The royal yachts are generally kept here, and near the dock is the seat of Sir John Evelyn, called Say's Court, where Peter the Great, Czar of Muscovy, resided for some time, and in this yard completed his knowledge in the practical part of naval architecture.

In this town are two hospitals, one of which was incorporated by king Henry VIII. for the use of seamen, and is called Trinity-House. This contains twenty-one houses, and is seated near the church. The other, called Trinity Hospital, has thirty-eight houses fronting the street. This is a very handsome edifice, and has large gardens belonging to it. Though this last is the finest structure, yet the other has the preference on account of its antiquity; and as the brethren of the Trinity hold their corporation by that house, they are obliged at certain times to meet there for business. Both these houses are for decayed pilots, or masters of ships, or their widows, the men being allowed twenty shillings, and the women sixteen shillings per month.

S E C T. VIII.

Of the County of Sussex; its Situation, Extent, Air, Soil, and face of the Country. Its produce, with a Description of the little Bird called a Wheatear; its Rivers, and principal Towns, as Chichester, Lewes, and Arundel.

SUSSEX received its proper name from the Saxons; for this being the most southern part of the island, they called it and Surry the kingdom of the South Saxons, whence this county has by abbreviation been called Suffex. It is bounded on the north by Surry, on the north-east and east by Kent, on the south by the English channel, and on the west by Hampshire. It is about fifty-three miles in length, sixteen in breadth, and one hundred and seventy-two in circumference.

The air in this county is very various: along the sea-shore it is thought agreeable; but it has a much greater effect on strangers than on the natives, who are generally very healthful. In the Weald, which is a rich deep soil, it is apt to be foggy, yet not unwholesome; but upon the Downs the air is extremely sweet and healthy. The soil is likewise various; that of the Downs, and from them to the sea, is very fertile, both in corn and grass, the latter feeding sheep whose wool is remarkably fine; the middle of the county abounds with meadows and rich arable ground, and the north side is shaded with extensive woods, that supply fuel for the iron works. This plentiful county therefore supplies numerous commodities, the chief of which are corn, malt, cattle, wool, wood, iron, chalk, glass, fish, and fowl. It is particularly famous for its wheatear, a small delicious bird, of the size of a lark, not much inferior to an ortolane, and is taken on the south-east downs in the following manner: a turf is cut up about a foot long and half a foot broad; in the cavity is placed a snare of horse hair, and the turf turned with the grass downwards to cover the greatest part of the hole. These birds are naturally so timorous, that the shadow of a cloud, or any thing that moves on the ground, makes them fly into these little pits for shelter, where they are taken. The season for them is when the wheat ripens; but they are so very fat that they cannot be carried many miles without being tainted, and even in plucking them great care must be taken to handle them as little as possible.

The chief manufactures of this county are great guns, and several sorts of work made in cast or wrought iron; the best gunpowder in the world is said to be made at Battle.

This county has few ports on account of its rocky shore, and its shelves and sand-banks, which the south-west winds, so common upon our coast in the winter, are continually augmenting.

It is divided into six rapes, each of which has its particular castle, river, and forest, and is sub-divided into sixty-five hundreds, in which are computed one city,

eighteen market-towns, one hundred and twenty-three vicarages, three hundred and twelve parishes, one thousand and sixty villages, hamlets, and chapelries, twenty one thousand five hundred and thirty-seven houses, and about one hundred twenty-nine thousand souls.

The principal rivers are the Arun, the Adur, the Ouse, and the Rother. The Arun rises in St. Leonard's forest, not far from Horsham, in the north-edge of the county, and after running a little way to the westward, turns due south, passing by Arundel, about three miles below which it falls into the sea. This river has lately had a new outlet cut for it in order to improve its navigation, which carries barges above Pulborough, and ships of a hundred tons as high as Arundel. Here are caught the mullets so much esteemed; they come from the sea in the summer season in vast shoals, and feeding upon a particular weed in this river, acquire that high luscious taste which renders them so great a dainty. The Adur, also called the Beeding, has likewise its source in St. Leonard's forest, forming its course on the same points of the compass as the Arun; but on its approaching the sea, turns four or five miles to the east, and then forms the harbour of New Shoreham. The Ouse rises from two branches, one of which has its spring in St. Leonard's forest, near the source of the Arun, the other in the forest of Worth, but they soon unite to the southward by Lewes, and run to the sea, forming the harbour called New-Haven. The Rother rises near Rotherfield, and runs mostly eastward; but about six miles to the north of Rye, makes an angle to the southward, and falling into the sea, forms Rye-Haven. From so many rivers one good harbour at least might be expected for the largest ships; but none of them will admit of a vessel of five hundred tons. The principal places in this county are the following:

Chichester, by the ancient Britons called Caerrei, and by the Saxons Cissanceaster, is seated in a plain on a little rivulet called Lavant, sixty-three miles to the south-west of London. It is a compact neat town, encompassed by a stone wall, the four gates answering to the four cardinal points, from whence the streets have their names, and meet in the center of the city, where is the market-place, which affords a view of the four gates. The cathedral is adorned on one side with pictures of all the kings and queens from Cissa, the son of Ella, the first king of the South Saxons, to the present time; and on the other are placed the portraits of all the bishops. The spire is deservedly admired for its workmanship, and some years ago afforded a convincing proof of the skill of the architect; for a flash of lightning striking upon it, about forty-five feet from the top, made a very large breach, by driving out the stones, and carrying several of them, which were even of a ton weight, to a considerable distance; but notwithstanding this shock the spire stood firm, which saved the body of the church, and it is now well repaired. Besides the cathedral there are seven small churches, built with flint stone. What is now called the Friars, was formerly a convent of Franciscans, but was originally a castle and seat belonging to the earls of Arundel. The streets are generally pretty broad, the houses uniform, and tolerably well built. Chichester is a city and county of itself, and the corporation consists of a mayor, recorder, fourteen aldermen, six bailiffs, twenty-seven common-council men, and a portreve; four justices of the peace are chosen out of the aldermen, and the mayor is annually elected by ballot of the aldermen and common-council, who put up two persons, and is attended by four serjeants at mace and a crier. The market-place is adorned with a stately cross, and on Saturdays furnished with plenty of all provisions, especially fish, and great quantities of corn. Every Wednesday fortnight here is also one of the greatest cattle markets in England. This city, as well as Southampton, gives title of earl to the duke of Cleveland, and has two charity schools, one for forty-two boys, and the other for twenty girls, who are taught and clothed. There are several houses of the nobility near this city, which have a delightful prospect of the sea.

Lewes, a town said to receive its name from the Saxon word Lefwa, or Pasture, is a place of great antiquity,

as appears from king Athelstan's having appointed his royal mint to be kept here. It is pleasantly situated, fifty miles to the south of London, on the edge of the south Downs, on one of the most delightful spots that England affords, and contains six parish churches, built with flint stone, and about six thousand two hundred inhabitants. It is adorned with the seats of the Pelhams, the Gages, the Shellys, and other persons of rank and fortune, whose gardens join to each other, though for the most part up and down hill. Near it are the remains of its ancient castle. The streets are handsome, and it has two suburbs, the one called Southover, which is the largest, and the other on the east side of the river called Cliff, from its lying under a chalky hill. A little river runs through the midst of the town, bringing goods in boats and barges from a port at eight miles distance. On this river are several iron works, where cannon are founded for merchant ships. Public horse races are run here almost every summer; but the road from hence to Tunbridge is so deep and dirty, that it is said the ladies are sometimes drawn to church in their coaches by six oxen. Lewes is governed by two constables; it sends two members to parliament, and has a good market on Saturdays.

Here, in 1264, a bloody battle was fought between king Henry III. and his barons, when the latter entered and plundered the town.

From a windmill near the town is a prospect of the sea for thirty miles west, and an uninterrupted view of Bansted Downs, which is full forty miles. Between this town and the sea is good winter game for a gun, and several gentlemen here keep packs of hounds; but the hills are so steep, that it is dangerous following them.

Arundel, a town eight miles to the east of Chichester, and fifty-five south-west-by-south of London, seems to derive its name from the river Arun, on which it is seated, and from whence it is supplied with the excellent mullets already mentioned. It is pleasantly situated on the side of a hill, and has a stately wooden bridge over the river, at a convenient distance from the sea. It gives title of earl to the duke of Norfolk, and is governed by a mayor, twelve burgeses, a steward and other officers, and sends two members to parliament. The ancient castle is seated on the river Tame, and is said to be a mile in compass. The town has two streets paved with stone, in which are about two hundred houses also built of stone, and about 800 inhabitants.

Horsham is a town about three miles out of the main road to Arundel, and has its name from Horfa, brother to Hengist the Saxon, and is one of the largest towns in the county: it has sent members to parliament ever since the thirtieth of king Edward I. and is the place where the county jail is held, and sometimes the assizes. It has a handsome parish-church, and a free-school well endowed. A great number of poultry are brought up to its weekly market on Saturdays, and bought up for London. Here is a quarry of very good stone fit for flooring.

Rye, a pretty populous sea-port town seated on the side of a hill, sixty-four miles to the south-east-by-south of London, and has a delightful prospect of the sea. It was walled in the reign of Edward III. and was well fortified by William d'Ypres, earl of Kent; a tower called by his name is the prison of the town. It has one of the largest parish-churches in England, and enjoys the same privileges as the other cinque-ports; but the port is so choaked up with sand, that it hardly affords entrance for the smallest vessels. The corporation consists of a mayor and jurats, and sends two members to parliament. It has a town-hall, and three streets paved with stone. One side of the town is walled in, and the other guarded by the sea. It has two gates, and is a place of considerable trade, particularly in hops, wool, timber, kettles, cannon, chimney-backs, &c. The houses are pretty well built, though generally old fashioned; but there are some very neat ones of the modern taste. In the reign of king Richard II. the French landed and burnt this town; but the people of Rye soon fitted out some ships, and, in conjunction with those from other ports, took seven of their vessels richly laden.

Winchelsea was once a considerable town, built in the time of king Edward I. after a more ancient town of the same name, that stood at two or three miles distance, and had eighteen parishes, but was swallowed up by the sea in a terrible tempest. New Winchelsea was never equal to the Old; it was encompassed with a rampart, and afterwards with a wall; but no sooner began to flourish, than it was sacked by the French and Spaniards, and being abandoned by the sea, which retired a mile distant, suddenly fell to decay. Though the streets are paved, the grass which grows in them is some years let for four pounds, and little more at present remains than the skeleton of a very handsome town: the streets standing all at right angles, were divided into thirty-two squares, or quarters. Some of the stone-work of three gates is still to be seen, though they are three miles asunder over the fields, and in many places of the town are vaults arched with stone. Near the town are large marshes, which the inhabitants are at great expence in defending from the encroachments of the sea, by great banks of earth and walls. Here were formerly three parish-churches; but only the chancel of one of them is now standing, which is more than large enough for the inhabitants. This borough is incorporated by the name of the mayor, jurats, and commonalty; and though there are only a few houses remaining in the upper part of the town, it sends two members to parliament, and gives the title of earl to the noble family of the Finches.

S E C T. IX.

Of the County of Surry; its Name, Situation, Extent, Air, Soil, Produce, and Rivers; with a Description of its principal Towns and Seats, and particularly of the Palace and Gardens of Richmond.

THIS county obtained its name from its situation on the south side of the Thames, and is bounded on the east by Kent; on the south by Suffex; on the west by Hampshire and Berkshire; and on the north by the river Thames, which divides it from Middlesex. The country, which is almost square, is thirty-four miles in length, twenty-one in breadth, and a hundred and twelve in circumference, containing about thirty-five thousand houses, a hundred and forty parishes, eleven market-towns, including Southwark, thirty-five vicarages, four hundred and fifty villages and hamlets, and a hundred and seventy-one thousand inhabitants.

It is a healthy pleasant country, on which account there are many of the nobility and gentry who have their seats there. The soil is very different in the extreme parts from that in the middle, whence it has been compared to a coarse cloth with a fine list: for the edge of the county on all sides has a rich soil, extremely fruitful in corn and grass, particularly in Holmesdale, and on the north towards the Thames; but it is far otherwise in the heart of the country, where are wide tracts of sandy ground and barren heath, and in some places are long ridges of hills, with warrens of rabbits and parks for deer. However, we meet here and there with some delightful spots interspersed in the middle of Surry, and it is not to be doubted that a great deal of the waste ground might, by proper management, be greatly improved. This country produces corn, box-wood, walnuts, hops, and fullers-earth; and near Dorking grows a wild black cherry, of which a very pleasant wine is made, little inferior to French claret. It has been observed of this part of Surry, that the natives are generally of a pale complexion, resembling the people of Picardy in France; and that even the cattle are of a lighter colour than is usual in other parts of England.

The rivers in this county, besides the Thames, are the Mole, the Wey, and the Wandle. The Mole, or Mole, rises in the southern border of Surry, and forms a course mostly south-east and south, till it reaches the Thames at Molesey. It is remarkable of this river, that at the foot of Box-hill, near a village called Mickleham, it works its way under ground like a mole, rising again at or near the town of Leatherhead, where its streams are united, and form a pretty large river running under Leatherhead bridge; and thus pursues its course to the

Thames,

Thames, which it joins at Molesey, and from this circumstance it obtained the name of the Mole. The Wey rises in Hampshire, and enters this county near Farnham, winding very much till it has passed Godalming, when it begins to run mostly southward. This river has been made navigable to Guilford, by which means all the neighbouring parts are plentifully supplied with commodities from London, particularly coals, which have been much wanted here. The Wandle is a small clear stream famous for its trouts; it rises near Carshalton, and runs southward to the Thames, into which it discharges itself at Wandsworth. The principal places in this county are the following:

Guilford, or Guildford, is a considerable market-town thirty miles to the south-west of London, where the assizes are sometimes held, and always the elections for members of parliament for the county, the town itself returning two. The river Wey being made navigable to this town, as hath already been observed, adds greatly to its trade; and a considerable quantity of timber being brought from the woody parts of Suffex and Hampshire to this town by land-carriage, is conveyed from thence by this river to London. It has three parish-churches: that which is called the Upper Church, by the fall of the steeple, had its roof beat in, on the twenty-third of April, 1740; the steeple had been repaired not long before; but a farther decay being discovered, the workmen had begun to take it down, but luckily for them it was a fair-day, and they had leave to divert themselves that afternoon; the roof was struck in with such impetuosity, that by the sudden pressure of the air all the glass-windows were blown out, as if it had been done by a blast of gun-powder. Here is a school founded by Edward VI. and an alms-house by George Abbot, archbishop of Canterbury, for the maintenance of a master, twelve brethren, and eight sisters, who have each half a crown a week. There are here also two charity-schools for thirty boys, and twenty girls. Here are likewise the ruins of an old castle, and some of the remains of a palace of great extent, which appears by the best authorities to have been the residence of Ethelwald, one of the Saxon kings. Here were formerly two or three convents, one of which was not long ago the seat of Daniel Coswell, Esq; and had a delightful park adjoining to it. Here is a fine circular course for horse-races, which begin when the Newmarket races are ended. Guilford had formerly a considerable manufacture of cloth, of which there are still some remains. The great road from Chichester and Portsmouth lies through the town, which has always been famous for good inns, clean linen, and other excellent accommodations.

The road from hence to Farnham is very remarkable, it running along the ridge of a high chalky hill no wider than the road itself, and the declivity begins on either hand at the edge that bounds the highway, and is very steep and high. From this hill is a surprising prospect to the north and north-west over Bagshot-heath; to the south-east into Suffex; and to the west it is so unbounded, that the view is only terminated by the horizon. On this hill, which is called St. Catharines, stands the gallows in such a position, that the inhabitants of Guilford may, from the High-street, sit at their shop-doors and see the criminals executed.

In the road from Guilford to Epsom, which is fifteen miles, you meet with a town almost at every two miles distance, in or near which is a handsome seat. The road is always good, it being a very hard gravel. On the right hand of the road lie the Downs, which have constantly a great number of sheep feeding on them; and on the left the parks, gardens, and cultivated fields belonging to the several gentlemen who inhabit those seats, all which render the road extremely agreeable.

Cobham is a small town situated on the river Mole, six miles from Epsom, and eight to the south-west of Kingston, in the road from Guilford to London. Near this town are several fine seats, particularly one belonging to the lord Ligonier; and another the seat of Mr. Bridges, which is built in a singular taste, somewhat after the manner of an Italian villa, though very plain on the outside. The principal rooms are richly ornamented; the ceilings are gilt; and the offices below are not only convenient, but contrived with great judgment, so as to

answer the purposes for which they were designed. As the house is situated on an eminence, it commands a view of the adjacent fields, which are kept in good order. The river Mole passes along by the sides of the gardens, and being made here four times broader than it was naturally, has a happy effect, especially as the banks are disposed into a slope, with a broad grass walk planted on each side with sweet shrubs. At one end of this walk is an elegant room, which is a delightful retreat in hot weather, it being shaded with large elms on the south side, and having the water on the north and east sides, is extremely cool and pleasant.

Darking, a town twelve miles to the east of Guilford, and twenty-four to the south-west of London, is famous for its meal-trade and its market for poultry, particularly for the fattest geese and largest capons, which are brought hither from as far as Horsham in Suffex, it being the business of all the country on that side, for many miles, to breed and fatten them; and some are so large as to be little inferior to turkeys. The town stands on a rock of soft sandy stone, in which are dug convenient cellars. The great Roman highway called Stony-street passes through the church-yard, and is plainly traced two miles to the south of Okeley, and appears to be made of flint and pebbles. This is a prodigious work, it being from seven to ten yards broad, and near a yard and a half deep, which is the more remarkable, as in some places there is not a flint stone to be seen within a great distance.

In the neighbourhood is a hill which affords a most enchanting prospect, and is much resorted to by the gentry from Epsom: it is called Box-hill from the abundance of trees, arbours, and labyrinths of box upon it, especially to the south, though on the north side it is almost covered with yew trees; it was first planted with box trees by that famous antiquary Thomas earl of Arundel.

About six miles from Box-hill and five miles to the south of Darking, is Leith-hill, which projects about two miles beyond a range of hills that terminates the North Downs to the South. "When I saw, says a late writer, "from one of those hills, at about two miles distance, that "side of Leith-hill which faces the Northern Downs, "it appeared the beautifullest prospect I had ever seen; "but after we conquered the hill itself, I saw a sight "that would transport a stoic: a sight that looked like "inchantment and vision. Beneath us lay open to our "view all the wilds of Surrey and Suffex, and a great "part of that of Kent, admirably diversified with woods "and fields of corn and pasture, being every where adorned with stately rows of trees. This beautiful vale "is about thirty miles in breadth, and about sixty in "length, and is terminated to the south by the majestic "range of the southern hills: and it is no easy matter to "decide, whether these hills, which appear at thirty, "forty, and fifty miles distance, appear more awful and "venerable, or the delicious vale between you and them "more inviting. About noon in a serene day you may, "at thirty miles distance, see the very water of the sea "through a chasm of the mountains. And that which "above all makes it a noble prospect, is, that at the same "time you behold to the south the most delightful rural "landscape in the world; and by a little turn of your "head towards the north you look full over Box-hill, "and see the country beyond it; and between that "and London, and over the very stomacher of it, see "St. Paul's at twenty five miles distance, and London "beneath it, with Highgate and Hampstead beyond it."

The vale beneath Box-hill is for many miles to the east and west called Holmefdale, which is now chiefly overgrown with furze; but was famous for producing such quantities of strawberries, that they were carried by horse-loads to market.

Kingston, also called Kingston upon Thames, to distinguish it from several other towns of the same name, is thus called from its having been the residence of several of our Saxon kings, some of whom were crowned on a stage in the market-place. It is a populous and well-built town, and in the reigns of Edward II. and III. sent members to parliament. It has a spacious church with eight bells, and in it are the pictures of the Saxon kings

who

who were crowned here, and also that of king John, who gave the inhabitants of this town their first charter. Here is also a wooden bridge of twenty-two arches over the Thames; a free school erected and endowed by queen Elizabeth; an alms-house built in 1670 by alderman Clive for six men and as many women, and endowed with land to the value of eighty pounds a year; and a charity-school for thirty boys, who are all clothed. The summer assizes for this county are generally held here. Besides the above bridge, is another of brick over a stream that flows from a spring, which rises four miles above the town, and within the distance of a bow-shot from its source forms a brook, that turns two mills. On the top of a hill is a gallery that overlooks the town. A house in this town, called Kircomb's Place, was the seat of the famous earl of Warwick, stiled The Setter up and Puller down of Kings. Here is a good market for corn, and the town carries on a considerable trade.

Essex, a village situated near Walton upon Thames, and affording a fine prospect of Hampton-court and other parts of Middlesex, is famous for the noble seats in and near it, particularly Essex-Place, which was the seat of the late Henry Pelham, Esq; The house is a Gothic structure of a brownish red brick, with stone facings to the doors and windows. This house was originally one of those built by cardinal Wolsey, but the late Mr Pelham rebuilt the whole, except the two towers in the body of the house, which are the same that belonged to the old building; and the whole is rebuilt in the same stile of architecture. There is a fine summer-house erected upon a hill on the left hand as you enter, which commands a view of the house, park, and country round, on both sides the Thames, for many miles. The park, in which the house is situated, appears plain and unadorned; but in one part of it is a little wilderness laid out in walks, and planted with a variety of evergreen trees and plants, with a grotto in it, and seats in different places. The wood in the park is well disposed, and consists of fine oaks, elms, and other trees; and the whole country round appears finely shaded with woods.

Richmond, which stands twelve miles from London, is esteemed the finest village in the British dominions, and hence has been termed the Fescati of England. It was anciently the seat of our monarchs, and the palace, for its splendor, was called Shene, which in the Saxon tongue signifies resplendent. Here king Edward III. died of grief for the loss of his brave son Edward the Black Prince; and here died Anne the wife of Richard II. who first taught the English ladies the use of the side-saddle; for before her time they rode astride. Her dying here gave Richard such a dislike to the place, that he defaced it; but it was repaired and beautified by king Henry V. In 1497 this palace was destroyed by fire, when king Henry VII. was there; but in 1501 that prince caused it to be rebuilt, and commanded that the village should from thence forward be called Richmond, from his having borne the title of earl of Richmond, before he obtained the crown. That prince died there, as did also his grand-daughter, queen Elizabeth.

The present palace, which is finely situated, is a plain edifice, erected by the duke of Ormond, who obtained a grant of a considerable space of land about Richmond from king William III. as a reward for his military services; but it devolved to the crown on that duke's attainder, in the beginning of the reign of king George I. His late majesty took great delight here, and made several improvements in the palace; while queen Caroline amused herself at her royal dairy, Merlin's cave, the hermitage, and other improvements which she made in the park and gardens of this delightful retreat. Though the palace is unsuitable to the dignity of a king of England, the gardens are extremely fine, without offering a violence to nature, and almost every thing here has an agreeable wildness, and a pleasing irregularity, which affords a much higher and more lasting satisfaction than the stiff decorations of art, where the artist loses sight of nature, which alone ought to direct his hand.

On entering these rural walks you are conducted to the dairy, a neat but low brick building, to which there is an ascent by a flight of steps, and in the front is a handsome pediment. The walls on the inside are covered with

stucco: the house is furnished suitably to a royal dairy, and the utensils for the milk are of the most beautiful china. On passing by the side of a canal, and through a grove, the temple presents itself to view, situated on a mount. It is a circular dome, crowned with a ball, and supported by Tuscan columns, with a circular altar in the middle, and to it is an ascent by very steep slopes.

Returning by the dairy, and crossing the gravel walk which leads from the palace towards the river Thames, you come to a wood which you enter by a walk terminated by the queen's pavilion, a neat elegant structure. In another part of the wood is the duke's summer-house, which has a lofty arched entrance. On leaving the wood you come to the summer-house on the terrace, a light small building, with very large and lofty windows, to give a better view of the country, and particularly of the noble seat called Sion-house. In this edifice are two good pictures representing the taking of Vigo by the duke of Ormond.

On passing through a labyrinth you see near a pond Merlin's cave, a thatched Gothic structure, within which are the following figures in wax; Merlin, an ancient British enchanter; the learned queen Elizabeth, and a queen of the Amazons. Here is also a library, consisting of a choice collection of the works of modern authors, neatly bound in vellum. On leaving this structure, which has an antique and venerable appearance, you come to a large oval five hundred feet in diameter, and turning from hence have a view of the hermitage, a grotesque building, which appears to have stood many hundred years, though it was built by order of her late majesty. It has three arched doors, and the middle part, which projects forward, is adorned with a kind of ruinous angular pediment; the stones of the whole edifice appear as if rudely laid together, and the venerable look of the whole is improved by the thickness of the solemn grove behind, and the little turret on the top, with a bell, to which you may ascend by a winding walk. The inside is in the form of an octagon, in which are the busts of the following great men, who by their writings were an honour not only to their country, but to human nature. The first on the right hand is the incomparable Sir Isaac Newton, and next to him the justly celebrated Mr. Locke. The first on the left hand is Mr. Woolaston, the author of *The Religion of Nature displayed*; next to him is the Rev. Dr. Samuel Clarke, and in a kind of alcove the honourable Mr. Robert Boyle.

Upon leaving this seat of contemplation, you pass through fields clothed with grass, corn fields, and a wild ground interspersed with broom and furze, which afford excellent shelter for hares and pheasants, and here there are great numbers of the latter very tame. From this pleasing variety, in which nature appears in all her forms of cultivation and barren wildness, you come to an amphitheatre composed of young elms, through which you pass to the forest walk, which extends about half a mile, and then passing through a small wilderness you leave the gardens.

At the extremity of the garden on the north-east, is another house that belonged to her late majesty, and near it the house of his late royal highness Frederic prince of Wales, which is on the inside adorned with stucco. Opposite the prince's house is the princess Amelia's, built by a Dutch architect, the outside of which is painted. To the west of the gardens is seen the fine houses of several of the nobility and gentry, particularly the lady Buckworth's, and Mr. Geoffrey's, and on the other side of the Thames appears Isleworth.

To return to the village of Richmond. The green is extremely pleasant, it being surrounded with lofty elms, and adorned on each side with the houses of persons of distinction. Among these is a handsome edifice that formerly belonged to Sir Charles Hedges, and since to Sir Matthew Decker, in the gardens of which is said to be the longest and highest hedge of holly ever seen, with other hedges of evergreens, vistas cut through woods, grottos, fountains, a fine canal, a decoy, summer-house, and stove-houses, in which the anana or pine-apple, so often mentioned in our treating of Asia, was first brought to maturity in this kingdom. On the north-east side of the green is a fine house, which belonged to the late Mr.

Heydigger,

Heydigger, and a little beyond it that of the late duke of Cumberland, on passing which you come to a small park belonging to his majesty, well stocked with deer, and opposite to it is the entrance into the gardens. On the side of this green has also been erected a theatre, in which plays are acted during the summer season.

The village runs up the hill to the New-Park, and with the royal gardens slopes towards the Thames. There is here an alms-house, built by Dr. Duppa, bishop of Winchester, in the reign of king Charles II. in pursuance of a vow made by that prelate, during that prince's exile, for ten poor widows. There is another alms-house endowed with above 100*l.* a year, which, since its foundation, has been considerably encreased by John Mitchell, esq. Here are also two charity schools, one for fifty boys, and the other for fifty girls.

On the ascent of the hill are wells of a purging mineral water, frequented during the summer by a great deal of good company. On the top is a most extensive and beautiful prospect of the country, interspersed with villages and inclosures; the Thames is seen running beneath, and the landscape is improved by the many fine seats scattered along its banks.

New-Park is situated between Kingston and Richmond, and was made in the reign of king Charles I. It is the largest of any within the environs of London, except that of Windsor, for it is said to be eleven miles in compass, and enclosed with a brick wall. In this park is a small hill cast up, called king Henry's Mount, from which is a prospect of six counties, with a distant view of the city of London and of Windsor castle. The new lodge, built by the late earl of Orford, is an elegant structure built of stone, in a square form, with wings on each side of brick. It stands on a rising ground, and affords a good prospect of the park, especially of a fine piece of water that is in it. Though this park has little more than a wild variety of natural beauties, yet these are such as cannot fail of pleasing those who are as much delighted with views in their rudest appearance, as in all the elegance of art and design.

Walton, a village situated on the Thames, eight miles to the west of Kingston, and opposite to Shepperton in Middlesex. It is said that the last mentioned county was joined to this town, till about three hundred years ago, when the old current of the Thames was changed by an inundation, and a church destroyed by the waves. There is here a curious bridge over the Thames, erected by that public-spirited gentleman Samuel Decker, esq. and completed in the year one thousand seven hundred and fifty. It consists of only four stone piers, between which are three large arches of beams and joists of wood, strongly bound together with mortises, iron pins, and cramps; under these three arches the water constantly runs; besides which are five other arches of brick-work on each side, to render the ascent and descent the more easy; but there is seldom water under any of them, except in great floods; and four on the Middlesex side are stopped up, they being on high ground, above the reach of the floods. The middle arch, when viewed from the river, affords an agreeable prospect of the country, beautifully diversified with wood and water, which is seen through it to a considerable distance. The prodigious compass of this great arch fills a person below with an uncommon sensation of awe and surprise; and his astonishment and attention are increased on his observing, that all the timbers are in a falling position, for there is not one upright piece to be discovered; and at the same time considers the very small dimensions of the piers by which the whole is supported. In passing over the bridge, when you have proceeded past the brick-work, the vacant interstices between the timbers, yield at every step a variety of prospects, which at the center are seen to a still greater advantage. But though each side is well secured with braces, and rails eight feet high, yet as it affords only a parapet of wide lattice-work, and the apertures seem large enough to admit the passage of any person to go through, provided he climbs or is lifted up, and as the water is seen through every opening at a great depth below, those unused to such views can hardly approach the side without some apprehensions. These openings are purposely left to admit a free passage for the air, in

order to keep the timbers the more sound, and that the least decay may be the more easily perceived, and repaired.

Epsom, a handsome well built town, sixteen miles from London, abounds with genteel houses, which are principally the retreats of the merchants and citizens of London, and is a delightful place, open to Banstead Downs. The town extends about a mile and a half in a semicircle, from the church to lord Guilford's fine seat at Durdan's; and as Mr. Whatley observes, there are so many fine fields, meadows, orchards, and gardens, that a stranger would be at a loss to know, whether this was a town in a wood, or a wood in a town. Its mineral waters, which issue from a rising ground nearer Ashsted than Epsom, were discovered in 1618, and soon became very famous; but though they have not lost their virtue, they are far from being in the same repute as formerly; however, the salt made of them is valued all over Europe. The hall, galleries, and other public apartments, are now run to decay, and there remains only one house on the spot, which is inhabited by a countryman and his wife, who carry the water in bottles to the adjacent places. Horse-races are annually held on the neighbouring downs, and there are many fine seats in this neighbourhood, besides Durdan's already mentioned, as the earl of Berkshire's, lord Baltimore's, the lady Fielding's, &c.

Croydon, a pleasant town on the edge of Banstead Downs, ten miles to the south of London, is pretty large, and inhabited by many citizens from London. Among the other buildings is the ancient palace of the archbishops of Canterbury, several of whom have been interred in the church, particularly archbishop Whitgift, who built and endowed an hospital for a warden and twenty-eight men and women, and a school for ten boys, and as many girls, who are clothed and taught. This town has a great corn-market on Saturdays, chiefly for oats and oatmeal, for the service of London.

Southwark, a borough of considerable extent, contains nine parishes, and sends two members to parliament; but as it may rather be considered as a suburb to London, we shall therefore defer any farther description of it till we come to that city.

Dulwich, a very pleasant village in Surry, five miles from London, where is a spring of medicinal water. The fine walk opposite to the Green Man, through the woods, affords from the top of that house a very noble prospect; but it is much exceeded by that from a hill behind the house, where under a tree, distinguished by the name of The Oak of Honour, you have a view of the houses, churches, and other edifices, from Chelsea to Putney, with all the adjacent villages, together with Westminster, London, Deptford, Greenwich, and over the metropolis as far as Highgate and Hamstead.

Dulwich is most famous for its college, founded and endowed in 1619, by Mr. William Alleyn, who named it The College of God's Gift. This gentleman being a comedian and principal actor in many of Shakespeare's plays, it is said, he once personating the devil, was so frightened at his imagining that he saw a real devil on the stage, that he from that moment quitted the theatre, devoted the remainder of his life to religious exercises, and founded this college for a master and warden, who were always to be of the name of Alleyn, or Allen; with four fellows, three of whom were to be divines, and the fourth an organist; and for six poor men, as many poor women, and twelve poor boys, to be educated in the college by one of the fellows as schoolmaster, and by another as usher. To this college belongs a chapel, in which the founder himself, who was several years master, lies interred. The master of this college is lord of the manor for a considerable extent of ground, and enjoys all the luxurious affluence and ease of the prior of a monastery. Both he and the warden must be unmarried, and are for ever debarred the privilege of entering that state, on pain of being excluded the college; but as the warden always succeeds upon the death of the master, great interest is constantly made by the unmarried men of the name of Allen, to obtain the post of warden.

The original edifice is in the old style of building; but

but part of it has been lately rebuilt with greater elegance, out of what has been saved from the produce of the estate. The master's apartments are very richly adorned with noble old furniture, which he is obliged to purchase on his entering into that station; and for his use there is a library, to which every master generally adds a number of books. The college is also accommodated with a very pleasant garden, adorned with walks, and a great profusion of fruit trees and flowers.

Lambeth, a village seated on the Thames, near the south-end of Westminster-bridge, is particularly famous for its containing for several ages, the palace of the archbishop of Canterbury. This structure was first erected by Baldwin, archbishop of that see in 1188, and was rebuilt by archbishop Boniface in 1250; but several of the succeeding prelates have added additional buildings. Hence, as the present structure has been erected at different periods, it is not at all surprising, that it has but little appearance of uniformity. However, the edifice, though old, is in most parts strong; the corners are faced with rustic, and the top surrounded with battlements: the principal apartments are well proportioned, and well enlightened. As it is situated on the bank of the Thames, it affords a fine view up and down the river, and from the higher apartments, a prospect of the country each way. This palace has a fine library, and a spacious garden abounding in fruit trees.

Vauxhall, a hamlet in the parish of Lambeth, is particularly famous for the beauty of the gardens, that have for many years been converted, during the spring and summer seasons, into a place of genteel entertainment. In the midst of the garden is a superb orchestra, containing a fine organ and band of music, with some of the best voices, and the seats or boxes are disposed to the best advantage with respect to hearing the music. In most of the boxes are paintings from the designs of Mr. Hayman; and in a large and superb pavilion, are several paintings by the hand of that ingenious artist. The trees are scattered here with a pleasing confusion. At some distance are several noble vistas, where the spaces between each are filled up with neat hedges, and on the inside are planted flowers and sweet smelling shrubs. Some of these vistas terminate in a view of ruins; others in a prospect of the adjacent country, and others are adorned with a painted representation of triumphal arches. There are here several statues, particularly a good one in marble by Mr. Roubiliac, of the late Mr. Handel, in the character of Orpheus, playing on a lyre. When it grows dark, the garden is instantly illuminated with about fifteen hundred glass lamps, which glitter among the trees, and render it extremely light and brilliant. Soon after a very extraordinary piece of machinery is exhibited on the inside of one of the hedges, near the entrance into a vista; by removing a curtain is shewn a fine landscape, illuminated by concealed lights, in which the principal objects that strike the eye are a cascade and a miller's house. The exact appearance of water is seen flowing down a declivity, and turning the wheel of a mill; it rises up in foam at the bottom, and then glides away. This moving picture attended with the noise of the water, has at once a surprising and pleasing effect; but the author of *London and its Environs*, a very useful and entertaining work, justly observes, that "here people being obliged to wait till the curtain is drawn, and after beholding it for a few minutes, having it again suddenly concealed from the view, when the exhibition is ended for that night, has too much the air of a raree-show. He adds, that if it could be contrived to make its appearance gradually with the rising of the moon in the same picture, which might seem to enlighten the prospect, and at length by degrees become obscured by the passing of a cloud before that luminary, the effect would perhaps be much more agreeable."

Farnham, a large populous market town, seated on the river Wye, on the eastern extremity of Surry, and forty-one miles to the west-south-west of London, was once the greatest corn-market in England, except Hempstead and London, particularly for wheat, of which vast quantities used to be brought here every market-day; but though its corn-market is dwindled, its plantation of hops are so much improved, that its trade in that ar-

ticle is superior to that of Canterbury, Maidstone, and many of the places in Kent; and the hops here being of superior goodness, yield a better price than any other in England: indeed all the country about Farnham may be considered as one general hop-ground. At this town is a castle built by a bishop of Winchester, which is said to have been possessed in a constant succession by the bishops of that diocese, ever since the reign of king Stephen. This palace is a magnificent structure in the Gothic taste, deeply moated, and strongly walled in, with towers at proper distances. It stands upon the edge of a hill, and has a fine park stocked with about seven hundred head of deer, the property of the bishop, who has them sent, together with fruit from the gardens, to supply his table at Chelsea. One large and broad street of the town at the bottom of the hill, fronts the castle, in which is an elegant music room. The rest of the town principally consists of a long strait street, which crosses it at right angles.

About two miles from Farnham, is More-Park, formerly the seat of Sir William Temple, who in his last will ordered his heart to be put into a china basin, and buried under a sun-dial in the garden, which was accordingly performed. This house is situated in a valley, surrounded on every side with hills, and having a running stream through the gardens. Going from this seat on the left-hand under a high cliff, is a famous natural grotto, which they call Mother Ludloe's Hole, through which runs a strong rill of water. The grotto is large; but diminishes and winds away as the spring seems to have directed. The owner has paved the bottom with a kind of Mosaic tile, and has separated the wider part from the narrower behind, by a little parapet, through which issues the stream of water, which glides through marble troughs one below another, till it is conveyed out of the grotto, and there murmuring down a considerable declivity over many artificial steps, falls into the river on the right-hand. From this grotto you command a fine prospect of the meadows and woods, which lie below and over against it, and these are again bounded by hills, which render the whole one of the most romantic situations imaginable.

S E C T. X.

Of Hampshire or Hants; its Situation, Extent, Divisions, Climate, Produce, Rivers, and principal Places.

THIS county, though called Hampshire, or Hants, is properly the county of Southampton, and is bounded on the east by Surry and Suffex, on the south by the British channel, on the west by Wiltshire and Dorsetshire, and on the north by Berkshire. It extends sixty-four miles in length from north to south, thirty-six from east to west, and is about one hundred and fifty miles in circumference. It is divided into thirty-nine hundreds, and contains nine forests, twenty-nine parks, one city, eighteen market-towns, 253 parishes, above thirty-six thousand houses, and by the most modest computation a hundred and eighty thousand inhabitants, who elect twenty-six members of parliament, two for the county, two for the city of Winchester, and two for each of the following towns, Southampton, Portsmouth, Petersfield, Yarmouth, Newport, Stockbridge, Andover, Whitchurch, Lymington, Christchurch, and Newtown.

The air is mild and wholesome; but a small part, which consists of the low grounds next the sea, is subject to the sea vapours; but without the bad effects usually experienced in other countries. The soil is generally rich, and the county affords plenty of corn, cattle, wool, bacon, wood, iron, and honey. The sheep are remarkably good, but small, and valued both for their flesh and wool. The bacon of this county is esteemed the best in England, and its honey, except that gathered on the heaths, bears a high price; and of this the inhabitants make most excellent mead and metheglin. The excellency of the Hampshire bacon is attributed to the swine being supplied with plenty of acorns from the New Forest and other woods, in which they are suffered to run at large. The sea-coast here furnishes oysters, lobsters, and other

other sea-fish, and its rivers abound in fresh fish, especially trouts. There is no county in England so well wooded as this; and though the vast consumption of timber at Portsmouth, Southampton, Redbridge, and other places, since the Revolution, in building men of war and smaller vessels, has consumed great quantities, yet there is no want of timber, a great deal being still left growing; and in New Forest there are oaks of several hundred years growth.

The rivers of this county are the Avon, which enters it at Charford, and running southward discharges itself into the sea below Christchurch: the Tese, which rises in the northern part of Hampshire, and running also southward forms several islands at Stokebridge, and falls into an arm of the sea called Southampton-water: the other rivers are the Stowre, and the Itching.

The gentry here delight much in fox-hunting, the woods and downs being proper for breeding and hunting these animals; and the best fox-hounds are said to be bred in this county. Kerseys and cloth are made here, though not in such plenty as in the neighbouring counties of Wiltshire, Somersetshire, and Gloucestershire; yet enough is made not only for home consumption, but to spare some for exportation. The convenient ports and harbours in this county have brought a good foreign trade to it. The principal places in it are the following:

Winchester, or Winton, a very ancient city, called by the Britons *Cae Gwent*, which signifies the White Town, from the chalky hills near it; and by the Saxons *Wintancester*. It is pleasantly situated in a valley between hills on the river Itching, sixty-seven miles to the west-by-north of London. This city at a distance has a venerable appearance, and yet has many modern buildings, some of them very handsome structures, as the college-schools, with the episcopal palace, built by bishop Morley. It has one spacious street; but the rest are mostly narrow, and the walls greatly decayed. The town-hall is built like an old chapel, supported by pillars, and in it are two aisles. Over the court of Nisi Prius, above the judge's seat, is fixed against the wall the pretended round table of king Arthur, with the names of the knights upon it, in such Saxon characters as no man can read. This is said to be a piece of antiquity of twelve hundred years standing; but Camden, and other authors, imagine it to be of a much later date. In former times there were in this city no less than thirty-two parish-churches, which are at present reduced to five, exclusive of the cathedral; and even these are more than are wanted. This last church is very plain on the outside, there not being, except one at the west end, either a statue, or a niche for a statue, to be seen on the outside. The tower is carried up but a very little height above the roof, and has no proper finishing, but is covered in, as if the building had been left off, which was probably the case, it being strong enough to support a very high spire. On entering at the west door, the church makes a venerable and majestic appearance; the vaulting of the roof is beautiful; but the pillars on each side are much too thick for the spaces of the arches. The entrance into the choir is by a noble flight of steps the whole breadth of the middle aisle; and the screen, which was designed by Inigo Jones, is a fine piece of architecture of the Composite order. But his thus joining the Roman to the Gothic stile is certainly a solecism in architecture. The stalls in the choir are of fine Gothic workmanship, to which the bishop's throne, erected at the expence of bishop Mew, would have been a great additional ornament, had it been Gothic and of a piece with the rest. The stone screen, where the high altar is placed, is a fine piece of Gothic work; but the angles of the niches, where formerly were images, being chipped away in order to make room for a number of urns, disgrace this fine piece.

Within this cathedral are many things worthy of observation. It was for some ages the burying-place of the Saxon, Norman, and English kings: the relics of some of these were collected by bishop Fox, and being put together into six large wooden chests, lined with lead, were placed on the great wall in the choir, three on one side, and three on the other, with an account whose bones are in each chest, namely, those of Egbert, Adulphus, Edredus, Edmundus, Canutus, and queen Emma. The

tomb-stone of William Rufus is in the midst of the choir, and his bones in a wooden chest that stands on the top of the septum, which parts the choir and the side aisles. The tomb of William of Wickham, who built this cathedral, is very spacious, lofty, and magnificent; as is also the tomb of cardinal Beaufort, brother to king Henry IV. with several others.

In the south suburb stands the college, erected by William of Wickham, which is a noble foundation. The building consists of two large courts, in which are lodgings for the masters and seventy scholars, and in the center is a very elegant chapel. In the second court are the schools, with a large cloister beyond them, and some inclosures laid open for the diversion of the scholars. There is also a great hall, where the scholars dine, and in the middle of the cloisters is a library, which is a strong stone building, well contrived to prevent fire. The scholars, after staying here a certain time, may remove to New College, Oxford, which was built by the same prelate. Not far from hence is St. Crosses, an hospital for thirteen brothers, with a daily allowance of bread and beer for poor travellers. There is here an infirmary for the reception of sick and lame, which is a very handsome modern structure, built of red brick, and supported by voluntary subscription.

In the place where the ancient castle stood, which was at the south side of the west gate, upon an eminence commanding the town, king Charles II. began a stately palace, upon which he had expended twenty-five thousand pounds, when his death put a stop to the design. The south side extends two hundred and sixteen feet, and the west three hundred and twenty-six; and this structure was so far prosecuted, that it was carried up to the roof, and covered. The principal floor of this edifice is a noble range of apartments twenty feet high, and the whole building contains no less than a hundred and sixty rooms. His late majesty king George I. made a present to the duke of Bolton of the fine columns of Italian marble, which were to have supported the grand stair-case, and were said to have been a present from the great duke of Tuscany. This structure was fitted up for the French prisoners taken during the late war.

Winchester is about a mile and a half within the walls; but it has no trade, except what is naturally occasioned by the inhabitants of the city and the neighbouring villages one with another. Here is a great deal of good company, and the many gentry in the neighbourhood add to the sociableness of the place: the clergy are also generally very rich and numerous.

The city is governed by a mayor, a recorder, several aldermen, six of whom are always justices, with a sheriff, two bailiffs, and four constables. On St. Giles's-hill, near this city, is held, on the 12th of September, one of the greatest fairs in England for horses, cheese, and leather; and another on Magdalen-hill, August the second, for the same.

Southampton, the county town, is situated seventy-eight miles to the west-south-west of London, between two rivers, the Itching on the east, and the Tese, or Anton, on the west, which falls into an arm of the sea called the Southampton-water, that is very deep, so that ships of five hundred tons have been built in it. The town has quays for the loading and unloading of merchandize, which renders it a place of good trade, and it is well inhabited by merchants and shop-keepers. It is surrounded with strong walls and a double ditch, with seven gates, and several watch-towers: it had also a strong castle to defend the harbour, placed on a high mount; but it is now in ruins. The walls of this old castle consisted of little white stones like the honey-comb on the back of oyster-shells, extremely hard, and gathered from the beach of the sea, which encompassed near half the town. At the south-east corner near the quay is a fort called the Tower, defended by some guns. Here is said to be one of the broadest streets in England, three quarters of a mile long, well paved and flagged on each side, terminating in the fine quay. It contains five parish-churches, with one for the French refugees; and an hospital called God's-house; also a free-school founded by king Edward VI. and a charity-school supported by subscription for thirty boys, who are clothed and

taught reading, writing, arithmetic, &c. In the town are four public conduits, to which water is conveyed from the neighbourhood by leaden pipes. Formerly all the Canary brought into the kingdom was obliged to be first landed here, till the London merchants, finding this an inconvenience, purchased that privilege of the corporation, and had their wines afterwards brought directly to London. Some merchants trade in Port and French wines; but their greatest dealings are with Jersey and Guernsey, and to Newfoundland for fish. The town is governed by a mayor, and the assizes are usually kept in the town-hall. This place is memorable for the expedient taken by king Canute to silence the flattery of his courtiers: for this purpose he seated himself on the bank of the river, dressed in all his regal ornaments, and commanded the tide not to approach his footstool; but it soon wetting his feet, he censured their impiety and servility in ridiculously pretending that his power was boundless.

About a mile from the town, on the bank of the Itching, is a vast pile of earth rising in the form of a cone from a wide foundation, and called Bevis Mount. This is supposed to have been an ancient fortification thrown up by the Saxons under the command of Bevis, a Saxon lord, to oppose the passage of the Danes over the river, who lay encamped on the other side. The river is not very large, but the tide forms a kind of bay just under the mount, which being contiguous to an estate belonging to the late earl of Peterborough, his lordship purchased it, and converted it into a kind of wilderness; and, as it was full of trees and brambles, cut through them several circular intricate walks and labyrinths. The mount terminates above like Parnassus in a kind of fork, and between the two peaks is a bowling-green, or pasture, adorned with fine Italian marble statues. On one side of this parterre, declining from the top of one of the peaks to the green, is planted a little vineyard exposed to the south; and on the very summit of the other stands a summer-house elegantly built, with a good cellar under it. There are as many things here fabled of Bevis, as there are in Wales and Cornwall of king Arthur; but both of them have suffered much from legendary writers.

Portsmouth, a strong sea-port town, seventy-two miles to the south-west of London, in the fiftieth degree forty-eight minutes north latitude, and in the first degree six minutes west longitude. It is the key of England on that side, and a regular fortification, at the entrance of a creek of Portsey island, which is about fourteen miles in circuit, and surrounded at high tides by the sea-water, of which salt is here made: it is also joined to the continent by a draw-bridge, where was anciently a small castle and town called Port Perus, or Port Chester, at which Vespasian landed: this town and castle stood at the upper end of the creek; but upon the retiring of the sea, the inhabitants followed it, and this gave rise to the building of the present town. Portsmouth is one of the principal places for building and laying up the royal navy, it being furnished with wet and dry docks, and vast magazines of naval and military stores: the rope-house in particular is one continued room eight hundred and seventy feet, or almost a quarter of a mile in length. The yard is defended by a good counterscarp, double moat, with ravelins in the ditch, double palisadoes, and works for covering the place where most accessible.

In Portsmouth haven a thousand sail of the largest ships may ride at anchor. The mouth, which is not much broader than the Thames at Westminster-bridge, is secured on the Gosport side by Charles's fort, James's fort, Borough fort, and Block-house fort, which has a platform of twenty great guns level with the water; on the other side by Portsmouth stands South Sea castle, and a number of additional works have been lately raised, so as to render the place impregnable. The harbour is so secured from winds, that they cannot blow from any point of the compass to the detriment of the ships at anchor in it; and is so deep, that a first rate man of war can ride at the lowest ebb without touching the ground; on the other hand, there is a boom, or chain, at its entrance, that in case of danger can be raised and fastened immediately on both sides, so as to stop any naval force; and

if attacked by sea the enemies ships must come directly under South Sea castle, and afterwards be exposed to a long train of cannon from the town and the block-house, which must rake them fore and aft, for a mile together, before they reach the haven's mouth.

A capital convenience to the harbour of Portsmouth is the safe and spacious road of Spithead, which lies between the continent of Hampshire and the Isle of Wight, and is about twenty miles in length, and in some places no less than three in breadth. It is defended from all winds blowing from the west to the south-east by the high lands of the Isle of Wight, and from the winds of the opposite quarter by the main land of Hampshire, the town of Portsmouth fronting the middle of the road. The very sands in its neighbourhood contribute to its safety; as for instance, the Spit lying to the north breaks the sea on that side, as the Horse's Bank does on the east, and No Man's Land and the Mother Bank on the south. As to the bottom, it is perfectly sound and good, and the flux and reflux of the sea repairs all the injuries done by the anchors. The limits of this road are also exactly distinguished by buoys properly placed.

The town is strong on the land-side, it being encompassed by a wall, and the many additional works that have been lately made. The men continually employed in the yard amount to at least a thousand, and their number is greatly increased in time of war. The docks and yards are, in short, a kind of marine corporation within themselves.

The situation of Portsmouth is low, and so full of water and ditches, as to be esteemed aguish. The streets are dirty, and have consequently a disagreeable smell; but the continual resort of seamen and soldiers render it always full of people, especially in time of war, when the inns and taverns are perpetually crowded; but the landlords bills are generally not the most moderate. The place is in want of fresh-water; and, though seated in a plentiful country, the great consumption makes all sorts of provisions dear; as are also lodgings and fuel. Here is a garrison and deputy-governor; the church is a large and handsome structure, and from the watch-house on the top of the steeple is a fine prospect of the harbour, as well as of Spithead, where ships ride before they come in, lying between Portsmouth and the Isle of Wight. Here is a fine new quay for laying up cannon; and also a school, founded by the government, for the instruction of youth in mathematics and navigation, to qualify them for the sea-service.

On the adjoining heath a suburb has been built, which, for number of inhabitants, and beauty of the houses, is like to exceed the town itself. It has a church, a chapel, and several meeting-houses.

The government of Portsmouth is by a mayor and aldermen, and the civil government is no more interrupted by the military than if there were no garrison; so that there are seldom any complaints, either for want of discipline among the soldiers, or want of prudence in the magistrates.

It ought not to be omitted, that on the third of July, 1760, a dreadful fire broke out at twelve in the morning in the dock-yard, in a fine pile of building; in the lower part of which were pitch, tar, oil, and turpentine; in the upper, cables, sails, and canvas: the next store-house was the spinning-house, and above it hemp: the next, where the bell hung, was a long lane piled up with decayed stores: the next to that were the rope-makers laying walk and tarring-walk, over which were sails, canvas, and ropes. The flames raged with such fury, that all these buildings were destroyed. It rained very hard all that night, and it is thought the stores caught fire by the lightning, which was very terrible, the element appearing all on a blaze. In the ware-houses that were consumed were deposited a thousand and fifty tons of hemp, five hundred tons of cordage, and about seven hundred sails, besides many hundred barrels of tar and oil; yet with all this devastation, such was the diligence exerted, and such the quantity of stores at Chatham, and in other magazines, that the loss was soon supplied without much affecting our public concerns, though in the midst of a heavy, glorious, and expensive war.

Gosport

Gosport is parted from Portsmouth by a narrow arm of the sea, and is a pretty large town that has a good trade in time of war; and has lately been improved by an hospital and some strong fortifications added to those already mentioned.

Andover, a large borough, sixty-two miles to the west-by-south of London, is a great thorough-fare on the direct western road, as well from Newbury to Salisbury, as from London to Taunton, and all the manufacturing towns in Somersetshire, by which means it is greatly enriched. It is very healthy, and pleasantly situated on the borders of the downs commonly called Salisbury-plain, and is a thriving, handsome, well-built, and populous town. Here is an hospital for six men, and a free-school.

Near this town is the village called Wey-hill, where the open down-country begins, and where is held the greatest fair for sheep in this nation, principally of ewes, for store-sheep; for the farmers of many of the neighbouring counties come here to buy: at the same time are sold great quantities of leather, hops, and cheese. This fair is held on the tenth of October.

We shall now describe the Isle of Wight, which is generally included under Hampshire. This island extends from east to west, in somewhat of an oval form: it is twenty-one miles in length, twelve in the middle where broadest, and sixty in circumference; but the sea breaks in so far on the north side, as almost to divide it into two parts. The most easterly point of the island lies opposite to Portsmouth, and the most westerly opposite the little borough of Christchurch. It is encompassed with rocks, especially towards France, of which the most noted are the Shingles and the Needles in the western point. These rocks render it in most places inaccessible; and where the shore is almost level and lies exposed, as it does towards the south-east, it is fortified by castles, forts, and block-houses.

The air is very healthy, and the soil fruitful, it producing corn enough in one year to serve the inhabitants seven; and this enables them to export great quantities to England and elsewhere. There is every where plenty of hares, rabbits, partridges, pheasants, lapwings, and variety of wild-fowl; it has two parks stocked with deer; but only one small forest, so that the inhabitants are obliged to fetch their wood from the neighbouring coasts. Through the middle of the island runs a long ridge of hills, which afford pasture for sheep, whose wool being very fine, is in great repute among the clothiers. In the north part is very good pasturage and meadow ground. The southern is in a manner all a corn country, inclosed with hedges and ditches. Here is found the best tobacco-pipe clay, and fine white sand, of which drinking-glasses are made. The inhabitants have also abundance of fish from the sea.

The natives are generally long lived, vigorous, and able to undergo much labour. The island contains four market-towns, of which three send members to parliament; four castles, fifty-two parishes, above three thousand houses, and near twenty-seven thousand souls, of which it is said five thousand are fit to bear arms. The militia are so well disciplined by their officers, that they are reckoned as good soldiers as any in the kingdom. They are divided into eleven bands, over each of which is a centurion, and the inferior officers are called vintons. There are several beacons in the island, at which continual watch is kept to give notice of the approach of an enemy.

The government of the island, which is a post of great trust, is always lodged in a general of the army, an admiral of the fleet, or some other person of high rank; and under him are all the governors of the forts and castles in the island, where a regiment, and sometimes more, are commonly kept in garrison. In ecclesiastical affairs it is subject to the bishop of Winchester, and in civil affairs to the county of Southampton. The parliamentary boroughs, which all lie on the north side of the island, are the following:

Newport, which is the principal town, and is seated in the middle of the island, eighty-five miles to the south-west of London. It was formerly called Medena, and Meden, from whence the whole adjacent country, to the

east and west of the bay, is called East and West Meden. It is a very ancient borough by prescription, but did not send members to parliament till the reign of queen Elizabeth; and its charter, by which it is now governed, was granted by king James I. It has a mayor, twelve aldermen, a recorder, and twelve burgesses. The town is large and populous, yet its church is only a chapel of ease to Carisbrooke. It is seated on the river Cowes, which falls into the sea near the town and castle of Cowes. Vessels of small burthen come up to the quays, but the larger ships are unloaded, and the merchandize brought up hither in barges. The houses are built of stone, the streets are clean, and it has a charity-school well endowed.

Yarmouth is seated upon a creek about a mile from its entrance, eight miles to the west of Newport, and is governed by a mayor, recorder, aldermen, bailiffs, and common-council. It is defended by a castle which has a garrison, and the houses, which are handsome, are generally built of stone.

Newtown, or Newton, is a little borough at the end of another small creek on the same side of the island, and is governed by a mayor and burgesses; but though it has a convenient haven, it is the most inconsiderable of all the three boroughs.

The other places of most importance are two pretty towns, both named Cowes, one on the east and the other on the west side of the river of the same name. West Cowes is the most flourishing town in the island; it is situated in fifty degrees forty-two minutes latitude, and in one degree twenty-six minutes west longitude, and has a castle built by Henry VIII. Here masters of ships, and merchants homeward or outward bound, are furnished with money for bills, and the ships supplied with stores of fresh provisions. Several merchants live here, and have handsome houses; but the town lying low is not esteemed very healthy. The castle of East Cowes has been neglected; but in that of West Cowes is constantly kept a garrison, under the command of the deputy-governor of the island. This is a place of general rendezvous for merchant ships that wait for convoys.

In the English Channel are four other islands opposite this county and subject to England; these are Jersey, Guernsey, Alderney, and Sark; which, though they lie much nearer to the coast of Normandy than to that of England, are within the diocese of Winchester. They lie in a cluster in Mount St. Michael's bay, between Cape La Hogue in Normandy and Cape Frebelle in Brittany. The computed distance between Jersey and Sark is four leagues, between that and Guernsey seven leagues, and between the same and Alderney nine leagues.

Jersey, the largest of these islands, lies farthest within the bay, in forty-nine degrees seven minutes north latitude, and in the second degree twenty-six minutes west longitude, eighteen miles to the west of Normandy, and eighty-four to the south of Portland in Dorsetshire, and in the time of the Romans was called Cæsarea. It is not above twelve miles in length, nor much above six where broadest, which is at the two extremities. It is defended by rocks and dangerous quicksands. On the north side the cliffs rise forty or fifty fathoms high, which render it inaccessible on that side; but on the south the shore is almost level with the water. In the west part of the island is a large tract of land once cultivated and very fertile, but now a barren desert, caused by the west winds throwing up sand from the bottom to the top of the highest cliffs. The higher lands are diversified by gritty, gravelly, stoney, and fine mold; the lower by a deep, rich, and heavy soil. The middle part of the island is somewhat mountainous, and so thick planted with trees, that at a distance it resembles one entire forest, though in walking through it there is hardly a thicket or any thing to be seen but hedge-rows and orchards of apple-trees. The valleys under the hills are finely watered with brooks, and have plenty of cattle and small sheep, with very fine wool, and very sweet meat, which is ascribed to the shortness of the grass. The horses are good for draught; but few fit for the saddle. The island produces variety of trees, roots, and herbs; but not corn enough for the inhabitants, who therefore send for it to England and France, and sometimes to Dantzic. The fields are in-

inclosed by great mounds of earth, raised from six to eight or ten feet high, proportionably thick and solid, planted with quicksets and trees.

There is no place in the world of the same extent that produces so much cyder, it being computed that in some years they have made twenty-four thousand hogsheads, on which account, and from the cheapness of French wine and brandy, it is not worth their while to set up malting and brewing. Though the whole island is in a manner one entire rock, there is scarce a house, even on the highest hill, but has some spring near it.

Here are abundance of hares and rabbits; the country also abounds with sea-fowl, and the common sorts of land-fowl, both tame and wild, especially barnacles, or Soland geese, which come only in very cold weather. The partridges of this island have red feet and eyes, like a pheasant, and feathers of various colours. This is indeed a beautiful bird; but the flesh is not more delicate than that of the grey partridges in England. They have also a great variety of sea fish, some of which are seldom seen on our coasts.

As the air of this island is very healthy, those of the inhabitants who are temperate live to a great age; but the coast is very subject to storms by westerly winds, from which they have no land to shelter them nearer than North America; and there is a vast chain of rocks about the island, among which the tides and currents are so strong and rapid, that the navigation is extremely dangerous to those who are not perfectly acquainted with the coast.

The inhabitants, who are computed to amount to above twenty thousand, have a mixture of English and French; but French is most generally the language both of the pulpit and the bar.

The buildings of this island are generally of rag-stone; but some of the wealthy inhabitants have their houses fronted with a reddish white stone, capable of being polished like marble, and of which there is a rich quarry on a hill called Montmado. Their churches and some of their edifices are covered with blue slate; but the ordinary dwellings are thatched.

The staple manufacture is knit stockings and caps, many thousand pair of which are weekly sold at St. Helier to the merchants. Their principal foreign trade is to Newfoundland, whither, particularly in 1732, they sent twenty-four ships; these proceed from thence to the Mediterranean to dispose of their fish.

The chief officer is the governor, who has the custody of his majesty's castles, with the command of the garrisons and the militia of the country, which consists of two troops of horse-guards, and five regiments of foot, in which are included all the men in the island. The civil government is administered by a bailey, assisted by twelve jurats. They have here also what they call an assembly of the states, which resembles in miniature the parliament of Great Britain.

The island is divided into twelve parishes, which are so laid out that each has a communication with the sea; these are subdivided into fifty-two vintaines, so called from the number of twenty houses, which each is supposed to have formerly contained, just as in England ten houses anciently made a tything. The principal places in the island are,

St. Helier, the capital, is seated in the bay of St. Aubin, where it has an harbour and a stone pier. Its situation is both commodious and pleasant, having the sea on the south-west, with a full prospect of the road for ships, and hills on the north that shelter it from the cold; on the bottom of these hills are meadows refreshed by a rivulet, that enters the streets and the very houses, so that the water is easily brought up by buckets let down through a trap-door, or by pumps. Another large hill projects in a manner over the town, and has an agreeable walk and an extensive prospect. The town consists of above four hundred houses, and the streets are wide and well paved. The seat of justice stands in a large square, with handsome structures on each side. Its market, which is on Saturday, resembles a fair, it being resorted to by people from all parts of the island. The town is chiefly inhabited by shop-keepers, artificers, and retailers of liquor, it wanting scarce any thing that is either necessary or con-

venient. The corn-market is within a piazza, and the shambles in a spacious room. The number of the inhabitants is computed to amount to at least two thousand. In the church, prayers are read alternately in English and French.

St. Aubin is chiefly inhabited by merchants and masters of ships, who settled here for the sake of its port, which is the best and most frequented in the island; but is too much straitened between hills and the sea, on which account it is not half so large as St. Helier; but the houses are as neat. Its market is rather an exchange for the merchants. Its parish-church, dedicated to St. Brelande, is at such a distance, and there is such a bleak hill to pass over to it, that the better sort of inhabitants have by contribution erected a handsome chapel in the town. There is a fort here with cannon planted on its bastions, and a strong pier has been run out into the sea, which joining that fort, renders the harbour very safe, for no ships can pass within the pier without permission. Into this port a vessel of a hundred and thirty tons may enter at half flood; but larger ships and men of war must keep without in the road, where is good anchorage.

Guernsey extends from east to west in the form of a harp, and is thirteen miles and a half from the south-west to north-east, and twelve and a half, where broadest, from east to west. The air is very healthful, and the soil naturally more rich and fertile than that of Jersey; but the inhabitants neglect the cultivation of the land, for the sake of commerce: they are, however, sufficiently supplied with corn and cattle, both for their own use, and that of their ships.

The island is well fortified by nature with a ridge of rocks, one of which abounds with emery, used by lapidaries in the polishing of stones, and by various other artificers. Here is a better harbour than any in Jersey, which occasions its being more resorted to by merchants; and on the south side the shore bends in the form of a crescent, enclosing a bay capable of receiving very large ships. The island is famous for a beautiful flower called *lilium jarniense*, the leaves of which are covered with spangles resembling gold dust. It is full of gardens and orchards, whence cyder is so plentiful, that the common people use it instead of small-beer, and the more wealthy drink French wine.

The only harbour is at St. Peter le Port, a little market-town on the south-east side of the island, which has only one long and narrow street. The mouth of the harbour is well set with rocks, and on each side defended with a castle, one called the Old Castle, and the other Castle Cornet. This is generally the residence of the governor of the island, who has the command of the garrison in this and all the other castles. The harbour has a good road, from whence ships may sail with any wind, and from the road pass under the guns of the castle to the pier, close up to the town. This pier is a noble work formed of vast stones, joined together with great art and regularity: it is not only a security to the ships, but being contiguous to the town is handsomely paved at the top with large smooth flag-stones, guarded with parapets, and being of a great length and breadth, forms a pleasant walk, it affording a free prospect of the sea and the neighbouring islands. Cornet castle, which commands both the town and the harbour, stands on a rock, is separated from the land by an arm of the sea, no less than six hundred yards wide, and not fordable but at low-water in great spring tides.

Alderney is about eight miles in compass, and is by much the nearest of all these islands to Normandy, from which it is separated by a narrow freight called the Race of Alderney, which is a dangerous passage in stormy weather, when the two currents meet, otherwise it is safe, and has depth of water for the largest ships.

The island is healthy, and fruitful both in corn and pasture; but has only one church and one town, in which are about two hundred houses, and a thousand inhabitants. The island is a dependence of Guernsey, and has but one harbour to the south, called Crabbie, which is at a considerable distance from the town, and capable of receiving only small vessels. From hence to the west is a range of rocks extending three leagues, which having several eddies are dreadful to mariners, who call them all

by the name of the Casquets, from the principal rock at the head of the reef.

Sarke, or Serke, is another small island dependant on Guernsey, and in the middle of all the rest. The air is serene, and generally free from fogs and clouds; and though they have no physicians in the island, it is common to meet men of upwards of four-score years of age. It contains six fine springs, and the soil, though for the most part hot and sandy, is so fruitful as to afford all necessaries for its inhabitants, and particularly bears all kinds of roots, as turneps, carrots, &c. and is well stocked with apple-trees, of which is made excellent cyder: it also produces most kinds of grain; but not in any extraordinary quantity. Their pasture is short, though exceeding sweet, and therefore they have fine mutton; but no more cows than are sufficient to supply them with milk and butter; for they have generally their cheese from England. The island also abounds in ducks, mallard, woodcocks, teal, and other wild fowl; and the cliff-pigeons, at some seasons, almost cover the whole island. Of rabbits they have great plenty, and also of a variety of sea-fish.

The trade here extends no farther than to Bristol and some of the western ports, and the chief if not the only manufacture in the island is knitting of stockings, gloves, and waistcoats, in which the men, women, and children are employed. These they trade with to the ports of England, and return with necessaries; for which purpose they have several small vessels.

S E C T. XI.

Of Berkshire; its Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and principal Towns; with a particular Description of Windsor Castle.

BERKSHIRE is bounded on the north by the Thames, which divides it from Buckinghamshire and Oxfordshire; on the east by Middlesex and Surry; on the south by Hampshire; and on the west by Wiltshire and Gloucestershire. It is thirty-nine miles in length, twenty-nine in breadth, and a hundred and twenty in circumference, containing about seventeen thousand houses, eighty-five thousand inhabitants, sixty-two vicarages, a hundred and forty parishes, six hundred and seventy-one villages, and twelve market-towns.

The whole county is divided into twenty hundreds, and sends nine members to parliament, namely, two for the county, two for New Windsor, two for Reading, two for Wallingford, and one for Abingdon.

The air is generally exceeding healthy, the soil fertile enough, where cultivated, and the whole county, which is one of the most pleasant in England, is well stocked with cattle and timber, particularly with oak and beech in the western parts, and in Windsor forest, which also abounds with wild-fowl and other game. The western part is the most fruitful, especially what is called the Vale of White-horse, so named from the bare side of a chalky hill, made to represent that animal, which, lest it should lose its shape, the neighbouring inhabitants once a year take some pains in trimming, and then conclude the day with merriment.

The chief produce of the country is corn of all kinds, particularly barley, they having great crops in the above vale, of which they make considerable quantities of malt. The rivers Thames and Kennet, the one on the north and the other on the south sides of the county, supply it with fish, especially fine large trouts and cray-fish. It is said that land in this county bears a better price than in any other at the same distance from London. Its principal manufactures consist of woollen cloth and sail cloth.

The rivers of Berkshire are the Isis, which here falls into the Thames, and is of great service in conveying its produce to London. The Kennet, which at Reading receives barges of a hundred and ten tons burthen, and is navigable as high as Newbury; and the Lamburn, which indeed is very small, but, contrary to the other rivers of this island, is always highest in summer, and gradually decreases as the winter approaches, till at last

it is entirely dry. The principal places in this county are the following:

Windsor, whose delightful situation on the winding shore of the Thames occasions its name, is a well inhabited borough twenty-four miles to the west of London, seated on the south bank of that river, in the midst of delightful valleys. Its church is a spacious ancient building, which stands in the high street of the town, in which is also the town-house, a neat regular edifice supported with columns and arches of Portland stone, having at the north end a niche in which is the statue of queen Anne, and on the south the statue of prince George of Denmark, her majesty's consort. In the area underneath the town-hall the market is kept every Saturday, and is plentifully supplied with corn, meat, fish, and all other provisions.

Many gentlemen of fortune and family constantly reside in the town and its neighbourhood. The duke of St. Alban's has a handsome large house on the east part of the town, with pleasant gardens that extend to the park; and at the south side of the town is the house of Sir Edward Walpole, a neat regular structure, with large gardens beautifully laid out and designed, where marshal Belleisle resided while prisoner in England.

This town is most celebrated for its castle, the delightful palace of the English monarchs. It was first built for a hunting-seat by William the Conqueror, soon after his being established on the throne. It was greatly improved by Henry I. who added many additional buildings. Our succeeding sovereigns resided in this structure till king Edward III. employed William of Wickham, afterwards bishop of Winchester, to rebuild the whole, which he accomplished, and enclosed it with a strong wall. Great additions were, however, made to the castle by several of our monarchs, particularly by Edward IV. Henry VII. and VIII. Elizabeth, and Charles II. This last prince entirely repaired the castle, and as he kept his court there during the summer season, he spared no expence in rendering it worthy the royal residence.

This venerable castle is divided into two courts, or wards, with a large round tower between them. The whole contains above twelve acres of ground, and has many towers and batteries for its defence. It is situated upon a high hill, which rises by a gentle ascent, and enjoys a most delightful prospect: in the front is a wide and extensive vale, adorned with meadows and corn-fields, with groves on each side, and the Thames winding through it; and behind are every where hills covered with woods, as if designed by nature for game and hunting. On the declivity of the hill is a fine terras faced with a rampart of free-stone eighteen hundred and seventy feet in length, which is one of the noblest walks in Europe, both with respect to its strength, its grandeur, and the fine and extensive prospect over the Thames of the adjacent country on every side, where, from the variety of fine villas scattered about, nature and art seem to vie with each other in beauty. From this terras you enter a fine park, which surrounds the palace, and is called the little park, to distinguish it from another much larger. This little park is four miles in circumference, and surrounded by a brick wall. The turf is of the most beautiful green, and it is adorned with many shady walks, especially that called Queen Elizabeth's, which on summer evenings is frequented by the best company. This park is well stocked with deer and other game, and the lodge at the farther end is a delightful habitation.

To return to the castle. In the upper court is a spacious and regular square, containing on the north side the royal apartments and St. George's hall; on the south and east sides are the royal apartments, those of the prince of Wales, and the great officers of state; and in the center of the area is an equestrian statue in copper of king Charles II. in the habit of one of the Cæsars, standing on a marble pedestal. The round tower, which forms the west side of this upper court, contains the governor's apartments: it is built on the highest part of the mount, and there is an ascent to it by a large flight of stone steps: these apartments are spacious and noble, and among the rest is a guard-room or magazine of arms.

The lower court is larger than the other, and is in a manner divided into two parts by St. George's chapel, which

which stands in the center. On the north or inner side are the houses and apartments of the dean and canons of that chapel, with those of the minor canons, clerks, and other officers; and on the south and west sides of the outer part are the houses of the poor knights of Windsor.

The royal apartments in the upper court are usually termed the star building, from a star and garter in gold in the middle of the structure, on the outside next the terras. The entrance is through a handsome vestibule supported by columns of the Ionic order, with some antique busts in several niches. This leads to the great staircase, which is finely painted with several fabulous stories from Ovid's *Metamorphoses*: in the dome Phaeton is represented entreating Apollo to let him drive the chariot of the sun: in large compartments in the staircase are the transformation of Phaeton's sisters into poplar-trees, and Cycnus into a swan. In several parts of the ceiling are represented the signs of the zodiac supported by the winds, with baskets of flowers beautifully disposed: at the corners are the four elements, each expressed by a variety of figures. Aurora is also represented with her nymphs giving water to her horses. The whole is beautifully disposed, and from this staircase you have a view of the back stairs painted with the story of Meleager and Atalanta.

On the top of the staircase you first enter the queen's guard-chamber, which is completely furnished with arms, beautifully ranged and disposed into various forms. On the ceiling is Britannia in the person of queen Catharine of Portugal, consort to king Charles II. seated on a globe, bearing the arms of England and Portugal, with the four grand divisions of the earth making their several offerings; and on different parts of the ceiling are heathen deities, with zephyrs, cupids, and other embellishments.

You next enter the queen's presence-chamber, on the ceiling of which is represented queen Catharine, attended by the Virtues, while Fame sounds the happiness of Britain, and below Justice is driving away Envy, Sedition, &c. The room is hung with tapestry representing the persecution of the primitive Christians.

The ceiling of the queen's audience-chamber is painted with Britannia in the person of queen Catharine in a car drawn by swans to the temple of Virtue, attended by Flora, Ceres, Pomona, &c. The room is hung with tapestry, and the canopy is of fine English velvet set up by queen Anne.

On the ceiling of the ball-room king Charles II. is represented giving freedom to Europe by the figures of Perseus and Andromeda. The tapestry, which was made at Brussels, and set up by king Charles II. represents the seasons of the year; and both this room and all the former are adorned with several pictures by the greatest masters.

The next is the queen's drawing-room, where on the ceiling is painted the assembly of the gods and goddesses: it is hung with tapestry representing the twelve months of the year, and adorned with pictures of Lot and his daughters after Angelo, and several other pieces by the great masters.

In the queen's bed-chamber the bed of state is of rich flowered velvet, made in Spitalfields by order of queen Anne, and the tapestry, which represents the harvest season, was also made at London. The ceiling is painted with the story of Diana and Endymion, and the room adorned with the pictures of the Holy family, by Raphael; Herod's cruelty, by Giulio Romano; and Judith and Holofernes, by Guido.

The next is the room of beauties, so named from the portraits of the most celebrated beauties in the reign of king Charles II. They are fourteen in number, and all original paintings, by Sir Peter Lely.

Queen Elizabeth's, or the picture-gallery, is adorned with a great number of fine paintings, among which are Rome in flames, by Giulio Romano; the pool of Bethesda, by Tintoret; a Roman family, by Titian; and two usurers, an admired piece, by the famous blacksmith of Antwerp. There is here likewise queen Caroline's china-closet, filled with a great variety of curious china, elegantly disposed. This closet is finely

gilt and ornamented, and likewise adorned with several pictures done by Holbein.

On the ceiling of the king's closet is painted the story of Jupiter and Leda; and among other curiosities this room contains a large frame of needle-work said to be wrought by Mary queen of Scots, and it is also adorned with several fine paintings, particularly Titian's daughter, by herself; a German lady, by Raphael, &c.

It would carry us to too great a length were we to describe the numerous paintings and ornaments of the king's dressing-room, bed-chamber, drawing-room, audience-chamber, presence-chamber, and guard-chamber; the ceilings being painted and the rooms adorned with admirable pictures.

St. George's chamber, which is set apart for the honour of the most illustrious order of the Garter, ought not, however, to be omitted, it being one of the noblest rooms in Europe. In a large oval in the center of the ceiling king Charles II. is represented in the habit of the order, attended by England, Scotland, and Ireland; Religion and Plenty hold a crown over his head; Regal Government is supported by Religion and Eternity, while Justice, attended by Fortitude, Temperance, and Prudence, beat down Rebellion and Faction. To the throne is an ascent by five steps of fine marble, to which the painter has added five more, with such perfection, as to deceive the sight, and induce the spectator to think them equally real. This noble room is a hundred and eight feet in length, and the whole north side is taken up with the triumphant entry of Edward the Black Prince, while Edward III. the founder of the order of the Garter, is seated on a throne receiving the captive kings of France and Scotland.

The king's chapel is no less richly adorned: on the ceiling is finely represented our Lord's Ascension; the altar-piece is adorned with a noble painting of the Last Supper, and the north side with the representation of our Saviour's raising Lazarus from the dead, his curing the sick of the palsy, and other miracles, by Verro. The canopy, curtains, and furniture are of crimson velvet; and the beautiful carved work is done by Gibbons.

St. George's chapel has always been esteemed for its neatness and beauty, and in particular the stone roof is accounted an excellent piece of workmanship; but what appears most worthy of notice is the choir: on each side are the stalls of the sovereign and knights companions of the most noble order of the Garter, with the helmet, mantling, crest, and sword of each knight set up over his stall, on a canopy of ancient carving curiously wrought; and over the canopy is affixed the banner or arms of each knight properly blazoned on silk, and on the back of the stalls are the titles of the knights, with their arms neatly engraved and blazoned on copper.

The sovereign's stall is on the right hand of the entrance into the choir, and is covered with purple velvet and cloth of gold, and has a canopy and complete furniture of the same rich materials; his banner is likewise of velvet, and his mantling of cloth of gold. The prince's stall is on the left, but has no distinction from those of the rest of the knights, they being all companions and colleagues equal in honour.

This chapel has also the monuments of several princes and of the nobility, some of which are very magnificent.

Having now finished our description of Windsor castle, we ought to take some notice of the great park, and the forest: the former lies on the south side of the town, and opens by a noble road in a direct line to the top of a delightful hill at near three miles distance. This road leads through a double plantation of trees on each side to the ranger's lodge, the residence of the late duke of Cumberland, who greatly improved the natural beauties of the park, and by large plantations, extensive lawns, new canals, and rivers, rendered this villa an habitation worthy of a prince. This park is fourteen miles in circumference, well stocked with deer and other game, with foreign beasts and birds. The new erected building on Shrub's hill is adorned beneath with a beautiful rural landscape; a noble piece of water, produced at a great expence from a small stream, capable of carrying barges and pleasure-boats, terminates in a grotto and large cascade,

cascade, and over it his royal highness erected a noble bridge consisting of one arch, a hundred and sixty-five feet wide.

The duke also greatly improved Windsor forest, which joins to the park, and has been rendered famous wherever the English tongue is understood, by the pen of the celebrated Pope. It is indeed generally barren and uncultivated, yet is finely diversified with hills and vales, woods and lawns, interspersed with pleasant villas, towns, and villages.

We shall now proceed to the principal towns, and shall begin with

Reading, which is so called from the British word Rhedim, that is Fern; which formerly grew in great quantities there. This is a very large and wealthy town, seated on the river Kennet, forty miles to the west of London, and seventy-five to the east of Bristol; but is so near the Thames, that the largest barges which they use may come up to the town bridge, where they have wharfs to load and unload them. The inhabitants carry on a very great trade, which chiefly consists in this water-navigation to and from London; and they have necessarily a great trade into the country for the consumption of the goods brought by their barges from London, particularly coals, salt, grocery-wares, oils, and all heavy goods. By these barges they send from hence to London great quantities of malt, meal, and timber. There are here three churches, which are St. Mary's, St. Laurence's, and St. Giles's, built of flint and square stones in the quincunx fashion, with tall towers of the same materials. Here are also two large meeting-houses, besides that of the Quakers. Reading contains about eight thousand people, including a little hamlet at the bridge over the Thames.

This town had formerly a famous abbey, in which the parliament of England has been sometimes held; it stood in a fine situation, and large ruins of it are still visible, built of flint: the walls which remain are about eight feet thick, though the stone that faced them is gone. There are many remnants of arched vaults, and the abbey gate is yet pretty entire. This structure was built by king Henry I. on an old abbey formerly erected by a Saxon lady: that prince was buried in it, with his queen, but their monuments are not now to be found. The town is governed by a mayor, twelve aldermen, twelve burgesses, and other officers.

Newbury is situated fifty-six miles from London, in a most fruitful plain, watered by the river Kennet, which is made navigable up to the town. The streets are spacious, and the market-place large, in which is sold a great deal of corn, and it contains a hall in which the business of the corporation is transacted. It is governed by a mayor, high-steward, aldermen, and burgesses. It has a charity-school for forty boys, and the place is noted for good trout and cray-fish: all sorts of provisions are here likewise very reasonable. Part of Newbury is known by the name of Speenham-land, it rising out of the ruins of an old town called Spine, the remains of which join to Newbury, in respect to which it was called New Borough, and for shortness Newbury. This town was anciently very famous for making woollen cloth, and the people now are generally employed in making shalloons.

Here lived the famous Jack of Newbury, the greatest clothier in England, he having a hundred looms at work in his own house. He flourished in the reign of Henry VIII. and marched at the head of a hundred of his own men, all clothed in one uniform, and maintained at his own expence, to the battle of Flodden-field, where he behaved with great bravery.

Near this town were fought two bloody battles between the army of king Charles I. and the parliament's forces, the king himself being present at both.

Maidenhead is an ancient town, twelve miles from Reading, and twenty-eight from London, under the government of a high-steward, a mayor, and ten aldermen, out of whom they annually elect two bridge-masters, to look after the large timber bridge which here crosses the Thames, for the repair of which the town has three trees annually allowed them out of Windsor forest. Maidenhead is said to be so called from one of the eleven thou-

sand virgins which the legend tells us were martyred with St. Ursula. The town is a great thorough-fare, and has many good inns, with a weekly market on Wednesday.

Wallingford is an ancient, large, and well-built town, forty-six miles to the west of London: in the town-hall the assizes are sometimes held, and there the quarter-sessions are always held for the borough. It is seated on the Thames, over which is a stone bridge of nineteen arches, and four draw-bridges. It has been surrounded with a wall a mile and a half in circumference, and had a strong castle, but it is now demolished. It had likewise four parish-churches, but two of them were destroyed during the civil wars. It has a free-school, and a handsome market-house, in which the magistrates keep the sessions, it being governed by a mayor, burgesses, &c.

Abingdon, a handsome well-built town, where the assizes, sessions, and other public meetings of the county are generally held. It has a stately market-house built on high pillars, over which is a large hall for the assizes. Here are also two churches, and the town consists of several well-built streets, which center in an open and spacious place, where the corn-market is kept. The inhabitants make great quantities of malt, which they send in barges to London. Here is a good free-school, and a charity-school founded in 1563. The corporation consists of a mayor, two bailiffs, and nine aldermen. This place was famed for religious houses in the time of the ancient Britons.

S E C T. XII.

Of Wiltshire, or Wilts; its Name, Situation, Extent, Air, Soil, Produce, Rivers, Divisions, &c. and principal Towns; with a particular Description of Stonehenge, and whatever is most curious in this County.

WILTSHIRE receives its name from Wilton, once its capital, which was so called from its situation on the river Willy, it being from Willy-town contracted to Wilton. It is bounded on the north-east and east by Berkshire, last described; on the south-east by Hampshire; on the south-west by Somersetshire; and on the north-west and north by Gloucestershire. Its length from north to south is near fifty-four miles, its breadth from east to west thirty-eight, and it is about a hundred and forty-two in circumference.

The air is sweet and healthy, though something sharp on the hills in winter; but it is mild during that season in the vales. The land in the northern parts is generally hilly and woody; in the southern it is rich and fertile; in the middle it chiefly consists of downs, that afford the best pasture for sheep; and in the valleys, which divide the downs, are abundance of corn-fields and rich meadows. In some places is found knot-grass near twenty feet in length, with which hogs are fed, especially about Market Lavington. Its chief commodities are sheep, wool, wood, and stone; of this last there are excellent quarries at Chilmark, on the banks of the river Nadder, where some of the stones are twenty yards in length, and four in thickness, without a flaw. The chief manufactures are those relating to the cloathing trade.

The principal rivers in Wiltshire are the Upper and Lower Avon, the Nadder, the Willy, the Bourne, and the Kennet. The Upper Avon rises near the center of the county, and running southward enters Hampshire. The Lower Avon rises in the northern edge of Wiltshire, passes by Malmesbury, and at length enters Somersetshire. The Nadder rises in the south-west point of the country, and flowing eastward to Salisbury, there joins the Avon. The Willy has its source on the western side of Wiltshire, and running towards the south-east falls into the Nadder, near Salisbury. The Bourne has its spring in the eastern limits of Wiltshire, and running to the southward joins the Avon a little below Salisbury; and the Kennet has its source near the middle of the county, and running eastward enters Berkshire. Thus is all Wiltshire supplied with rivers, which not only afford great

plenty of fish, but add to the beauty and fertility of the country in their several courses between the hills and the downs.

This county, which lies in the diocese of Salisbury, contains twenty-one market-towns, a hundred and seven vicarages, three hundred and four parishes, and nine hundred and fifty villages. It is divided into twenty-nine hundreds, which contain near twenty-eight thousand houses, and a hundred and sixty-eight thousand inhabitants. It sends thirty-four members to parliament, namely, two knights for the shire, and two burgesses for each of the following boroughs: New Sarum, Wilton, Marlborough, Old Sarum, Wootton-Basset, Luggershall, Great Bedwin, Cricklade, Malmesbury, Chippenham, Devizes, Calne, Westbury, Heytesbury, Hinton, and Downton. The principal places in this county are the following:

Salisbury, or New Sarum, is pleasantly seated at the confluence of the rivers Avon and Willy, eighty-four miles from London; it rose out of the ruins of Old Sarum, which stands on a hill a little to the north of this city, which is large, well built, and very pleasant; but its founders seem to have run from one extreme to another, for as the old city was in great want of water, this has rather too much, the water running through the middle of every street, which keeps them always wet and dirty, even in the midst of summer. The cathedral is famous for the height of its spire, which is said to be the most lofty in England, it being four hundred and ten feet from the ground, and yet the walls are so exceeding thin at the upper part of the spire, that, upon a view made by the late Sir Christopher Wren, they were found to be less than five inches thick; on which that great architect ordered it to be strengthened with bands of iron plates, which have so effectually secured it, that it is said by the best architects to be stronger now than when it was first built. This venerable structure is in the form of a cross, and cost an immense sum of money; but the work on the inside is not answerable to the numerous decorations without. The painting in the choir is mean, it being probably performed when that art was but in its infancy in this kingdom; but the carving is well executed. However, the author of the Tour through Great Britain observes, that it is rather a fine church, than finely adorned. The following lines shew the number of its windows, pillars, and gates:

As many days as in one year there be,
So many windows in one church we see;
As many marble pillars there appear,
As there are hours throughout the fleeting year;
As many gates as moons one year do view:
Strange tale to tell, yet not more strange than true!

There are some very fine monuments in this church; particularly in what is called the Virgin Mary's chapel, is a noble one of the late duke and duchess of Somerset. The cloyster is a hundred and sixty feet square, and the inner cloyster thirty feet wide. Over the east part of the cloyster is a spacious library. The cathedral, with the close adjoining, where the prebendaries live, make a noble appearance. The chapter-house is an octagon no less than a hundred and fifty feet in circumference, yet the roof has no other support in the center than a small marble pillar. The corporation consists of a mayor, recorder, aldermen, &c. and the town-house, which makes a noble appearance, is adorned with a very fine original picture of queen Anne, done by Dahl.

Wilton, an ancient borough town, once so considerable that it gave name to the county, stands near the junction of the Nadder with the Willy, seven miles from Salisbury, and eighty-six from London, but is now a mean town, though it sends two members to parliament, and is the place where the knights of the shire are chosen. It has, however, a manufacture of carpets, which is carried to great perfection, and many of the carpets made there, being very beautiful, are sold in London at a good price.

Wilton house is situated in a pleasant vale, with the town of Wilton on one side, and a spacious park on the

other. The canal before the house lies parallel with the river, and on entering the court-yard you see a noble column of porphyry, on the top of which is a fine marble statue of Venus, of excellent workmanship. The house is a noble pile of building, designed by the celebrated Inigo Jones, and the rooms are adorned with the most beautiful statues and paintings. The great geometrical stair-case has been deservedly admired, it being the first of the kind in England; and the grand apartment is a superb piece of architecture, particularly the saloon, which is sixty feet long, thirty high, and thirty broad. "When you have entered these grand apartments, says a late writer, such varieties strike upon you every way, that you scarce know to which hand to turn: on one side you see several rooms adorned with paintings, so curious and various, that you leave them with reluctance; and looking another way, you are called off by a vast collection of busts and pieces of the greatest antiquity of the kind, both Greek and Roman. At one end of the grand room is the celebrated family picture, by Vandyke, twenty feet long, and twelve feet high, containing thirteen figures as big as the life." This room is also adorned with a great number of family pictures.

In most of the apartments the marble chimney-pieces are of the most exquisite workmanship, all carved in Italy, with many curious statues, basso relievos, and pictures, by the greatest masters. The loggia in the bowling-green is supported by beautiful pillars, and adorned with niches and statues. The grotto has its front curiously carved, and all the inside is cased with marble; it has black columns of the Ionic order, with capitals of white marble, and four fine basso relievos from Florence.

The front of the house next the gardens is esteemed one of the best pieces of the celebrated Inigo Jones, and is a hundred and ninety-four feet in length. The gardens are on the south side of the house, and extend beyond the river, a branch of which runs through a part of them. To the south of the gardens is the great park, which reaches beyond the vale, and the view opens into Salisbury-plain. Here is also a hare warren, as it is called, which has been for many years a sanctuary for the hares; but the neighbouring gentlemen complain that it spoils their sport, for if they put up a hare within two or three miles of it, she always runs to the warren, and an end is put to their pursuit: besides, these animals are of great prejudice to the corn.

Salisbury-plain is very delightful, as well as extensive, the numerous flocks of sheep all round are a pleasing sight, and it is not uncommon for these flocks to contain from three to five thousand, all belonging to one man.

On this plain are a great number of barrows, or little hills, thrown up over graves; also the remains of temples, and the traces of many old British, Roman, Saxon, and Danish camps and fortifications. But the greatest curiosity in this county is that noble monument of antiquity called Stone-henge, which Inigo Jones endeavoured to prove to be the remains of a temple of the Tuscan order, built by the Romans to the god Cœlum, or Terminus; but the learned doctor Stukeley has endeavoured to prove it to be a temple built by the ancient Britons. It received its name from the Saxon Rode-hengenne, or hanging-rocks; and in Yorkshire hanging rocks are still called henges.

Stone-henge is situated in Salisbury-plain, six miles to the north of Salisbury. It has the river Avon to the east, and a brook that runs into the Willy on the west, which streams encompass it half round, at the distance of two miles, forming as it were a circular area of four or five miles diameter, compassed by gentle acclivities. This antiquity stands on the summit of a hill, which rises with a very gentle ascent.

At the distance of about half a mile it has a stately and august appearance, and as you advance nearer, especially up the avenue on the north-east side, where the remains of this wonderful structure are most perfect, it fills the eye in an astonishing measure. It is encompassed with a circular ditch, and after this is passed you proceed a hundred and eight feet to the work itself, which is a hundred and eight feet in diameter. "When we enter the building,

Stone-henge

“ing, says Dr. Stukeley, whether on foot or on horse-back, and cast our eyes on the yawning ruins, we are struck with an extatic reverie, which none can describe, and they only can be sensible of that feel it. When we advance farther, the dark part of the ponderous imposts over our heads, the chasm of sky between the jambs of the cell, the odd construction of the whole, and the greatness of every part, surprises. If you look upon the perfect part, you fancy entire quarries mounted up into the air: if upon the rude havock below, you see, as it were, the bowels of a mountain turned inside outwards.”

The stones are supposed to have been brought from the Grey Wethers, upon Marlborough downs, which is sixteen miles distant from the place; but the difficulty in bringing them hither must appear inconceivable. The stone at the upper end of the cell, which is fallen down and broke in half, is, according to Dr. Hales, twenty-five feet in length, seven in breadth, and at a medium three and an half in thickness, and amounts to six hundred and twelve cubic feet. Rude as the work seems, there is not a stone that has not felt more or less the chisel. The upright stones are made to diminish a little every way, by which means the imposts project two feet seven inches, which is very considerable in a height of eighteen feet. On the top of each of the upright stones is a tenon ten inches and a half in diameter, and made exactly to fit the mortises made in the imposts. On the outside the imposts are rounded a little, to humour the circle, but within they are straight and make a polygon of thirty sides, which, without injuring the beauty of the work, adds to its strength. The height of the uprights and imposts is ten cubits and an half, the uprights being nine cubits, and the imposts one and a half.

Of this outer circle, which in its perfection consisted of sixty stones, thirty uprights, and thirty imposts; there are seventeen uprights left standing, eleven of which remain contiguous by the grand entrance, which is somewhat wider than the rest, with five imposts upon them. One upright at the back of the temple leans upon a stone of the inner circle, and six others lie upon the ground whole or in pieces. Somewhat more than eight feet from the inside of this exterior circle is another of forty smaller stones, without any imposts, which, with the outer circle, form as it were a circular portico. These are a cubit thick, and four cubits and a half in height, being every way half of the outer uprights. Of these nineteen are only left; of which eleven are only standing. But besides this outer portico, which is three hundred feet in circumference, there is an inner one, which originally composed about two-thirds of an oval; the outer part of this is formed of certain compages of stones, which Dr. Stukeley calls *trilithons*, because each of these compages is formed of two upright stones, with an impost on the top. The stones of which these *trilithons* are composed are really stupendous, and cannot fail of filling the beholder with surprise. These stones diminish very much towards the top, probably to take off from their weight, and they rise in height and beauty of the stones from the lower end on each side next the principal entrance to the upper end, and are, upon a medium, twenty feet high; but the imposts on the top are all of the same size.

On the inside of the oval is a lesser oval of nineteen stones, somewhat of a pyramidal form; these are two feet six inches in breadth, one foot and an half thick, and upon a medium eight feet high; they rising in height as they approach the upper end of this inclosure. The space within it has been called the *adytum*, or the Holy of holies, it being supposed that none entered it but the druids, or British priests, who offered their sacrifices on the altar at the upper end. This altar is composed of a kind of blue coarse marble, twenty inches thick, four feet broad, and, according to Mr. Webb, sixteen feet in length. All the stones added together, with which this whole temple was built, make just a hundred and forty. This is the solution of the mighty problem that has so much perplexed the vulgar.

As the most early method of building temples, says our author, was to make them open at the top, this is a proof of the prodigious antiquity of this fabric. It must be owned, that they who had a notion that it was degrad-

ing the Deity to pretend to confine him within a limited space, could not easily invent a grander design for sacred purposes. Here space indeed is not marked out and defined, but with the utmost freedom. Here the presence of the Deity is intimated, but not bounded.

On the downs, about two or three miles from Marlborough, are abundance of loose stones, lying scattered about the plain, of the same kind with those of Stonehenge, and some larger, they are called by the country people the Grey Wethers, they appearing at a distance not unlike sheep straggling upon the downs. They are found to be a sort of white marble, and lie upon the surface of the earth in infinite numbers, and of all dimensions. They are loose and detached from any rock, and Dr. Stukeley imagines that they have lain there ever since the creation.

Marlborough, so called from its hills of chalk, which was anciently called Marl, is seated on the river Kennet, in a chalky soil, seventy-five miles to the west of London, and contains two parish-churches and about five hundred houses. The streets are broad and paved, and it is governed by a mayor, aldermen, and burgesses. It had formerly a castle at Marlborough Mount; this Mount was the key of the castle, and is now converted into a pretty spiral walk, on the top of which is an octagonal summer-house, from whence you have a pleasant view over the town and country. Near Marlborough are the remains of several religious houses, particularly of a priory, the gate-house of which is still standing.

Between Marlborough and Newbury is Savernack forest, which is about twelve miles in circumference, well stocked with deer, and rendered delightful by the many vistas cut through the woods and coppices with which it abounds. Eight of these vistas meet like so many rays of a star in a point near the middle of the forest, where the late earl of Ailesbury, to whom it belonged, prepared the ground for erecting an octagon tower, whose sides were to correspond with the vistas; through one of which you have a view of the seat at about two miles distance, called Tottenham, from a park of that name, in which it is situated, contiguous to this forest. This is a stately edifice, erected after the model and under the direction of our modern Vitruvius, the earl of Burlington, who, to the strength and convenience of the English architecture, has added the elegance of the Italian. The house has four towers and four fronts, each differently beautified; to which are now added four wings, in which are rooms of state, a noble and capacious library, containing a collection of several thousand volumes in all languages, especially the modern. The beauty and delightfulness of the buildings are much augmented by the large canals, the spacious and well-planted walks, with which it is surrounded.

The Devizes is seated on high ground about two miles from the bottom of hills that keep off the eastern winds, in a rich soil eighty-nine miles to the west of London. It is a large town, consisting chiefly of two long parallel streets, the houses mostly of timber, but of a very good model. It has two churches, besides a chapel and a dissenting meeting house. The corporation consists of a mayor, a recorder, eleven masters, and thirty-six common council. On the utmost part of the Rundway hill, which overlooks the town, is a square single-trenched camp; and there have been discovered in its neighbourhood several hundred pieces of ancient Roman coin of different emperors, and in 1714 was dug up a large urn with Roman coins, and a number of little brass statues of several of the heathen gods and goddesses. The inhabitants make a great deal of malt; their principal manufacture is woollen cloth, especially druggets, and the market is much frequented for all sorts of cattle, wool and horses; but it has great scarcity of water.

S E C T. XIII.

Of Dorsetshire; its Name, Situation, Extent, Air, Soil, Produce, Rivers, and principal Towns, with a Description of the Peninsulas of Portland and Purbeck.

THIS county was anciently called Durotriges by the Romans, and by the Britons Dwn Gwyr, both of which signifies Dwellers by the Water-side. This county

county is bounded on the north by Somersetshire and Wiltshire; on the east by Hampshire; on the south by the British channel; and on the west by Devonshire and part of Somersetshire, extending about fifty miles in length from east to west, where broadest about thirty, and near one hundred and fifty in circumference.

The air is for the most part very good and wholesome. on the hills it is however somewhat bleak and sharp, but it is very mild and pleasant near the coast.

The soil is generally rich and fertile, though in some parts exceeding sandy; the northern part, which was formerly divided by a range of hills from the southern, was anciently overspread with forests, but now affords good pasture for cattle, while the southern part chiefly consists of fine downs, and feeds incredible numbers of sheep. The inhabitants have not forgot what king Charles said of Dorsetshire, that he never saw a finer country either in England or out of it. Indeed the downs and hills are covered with great flocks of sheep, whose flesh is sweet and delicate, and wool so fine, that it is much coveted by the clothiers, and the valleys abound with other cattle. The husbandman reaps an ample return for his toil and labour, his grounds generally producing a profusion of corn, or of flax and hemp, which last is allowed to be the best that grows in all his majesty's dominions. Here are also plenty of fowl, as poultry of all sorts, swans, woodcocks, pheasants, partridges, field-fares, &c. The chief commodities are corn, cattle, wool, fish, fowl, hemp, fine Portland stone, and some marble. The isle or rather peninsula of Purbec also furnishes a particular kind of stone, called by its name, and tobacco-pipe clay. This county is also famous for its linen and woollen manufactures, and fine ale and beer.

The principal rivers of this county are the Stour, which rises in Somersetshire, but soon enters into this county, running south to Sturminster, where making an angle, it forms a course nearly west-south-west, and leaves Dorsetshire about five miles below Winborn in Hampshire, and soon after falls into the sea. The From rises in the east end of the county, and running chiefly westward, falls into the bay called Pool-harbour. Both these rivers afford plenty of fish; but the tench and eels of the Stour are particularly famous.

The coast of Dorsetshire is very dissimilar, it being in some places bounded with high lands and cliffs, and in others with only a beach of pebbles; the cliffs are in some parts composed of sand, earth, and loamy clay, in others they consist of chalk, but very few of stone, except in the islands.

This county lies in the diocese of Bristol and contains sixty-eight vicarages, two hundred and forty eight parishes, upwards of twenty-one thousand nine hundred houses, and about one hundred and nine thousand seven hundred inhabitants. It is divided into twenty-eight hundreds, and sends twenty members to parliament, of which two are knights of the shire, and two for each of the following towns, Dorchester, Pool, Lime, Bridport, Shaftsbury, Wareham, Corfe-Castle, Weymouth, and Melcomb-Regis; for though these two last are united each sends two. The principal places in this county are the following:

Dorchester, the county town, is clean and regularly built, and is situated one hundred and twenty-eight miles to the south-west of London, is encompassed by the foundations of an ancient Roman wall; but to the eastward a street is built upon it, and the ditch filled up; for on that side the town is swelled out into a considerable suburb or village, named Fordington or Farington, which has a church. There are three other churches in the town, and the streets are wide and handsome. On the south and west sides, without the walls, is planted an agreeable walk of sycamores. The banks of the river are here steep, the town stands on high ground. Beyond the river are meadows and warm sandy lands. At a small distance is the noble Roman amphitheatre called by the vulgar Maumbury, and the terras on the top is a common place of rendezvous, it affording an agreeable circular walk, which has a prospect of the town and of wide plains of corn fields all round.

Weymouth is a clean and agreeable town, considering its low situation, it standing close to the sea. It is situated

eight miles to the south of Dorchester, and one hundred and thirty-two to the west-south-west of London. It is well built, and has an excellent harbour, defended by two forts. Many substantial merchants reside here, who have a considerable number of ships, and carry on an extensive trade, not only to France, but to Portugal, Spain, Newfoundland, and Virginia, and they have a custom-house, and a good quay. Without the harbour stands Sand-foot castle, and opposite to them is Portland-castle, seated in the isle of that name. It is joined to Melcomb Regis by a wooden bridge over the little river Wey. The united towns have a church, and about four hundred houses. In Weymouth is a chapel upon a steep rock, and there are sixty steps to go up to it. They are governed by a mayor, several aldermen, and a recorder, and each sends two members to parliament.

Portland, which was formerly an island, is now joined to the continent by a shelf of sand, thrown up by the sea. It is situated in the fiftieth deg. thirty min. latitude, and in the second deg. forty-eight min. west longitude. It is about ten miles in circumference, and thinly inhabited, yet affords plenty of corn, and pasture for sheep; but wood and coals are so scarce that the inhabitants, are generally obliged to make use of cow dung dried in the sun for fuel. The natives are for the most part stone-cutters, for from this peninsula come our best and whitest free-stone, with which the cathedral of St. Paul, and all the most magnificent edifices in the city of London, are principally built.

The whole island is little more than one continued rock of free-stone, and the height of the land is such that when the weather is clear and serene one may see from thence above half over the Channel to France, though it is here very broad.

Those who are delighted with natural curiosities are greatly amused here with seeing in the midst of the stone a great number of shells of oysters, mussels, cockles, &c. and above all spirals, or screws as they are vulgarly called, which every where abound in the stone; they are perfectly solid, and nicely coiled about as it were an imaginary axis. These being of the same substance as the stone, are very brittle, and generally break in taking out.

In some quarries on the south-west part of the island is found a sort of stone which they call sugar-candy stone, of which there are two sorts, one pale like white sugar-candy; and the other of an amber-colour like brown sugar-candy; and indeed they so resemble sugar-candy in the lump, that any person might be imposed upon by them till his tongue and teeth convinced him that they were only an insipid exudation of juices petrefied and crystallized by nature in this form.

To prevent any ships being embayed to the west of Portland, and driven a-shore on Portland Race, which extends to the main land, two light houses are erected on the two points of the peninsula. Not far from these light houses, on the south side of the island, is a very remarkable hole through the earth, wide on the top and narrowing about seven or eight feet downwards where it opens into a large subterranean cavern, where you see the waters of the sea, the sight and noise of which in boisterous weather fill the mind with terror: so large is this cave, that some small craft with their sails up have been driven from the sea into it.

Not far from Portland lies the peninsula of Purbec, which was formerly full of heaths, woods and forests, well stocked with fallow deer; but there is at present good lands towards the southern part of it, and under ground there are veins of marble and different kinds of stone. This peninsula is ten miles in length; but not more than five or six in breadth, and there is a good passage to it by land. At the first entrance into this peninsula is a plain of barren heathy ground, replenished with red deer, disjoined from the rest by an almost continued ridge of high hills, which when once passed there are grounds that afford excellent pasture for sheep and other cattle, with plenty of good corn as also quarries of a lasting kind of flat stone, used in London for paving the foot-ways or sides of London and Westminster bridges, and of the sides of the streets; also spotted and blue marble.

Pool, the most considerable sea-port in all this part of England, is seated one hundred and ten miles to the west-by-fourth of London, and twenty-four to the east of Dorchester, at the bottom of a great bay or inlet of the sea, which entering at a narrow mouth, opens to a great breadth, and comes up to the very shore of the town. It also runs almost west to Wareham, a little below which it receives the Frome and Peddler. At the entrance of this large bay is an island called Branksey, which lying in the very mouth of the passage divides it into two, and has an old castle, built to defend the entrance. The town consists of a church, and about six hundred houses, disposed into broad paved streets, and has a manufactory of knit hose. It was formerly only a place inhabited by a few fishermen; but was greatly enlarged in the reign of Henry VI. when the inhabitants had the privilege of walling it round. It was also made a county of itself, and allowed to send two members to parliament; but since that time it has much decayed, though it has still some trade, and a number of merchants, who every year send ships to the Newfoundland fishery. This place is famous for the best and largest oysters in all this part of England, which the people of Pool pickle, and, barrelling them up, send them not only to London, but to Spain, Italy, and even the West-Indies. The town is governed by a mayor, a senior bailiff, four other justices, and an indeterminate number of burgesses.

Wareham, a town seated between the rivers Frome and Peddler, where they fall into the Luckford lake, one hundred and nine miles from London, and twenty miles from Dorchester. It was once a very large place and had several churches, which are now reduced to three. It was also walled round, and had a castle, but it has suffered so much by the various turns of fortune, and particularly by having its harbour choaked up, that it is at present only the shadow of what it was.

Lyme, a sea-port town, one hundred and forty-four miles from London, and twenty-three miles from Dorchester, is situated on the sea-shore, and though it has neither creek nor bay, road nor navigable river, has a good harbour; but it is such a one as is not to be found perhaps in any other part of the world. It is formed by a massy pile of building consisting of high and thick walls of stone raised at first with great art, and maintained still with very little difficulty. These walls are raised in the main sea at a good distance from the shore. There is one solid wall of stone large enough for carts and carriages to pass on the top, and to admit houses and warehouses to be built on it, it being as broad as a street: opposite to this, but farther in the sea, is another wall of the same workmanship which crosses the end of the first, and after winding runs parallel to it. The entrance into the port is between the point of the first wall and the second, or opposite wall, which breaks the violence of the sea from the entrance, and ships there go into the basin, where they ride as secure as in a wet dock. This work is called the Cobb, and the custom-house officers have a lodge and warehouse upon it. As the shore is convenient for batteries, some guns are planted in proper places for the defence of the Cobb and town, which is large and well built. It is a place of good trade, and is under the government of a mayor and aldermen.

In 1685 the duke of Monmouth landed here with a handful of men, which was soon increased to six thousand, and he was proclaimed king; but being defeated by king James's army, was taken prisoner and beheaded.

S E C T. XIV.

Of Somersetshire; its Situation, Extent, Air, Soil, Produce, Mountains, Caverns, Minerals, and particularly several beautiful kinds of Ochres. Of its Rivers, and principal Towns.

THIS county probably takes its name from Somerton, once the capital, but now obscured by Bath, Wells, &c. Some indeed have derived the name Somersetshire from Summer, alleging that the largest share

of that season is enjoyed in this county above any other in England. It is bounded on the north by Gloucestershire and Bristol Channel; on the east by Wiltshire; on the west by Devonshire; and on the south by Dorsetshire. It is computed to be sixty-two miles in length, thirty-two in breadth, and two hundred and four in circumference.

Somersetshire, which is situated in the diocese of Bristol, and in that of Bath and Wells, is divided into thirty-seven hundreds, and contains about one hundred and thirty-two vicarages, three hundred and eighty-five parishes, thirty-five market towns, fifty-six thousand houses, three hundred thousand inhabitants, and sends eighteen members to parliament, namely, two knights of the shire, and two burgesses for the following towns, Bristol, Bath, Wells, Taunton, Bridgewater, Minehead, Ilchester, and Milborne Port.

The air of Somersetshire is, in the lower grounds, universally mild, and generally wholesome. The soil is various; the lower grounds, except where it is boggy, yield great quantities of corn and grass; the hilly parts are less fertile, yet in many places, by the help of art and industry, good crops of corn are raised, and where they are most barren they afford pasture for sheep, though where there are mines the grass is discoloured, and the sheep that feed upon it are small and big-bellied. The country about Taunton is exceeding rich, and affords the greatest plenty of corn, grass, and rich fruit for cyder. Within the mountains are mines of lead and lapis calaminaris. The commodities produced by this county are therefore corn, cattle, lead, woad for dying, Cheddar cheese, lapis calaminaris, and Bristol stones. It is also one of the greatest clothing counties in England: the manufactures are chiefly on fine Spanish medley cloths, druggets, serges, cantaloons, knit stockings, &c. in which vast numbers are employed.

In describing this county it will be proper to take notice of its mountains, mines and caverns.

The ridges of Mendip hills run confusedly, but mostly extend east and west, and are of a very unequal height. The soil is barren, and the air cold, moist, thick, and foggy. The surface is in a great measure covered with heath, fern, and furze, and consequently affords but little food for the cattle, which are for the most part sheep. The ore in these mountains runs in veins, sometimes it is also dispersed in banks, and sometimes lies between the rocks. About the ore is spar and chalk, with another substance called croots, which is a mealy white and soft kind of stone. The spar is white, transparent, and as brittle as glass; the chalk is also white, and heavier than any stone. The vein lies between these coats, and is of different breadths; it sometimes also rises near the surface, and at others lies very deep in the earth.

About two miles from Wells, on the south side of this ridge of mountains is a famous grotto called Wokey, or Okey hole, which is much resorted to by strangers. You ascend the hill about thirty yards to the mouth of a cave, which is about fifteen or twenty-feet high, and opens into a spacious cavern that resembles the body of a cathedral; the upper part is very craggy, abounding with pendant rocks that strike terror into a timorous spectator, especially as they appear by candle light, by which they may be plainly seen. From all parts of the roof, a clear water is constantly dropping, forming a number of stony cones resembling icicles. The bottom of this vault is extremely rough, slippery, and rocky.

From this grotto you proceed by a gradual descent, through a very narrow and even passage, into another spacious vaulted cavern; but not quite so high, though nearly as wide, and in other respects much like the first. From this you pass through a long low rocky passage into a third vault, with a cylindric roof; on one side it has a fine sandy bottom, about fifteen or twenty-one feet wide, and on the other a rivulet about eight or ten feet wide, and two or three deep; the water of which is extremely clear and cold. This rivulet, after its course thro' the rock, descends forty or fifty feet to the level ground, where it turns a paper-mill at a small distance from the foot of the hill. The loudest noise made by a number of people in these caverns cannot in the least be heard by those on the outside

outside of the hill over them. The air within them is very cold and damp.

About five miles to the north-west of Okey hole lies Cheddar, a village famous for its cheese, which excels, in high relish and delicate flavour, all other cheese in England. This village is famous for the stupendous chasm, or cleft, through the body of Mendip hills near this place. It seems as if the hills had been split asunder by the shock of an earthquake: the impending tremendous rocks on either side are very astonishing; some standing on the bottom, reach near the height of the cliff, and yet are entirely severed from the body of the rock. The passage between is but narrow, yet is the road from this part of the country to Bristol. At the entrance of the cleft is a most remarkable spring of water, rising as it were upright out of the rocky basis of the hill, with so large and rapid a stream, that it drives a mill within a few yards. This stream, and that of the cavern just mentioned, are the sources of a river named Ax.

At a small distance from Cheddar is another cavern, but smaller than that we have mentioned: Mr. Beaumont, however, mentions a still more extraordinary cavern than any of those yet described, and of which he has given an account in the Philosophical Transactions. This is on a hill called Lamb. "Much ore, says that gentleman, has been formerly raised on this hill; and being informed that a great vault was discovered there, I took six miners with me and went to see it. First we descended a perpendicular shaft about seventy fathoms, when we came into a leading vault, which extends about forty fathoms in length, and as it does not run upon a level, but descends, when you come to the end of it you are twenty-three fathoms deep by a perpendicular line. The floor is full of loose rocks, and its roof vaulted with rocks of lime-stone, among which are flowers of all colours hanging from them, which appear extremely beautiful, and are always kept moist by the distilling waters. In some parts the roof is about five fathoms high, in others, so low that it was difficult to pass through by creeping. The width for the most part is about three fathoms. This cavern crosses many veins of ore. About the middle of it, on the east side, is a passage into another, between forty and fifty fathoms in length. At the end of the first another vast cavern opens. I fastened a cord about me, and ordering the miners to let me down; after descending twelve or fourteen fathoms, I came to the bottom. This cavern is about twenty fathoms in height, fifteen in length, and sixty in circumference. I afterwards caused the miners to drive forwards the breast of this cavern, which terminates to the west, and after they had driven about ten fathoms, they happened into another about one hundred fathom in length, and eight or ten in height. The frequency of caverns on these hills, he adds, may easily be guessed at, by the frequency of swallow pits, which are made by the falling in of the roofs of caverns. Some of these pits are of a large extent, and very deep. Sometimes our miners sinking in the bottom of these swallows, have found oaks, fifteen fathoms deep in the earth."

There are several other hills in this county besides those of Mendip. On each side the river Avon the hills form a most beautiful prospect; but are of little advantage to their possessors; for they are neither fertile in herbage, nor timber; but are in general filled with rocks, and are in a manner covered with fern and furze; nor do the few trees scattered upon them flourish like those in a better soil. From the redness of the earth and stones they seem to abound with iron, and in the cracks of the rocks is found ochre, which is greatly superior to that in the shops, and considerable advantage might doubtless be made of it, by collecting the purest parts, and sending it to this metropolis, where it might be sold to great advantage to the colourmen.

The late Mr. Owen, who made very curious observations on the natural productions about the city of Bristol, observes, that there are two principal kinds of earth of the nature of ochre, the one red and the other yellow, which here often crumbled to dust in the places where they lie. The red is of a deep colour, between crimson

and purple, and of a strong body: the yellow, of a fine gold colour, light, dusty, and of so strong a body, that a dram of it is equal to an ounce of common ochre, and is besides of a better colour. They both tinge the fingers very much on being touched; and being ground with oil, prove excellent colours for painting. In some of the creeks and crevices of the yellow iron ores is a fine sort of ochre like meal, as fine to the touch as powder for the hair: this is of a lemon colour, and nearly resembles French ochre; but is finer, and can be had but in small quantities. These several kinds of ochre are found not only in crevices of the rocks, but adhering to lumps of various kinds of ore, which being broken shew a variety of colours. Here are also lumps of emery and manganese, and in the same rocks are also veins of lead ore; but they are small. Some of these veins are pure, others are intermixed with a brown stone of the nature of calamine, and some have small clusters of yellowish or white spars, accompanying them in beautiful forms.

The chief rivers belonging to this county, besides the mouth of the Severn, commonly called the Bristol Channel, are the Avon, the Brent, and the Parret. The Avon enters this county about five miles to the south-east of Bath, and soon becomes the northern boundary between Somersetshire and Gloucestershire, and passing by Bristol, discharges itself into the mouth of the Severn. It ought not to be omitted, that about two miles from the Hot Wells, near Bristol, this river is bounded on each side with high, rough, and craggy rocks, the cliffs of which are in some places above two hundred feet high, hanging over in an astonishing manner; and many of these being covered with tufts of grass, small shrubs, tall plants, and and chumps of short trees, seem to form little hanging woods, and afford a most agreeable and romantic prospect.

The Brent rises in the eastern edge of the county, and runs to the westward by Glastonbury, below which it forms a large lake, and then falls into the river Parret near Bristol Channel.

The Parret rises in the south edge of Somersetshire, and running to the northward, receives in its course the Yeovil and the Tome, then passing by Bridgwater, falls into the Bristol Channel. This county is also watered by abundance of smaller streams, which furnish it with plenty of all sorts of fish; but one particular species in the river Avon deserves our notice: they are called elvers, and resemble a diminutive eel: in the spring the river is in some places covered with them, and even looks black with the prodigious multitudes of them on the surface of the water, they being in size about the thickness of a goose-quill. When taken they are made, by a particular management, to cast their skins, and then appear very white; after which they are kneaded into a kind of cake, and then fried.

The principal towns in this county are the following:

Bath, a celebrated city, seated in a plain of moderate extent, surrounded with hills, which form a kind of amphitheatre, and supply the springs that render this city so famous. It is situated a hundred and eight miles to the west of London, nineteen to the north-east of Wells, and twelve to the south-east of Bristol. This city arose from its salutary springs, which in the time of the Romans were greatly celebrated, and is now become a city of pleasure, it being justly esteemed the most polite, gay, and agreeable place in the world. It is encompassed with verdant meadows, hills, and pleasant walks; and perhaps there is no other place where such a number of delightful and variegated landscapes rise to the view. The buildings are magnificent, and many of them in a grand taste; the streets are large, well paved, and clean; the market-place spacious, open, and supplied with the best meat, fish, vegetables, fruit, &c. The grove, the squares, the parades, are worthy of notice; but the most extraordinary buildings are that circular range of magnificent structures built of stone, called the Circus. Nothing can be more singular, and at the same time more beautiful, than a number of noblemen's houses magnificently built, formed into a fine circle, with a noble and spacious area in the middle. But more than all this the wretched and miserable are here frequently delivered from their painful

painful disorders, by the healing qualities of the waters of the different baths, or relieved, and have the advantage of being directed by the advice of gentlemen the most eminent in the profession of physic.

With respect to the baths, it is proper to observe, that in some places the hot and cold springs rise very near each other, and in one place within two yards. In this city the hot springs exhale a thin kind of mist, and something of an ill smell proceeding from the sulphureous particles mixed with the water. These hot springs are always the same, for the longest and heaviest rains do not make them discharge more water, nor the driest seasons make them discharge less.

Of these springs that called the Cross-bath, from a cross formerly erected in the middle of it, is of a moderate warmth, and a person may stay much longer in it than in any of the others. It is enclosed with a wall, on the sides of which are seats, and at the ends galleries for the music and spectators, under which are ranges of small dressing-rooms; one of which ranges is for the gentlemen, and the other for the ladies, who being dressed in linen habits go both together into the water, the men keeping on one side and the women on the other.

The Hot-bath, so called from its being much hotter than the Cross-bath, is fifty-eight feet and a half distant from it. This bath has a well, the water of which not only supplies its own pump, but is conveyed by pipes to the pump in the Cross-bath.

The King's-bath, which is much the largest, is accommodated with many dressing-places, some of which are appropriated to the men, and others to the women, both of whom bathe in linen-drawers and shifts. There is here a spring so hot, that they are obliged to turn most of it away, for fear of heating the bath too much. However, the heat of the hottest spring is not sufficient to harden an egg.

The Queen's-bath has no spring of its own, but is supplied by water conveyed from the King's.

There is likewise a bath for lepers, into which none go but such as the physicians suppose to have the leprosy, or some other disease of the same kind: this is made by the overflowing of the Cross-bath. The poor who bathe in it have an allowance for their support from the town; but are chiefly relieved by the generous contributions of the gentlemen and ladies who come to enjoy the benefit of the other baths.

That nothing may be wanting to complete the circle of pleasures in this city, there are spacious and lofty rooms for balls and assemblies; the studious have here an easy supply of all kinds of books; two large and elegant theatres have been erected, and a large stone bridge built over the river. The stone with which the fine buildings in this city are erected is dug out of the quarries upon Charlton down, and brought from thence down a steep hill, by a four-wheeled carriage of a particular form and structure; the wheels are of cast iron, broad and low, with a groove in the perimeter to keep them on the pieces of wood on which it moves down hill, with four or five ton weight of stone, very easily, without the help of horses, the motion being moderated by means of a friction lever bearing more or less on the hinder wheel, as occasion requires.

The walls of Bath are almost entire; the small circuit of ground encompassed by these walls is in the form of a pentagon, with four gates, besides a postern. Without the walls is a handsome square, in the center of which is an obelisk seventy feet high. The market-house is a large stone building, supported by thirty-one stone pillars, and over it is the town-hall. Here is a general hospital for the reception of the sick and lame poor from all parts of the kingdom, erected in 1738, by the contributions of the nobility and gentry, and is capable of containing a hundred and fifty patients. Another new square has been laid out in the gardens adjacent to the public walks on the south side of the city by the Avon, where is a noble room for balls and public assemblies. Bath is the see of a bishop, who is also prelate of Wells. St. Peter's cathedral is a lofty venerable pile, with a handsome tower in the middle, and a good ring of eight bells; besides there are likewise three other churches, with two schools, one for fifty boys, and the other for as many girls. Near

the Cross-bath is St. John's hospital for poor sick people, which has a chapel of white free-stone. Here are also two other hospitals and an alms-house. In this city is a manufactory of cloth; and it is under the government of a mayor, aldermen, and common-council.

Wells is situated at the foot of Mendip-hills, a hundred and twenty miles west of London, and nineteen south-west of Bristol, and has its name from the wells and springs about the city, which is but of small extent, tho' well inhabited. The public and private buildings are very neat, and the cathedral one of the handsomest in England, it being a stately pile, whose frontispiece at the west end is adorned with images and carved work. The close, which contains the bishop's palace, is walled in like a little fortification, and encompassed by a moat. The dignified clergy live in the inside of it, and the prebendaries and canons have very agreeable dwellings. The market-house is a handsome structure supported by columns, and the city is governed by a mayor, a recorder, seven aldermen, and sixteen common-councilmen. The chief manufactures of this city are making of bone-lace, and knitting of hose.

Bristol, called by the Saxons Brightstow, is situated in fifty-one degrees twenty minutes north latitude, and in two degrees forty-nine minutes west longitude, partly in this county, and partly in Gloucestershire; but being a county of itself, is independent of them both. It is divided by the river Avon which runs through it, and separates the two counties; but that part which is on the Gloucestershire side is the largest and most populous; for, according to a survey made in the year 1736, the circumference on the Gloucestershire side was four miles and a half, and on the Somersetshire side two miles and a half. This city has a stone bridge of four broad arches over the Avon; and here is one of the most commodious quays in England for shipping and landing merchants goods, which lies along the river From, and is half a mile in length, from the bridge on the Gloucester side of the city, to the place where that river falls into the Avon. This is the second city in Great Britain for trade, wealth, and number of inhabitants. The trade of many nations is drawn hither by the convenience of commerce, and the harbour, which receives vessels under sail into the heart of the city. The Avon swells so high by the coming in of the tide, that ships upon the shallows are borne up eleven or twelve fathoms. The merchants here, as well as those of London, have an Exchange; but it was formerly a custom with them to meet, walk, and transact mercantile affairs in the open street, and pay their money on large brass basons on the tops of posts, in that part of the street called the Tolzey. They were the first adventurers to the West Indies, and about forty years ago it was computed that they employed two thousand sail of ships, in trade, to the several parts of the world. By the Severn and the Wye the inhabitants of this city have almost the whole trade of South Wales to themselves, and the greatest part of that of North Wales; and by land-carriage they send goods to Exeter, Bath, Wells, From, and all the principal towns from Southampton to the banks of the Trent. Here are considerable manufactures of woollen stuffs, particularly cantaloons, carried on chiefly by French refugees; and here are no less than fifteen glass-houses, which are supplied with coals from Kingwood and Mendip-hills; some are for glasses, others for crown-glass, and others for bottles, for which there is a great demand at the hot well in its neighbourhood, which lies about a mile and half from the city down the Avon, and also at Bath, for exporting their mineral waters.

The city with its suburbs is very compact, being almost as broad as long, and no way above a mile; yet the houses are computed at about thirteen thousand, and the souls at ninety-five thousand. Besides the cathedral there are eighteen churches, and seven or eight meeting-houses of Protestant Dissenters: and, according to Mr. Whatley, there are eighteen hospitals, besides charity-schools, a guildhall, and a very large council-house; and its custom-house stands on the side of Queen's-square, which is adorned with rows of trees that lead to a curious equestrian statue of king William III. On the north-west side of the city is Brandon-hill, under which is Jacob's-well,

where plays are acted almost every night in the summer season by comedians from London. The College-green is justly admired for its situation, as it commands a most delightful prospect over the whole city and harbour; and here stands the cathedral, with a stately cross, which is a fine Gothic structure surrounded with the effigies of several kings of England. It is remarkable, that though the city carries on such a prodigious trade, no carts are admitted into it, for fear of damaging the arches of the vaults and those of the gutters made under ground for carrying off the soil into the river; so that the goods being constantly drawn through the streets upon sledges, the pavement is necessarily rendered exceeding slippery.

Bridgwater is seated about twelve miles from the Start-point, where the Parret runs into the Bristol Channel, a hundred and forty-three miles from London. The spring-tide here flows twenty-two feet at least at the quay, and comes in with such an impetuous torrent, and such a noise, that it is called The Raging Bear. Ships of two hundred tons come up to its quay, and from its convenient situation for commerce the inhabitants have a pretty good coasting trade to Bristol, and carry coals to Wales, and slate, &c. to Cornwall, twenty ships at least being constantly employed. Its foreign trade is principally to Newfoundland. It is a large well frequented place; has several good inns, and the market is well supplied with corn, cattle, hogs, and sheep, and particularly excellent cheese.

Somerton, once the most celebrated town in the county, and that from whence it took its name, is now but a poor place, a hundred and twenty-nine miles to the west of London, but has a considerable market for corn, provisions, and cattle.

Glastonbury is seated one hundred and twenty miles from London, and is famous for its abbey, some magnificent ruins of which are still remaining, but are daily diminished for the sake of the stones: however, the curious structure called the Abbot's Kitchen, is still pretty entire, and of a very unusual contrivance. It is pretended that the bodies of Joseph of Arimathea, of king Arthur, and of king Edward the Confessor, were buried here. The town is pretty large and well built; near it, on a high steep hill, named the Tor, is placed a tower that commands an extensive prospect, and serves as a land-mark to seamen. The last abbot of this place was hanged on the top of the Tor, by order of king Henry VIII. for not acknowledging his supremacy. The holy thorn, or haw thorn, in the church yard upon the hill, said to have taken root from a staff stuck in the ground by Joseph of Arimathea, and to blossom only on Christmas-day, has brought a vast number of people to visit this town, though it is very dubious whether Joseph was ever in Britain. Dr. Gibson says it has been cut down for many years, yet there are still some growing in the county from branches of it, particularly in the garden of Mr. Stroud, the possessor of the ground where the other stood; and another in the garden now belonging to an inn there. These branches, however, do not always blossom on Christmas-day; for they sometimes blossom three or four days after, and seldom so soon as Christmas-day, except the weather be extremely mild. Glastonbury, about fifteen years ago, was for some time famous for its mineral waters, but for want of proper caution they proved fatal to several who drank them, but have been found serviceable in the asthma and dropsy, in the cure of scorbutic disorders, ulcers, and even cancers.

Taunton, a handsome, neat, well-built town, a hundred and forty-eight miles to the south-west of London, received its name from its being seated on the river Thone. The streets are spacious, and it has two parish-churches, besides several meeting-houses of Protestant Dissenters, and it is surrounded by delightful meadows, orchards, and gardens. This town is very populous, and some thousands are employed in the manufacture of serges, du-roys, sagathies, shalloons, &c. for weaving of which eleven hundred looms have been employed at a time. The river is navigable for barges within three miles of the town, where there is a handsome bridge, and it once had a castle.

SECT. XV.

Of Devonshire; its Situation, Extent, Divisions, Representatives in Parliament, &c. Its Air, Soil, Produce, Rivers, and Curiosities; with a Description of the principal Towns.

DEVONSHIRE is bounded on the north by Bristol Channel; on the east by Somersetshire; on the south by the English Channel; and on the west by Cornwall, and has the title of a duchy. It extends sixty-one miles in length, fifty-four in breadth, and contains fifty-six thousand three hundred and ten houses, three hundred and thirty-seven thousand eight hundred and sixty inhabitants, three hundred and ninety-four parishes, thirty-eight market-towns, and about seventeen hundred and thirty villages. This county, which is subdivided into thirty hundreds, sends twenty-six members to parliament: these are two knights for the shire, and two members for each of the following places; Exeter, Plymouth, Totness, Plympton, Okehampton, Honiton, Barnstaple, Tavistock, Ashburton, Tiverton, Beralstone, and Clifton-Dartmouth-Hardness.

The air of this county is very mild and healthful in the valleys; but excessively cold and bleak upon the mountains. The soil is various, for the lower grounds are naturally fruitful, and yet are made much more so by the art and industry of those who possess the lands; but the hills are very barren. In the eastern parts there is plenty, not only of good corn, but of fine pasturage for sheep, where the grounds are dry and chalky. The southern part of the county is remarkably fertile, and is as justly called The Garden of Devonshire, as Italy The Garden of the World. The trees are in as great variety here, as in any other part of the kingdom; and fruit-trees are particularly plentiful, especially apples, with which they make a great quantity of cyder. The merchants who go long voyages to sea find this a very serviceable drink in their ships, and therefore lay in great stores of it; for it is said one ton of cyder will go as far as three of beer, and it is found by experience to be much more wholesome in hot climates.

On the coast in this county is found plenty of a peculiar rich sand, which proves of singular service to the husbandmen, as those who live at a distance from the sea purchase it in order to improve their poor lands, for it renders the most barren soil fruitful, and, as it were, impregnates the glebe. However, those husbandmen who live at too great a distance from the sea-shore, and whose circumstances are too narrow to purchase a sufficient quantity of this valuable manure, are reduced to the necessity of using marl, lime, and the turf of the ground pared off and burnt to ashes.

Though the inhabitants are in no want of horses, kine, hogs, goats, sheep, or rabbits, yet their principal commodity is fowl, which they enjoy in the greatest profusion. In the western parts of Devonshire are great quantities of game, especially hares, woodcocks, and pheasants, in such abundance as to render them very cheap. And in that part of the country is a bird so very small that it is reputed a humming-bird, and like that hangs its nest on the extreme branches of the trees. The inhabitants insist that no venomous creature, of what nature or species soever, will live among them.

In the south-west parts of Devonshire are great quantities of marble, and in many places marble rocks are found to be the basis of the road on which people travel; this marble, when polished, is little inferior to some we have from abroad, and accordingly is much used by the gentry in those parts.

This county abounds with a greater variety of rivers than any other can boast of, yet there are only two, namely the Tamar and the Ex, that are peculiarly worthy of the reader's attention. The former, which separates this county from Cornwall, has its source in the hills near Welcomb, and runs nearly from north to south till it reaches the English Channel at Plymouth. This river is particularly remarkable for the goodness of the salmon caught in it. The Ex forms a course upon the same points, and, passing by Exeter, also falls into the Channel.

Channel. Great plenty of salmon is also found in this river, where they come in great quantities in the spawning season. From these two rivers the country is stocked with a great variety of common fish; but the most beneficial are herrings and pilchards, for by trading with them they obtain all sorts of commodities from the adjacent counties and foreign nations.

In several places in Devonshire are mineral waters that have been of singular service in dangerous epidemic diseases.

Among the curiosities of this county is Lay-well, which ebbs and flows near eleven times every hour.

The river Tamar, just mentioned, receives into it a small river called the Lid, which is peculiarly remarkable for being pent up with rocks at the bridge, and running so far below it, that the water is scarcely to be seen, or the murmurs of it to be heard, to the astonishment of all strangers who have the curiosity to attend to these uncommon circumstances; for the bridge is level with the road, and the water runs near seventy feet below it.

Within a mile of this place is a cataract, where the water falls above an hundred feet; it comes from a mill at some distance, and after a course upon a descent of near an hundred feet from the level of the mill, it arrives at the brink of the precipice, from whence it falls in a beautiful manner, and striking upon a part of the cliff, rushes from thence in a wider cataract to the bottom, where falling with great violence, it makes a deep and foaming basin in the ground. This wonderful fall of water fills the air all round at the bottom with such an atmosphere of aqueous particles, that a person approaching it finds himself in a mist. The principal places in this county are the following:

Exeter, thus called by contraction from Excester, a castle on the river Ex, was the Augusta of the Romans; it is situated a hundred and seventy-three miles from London, on the top of an easy ascent on the eastern bank of that river. The walls are in pretty good repair, and form an agreeable walk round the city, with the view of a fine country, hills covered with trees, fields, orchards, villages, and gentlemen's seats. The principal part of the city consists of four streets centering at a handsome conduit. The High-street particularly makes a noble appearance, it being broad and straight; and the houses are of a very old but good model, spacious, commodious, and not inelegant. This street is full of shops well furnished, and all trades are briskly carried on. In the northern angle of the city, and the highest ground, stands Rugemont castle, once the residence of the West Saxon monarchs, and afterwards of the earls of Cornwall. It is of a square figure, not very large, but environed with a high wall and a deep ditch. It has a rampart of earth parallel to the top of the wall, and forming a terrace that over-looks the city and country. In this castle the assizes are held, and it also contains a chapel. The bridge over the Ex is of great length, and has houses on both sides, with a considerable vacancy in the middle.

The cathedral was about four hundred years in building, and is yet very remarkable for the uniformity with which it was carried on; for the whole seems the workmanship of one and the same architect. The altar-piece, which was done a hundred years ago, is the representation of the church in perspective, a very fine piece of painting. The fine painted glass, of which there is a great deal, was much damaged during the time of the civil wars, in the reign of king Charles I. and the carved figures of the patriarchs and prophets were greatly defaced. On the south side of the high altar are three seats adorned with Gothic carvings to the height of about twenty-five feet, supported by brass pillars. In one of the towers of this church is a very large bell of about three ton weight, and in the other a fine ring of ten large ones.

The other buildings of a public nature are the chapter-house and cloisters, the bishop's palace, the houses belonging to the dean, the chancellor, treasurer, and other dignitaries of the church, the guild-hall, with the hospital of St. John the Baptist. There are within the city and liberties twenty parish-churches; to which may be added some chapels and alms-houses, with the ruins of several others. There are likewise three or four meeting-houses, a quay for landing goods, and a custom-house.

The city is governed by a mayor, twenty-four aldermen and common-council, a recorder, a sheriff, four stewards, a chamberlain, and town-clerk, who are attended by a sword-bearer, who wears the cap and carries the sword given by king Henry VII. before them in all public processions. There are also in this city twelve incorporated trades, who on public occasions walk in the mayor's train, dressed in gowns, each company having a beadle in a laced coat bearing the ensigns of their several professions.

Plymouth is situated in the fiftieth degree twenty-six minutes north latitude, and in the fourth degree twenty-seven minutes west longitude, two hundred and fifteen miles from London, between two very large inlets of the sea, in the bottom of a spacious sound, or bay, encompassed on every side with hills; the shore is generally steep and rocky, though the anchorage is good, and it is pretty safe riding. In the entrance of the bay is a large and dangerous rock, which at high water is covered, but at low tide lies bare. Upon this rock, which is called the Eddy-stone, the ingenious Mr. Winstanley first built a light-house for the direction of sailors; this work, considering its height and the magnitude of the building, stood to admiration several dreadful storms. Mr. Winstanley, who often visited it, strengthened the building by new works, and was so confident of its stability, that he usually said to those who doubted its standing in hard weather, that he only desired to be in it when a storm should happen; but in the dreadful tempest of November 27, 1703, when he happened to be so unhappy as to have his wish, he in vain made signals for help; but no boats dared to go off to him; and in the morning after the storm nothing was to be seen but the bare rock, the light-house being gone, in which Mr. Winstanley and all that were with him perished; but a very stately light-house has since been built in its room. The town is defended by a castle seated on an island named St. Nicholas, and by a citadel in the town opposite to the island. This is a small but regular fortification, inaccessible by sea, but not exceeding strong by land. It is surrounded with a deep trench, out of which was dug the stone of which the citadel was built. It is about three quarters of a mile in circumference, and has three hundred guns on its walls, which stand thickest towards the sea. The town stands above the citadel upon the same rock, sloping on the side of it towards the east. The inlet of the sea, called Catwater, forms a harbour capable of receiving any number of ships, and of any size; it washes the eastern shore of the town, where they have a kind of natural mole, with a quay and all other conveniences for loading and unloading of vessels. On the other side of the town is another inlet of the sea, called Hamouze; this is the mouth of the river Tamar, where is a wet dock, with yards, dry docks, launches, and conveniences of all kinds for building and repairing of ships. These wet and dry docks exceed every thing of the kind, being hewn out of a mine of slate, and lined with Portland stone. The dry dock is large enough for a first-rate man of war, and the wet dock will contain five of the same size. Here are also store-houses for rigging, and for the naval and military stores of such ships as may be appointed to be laid up there; with very handsome houses for the commissioner, clerks, and officers of all kinds usual in the king's yards. In short, it is now become as complete a yard as any belonging to the government, though not so large. Here are two fine churches, and two or three meeting-houses for Protestant Dissenters and French refugees; also a free-school, and an hospital for blue coat boys. It gives title of earl to the noble family of Hickman.

Dartmouth, a sea-port town seated on the declivity of a hill at the mouth of the river Dart, where it empties itself into the sea, a hundred and ninety-eight miles from London, and thirty-one from Exeter. The opening into the harbour is not broad; but the channel deep enough for the largest ships in the royal navy. The sides of the entrance are mounded with rocks, and at the first narrowing of the passage is a good strong fort, and a platform of guns which command the port. The narrow entrance extends about half a mile, and then opening forms a harbour, in which five hundred sail of ships may ride with

the greatest safety, and the entrance may, upon occasion, be chained up.

Dartmouth is situated on the west side of this basin, or harbour, in a kind of semicircle, on the ascent of a steep hill; but though large and populous it is but meanly built, yet the quay is spacious, as is also the street before it. Here live some very flourishing merchants, who carry on a prosperous trade to the most considerable ports of Spain, Portugal, Italy, and the plantations; but especially to Newfoundland, and from thence to Spain and Italy with fish; and they also drive a good trade in their own fishery of pilchards, which is carried on with the greatest number of vessels of any port in the west, except Falmouth. It has three churches, and a very large meeting-house; but the streets are narrow and bad, though they are all paved, and is governed by a mayor, a recorder, twelve masters, or magistrates, a town-clerk, and a high-steward.

This town was burnt by the French in the reign of Richard I. They some time after besieged it again; but were bravely repulsed, particularly by the women, when the enemy being routed, general Castel, with three lords, and twenty-three knights, were made prisoners. This town has the title of an earldom.

About fifty miles from the north-west coast of this county is Lundy Island, which is five miles long, and two broad; but it is remarkable that it is so encompassed with inaccessible rocks, that it has but one entrance into it, and that so narrow that two men can scarce go abreast. The south part of the island enjoys a pretty good soil; but the north part is in a great measure barren, and has a remarkable high pyramidal rock called the Constable.

S E C T. XVI.

Of Cornwall; its Name, Situation, Extent, Division, &c. and the Members it sends to Parliament. The Air, Soil, and Vegetables; the Mines, Minerals, and natural Curiosities; with the Cattle, Fowls, Fish, and Rivers of this County. The Manners of the Inhabitant, a Description of the principal Towns, and a concise Account of the Scilly Islands.

THE present name of this county is differently accounted for; but the most probable derivation seems to be that which brings it from the promontories projecting into the sea like horns, called in the British language Kernaw, with the Saxon addition of Waules, to denote the people who fled thither. It is surrounded by the sea on all sides, except the east, where it is parted from Devonshire by the river Tamar: the northern coast being washed by the Bristol Channel, the western by St. George's, and the southern by the British sea. Its length from east to west is near seventy miles, its breadth next to Devonshire, where it is broadest, is computed about forty; but in the narrowest, at St. Ives, it does not exceed five, yet its circumference from its unequal shore measures upwards of two hundred and thirty-three miles.

Cornwall is situated in the diocese of Exeter, and contains about twenty-seven thousand six hundred and twenty houses, a hundred and sixty-five thousand inhabitants, a hundred and sixty-one parishes, twenty-seven market-towns, and twelve hundred and thirty villages: it is subdivided into nine hundreds, and sends no less than forty-four members to parliament; these are two knights of the shire, and as many members for each of the following towns: Camelford, Bodmin, Boffiney, Dunevet, Launceston, East Loe, Foy, Helston, Grampound, St. Maws, Lefkard, Kellington, St. Ives, St. Germans, Truro, St. Michael, Tregony, Newport, Portpigham, and Saltash.

The air is sharp and healthful to the natives, yet the vicinity of the sea, on three of its sides, prevents its being subject to hard frosts, and the snow lying long on the ground. The same reason may be assigned for the frequent gusts of wind which are here very boisterous, and consequently sometimes pernicious; but the inhabitants are seldom troubled with infectious diseases. The seasons are somewhat different from those in other parts,

the summer being more temperate; and as the autumnal fruits are later, their harvest is seldom ripe enough for the barn till near Michaelmas.

The soil as it is very shallow cannot be extraordinary fruitful, especially on the hilly parts. The vallies yield plenty of grass, and the lands near the sea, by being manured with orewood, a kind of sea-weed, and fat sea-land, produce considerable quantities of corn. The fruits and herbs of this county are much the same with those of others, though not so plentiful among the common people. It has besides some plants which are either uncommon, or have never been found in other counties: among these is a sort of grain sown plentifully towards the farther end of the county, which is naked oats, called pillcorn, from its being naturally stripped of the husk, with which the common oat is covered, for which reason it is much esteemed. They have also plenty of sea-herbs, as camphire, eringo, ros solis, and what is peculiar to this county the sweet-briar grows naturally here.

From the surface we shall pass to the bowels of the earth, where are found many sorts of stones and metals. As to the former, the moor-stone is the chief: this is used both in buildings and for large mill-stones. Its natural composition is very beautiful, it consisting for the greatest part of a whitish granulated marble, variegated with a sort of black and yellow matter resembling tinsel and tin-glass, shining and glittering very agreeably in the sun beams. This stone, therefore, while new, gives a glorious aspect to buildings; but though prodigiously hard at first, it soon changes its colour and consistence. When polished it appears much more splendid and beautiful than any of the marble kind, and makes the richest furniture, as tables, chimney-pieces, &c. but being exceeding hard, the polishing is very expensive.

With respect to the mines of Cornwall, they consist of two sorts, one of tin, the other of copper; those of tin are very numerous, and are in general very large and rich in ore, these have rendered this county famous in all ages. There have also been sometimes found a small quantity of gold and silver, but not worthy of notice. With the metalline ores are intermixed large quantities of mundic and arsenic.

The tin works are of different sorts, on account of the different forms in which the tin appears, for in many places the tin ore so nearly resembles common stones, that they can only be distinguished from them by their superior weight. The second form in which tin appears consists of tin and earth, compounded and concreted into a substance almost as hard as stone, of a bluish or greyish colour, and often the mundic gives it a yellowish cast. This ore is always found in a continued stratum or bed, which the tinnerns call the load, and thus, for the most part, is found running through the solid substance of the hardest rocks, beginning in small veins near the surface, perhaps not above half an inch or an inch wide, and increasing as they go into larger dimensions branching out into several strata, and proceeding downwards in a direction that is in general nearly east and west. These loads are sometimes white very wide and thick; so that great lumps of this ore are often drawn up of more than twenty pounds value. The loads of tin ore are not always contiguous; but sometimes break off so entirely, that you would think you had got to the end of it, but the sagacious tinner knows by experience, that by digging a small distance on one side he shall meet with a separated part of the load appearing to tally with the other end as nicely as if it had been broken off by some sudden shock of the rock.

The mines of this country follow the load in all its rich and meandering windings in the bowels of the rocky earth. Sometimes the waters are drained from these mines by subterranean passages, formed from the body of the mountain to the level country; these, which are called adits, sometimes prove the labour of many years, but when effected they save the constant expence of large water-works and fire engines. From the surface of the earth they sink a passage to the mine, which they call a shaft, and over it place a large winch; but in greater works a wheel and axle, by which means they draw up large quantities of ore at a time, in vessels called kibbuls.

This

This ore is thrown into heaps, where great numbers of poor people are employed in breaking it to pieces and fitting it for the stamping mills.

The third form in which tin appears is that of crystals; for tin being a salt, will, under some circumstances, readily crystalize; and therefore in many parts of the mineral rocks are found the most perfect transparent and beautiful crystals of pure tin.

The copper mines of this county next deserve our notice, they being very numerous, and some of them large and rich in ore. It is remarkable, that in some parts of Cornwall the earth has produced such an exuberance of this metal, as to afford it in large massy lumps of malleable copper, several pieces of which they shew in very curious vegetable forms. The mundic, which we have observed, is found in the loads of tin, was for many ages considered as of no other use but to nourish tin while in the mine. However, in the reign of queen Elizabeth, a laudable curiosity prompted some private persons to examine into its nature; but the design miscarried, and the mundic was thrown as useless into the old pits with other rubbish; but about eighty years ago, Sir Gilbert Clark began to work upon the mundic, and others following his example have by degrees brought the work to bear, and the copper extracted from this ore, once esteemed useless, now brings in above one hundred and fifty thousand pounds a year, and equals in goodness the best Swedish copper, yielding a proportionable quantity of lapis caliminaris for making brass. In Mount's bay, near Penzance, the shore is as it were paved with a rocky stone, of so fine a grain that it equals any hone in giving an edge to a razor.

In many of the cavernous parts of the rocks are found those transparent crystals called Cornish diamonds, they being extremely brilliant when well polished. Their form is that of a six sided prism pointed on the top, and they are sometimes four or five inches in length.

All the parts of Cornwall on this side St. Austle's, St. Michael's, and St. Agnes, have little or no mineral ores, but mostly abound with rocks of blue slate, especially towards the south, where are many large quarries of that useful fossil.

Among the curiosities observable in this county, it is worthy of notice that the Lands-end consists of very steep rocks projecting beyond the rest into the sea, in which the water of the sea runs with great rapidity, violence, and noise.

Among the rude relics of nature in this county, we ought not to pass by the logan or rocking-stone, of which there are two sorts, some artificial, others natural; we shall here only take notice of the latter. In the parish of St. Levin is a promontory called Castle Treryn. This cape consists of three distinct groups of rocks, and on the top of the middle group is the most wonderful of these stones perhaps in the world. It is computed that its solid contents amount to about ninety-five tons; the two inclined sides somewhat resemble the roof of a house meeting in a sort of obtuse ridge upon the top. The lower part is a large plain base, near the middle of which projects a small part on which it rests, not more than eighteen or twenty inches in diameter. This prodigious stone is easily moveable upon the large stone below, the power of one man being sufficient to make it vibrate up and down.

With respect to the cattle of this country, it has all the several kinds found in the others; but it is remarkable that the sheep, which when it lay open and uncultivated were small, and their wool so coarse that it was usually called Cornish hair, have since the land has been well manured, equalled the sheep of other counties in size, and in the fineness of the wool. The cows and oxen are small, but their flesh sweet and juicy. They use oxen chiefly in ploughing. Their horses are bred hard, and fed as coarsely; but though they are small, they travel well, and are very serviceable in this mountainous country: mules are also much used. The parks are well stocked with fallow deer; but they have no red deer except what stray thither out of Devonshire. Many foxes, otters, badgers, and martins harbour in the cliffs near the sea side.

The fowl of this county are generally such as are found in others. Wild fowl are very plenty in the parts

adjoining to Devonshire. The birds called the choughs, which are in a manner peculiar to this county, are found in great plenty, and somewhat resemble the pied or grey crow; they are nearly of the size of the jack-daw, have red legs and beak, and have the character of being a very thievish bird. The most remarkable among the water-fowl is one about the size of a sea-gull, which has a singular method in taking of its prey; for it rises high in the air, and from thence falls as if dead, and by the velocity of the fall, is enabled to penetrate through the water, and suddenly seize the fish it strikes at. These are seen in very great numbers in Mount's bay, and other parts of the sea-coast.

The rivers and seas afford great plenty of fish, but mostly such as are common to other counties; but the prodigious shoals of pilchards enable them to carry on a very great trade in that fish. On the south coast are found large quantities of those small shell-fish which affords that beautiful tint called the Tyrian dye; this matter is contained in small cisterns or bags, and when taken out appears of a greenish yellow. If this be spread upon a piece of fine linen, it will in a day or two appear of a pale reddish colour, the linen being washed the first time it is heightened into a paleish purple, and every washing after renders the colour still more strong and vivid, and it is not in the least subject to fade.

The chief rivers are the Tamar, the Camel, and the Fale. The Tamar runs a long course from north to south, and is the boundary between the two counties of Cornwall and Devonshire, emptying itself into Plymouth Sound. The Camel runs from south to north, and forms Padstowe haven in the Bristol Channel. The Fale runs from north to south, and discharges itself into St. George's Channel, forming the haven of Falmouth.

The language of the Cornish gentry is English, which is said to be as pure as that in London, except in two or three parishes, where a corrupt dialect of the ancient Cornish tongue is much used. The natives of this country are distinguished by their plainness and simplicity of manners; they seem absolutely unacquainted with fraud, dissimulation, and flattery, and are of a free, facetious, and generous temper; they are curious and inquisitive, and are also distinguished for their humanity and hospitality to strangers; they are great encouragers of the arts and sciences, and excel in mechanics.

The principal places in this county are the following:

Leskard is a considerable town, two hundred and twenty-one miles to the south-west of London, and had anciently a good castle and a palace, in which the dukes of Cornwall kept their court, particularly Edward the Black prince, who resided here as prince of Wales and duke of Cornwall. Its town hall has a turret with a fine clock. There is here an ancient large church, dedicated to St. Martin, a spacious meeting house for the dissenters, a good free-school, and a fine conduit in the market place. It has a very great trade in all manufactures of leather, as boots, shoes, gloves, purses, breeches, &c.

Launceston is seated on the top of a small hill near the river Tamar, twenty-eight miles to the north of Plymouth, and two hundred and nine to the westward of London. Here the business of the county, as the assizes, and the election of the knights for the shire, are usually transacted. It is a neat town, and was formerly defended by a castle which is now in ruins.

Falmouth, a sea-port town, and by much the richest and best trading town in the county, is situated in fifty degrees, twelve minutes north latitude, and in five degrees twelve minutes west longitude, two hundred and eighty-two miles from London. The harbour is so large, that one hundred sail may safely ride at anchor at a time, and those of the greatest burthen may come up to the quay. The entrance into the harbour is defended by St. Mawes and Pendennis castles, both of which are very strong, and have governors and garrisons.

St. Mawes, also called St. Mary's, has a little town annexed to the castle; but it has neither church nor market. Falmouth is well built, and has abundance of ships belonging to it. It is full of merchants, and its trade has greatly increased since the establishment of the English packets between this town, Portugal, and the West

Indies, as also between it and the Groyne in Spain: those from Portugal bringing over not only vast quantities of gold for the London merchants, but for those of Falmouth, who trade with the Portuguese in their own ships, and have a great share in the profitable pilchard fishery. Here is the custom-house for most of the towns in the county, and a head collector lives at Falmouth. This town gives title of viscount to the noble family of Boscawen.

Truro is one of the chief towns in the county, and is seated two hundred and seventy-four miles from London, on a branch of Falmouth haven, which is here divided into two streams, and almost surrounds the town. It is a large, handsome, and well inhabited place, which takes its name from its three streets, which in the Cornish tongue are expressed by the word Truru. It has three churches, about six hundred houses, and is governed by a mayor and aldermen.

Penryn is up the same branch of the haven as Falmouth, but stands four miles to the west: It is a pleasant agreeable town, full of orchards, and looks like a town in a wood. The streets are broad and paved: it has a church, and about three hundred houses, and is governed by a mayor, four aldermen, and a town clerk, and there has been lately set up here a manufactory of ferges.

Penzance, a town seated on Mount's bay, within about twelve miles of the promontory called the Lands-end, and two hundred and ninety to the south-west of London, is a market-town well built and populous, and has many ships belonging to it, and also a considerable number of families of rank. It consists of about six hundred houses; the streets, though bad, are paved. The church stands about half a mile from the town; but the inhabitants have a chapel. It is governed by a mayor, a recorder, fourteen aldermen, and twenty-four common-council men. It is remarkable that veins of lead, tin, and copper ore are said to be seen even to the utmost extent of land at low-water mark, and in the very sea.

The rocks of Scilly, called by the Greeks Cassiterides, and by the Dutch seamen, Sorlings, are about one hundred and forty small islands and rocks thirty miles from the Lands-end, of which St. Mary's is the largest, and most fruitful, though but nine miles in circumference. It has a good harbour defended by a castle. The isle of Scilly was once esteemed the most considerable; that and some others stand very high; but several of them are overflowed at high tides. Some of them bear good corn, and most of them pasture. They abound with rabbits, cranes, herons, swans, and other water-fowl. These islands being situated near the mouth of the English Channel, have proved the destruction of many ships; for, in spite of light houses and the best skill of the mariners, they are very dangerous in the night, and in stormy weather: here Sir Cloudsley Shovel, in the admiral-ship, with three other men of war, unhappily ran upon these rocks, on the twenty-second of October, 1707, and not a man was saved out of all the ships.

We have now described all the counties of England to the south of the Thames and Bristol channel, and shall therefore proceed further north, and begin with Monmouthshire.

S E C T. XVII.

Of Monmouthshire; its Situation, Extent, Air, Soil, Produce, and Rivers.

Monmouthshire was formerly a part of Wales, and as such is described by Camden, and other authors; but as all the later writers have placed it in England, we shall follow their example, though there seems to be no better reason for it than the Oxford circuit being extended through that county in the reign of king Charles II.

Monmouthshire receives its name from Monmouth its county town, and is bounded on the north by Herefordshire; on the east by Gloucestershire; on the south by the river Severn; and on the west by the Welsh counties of Brecknock and Glamorgan. Its extent from north to

south is about twenty-nine miles, from east to west twenty, and in circumference eighty-four. It is subdivided into six hundreds, and contains seven market-towns, one hundred and twenty-seven parishes, about six thousand four hundred and ninety-four houses, thirty-eight thousand nine hundred inhabitants; but sends only three members to parliament, that is, one for Monmouth, and two for the county.

The air is temperate and healthy, and the soil fruitful, though mountainous and woody. The hills feed sheep, goats, and horned cattle, and the valleys produce plenty of grass and corn, especially of the latter, of which there is as good wheat as in any county in the kingdom.

This county is extremely well watered by several fine rivers; for besides the Wye, which parts it from Gloucestershire, the Mynow, which runs between it and Herefordshire, and the Rumney, which divides it from Glamorganshire, it has peculiar to itself the Usk, which enters this county a little above Abergavenny, runs mostly southward, and falls into the Severn by the mouth of the Ebwith; which last river runs from north to south in the western side of the county. All these rivers, especially the Wye and Usk, abound with fish, particularly salmon and trout.

The gentlemen here generally speak English, though the common people use the Welsh language. The manufacture of the county is flannels.

The principal towns in this county are the following:

Monmouth, or Mynwy, is seated at the mouth of the river Mynwy, or Mynow, between that river and the Wye, over each of which it has a bridge. The town is in a manner surrounded with water, there being another river called the Troby, over which it has also a bridge. It is a populous, handsome, well built town, and has a stately church, the east end of which is much ornamented. It has been a place of great strength, and might be easily made so again. The castle, though now in a ruinous condition, was formerly a stately edifice. The market, which is very considerable for corn and all sorts of provisions, is held on Saturdays. The government is under a mayor, two bailiffs, fifteen common-council-men, a town-clerk, &c.

Chepstow is seated on the side of a hill, fourteen miles to the south of Monmouth, and a hundred and thirty-one to the west of London, near the mouth of the Wye, over which it has a fine bridge: it was formerly much resorted to, and is still a large, well-built, and populous town. It was antiently walled round, and defended by a castle; and among the other public buildings had a monastery, the remaining part of which is converted into a parish-church. This is the port for all the towns that stand on the rivers Wye and Lug; ships of good burthen come up to it, for the tide commonly rises here six fathoms, or six and a half at the bridge, which is of timber, and no less than seventy feet high from the surface of the water when the tide is out. In the year 1689 was discovered in this town a Roman pavement, which when entire was very beautiful, representing men, beasts, birds, trees, &c.

Abergavenny has its name from the river Gavenny, which falls below it into the Usk. It is a handsome well-built town, sixteen miles to the west of Monmouth, and a hundred and forty-two of London. This town is encompassed by a wall, and defended by a strong castle. It is a great thorough-fare from the west parts of Wales to Bristol and Bath, and also from Monmouth to Gloucester; and the inhabitants carry on a great trade in flannel. It gives title of baron to the ancient and noble family of Neville.

S E C T. XVIII.

Of Gloucestershire; its Name, Situation, Extent, Divisions, Representatives in Parliament, Air, Soil, Produce, Rivers, and principal Towns.

THIS county takes its name from the city of Gloucester, which was called by the Saxons Gleaucaster, and is bounded on the north by Worcestershire, and

and a small part of Warwickshire; on the east by Warwickshire, Oxfordshire, and Berkshire; on the south by Wiltshire and Somersetshire; and on the west by Herefordshire and Monmouthshire. It is sixty-five miles in length and thirty-two in breadth, and contains twenty-seven market-towns, two hundred and eighty parishes, one castle, two forests, nineteen parks, twenty-six thousand seven hundred and sixty houses, and a hundred and sixty-two thousand five hundred and sixty inhabitants: it is subdivided into thirteen hundreds, and sends only eight members to parliament, that is, two for the county, two for the city of Gloucester, and two each for Cirencester and Tewksbury.

The air of this county is wholesome throughout its whole extent; but has a different soil and appearance in the different parts of it: in the east it is hilly, in the west woody, and in the middle is enriched with a fruitful vale. The east part, called Cotswould, has a sharp air; and though the lands are not very fertile in corn, they feed a great number of sheep: the Vale includes both sides of the river Severn, and is very fertile, especially in rich pastures. Here is made the cheese which, next to that of Cheshire, is highly esteemed all over England; and a great deal of this cheese is also made in Wiltshire: in this Vale the air is so mild, even in winter, that it seems to enjoy a different climate from that of Cotswould. The Forest of Dean, which borders upon Herefordshire and Monmouthshire, is fertile both in pasture and tillage; it bears very fine oaks, and has rich mines of iron and valuable coal pits. In general this county may be justly said to abound with all the necessaries of life in the greatest perfection, as corn, wool, iron, steel, timber, bacon, cyder, and salmon. The chief manufacture carried on by the inhabitants is clothing, which, before our wool was smuggled to France, has been known to return five hundred thousand pounds per annum.

Its principal river is the Severn, which rises in Montgomeryshire, and entering this county a little above Tewksbury runs near south-west by Gloucester, discharging itself into the Bristol Channel. The tide flows as high as Tewksbury, which, following the course of the river, is near seventy miles. A little below Newnham it resembles a sea, and the tide of flood rushes on with such impetuosity, that it comes in a roll often near four feet high, carrying every thing before it. This is called The Boar. But what is still more remarkable is, that the tides are highest one year at the full moon, and the next at the change; and one year the night-tides are highest, and the next the day-tides. In this river are taken plenty of excellent salmon, lamprey, and conger eels.

The principal places in Gloucestershire are the following:

Gloucester, by the Britons called *Caer-Glow*, which signifies fine city, and by the Romans *Glevum*, is seated on the east side of the river Severn, a hundred and two miles from London. It abounds much with crosses and statues of the kings of England, and has a handsome prospect of steeples, some without a church. These and their religious foundations in every part of the city gave rise to the old proverb, "As sure as God is at Gloucester." The cathedral is a venerable pile with a handsome tower, and a finely vaulted choir. On the north side lies the unfortunate king Edward II. and before the high altar, in the middle of the church, lies the equally unfortunate prince Robert, the eldest son of William the Conqueror, who, after being imprisoned twenty-six years by his younger brother Rufus, died, and was interred here. In this cathedral is a whispering-place, which formerly passed among the vulgar as somewhat almost miraculous, till they were taught that there is a whispering-gallery in St. Paul's cathedral. This city was anciently fortified, but after the Restoration was dismantled by act of parliament, on account of the resistance it made against the forces of king Charles I. The old houses projecting into the streets, and its crosses, have been pulled down by act of parliament in 1750, and instead of the latter is a statue of colonel Selwyn, their member, who at his own expence made a very large reservoir about half a mile off, from which the water is conveyed into a square basin at the foot of this statue, from whence it runs into four canals, which

flow through the four great streets that here meet in the center of the city. There are large remains of abbeys and convents, both of black and white friars.

There is a large quay, wharf, and custom-house on the river; and in the city are twelve companies, the masters of which attend the mayor on all public occasions in their gowns, and with streamers. Great provision is here made for the poor, particularly Bartholomew's hospital for fifty-four men and women; a blue-coat hospital for educating twenty boys, and for maintaining and annually cloathing ten men and women: there are also three others, with several benefactions for encouraging young tradesmen and putting out boys apprentice, and lately an infirmary has been erected here. The city is governed by a mayor, twelve aldermen, and common-council, who are never fewer than twenty-six, nor above thirty-nine, a town-clerk, and sword-bearer. This city was made the see of a bishop by king Henry VIII. who erected the abbey-church into a cathedral, with a dean and six prebendaries.

Cirencester, so called from the river Churn, on which it stands, and Cestre, a castle, is a populous, rich, and trading town, full of clothiers; it stands eighteen miles to the south-east of Gloucester, and eighty-five to the north-west of London, and carries on a great trade in wool, which is brought from the inland counties of Leicester, Northampton, and Lincoln, and bought up here by the clothiers of Wiltshire and Gloucestershire, for the supply of the great clothing trade. Here is a large beautiful church, with two isles, supported by strong pillars. The chancel is handsomely decorated, and the tower is very neat and lofty: the windows shew some beautiful remains of painted glass, and there are five chapels adjoining it. In this town is a free-school, and several hospitals and alms-houses.

Many antiquities have been found here. In 1723 was discovered a fine Mosaic pavement, and afterwards Mr. Bishop dug up in his garden a vault sixteen feet long and twelve broad, supported by square pillars of Roman brick three feet and half high, on which was a strong floor of terrace, and near it are several other vaults. These were probably the foundations of some Roman temple, for in the same place they found pedestals, the shafts and capitals of columns, and handsome entablatures. Indeed there have been found here innumerable coins and entaglios. The town is governed by two high-constables; and has two weekly markets, one on Monday for corn, cattle, and provisions; and on Friday for wool. In the neighbourhood of this town lord Bathurst has an elegant seat, park, and gardens.

Fairford is a small market-town situated on the river Coln, and is remarkable for the many medals and urns that have been dug up here, and particularly for the fine painted windows of the church. For John Tame, a merchant of London, having taken a prize-ship bound for Rome, in which he found a great quantity of painted glass, he brought both the glass and workmen to England. This painted glass was so beautiful, that Mr. Tame built this church in order to place it in the windows, and dedicated this structure, which is a hundred and twenty-five feet long, and fifty five broad, to the Virgin Mary. It has three chancels, a good vestry, and a noble tower. The windows, which are twenty-eight in number, are glazed with this invaluable prize, and still remain entire; for in the civil wars the glass was taken out and concealed. The painting was from the design of Albert Durer, and the colouring in the drapery and some of the figures so well executed, that Vandyke affirmed they could not be exceeded. The subject is taken from the scripture histories of the Old and New Testament. John Tame, Esq; the founder of this structure, who died in 1500, lies buried on the north side of the church, under a marble monument.

Tewksbury is seated at the confluence of the rivers Severn and Avon, ninety-six miles west-north-west of London, and contains about five hundred houses. Its church is a noble structure, and one of the largest in England, that is not collegiate or a cathedral. It is very lofty, has two spacious isles, a stately tower, and a large chancel. The communion-table consists of one entire piece of marble, fourteen feet long, and three and a half

broad. The town is governed by two bailiffs and twenty-four burgeses, and its neighbourhood to Cotswould makes the clothing trade flourish here. It has likewise a manufacture of cotton.

We have already described the city of Bristol in treating of Somersetshire, though a considerable part of that city stands in this county; and have purposely omitted taking notice of St. Vincent's rocks, and the Hot Well, which stand about two miles distance from Bristol, and ought to be mentioned in this county. St. Vincent's rocks are a vast and irregular heap of stones, intermixed with minerals; but the principal substance of the rocks is a very hard limestone. The rock, out of which issues the famous water called that of the Hot Well, or Bristol water, stands on the north side of the river Avon, and affords a romantic and beautiful prospect. To taste this water in perfection it must be drank warm from the spring, or else it loses its flavour. As it passes through a vast bed of rocks, and among a variety of different stones, it doubtless borrows its taste and virtues from the most particular kinds, and when drank at the spring-head has a fine gentle warmth and a delicate soft milky taste; it is very grateful to the stomach, and is allowed to be cooling, cleansing, and balsamic; but one of its greatest qualities is its astringency: this renders it useful in the diabetes; and in consequence of its other qualities, it is drank with great success in obstructions in the urinary passages from gravel, as also in many of the chronic cases which are least to be relieved by the common course of medicine.

Bristol-stones are found in vast quantities in the cracks of rocks and cavities of stones; but chiefly in the cavities of iron ore. They rise in a great variety of forms in different places, and the clusters of them are yet more various in their appearance, they generally adhere to the rock or ore at one end, and terminate in a point at the other.

S E C T. XIX.

Of Herefordshire; its Situation, Extent, Divisions, &c. Its Air, Soil, Produce, Rivers, and principal Towns.

HEREFORDSHIRE is bounded on the north by Shropshire; on the east by Worcestershire and Gloucestershire; on the south by Monmouthshire; and on the west by Radnorshire, in Wales; it extends thirty-five miles from north to south, thirty from east to west, and a hundred and eight in circumference.

This county lies in the diocese of Hereford, and contains eight market-towns, eighty-seven vicarages, a hundred and seventy-six parishes, and three hundred and ninety-one villages, fifteen thousand houses, and ninety-five thousand six hundred inhabitants. It is divided into twelve hundreds, and sends eight members to parliament, namely, two knights for the shire, and two for each of the following towns: Hereford, Lempster or Leominster, and Weobly.

The air of this county is healthy and delightful, whence the inhabitants generally live to a great age. As an instance of which, it is said, that a morris-dance was performed before king James I. by ten men and women, whose ages together made a thousand years. The soil is exceeding rich, producing excellent corn, wool, and fruit, as is evident from the Lempster bread, Webber ale, and Herefordshire cyder: the last of which is sent to all parts of England. It also abounds with wood and fish.

Herefordshire is plentifully watered with several rivers, the chief of which are the Wye, the Monow, the Zug, and the Frome, or Froom; all of which are well stored with fish. The salmon of this county are very remarkable, for in other parts of England they are so far out of season, after spawning, as to be unwholesome food, till they have been again at sea to recover themselves; but here they are always found, fat, and fit for the table. The principal places in this county are the following:

Hereford, the metropolis and only city of that county, received its name from the Saxon, it signifying the ford of the army, being the head-quarters of the Saxons: it

is seated on the banks of the Wye, a hundred and thirty-one miles from London, and twenty-six from Gloucester. It has a good stone bridge of eight arches over the Wye, and is surrounded with rivers on all sides but the east. This city, though large, is not populous; as it lies low the streets are often overflowed, so that they are very dirty. It originally owed its flourishing state to the martyrdom of Ethelbert, king of the East Angles, who was basely murdered by king Offa, and had a church built here to his memory, which was soon erected into an episcopal see. This is a stately fabric, the choir, though plain, is neat, and has a good organ; and the spire is handsome, but not very lofty.

The city is governed by a mayor, and has distinct privileges for its several companies, who have their respective halls. In the time of the civil wars this city, being very strong, and well defended, supported a very severe siege against the parliament forces, and even the Scottish army, four thousand of the latter having been slain before it; but at length it surrendered. Of its six parish-churches two were demolished by the siege; but in 1738 the Gothic chapel belonging to the bishop's palace was pulled down, in order to erect another for the public service. Without the walls of Hereford city are the ruins of Black friars monastery, and a pretty stone cross entire, round which were the cloisters, and now the cloisters of the cathedral inclose just such another. These crosses served as a kind of pulpit, whence a monk preached to the people in the open air. It has an hospital liberally endowed for twelve poor persons, with two charity-schools, one for sixty boys, and the other for forty girls, all taught and clothed by subscription. Its weekly markets are on Wednesday, Friday, and Saturday; and it gives title of first viscount of England to a branch of the Devereaux family.

The walls may be traced all round the city, though overgrown with trees, shrubs, grass, and hedges. Towards the north it is sheltered by a high mountain of steep ascent, with a vast camp at the top, from which is a prospect as far as St. Michael's Mount in Monmouthshire, and on the other side is a lofty bleak mountain that separates Brecknockshire from this county.

Lempster, or Leominster, is a large borough on the river Lug, over which are several bridges, fifteen miles from Hereford, and a hundred and thirty-six from London. The church, which is very large, having been in a manner rebuilt, is a very beautiful structure. On the north side of it was a considerable priory, two aisles of which now belong to the church, and two others of more lightsome work, have been added. There are some poor remains of the priory, particularly a little chapel which probably belonged to the prior's family, and underneath it runs a rivulet, which served to grind the prior's corn, but now turns a fulling-mill; and near it are very large ponds for fish, which used to furnish the monks on fasting days. This town is noted for its fine wool and the best wheat and barley, and consequently for the finest bread: it has also a brisk trade in hat-making. Three rivulets that have a swift current run through the town, and there are others very near it; the inhabitants make use of these to work their mills and other machinery in the various branches of their trade.

Between Lempster and Hereford is Hampton, the seat of the late lord Coningsby. There is a plentiful supply of water on all sides of the house for fountains, basins, and canals; and the windows of the chapel are well painted. The park, which is very fine, is eight miles in circumference, and consists of lawns, groves, canals, hills, and plains.

S E C T. XX.

Of Oxfordshire; its Situation, Extent, Divisions, Representatives, Air, Soil, Produce, and Rivers; with a Description of the principal Places it contains, particularly Oxford and Blenheim-house.

THIS county takes its name from the City of Oxford, and is bounded on the north by Warwickshire and Northamptonshire, between which counties it runs

runs for a few miles due north, in the form of a wedge; on the east by Buckinghamshire and Hampshire; on the south by Berkshire; and on the west by Gloucestershire. It extends forty-one miles in length, eighteen in breadth, and a hundred and thirty-eight in circumference.

This county sends nine members to parliament, namely, two knights for the shire, two representatives of the university, two burgesses for Woodstock, and one for Banbury. It is divided into fourteen hundreds, and contains sixty-two vicarages, two hundred and eighty parishes, twelve market-towns, four hundred and fifty-one villages, nineteen thousand houses, and a hundred and fourteen thousand inhabitants.

The air of this county is equal in goodness to any of the other; for the soil being naturally dry, and at the same time plentifully watered with limpid streams, the air is naturally sweet and wholesome.

The soil in general is very fruitful both in corn and grass; but there is a great variety in it, and consequently several degrees of fertility. The husbandmen know well how to distinguish and manage accordingly, both as to the tillage and the different kinds of grain sown here, there being no less than five sorts of wheat adapted to as many kinds of soil. The meadows are covered with rich grass, and are extremely profitable to the farmer. The chief commodities are corn, malt, cattle, fruit, freestone, several sorts of earth, useful in medicine, dyeing, and scouring. Whitney in this county is famous for its manufacture of blankets.

The principal rivers are the Thames, Isis, Charwell, Windrush, and Evenload, which afford plenty of fish, and are remarkably good. The principal places in this county are the following:

Oxford, a noble, populous, and fine city, seated in a delightful plain on the banks of the Isis and Charwell, fifty-five miles from London. It is pretended by some authors, that it was built a thousand years before the birth of our Saviour; but this is justly controverted by others; however, it is allowed by all to have been a place of note before the coming of the Saxons. The whole city, with its suburbs, is of a circular form, three miles in circumference. The streets are spacious, neat, and generally straight; the mayor and aldermen govern the corporation, but in subjection to the chancellor and vice-chancellor of the university, to whom both they and the sheriff of Oxfordshire swear to maintain the rights and privileges of the university. On St. Scholastica's-day, which is on the tenth of February, sixty-two of the principal citizens pay an acknowledgment of one penny each, instead of a heavy fine laid on the city, for an outrage committed against the university in the reign of king Edward III. when sixty-two students were barbarously murdered by the citizens.

The university, considered as a body corporate, consists of the officers of the university in general, and of the several colleges. The governors of this great university, which, for the number of its colleges, and the fineness of its buildings, has not its equal, are the following: I. The chancellor, who is chosen by the students in convocation, and whose office is to inspect the government of the university, to protect its privileges, and call assemblies. The choice generally falls on some nobleman of high rank, and his office is for life. II. The high-steward, who is nominated by the chancellor, and accepted of by the university: his office is for life, and his employment to assist the chancellor and proctors in the execution of their offices, and to sit as judge in capital causes, when required by the chancellor. III. The vice-chancellor is annually nominated by the chancellor as his deputy, and is elected in convocation. He is always the head of some college, and is in orders; he on all occasions represents the chancellor in his absence. IV. The proctors, who are two in number, are annually chosen out of the several colleges by turns. Their duty is to inspect the public exercises, to see discipline preserved, and all disorders prevented or punished. After these are the public orator, the keeper of the records, the register, six beadles, and a verger.

The colleges are places provided with sufficient revenues for the maintenance of a master, professors, and students: the halls are houses where the students live

either wholly, or in part, at their own expence. Of the first sort there are twenty, and of the latter but five. In each of these are private lectures and disputes in the liberal sciences, to prepare the students for the public exercises. They are ranked in the following order:

I. University-college is situated near the east gate of the city, and was the beginning of the university. It was founded before the year 721, but how much earlier is not certain, king Alfred not being so properly the founder of this university, as its restorer after the Danish devastations. It has one master, twelve fellows, seventeen scholars, and two exhibitioners. Before the noble benefaction of Dr. Radcliffe, it had one large beautiful quadrangle, the south side of which is divided into a handsome hall and chapel. In a niche before this quadrangle is a statue of the late queen Anne, and in a niche on the inside of a new quadrangle is that of Dr. Radcliffe, who left forty thousand pounds for building a public library, which is a noble structure.

II. Baliol-college stands in the north part in the suburbs, and was founded by John Baliol, whose son was king of Scotland. It maintains a master, twelve fellows, thirteen scholars, and eighteen exhibitioners. It has one large ancient quadrangle, on the north side of which is the chapel, and a library furnished with a noble collection of books.

III. Merton-college is situated on the south side of the city, and takes its name from its founder Walter of Merton, bishop of Rochester, and chancellor of England, about the year 1267. It has a warden, twenty-four fellows, fourteen portionists, and two clerks. The chapel is the parish-church of St. John Baptist. The inner large court of the college is very beautiful, and has a well furnished library, with a fine garden.

IV. Exeter-college is situated on the west side of the schools, in the north part of the town, and was founded in 1316, by Walter Stapleton, bishop of Exeter, and lord treasurer of England. It maintains a rector, twenty-three fellows, one bible-clerk, and three exhibitioners. It has one large quadrangle, which has a very noble front, and over the gate is a splendid tower.

V. Oriel-college is situated on the south side of the town, and was at first named St. Mary's and King's-college. It was founded by king Edward II. in 1324, and his son Edward III. adding to the revenue a rich messuage called Le Oriel, it thence took the name of Oriel-college. It consists of one handsome regular quadrangle, and has a provost, eighteen fellows, and twelve exhibitioners.

VI. Queen's-college is seated near the parish-church of St. Peter's in the East, and founded in 1340 by Eglesfield, chaplain or confessor to Philippa, consort to king Edward III. in honour of whom he called it Queen's-college. It maintains a provost, sixteen fellows, sixteen scholars, eight chaplains, nine taberders, and twenty exhibitioners. It has had some noble benefactors, who have erected extensive buildings that are justly admired. One side of it is three hundred and twenty-seven feet long, supported by a piazza, and adorned with statues, in which is a long and lofty library, well furnished with books; and on the other side of the college is the new chapel and hall. Her late majesty queen Caroline's statue is erected in this college under a kind of temple supported by pillars, she having given a thousand pounds towards completing the new building.

VII. New-college, which stands on the north-east part of the city, was founded in 1386 by William of Wickham, bishop of Winchester, and lord high chancellor, under the name of the college of the Blessed Virgin Mary. It has a warden, seventy fellows, ten chaplains, three clerks, sixteen choristers, &c. Great additions have been made to the beauty of the buildings, which have been also enlarged towards the garden with two stately and uniform wings. The chapel is a magnificent structure, with a very lofty tower, and a fine ring of bells. The library is well furnished with books and manuscripts, and the great garden laid out in form. In the front is a range of iron palisades, and a gate of exquisite workmanship.

VIII. Lincoln-college, which stands in the middle of the city, was founded in 1427 by Richard Fleming, bishop

bishop of Lincoln; but finished by Thomas De Rotherham, bishop of Lincoln, afterwards lord high chancellor and archbishop of York, in 1475. It has a rector, twelve fellows, nine scholars, twenty exhibitioners, two chaplains, &c. This college has two small ancient quadrangles, with a beautiful chapel, the windows of which are curiously painted.

IX. All Souls college, which fronts the High street, was founded by Henry Chicheley archbishop of Canterbury, for offering up prayers for the souls of all who fell in the wars of king Henry V. in France. It has a warden, forty fellows, two chaplains, nine scholars, three clerks, six choiristers, &c. Colonel Codrington bequeathed ten thousand pounds to this college for building a library and furnishing it with books. This library is two hundred feet long within the walls, and thirty-two feet and a half broad: it has eleven large windows to the south, with a window of seventeen feet in width at each end. It is a fine gothic structure, and is thus built in conformity to the chapel.

X. Magdalen college stands without the east gate, and was founded in 1458, by William Patten, otherwise Wainfleet, bishop of Winchester, and lord high chancellor. It has a president, forty fellows, a school-master, thirty scholars, called demies, an usher, three public readers, four chaplains, eight clerks, sixteen choristers, &c. The chapel and hall are very magnificent, and the walks very delightful. The library, to which colonel Codrington also bequeathed ten thousand pounds, is very well furnished.

XI. Brazen-Nose college is situated in the middle of the city, where stood a hall of the same name, with a monstrous nose of brass fixed upon the door. It was founded in 1509, by William Smith bishop of Lincoln, and has a principal, twenty-four fellows, thirty-three scholars, &c. It consists of two very handsome quadrangles, in the lesser of which are the chapel and library, and under them a wide and pleasant cloister, compactly and elegantly built.

XII. Corpus Christi college stands on the south side of the city, and was founded in 1516, by Richard Fox, bishop of Winchester, and lord privy seal to king Henry VII. and VIII. It has a president, twenty fellows, twenty scholars, two chaplains, and four exhibitioners. It contains some very noble buildings, and its library has a valuable collection of books and manuscripts.

XIII. Christ-Church college, takes up a vast extent of ground, on the south side of the city. It was begun in the year 1515, by Cardinal Wolsey, but upon his disgrace it fell into the king's hands, who made it an episcopal see, and joined it to Canterbury college, and Peckwater Inn. It has a dean, eight canons, one hundred and one students, eight chaplains, eight singing men, eight choiristers, and a teacher of music, a school-master, usher, forty grammar scholars, &c. In the stately tower in the front of the gate, hangs the great bell called Tom, which was removed thither out of the steeple of the cathedral, and is seven feet one inch in diameter, weighing seventeen thousand pounds weight. This bell is tolled every night one hundred and one strokes, agreeable to the number of students in the college, to give warning for shutting up the gates in the colleges and halls in the university. The buildings of this college are very large and splendid. The great quadrangle has a wide and handsome terrace round it, and a fountain in the middle. Peckwater quadrangle is finely built, and there are also two other squares. The cathedral is lofty, the hall and library are high and spacious, and the latter contains a noble collection of books. In a word, this college is a university of itself.

XIV. Trinity college was originally a religious house, called Durham college; for the monks of Durham cathedral, seated in the north suburbs; but upon the dissolution of monasteries, Sir Thomas Pope purchased it of those to whom it had been granted by the crown, and converted it into a college. It has a president, twelve fellows, twelve scholars, &c. It consists of two quadrangles, in the first of which are the chapel, the hall, and the library. The chapel, which has been rebuilt, is an elegant structure, and the roof is enriched with fret-work, and an admirable painting representing our Saviour's ascension.

The gardens on the east side of the college are large and well laid out.

XV. St. John Baptist's college stands in the north suburbs, and was founded in 1555, by Thomas White, lord mayor of London in the place where St. Bernard's college stood before the Reformation. The two quadrangles are large and uniform, particularly the inner court built by archbishop Laud, which is very elegant, the east and west sides of it being supported by noble piazzas. The hall is neat, and adorned with good pictures, and the gardens large and well laid out. It has a president, thirty-nine fellows, eleven scholars, &c.

XVI. Jesus college is situated in St. Michael's parish, and was begun in 1571, by Hugh Price prebendary of Rochester, and appropriated to the benefit of the Welsh; it has met with several benefactions, by which it is enabled to maintain a principal, nineteen fellows, eighteen scholars, twenty-one exhibitioners, &c. It has two handsome quadrangles, the innermost of which is very regular and uniform.

XVII. Wadham college is seated in the north skirts of the city, and received its name from its founder Nicholas Wadham, of Somersetshire, Esq. It was begun in 1609, and finished after his death by his lady in 1613. It consists of one noble quadrangle, besides the library and chapel, the windows of which are beautifully painted, and has a handsome garden. It maintains a warden, fifteen fellows, fifteen scholars, &c.

XVIII. Pembroke college stands on the south side of the city, and was formerly called Broad-gate hall, but was erected into a college by the bounty of Thomas Tesdale, Esq. and Richard Wrightwicke, B. D. in 1624, who gave it the present name in honour of the earl of Pembroke, then lord chancellor. It has one handsome quadrangle, the front of which is a regular neat piece of building, and has a pleasant garden. It has a master, thirteen fellows, and twenty-three scholars, &c.

XIX. Worcester college was lately called Gloucester hall; but was erected into a college by Sir Thomas Cooksey, of Aitley in Worcestershire, and has lately been adorned with new buildings, which make a stately and splendid appearance.

XX. Hertford college was originally called Hart hall; but was erected into a college in 1740, by his late majesty's royal charter, by which it is to consist of a principal, with four senior and eight junior fellows. It stands in the parish of St. Peter's in the east, and consists of one quadrangle.

These are the twenty colleges of which this celebrated university consists; there are besides five halls, which are places unendowed, though not without exhibitions; the students in these subsist at their own expence, are under the government of a principal, and vice-principal, and pay the former for their lodgings. These five halls are Alban hall, Edmund hall, St. Marys hall, New-Inn hall, and St. Mary Magdalen hall.

Besides the building already mentioned, is the theatre, a magnificent structure raised by the munificence of Dr. Gilbert Sheldon archbishop of Canterbury, and built by Sir Christopher Wren. The roof, which is supported without pillars, is finely painted. There is here also the noble Bodleian library, and the museum Ashmoleanum, one of the richest repositories of natural curiosities in the world, the Clarendon printing-house, &c.

The city of Oxford was made an episcopal see in 1541, and besides the colleges and halls just mentioned, has two charity schools, one erected by the university for fifty-four boys, and the other by the city, for fifty boys and girls.

Woodstock, a borough seven miles to the north of Oxford, is pleasantly seated on a rising ground, and was formerly celebrated for the famous labyrinth in which fair Rosamond was concealed by king Henry II. and murdered by his queen. Some years ago a small part of the old palace, and of this labyrinth were remaining; but not the least vestige of them is now left. This town is now principally famous for Blenheim house, a magnificent pile of building erected about half a mile from the town to perpetuate the memory of the signal victory obtained by the allies over the French and Bavarians near the village of Blenheim on the banks of the Danube.

in August 1704. This noble seat, with the manor of Woodstock, was settled by the British parliament on John Churchill, duke of Marlborough, and his heirs, as a grateful acknowledgment for his bravery and conduct on that occasion. The roof is adorned with a stone balustrade; but there are several towers on the top of the wings, that have a very heavy aspect. The lofty hall was painted by Sir James Thornhill, and the ceiling by La Guerre; the rooms are finely enriched with marble chimney pieces, beautiful furniture, incomparable hangings, and paintings representing the principal exploits of the duke of Marlborough. Among the pictures are many of Rubens's best and largest pieces, and the famous loves of the gods by Titian, which was a present from the king of Sardinia. The gallery is supported by marble columns and pilasters, supporting a most curious entablature. Over a pediment in the front of the house, facing the gardens, is a fine bust of Lewis XIV. bigger than the life, taken from the gate of Tournay. The chapel is very beautiful, and the garden is a large plot of ground taken out of the park and well laid out, having fine walks, espaliers, &c. and the vistas are terminated by some remarkable objects in the neighbouring country. In the park is a lofty bridge, consisting of one arch above one hundred and ninety feet wide, and a vast obelisk, in which is inscribed an excellent summary of the duke's actions and character.

Banbury is a large well built market-town, seated on the Charwell, seventy-seven miles to the north-west of London. It contains several good inns, and its markets are well supplied with provisions. This is esteemed the second town in the county for beauty; the houses are generally built with stone, and the church is a large handsome structure. This town has long been famous for its cakes and ale.

SECT. XXI.

Of Buckinghamshire; its Name, Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, and principal Places.

THIS county probably derived its name from the Saxon word Buc, it formerly abounding more in deer than any other county. It is bounded on the north by Northamptonshire; on the east by Bedfordshire, Hertfordshire, and Middlesex; on the south by Berkshire, from which it is separated by the Thames; and on the west by Oxfordshire. Its length is about thirty-nine miles, its breadth where broadest, is about eighteen, and it is one hundred and thirty-eight miles in compass.

This county, which lies in the diocese of Lincoln, and in Norfolk circuit, is divided into eight hundreds, and contains fifteen market-towns, seventy-three vicarages, one hundred and eighty-five parishes, six hundred and fifteen villages, eighteen thousand three hundred and ninety houses, and about one hundred and eleven thousand three hundred and forty inhabitants. It sends fourteen members to parliament, namely two for the county, two for Buckingham, two for Chipping-Wycomb, two for Ailesbury, two for Great-Marlow, two for Wendover, and two for Agmondesham.

The air of Buckinghamshire is generally esteemed good, especially in the higher parts; and even in the vallies it is more healthful than in many other counties. The soil is for the most part chalk, or marl, and very rich; so that the corn and cattle of this county are excellent, particularly their sheep. The chief commodities are timber, beach, fine wool, and the chief manufactures are bone-lace, which is here made in great perfection, straw-hats, and paper.

The rivers of this county are but small, except the Thames, which washes its borders to the south; the others are the Ouse and the Colne.

The principal places in this county are the following:

Buckingham, which is seated on the Ouse, which surrounds it on all sides but the north, and is forty-six miles to the north-west of London. It stands on a low ground, and has three bridges over the river. A castle was for-

merly seated in the middle of the town, but hardly any of its ruins now remain. It has a town-hall, a church, and a chapel, erected by archbishop Becker, now used as a free-school, and several meeting-houses. The county jail and court are sometimes kept here, and sometimes the assizes are held in this town.

Near this town is Stow, a village rendered deservedly famous by the noble gardens which belonged to the late lord viscount Cobham, and now to earl Temple. On entering the garden on the south-side, you are struck with the grandeur and variety of the objects that present themselves to view. In the middle of a large octagon piece of water is an obelisk near seventy feet high, from the top of which rises a stream of water. At a good distance are two beautiful rivers, which join, and enter the octagon in one stream, and over one of them is a Palladian bridge. At a distance on the right hand is a Gothic structure seated on a hill, and dedicated to Liberty, and on the left, an Egyptian pyramid sixty feet high.

From the above octagon falls a natural cascade, in three different sheets of water. From hence you pass to the hermitage, which is agreeably situated in a wood; on passing through you come to a neat structure called the Veneris Hortus, before which are the statues of Cain and Abel. Each way from the entrance of the room is a handsome colonade leading to some pavilions, where are four antique busts of Vespasian, Cleopatra, Nero, and Faustina.

On the top of a mount is the Belvidere, a building which affords a delightful prospect. In the garden is also the temple of Friendship, a lofty square building of the Doric order, with three noble porticos on the sides. The ceiling is painted, and in the room are ten pedestals, on which are the busts of his lordship, and nine of his friends, his late royal highness the prince of Wales, the earl of Chesterfield, Mr. Pitt, &c. There are also in the garden, St. Augustine's cave, which is formed of roots of trees and moss: the temple of Bacchus; a Saxon temple, standing in a solemn grove, and containing the seven Saxon deities presiding over the several days of the week; and in the middle an altar for sacrifice; a Corinthian column, on which is placed the statue of his late majesty king George; Dido's cave, seated in a wood; a rotunda, the dome of which is supported by ten Doric columns, and in the centre is a circular pedestal, on which is placed a Venus de Medicis; the statue of her late majesty queen Caroline, erected on four Ionic columns placed on a large pedestal; the sleeping parlour, a square structure placed in a wood in the centre of six walks; the temple of ancient Virtue, which is a rotunda of the Doric order, and in four niches are the statues of Epaminondas, Lycurgus, Socrates, and Homer; the Elysian fields, a most delightful spot; a grotto adorned with shells, pebbles and minerals; a shell pavilion, the dome of which is supported by six wreathed columns; the Chinese house; the monuments of British worthies, these are Mr. Pope, Sir Thomas Gresham, Shakespear, Sir Isaac Newton, Sir Francis Bacon, king Alfred, Edward the Black Prince, queen Elizabeth, king William III. Sir Walter Raleigh, Sir Francis Drake, John Hampden, Esq; Sir John Barnard, &c.

In short, the temples, pavilions, pyramids, obelisks, monuments, statues, busts, &c. are all highly finished, and the many inscriptions are designed for the information and instruction of the beholder; and this delightful spot seems to want nothing that can contribute to render it a terrestrial paradise.

Ailesbury, the largest and best town in the county, is seated on a hill, 44 miles from London; but the country round it is low and dirty. It consists of several large streets, and has a handsome market-house, which stands in a kind of square. It has also a town-house, where the assizes, the sessions, and other meetings of the county are held, and under it the jail. Many of the poor are employed in making bone-lace. Provisions are here plentiful and cheap, which is owing to its being encompassed by some of the richest land in England. This town is governed by a bailiff, ten aldermen, and twelve capital burgesses. It gives title of earl to the noble family of Bruce.

Eaton, or Eton, a town seated on the Thames, opposite to Windsor, is justly celebrated for its college, which

has produced a great number of learned men. This building, except the great school-room, are in the Gothic style, and together with the chapel were founded by Henry VI. for the support of a provost and seven fellows, one of whom has the title of vice-provost, and for the education of seventy king's scholars, as those are called, who are on the foundation. The revenue of the college is about five thousand pounds a year. These scholars, when properly qualified, are elected on the first Tuesday in August, to King's college Cambridge, but are not removed till there are vacancies in the college, and then they are called according to seniority; and after they have been three years at Cambridge, they claim a fellowship. Besides those on the foundation, there are seldom less than three hundred scholars, at this time there are many more, who board at the masters houses, or within the bounds of the college. The school is divided into upper and lower, and each of these into three classes. To each school there is a master, and four assistants. Here is a noble library. In the great court is a fine statue of the founder, erected at the expence of the late provost Dr. Godolphin, dean of St. Paul's.

In this county are also Newport Pagnel, Stoney Stratford, and a number of fine seats.

S E C T. XXII.

Of Middlesex; its Name, Situation, Extent, Divisions, Air, Soil, and Produce; a concise Description of the River Thames, of the City of London, the Palace of Hampton-Court, and Kensington, with the other remarkable Places in this County.

THIS county received its name from its situation: it being surrounded by the East, West, and South Saxons. It is bounded on the north by Hertfordshire, on the east by Essex, from which it is divided by the river Lea, on the south by the Thames, which runs between it and Surry, and on the west by Buckinghamshire, from which it is separated by the river Coln. It extends twenty miles in length, fourteen in breadth, and is about ninety-five in circumference.

This county, which lies in the diocese of London, is divided into five hundreds; and, besides the cities of London and Westminster, contains four market towns, thirty-one vicarages, seventy-three parishes, five thousand houses, and twenty-five thousand inhabitants: but with the addition of London, the number of all these is vastly encreased. It is indeed one of the least counties, but is by much the richest, most populous, and pays more taxes to the government than any ten besides; yet sends only eight members to parliament, two for the county, four for London, and two for Westminster.

The air must be extremely wholesome, since not even the great number of people in London can affect it so much as to render it more subject to epidemical diseases, than other places usually are; but, at a very small distance from the smoke of this immensely populous city, the air is not only healthful but exceeding pure; to this the soil, which generally consists of gravel, greatly contributes. The land which chiefly consists of pasture and kitchen-gardens, is extremely fertile, which indeed cannot be otherwise, considering the advantages of the dirt of London streets, which in many places improves the land, and there being never any want of dung for manure, from the many thousand horses kept in this city and its neighbourhood.

The Thames, though running through various counties, seems properly to belong to Middlesex; it being here of the greatest importance to the kingdom. It may be here proper to take notice, that the right reverend annotator on Camden observes, that though it is the current opinion that the Thames had its name from the conjunction of the Thame and Isis, yet it is always called Thames before it comes near the Thame. This he proves from several ancient records, and adds, that it may be safely affirmed, that it does not occur under the name of Isis in any charter and authentic history; and that the name is no where heard of, except among scholars; the common people all along from the spring-head

to Oxford, calling it by no other name but that of the Thames. See Gibson's Camden, Vol. I. page 99.

It was necessary to say thus much to rescue truth from the poetic fictions of the marriage of Thame and Isis, which has been farther strengthened by the painters and engravers.

The Thames, says the author of London and its Environs, if considered with respect to its course and navigation, is not to be equalled by any river in the known world. It rises from a small spring a little to the south-west of Cirencester, in Gloucestershire; and taking its course east-ward, becomes navigable at Lechlade for vessels of fifty tons, and there receives the river Colne, about one hundred and thirty-eight miles from London. From Lechlade it continues its course north-east to Oxford, where it receives the Charwel; after which it runs south-west to Abingdon, and from thence to Dorchester, where it receives the Thame, and continuing its course south-east, flows by the borders of Berkshire, Buckinghamshire, Surry, Middlesex, Essex, and Kent, and passing by a number of towns and fine villages, proceeds by Westminster and London, to Deptford, Greenwich, Woolwich, Gravesend, and so on to the sea. It is impossible to represent the beauties with which the banks of this noble river are embellished from Windsor to London; the numerous villages on its banks being all along adorned with the magnificent houses and fine gardens of the nobility. This river is navigable as far as Lechlade, in Oxfordshire, which is two hundred and thirty miles from its mouth, and the tide flows as high as Richmond in Surry, which, following the course of the river, is seventy miles from the sea. At London the depth is sufficient for the navigation of large ships, which renders it one of the greatest ports for trade in the universe. The water is justly esteemed exceeding wholesome and fit for use in very long voyages, during which it will work itself perfectly fine. It likewise abounds with a great variety of fish.

London, the metropolis of Great Britain, and one of the largest as well as the richest cities upon earth, is situated in the fifty-first degree thirty minutes north latitude, and from this city we have, through the course of this work, computed the longitude of all other countries in the three parts of the world of which we have treated; but it is proper here to observe, that placing the first meridian at the isle of Ferro, its longitude east from thence is seventeen degrees thirty-five minutes.

This city was neither built by brute nor king Lud, as some romantic and fanciful authors pretend; but probably existed in the time of the ancient Britons, before the art of writing was brought into England, and when there were no other monuments of ancient facts than what were found in the songs of the bards which were preserved only by memory. London, however, had no buildings either of brick or stone till it was inhabited by the Romans; for the dwellings of the Britons were only huts formed of twigs wattled together: however, Tacitus observes, that in the year 26 it was very famous for the multitude of its merchants, and the greatness of its traffic; but soon after Suetonius abandoned the city to the fury of Boadicea, it being too large to be defended by his little army of ten thousand Romans, which is doubtless a proof of its being even then of considerable extent, that injured princess burnt the city, and in the cruelty excited by revenge, put the inhabitants to the sword.

It is impossible in the small compass required in a work like this, in treating of a single city, to give the revolutions that have happened in this metropolis: it will be sufficient therefore in this place to describe its present state. The two last great calamities this city has suffered were the plague in 1665, which swept away sixty-five thousand five hundred and ninety-six persons, at a time when the buildings of the city and its inhabitants did not amount to half the number they do at present; and the fire in 1666, which burnt down thirteen thousand two hundred dwelling-houses, four hundred streets and lanes, the cathedral of St. Paul's, eighty-six parish churches, six chapels, the royal exchange, with many other public structures, and fifty-two of the companies halls. In memory of this last a monument is erected near the place where

Boadicea haranguing the Britons.

where it began, which is a magnificent column that rises to a prodigious height, and on the base is an allegorical representation in basso rilievo of the raising of the city from this dreadful conflagration.

London is seated on the banks of the Thames, and, including the buildings which generally go under that name, extends above seven miles in length, but its breadth is in some places only three, in others two, and in others again not much above half a mile. A person unaccustomed to the sight cannot behold without surprise the vast number of barges and boats, both of pleasure and burthen, above London bridge, continually passing and repassing, for the convenience and supply of this city and the towns on the banks of the Thames; for is it possible to observe without astonishment the vast fleets which constantly appear below bridge, carrying away the manufactures of Britain, and bringing back the produce of the whole earth.

The city of London was formerly surrounded with walls, and till lately had seven gates: these were Ludgate, Aldersgate, Aldgate, Cripplegate, Newgate, Moorgate, and Bishopsgate; the three first of which were taken down in 1760, and all the rest, except Newgate, before the end of the following year. But the bounds of what is strictly called the city, including the liberties, are still every where determined by wooden bars, or rails, except on the west, where is a magnificent gate called Temple-bar.

We shall first consider the buildings belonging to the city, strictly so called. A little without the gates to the south-east it was defended by the Tower of London, a very ancient structure, in which the White Tower is said to be founded by William the Conqueror; it is surrounded by a wall and deep ditch, which inclose several streets, besides what is properly called the Tower: there are here some artillery, a magazine of small-arms for sixty thousand men, ranged in the most beautiful order, and a horse-armoury, in which are fifteen figures of kings on horse-back. Here are likewise the crown and other regalia, the mint for coining of money, and the managerie for lions and other beasts, with several foreign birds. The circumference of the whole is about a mile. It contains one parish-church, and is under the command of a constable and lieutenant.

In Thames-street, near the Tower, is the custom-house, with the front facing the river. This is a large and stately structure, where the king's customs are received for all goods imported and exported; and opposite to it, as well as a great way down the river, is a delightful prospect of a grove of masts belonging to merchant ships. A little farther to the west is London bridge, which was formerly much admired for having houses on each side; but having been of infinite disadvantage by blocking up and narrowing the passage, they have been taken down; instead of houses a handsome stone balustrade is now fixed on each side, and the passage rendered as commodious, and at the same time as beautiful as possible, without entirely rebuilding it.

The royal exchange in Cornhill is generally allowed to be one of the best structures of the kind in the world. It was first built by Sir Thomas Gresham in 1566, and 1567; but being burnt in 1666, it was rebuilt in a grander manner, the principal part of Portland stone, and cost eight thousand pounds. In each of the principal fronts is a piazza, and in the center a grand entrance into an area, under a noble and lofty arch; on each side that of the principal front, which is in Cornhill, are Corinthian demi-columns, supporting a compass pediment; and in the intercolumnation, on each side, is a nich with the figures of king Charles I. and II. in Roman habits. On the sides of this entrance is a range of windows placed between demi-columns and pilasters of the Composite order, above which runs a balustrade. The height of the building is fifty-six feet, and from the center of this side rises a lantern and turret a hundred and seventy-eight feet high, on the top of which is a fane in the form of a grasshopper, of polished brass. The north front of the royal exchange is adorned with pilasters of the Composite order; but has neither columns nor statues; and instead of the two compass pediments has a triangular one. The inside of the area, which is

a hundred and forty-four feet long and a hundred and seventeen broad, is surrounded with piazzas like those of the south and north fronts, forming ambulatories for the merchants to shelter themselves from the weather. Above the arches of these piazzas is an entablature extending round, and a compass pediment in the middle of each of the four sides. Under that on the north are the king's arms, on the south those of the city, on the east those of Sir Thomas Gresham, and on the west those of the mercers company. In these intercolumnations are twenty-four niches, twenty of which are filled with the statues of the kings and queens of England. In short, in the center of the area is another statue of king Charles II. in a Roman habit, encompassed with iron rails. In this area merchants meet every day at twelve at noon, and continue there in order to transact business till two. These merchants are disposed in separate classes, each of which has their particular station, called their walk.

The bank of England began to be erected in 1732; this is a very noble structure, to which very large additions are now making; with a grand passage to it from Cornhill.

The mansion-house is a magnificent structure; but too heavy and too large for the use for which it was designed. It is built of Portland stone, and has a portico of six lofty fluted columns of the Corinthian order in the front, the same order being continued in pilasters, both under the pediment and on each side. The basement story is very massy, and built in rustic, and on each side rises a flight of steps of very considerable height, leading up to the portico, in the middle of which is the door which leads to the apartments and offices. The columns support a large angular pediment, adorned with a very noble piece in basso rilievo, representing the dignity and opulence of the city of London, executed by Taylor. In the center stands a very graceful woman crowned with turrets, representing the city, her left foot placed upon the figure of Envy, who lies on her back, and seems endeavouring to rise. Her left arm rests upon a large shield, which has the city arms, and in her right hand she holds a wand. This being the principal figure, it is done in alto rilievo: she seems ready to step forwards, her head and right arm project from the back ground, and her wand extends beyond the cornice of the pediment. Near her, on her right hand, stands a Cupid, holding the cap of Liberty on the end of a short staff, and a little farther a river god, representing the Thames, lying reclined, pouring a stream of water from a large vase; and near him an anchor fastened to its cable, with shells lying on the shore. On the left hand of London is Plenty kneeling and supplicating London to accept of the fruits she is pouring from her cornucopia; and behind her are two naked boys with bales of goods, as emblems of commerce. Beneath this portico are two series of windows, which extend along the whole front; and above this is an Attic story, with square windows crowned with a balustrade. This building has an area in the middle, and the apartments are extremely noble.

Guildhall is the town-hall of the city, and is an old Gothic structure, in which the courts of justice are kept: the great hall is a hundred and fifty-three feet long, fifty broad, and fifty-eight high, embellished with two monstrous wooden giants, the pictures of several of the kings and queens of England, and of eighteen judges who distinguished themselves in determining the differences between landlords and tenants on rebuilding the city after the fire.

Blackwell-hall is famous for being the greatest mart for woolling cloth in the world. Sion-college has a library appropriated to the use of the London clergy.

In Warwick-lane is the college of physicians, where two of the fellows meet twice a week to give medicines to the poor gratis. The structure is very fine; but is in a manner entirely concealed.

Christ's hospital was formerly a house of the Grey friars, and was founded by Edward VI. for the entertainment and education of the children of citizens of both sexes. Here is a writing-school, drawing school, grammar-school, and another for teaching the mathematics. The boys educated, maintained, and clothed gratis in this school

where it began, which is a magnificent column that rises to a prodigious height, and on the base is an allegorical representation in basso relievo of the raising of the city from this dreadful conflagration.

London is seated on the banks of the Thames, and, including the buildings which generally go under that name, extends above seven miles in length, but its breadth is in some places only three, in others two, and in others again not much above half a mile. A person unaccustomed to the sight cannot behold without surprise the vast number of barges and boats, both of pleasure and burthen, above London bridge, continually passing and repassing, for the convenience and supply of this city and the towns on the banks of the Thames; for is it possible to observe without astonishment the vast fleets which constantly appear below bridge, carrying away the manufactures of Britain, and bringing back the produce of the whole earth.

The city of London was formerly surrounded with walls, and till lately had seven gates: these were Ludgate, Aldersgate, Aldgate, Cripplegate, Newgate, Moorgate, and Bishopsgate; the three first of which were taken down in 1760, and all the rest, except Newgate, before the end of the following year. But the bounds of what is strictly called the city, including the liberties, are still every where determined by wooden bars, or rails, except on the west, where is a magnificent gate called Temple-bar.

We shall first consider the buildings belonging to the city, strictly so called. A little without the gates to the south-east it was defended by the Tower of London, a very ancient structure, in which the White Tower is said to be founded by William the Conqueror; it is surrounded by a wall and deep ditch, which inclose several streets, besides what is properly called the Tower: there are here some artillery, a magazine of small-arms for sixty thousand men, ranged in the most beautiful order, and a horse-armoury, in which are fifteen figures of kings on horse-back. Here are likewise the crown and other regalia, the mint for coining of money, and the managerie for lions and other beasts, with several foreign birds. The circumference of the whole is about a mile. It contains one parish-church, and is under the command of a constable and lieutenant.

In Thames-street, near the Tower, is the custom-house, with the front facing the river. This is a large and stately structure, where the king's customs are received for all goods imported and exported; and opposite to it, as well as a great way down the river, is a delightful prospect of a grove of masts belonging to merchant ships. A little farther to the west is London bridge, which was formerly much admired for having houses on each side; but having been of infinite disadvantage by blocking up and narrowing the passage, they have been taken down; instead of houses a handsome stone balustrade is now fixed on each side, and the passage rendered as commodious, and at the same time as beautiful as possible, without entirely rebuilding it.

The royal exchange in Cornhill is generally allowed to be one of the best structures of the kind in the world. It was first built by Sir Thomas Gresham in 1566, and 1567; but being burnt in 1666, it was rebuilt in a grander manner, the principal part of Portland stone, and cost eight thousand pounds. In each of the principal fronts is a piazza, and in the center a grand entrance into an area, under a noble and lofty arch; on each side that of the principal front, which is in Cornhill, are Corinthian demi-columns, supporting a compass pediment; and in the intercolumnation, on each side, is a nich with the figures of king Charles I. and II. in Roman habits. On the sides of this entrance is a range of windows placed between demi-columns and pilasters of the Composite order, above which runs a balustrade. The height of the building is fifty-six feet, and from the center of this side rises a lantern and turret a hundred and seventy-eight feet high, on the top of which is a fan in the form of a grasshopper, of polished brass. The north front of the royal exchange is adorned with pilasters of the Composite order; but has neither columns nor statues; and instead of the two compass pediments has a triangular one. The inside of the area, which is

a hundred and forty-four feet long and a hundred and seventeen broad, is surrounded with piazzas like those of the south and north fronts, forming ambulatories for the merchants to shelter themselves from the weather. Above the arches of these piazzas is an entablature extending round, and a compass pediment in the middle of each of the four sides. Under that on the north are the king's arms, on the south those of the city, on the east those of Sir Thomas Gresham, and on the west those of the mercers company. In these intercolumnations are twenty-four niches, twenty of which are filled with the statues of the kings and queens of England. In short, in the center of the area is another statue of king Charles II. in a Roman habit, encompassed with iron rails. In this area merchants meet every day at twelve at noon, and continue there in order to transact business till two. These merchants are disposed in separate classes, each of which has their particular station, called their walk.

The bank of England began to be erected in 1732; this is a very noble structure, to which very large additions are now making; with a grand passage to it from Cornhill.

The mansion-house is a magnificent structure; but too heavy and too large for the use for which it was designed. It is built of Portland stone, and has a portico of six lofty fluted columns of the Corinthian order in the front, the same order being continued in pilasters, both under the pediment and on each side. The basement story is very massy, and built in rustic, and on each side rises a flight of steps of very considerable height, leading up to the portico, in the middle of which is the door which leads to the apartments and offices. The columns support a large angular pediment, adorned with a very noble piece in basso relievo, representing the dignity and opulence of the city of London, executed by Taylor. In the center stands a very graceful woman crowned with turrets, representing the city, her left foot placed upon the figure of Envy, who lies on her back, and seems endeavouring to rise. Her left arm rests upon a large shield, which has the city arms, and in her right hand she holds a wand. This being the principal figure, it is done in alto relievo: she seems ready to step forwards, her head and right arm project from the back ground, and her wand extends beyond the cornice of the pediment. Near her, on her right hand, stands a Cupid, holding the cap of Liberty on the end of a short staff, and a little farther a river god, representing the Thames, lying reclined, pouring a stream of water from a large vase; and near him an anchor fastened to its cable, with shells lying on the shore. On the left hand of London is Plenty kneeling and supplicating London to accept of the fruits she is pouring from her cornucopia; and behind her are two naked boys with bales of goods, as emblems of commerce. Beneath this portico are two series of windows, which extend along the whole front; and above this is an Attic story, with square windows crowned with a balustrade. This building has an area in the middle, and the apartments are extremely noble.

Guildhall is the town-hall of the city, and is an old Gothic structure, in which the courts of justice are kept: the great hall is a hundred and fifty-three feet long, fifty broad, and fifty-eight high, embellished with two monstrous wooden giants, the pictures of several of the kings and queens of England, and of eighteen judges who distinguished themselves in determining the differences between landlords and tenants on rebuilding the city after the fire.

Blackwell-hall is famous for being the greatest mart for woolling cloth in the world. Sion-college has a library appropriated to the use of the London clergy.

In Warwick-lane is the college of physicians, where two of the fellows meet twice a week to give medicines to the poor gratis. The structure is very fine; but is in a manner entirely concealed.

Christ's hospital was formerly a house of the Grey friars, and was founded by Edward VI. for the entertainment and education of the children of citizens of both sexes. Here is a writing-school, drawing school, grammar-school, and another for teaching the mathematics. The boys educated, maintained, and clothed gratis in this school

school generally amount to near a thousand, exclusive of the girls, who are about seventy in number.

The college of heralds, to which belong three kings at arms, namely, Garter, Clarencieux, and Norroy, with six heralds, four pursuivants, and eight proctors, is a spacious building, with convenient apartments, a good library relating to heraldry, and here the coats of arms are kept of all the families of note in England.

St. Paul's cathedral, which is seated on the highest ground in the city, is deservedly esteemed the second in Europe, not for magnitude only, but for the magnificence and grandeur of the building. Its general form is that of a long cross: the walls are wrought in rustic, and strengthened as well as adorned by two rows of coupled pilasters, one over the other; the lower Corinthian, and the other Composite. The spaces between the arches of the windows, and the architrave of the lower order, are filled with a great variety of curious enrichments, as are those above. The west front has a most magnificent portico, a noble pediment, in which is represented the conversion of St. Paul in basso relievo, and two stately turrets. At this end is a grand flight of steps of black marble, that extend the whole length of the portico, which consists of twelve lofty Corinthian columns below, and eight of the Composite order above, supporting the above pediment. These are all coupled and fluted. The magnificent figure of St. Paul on the apex of the pediment, with St. Peter on his right, and St. James on his left, have a fine effect. The four evangelists, with their proper emblems on the front of the towers, are also well executed. The other sides of the church are beautifully ornamented, and each has a different front. The dome, which rises in the center of the whole, appears extremely grand: twenty feet above the roof of the church is a circular range of thirty-two columns terminated by their entablature, which supports a handsome stone gallery, adorned with a balustrade. Above these columns is a range of pilasters, with windows between; and from the entablature of these the diameter encreases considerably. On the summit of the dome is an elegant balcony, and from its center rises the lantern, adorned with Corinthian columns; and the whole is terminated by a ball, from which rises a cross, both elegantly gilt.

This vast and noble fabric, which is two thousand two hundred and ninety-two feet in circumference, and three hundred and forty in height to the top of the cross, is surrounded at a proper distance by a dwarf stone wall, on which is placed a balustrade of cast iron. In the area of the grand west front stands a statue of queen Anne, formed of white marble, with proper decorations. Four statues sitting at the base, representing Britannia with the spear; Gallia or France with a crown in her lap; Hibernia, with her harp; and America with her bow.

At the entrance into the choir the organ gallery is supported by eight Corinthian columns of blue and white marble; and the choir has on each side thirty stalls, besides the bishop's throne on the south-side, and lord mayor's on the north. The carving of this beautiful range of stalls, as well as that of the organ, is much admired. The reader's desk, which is at some distance from the pulpit, is an inclosure of very fine brass rails gilt, in which is a gilt brass pillar, supporting an eagle of brass gilt, which holds the book on his back, and extended wings. The altar-piece is adorned with four noble fluted pilasters painted, and veined with gold, in imitation of lapis lazuli, and their capitals are double gilt. In the intercolumniations are twenty-one pannels of figured crimson velvet, and above them six windows in two series. The floor of the choir, and indeed of the whole church, is paved with marble; but within the rails of the altar with porphyry. In the large cross aisle between the north and south porticoes, and at a small distance from the choir, rises the cupola, where you have a view of the whispering gallery, of the paintings above it, and the concave at the top, which fills the mind with surprise and pleasure. Under its center is fixed in the floor a brass plate, round which the pavement is beautifully variegated; but the figures into which it is formed can no where be so well seen as from the whispering-gallery, to which any person may ascend for a trifling expence, and there the voice of one person softly speaking

against the wall, on the other side, seems as if he stood at your ear on this, though the distance between is not less than one hundred and forty feet; and the shutting of the door resounds through the spacious vault like thunder, or as if the whole fabric was falling asunder.

The other churches most worthy of notice in the city, are St. Stephen's Walbrook; which is justly admired for the inside, which is covered with a spacious and noble dome, finely proportioned to the church, and divided with small compartments decorated with great elegance, and crowned with a lantern, while the roof, which is also divided into compartments, is supported by very noble Corinthian columns, raised on their pedestals. Bow church in Cheapside, and that of St. Bride, are rendered very famous by the extraordinary elegance and lightness of their steeples. The Temple church is one of the most beautiful Gothic structures in England: it was founded by the Knights Templars, whose house is converted into two inns of court, called the Inner and Middle Temple, and consist of handsome buildings adorned with gardens.

Among the numerous hospitals in this city, are St. Bartholomew's near Smithfield, a very magnificent structure, of Portland stone, consisting of four sides, which, when the old buildings and shops are taken away, will form the most superb, though not the largest square in this metropolis. This is designed for the relief of the sick and lame; as is also the London hospital at Mile End. Bedlam or Bethlehem hospital is a magnificent building for the reception of lunatics, and St. Luke's hospital is a plainer, but no less useful building for the same purpose. The Magdalen hospital, and the small-pox hospital, are also noble foundations.

The borough of Southwark is a considerable part of this metropolis, it is seated on the south side of the Thames, and consists of the parishes of St. Olave, St. John, St. Saviour, St. George, and St. Thomas; and for its extent, and number of inhabitants, is perhaps inferior to few cities in England. Though in the county of Surry, it is justly considered as a part of London, it being in some measure subject to the lord-mayor, who has under him a steward and bailiff, the former of whom holds a court of record every Monday at St. Margaret's hill, for all debts, damages, and trespasses within his limits; and the lord-mayor proclaims Southwark fair. But tho' this is considered as one of the city wards, and an alderman is appointed for the government of it, yet it has its own magistrates, distinct from those of the city.

The most remarkable structures in Southwark are the two noble hospitals for the sick and wounded, called St. Thomas's and Guy's. The former consists of three fine squares encompassed with buildings, and adorned with the statues of king Edward VI. and Sir Robert Clayton. Its annual disbursements amount to eight thousand pounds: there are four hundred and seventy-four beds, which are constantly kept filled; and they have always a considerable number of out-patients.

Guy's hospital is also a noble structure, in one of the squares of which is a fine brazen statue of Mr. Guy. This hospital is seated near the former, and contains four hundred and thirty-five beds.

The government of the city has a near resemblance to the political constitution of the nation: for as England is governed by the king, lords, and commons in parliament assembled, so is the city by the lord-mayor, aldermen, and common-council. The city is divided into twenty-six districts, called wards, each of which is governed by its respective alderman, who is elected by the house-keepers.

Out of this body the lord-mayor, or principal magistrate, is annually chosen on Michaelmas-day, and enters upon his office on the ninth of November. He is also conservator of the river Thames, from the bridge at Stanes to the river Medway. When the lord-mayor appears abroad as a magistrate, it is in a coach of state; he then wears a purple or a scarlet robe, has a gold chain, with a rich jewel to it, round his neck, and is attended by several officers walking before and on each side of him.

The next in power and dignity are the twenty-six aldermen, each of whom has under him a certain number of common-councilmen, one of whom is his deputy: these, as well as the aldermen, are chosen by the inhabitants of each ward. The mayor and aldermen chuse the recorder, who is their speaker, and counsellor with respect to the laws and customs of the city.

The two sheriffs are considerable magistrates, who have the power to impanel juries, and in their courts causes are tried on actions of debt, trespass, breach of covenants, &c. the execution of the laws is intrusted to them. They are annually chosen on Midsummer-day by the liverymen.

The chamberlain of London is an officer of great trust, he having the charge of the city cash, and is usually general receiver of the land-tax for the city of London and county of Middlesex. He has also full authority over the apprentices of the city; for in his court he decides causes between them and their masters, and admits them to the freedom of the city.

The common-council are members chosen out of every ward, to the number of two hundred and thirty-six, by the house-keepers, from among themselves. These are the representatives of the people.

The liverymen of the city are such as have not only taken up the freedom of the city, but also the livery or gown of their respective companies. These companies amount to ninety-two in number, and the lord-mayor belongs usually to one of the principal of them; these are the mercers, grocers, drapers, fishmongers, goldsmiths, skinners, merchant-tailors, haberdashers, salters, ironmongers, vintners, and cloth-workers. Most of the ninety-two companies have halls, several of which are magnificent structures; together with a master, a clerk, several wardens, assistants, and liverymen, who transact the business of the company, and provide for a number of their own poor. In these companies are seventy-nine masters, two hundred and twenty wardens, two thousand three hundred and eighteen assistants, eight thousand two hundred and seventeen liverymen, who alone have the privilege of electing the representatives of the city, with fifty-two halls; and it is computed that above twenty-six thousand pounds is disposed of annually by these companies to charitable uses; and many of them have very noble alms-houses in the neighbourhood of the city, where the old and decayed members of their respective companies are lodged, maintained, and clothed.

Besides these there are several companies of merchants trading to different parts of the world, who have their respective halls: and a considerable number of companies for insuring ships at sea, and houses from fire; these always keep fire-engines and a set of men in pay, who are ready at all hours to give their assistance in case of fire; and are on all occasions extremely bold, dexterous, and diligent; but though all their labours should prove unsuccessful, the person who suffers by this devouring element has the comfort arising from the certainty of being paid the value of what he has insured.

We now come to Westminster, which is generally included under the name of London, and is only distinguished from it by its not being under the government of the same magistrates. It received its name from its abbey, or minster, being seated to the west of St. Paul's, and was once a mile distant from London; but its suburbs extending to that city, have perfectly united them.

As Westminster has the honour of containing the palace of the king of Great Britain, our law-tribunals, and both houses in which the parliament assemble, it is inhabited by the nobility and gentry, and thence that city and its liberties has a greater number of noble squares and elegant private buildings. The city of Westminster at present consists but of two parishes, St. Margaret's and St. John's the Evangelist; but the liberties contain ten parishes, namely, St. Martin's in the Fields, St. James's, St. Anne's, St. George's Bloomsbury, St. George's Hanover-square, St. George's Queen-square, St. Paul's Covent-garden, St. Mary le Strand, and St. Clement's Danes; to which may be added the precinct of the Savoy. However, each of the above parishes is of such prodigious extent, considering the number of the houses they con-

tain, that it would be impossible for one-tenth part of the inhabitants to attend divine worship at one and the same time, there are therefore many chapels of ease for the convenience of those who could not be so well accommodated in their parish-churches.

The abbey-church of St. Peter's Westminster is a venerable pile of building in the Gothic taste, where most of our monarchs have been crowned, and many of them interred. The present fabric was in part erected by Henry III. and finished after his death. The extent of the building is very considerable; for its length is three hundred and sixty feet within the walls, at the nave it is seventy-two broad, and at the cross a hundred and ninety-five. The Gothic arches and side aisles are supported by forty-eight pillars of grey marble, each composed of clusters of very slender ones, and covered with ornaments. This structure is adorned with a prodigious number of monuments of kings, heroes, generals, and persons distinguished by their learning and genius: many of which are extremely beautiful, being adorned with admirable statues of white marble, basso-relievos, the most beautiful kind of granite, porphyry, and other rich kinds of marble, finely polished, and accompanied with elegant inscriptions.

Henry the seventh's chapel joins to the abbey, and is styled by Leland, *The Wonder of the World*; it is, indeed, one of the most expensive remains of the ancient English taste and magnificence, and was founded by Henry VII. in 1502. The ceiling is wrought with such an astonishing variety of figures as is impossible to be describe. The stalls on each side are of oak, with Gothic canopies most beautifully carved; as are also the seats; and the pavement is of black and white marble. In the middle of the east end of the nave is the magnificent tomb of Henry VII. enclosed with a screen of cast brass, most admirably executed and ornamented with statues. In this chapel are the tombs of George Villiers, duke of Buckingham, and several other persons of high rank.

Westminster-hall is near the abbey, and is one of the largest rooms in Europe, whose roof is not supported with pillars. Here the courts of law are kept; and adjoining to it are the houses of the Lords and Commons.

Westminster bridge is universally allowed to be one of the finest in the world. The first stone was laid on the twenty-ninth of January, 1739, and the last in 1747. It is adorned and secured on each side with a lofty and noble balustrade, and is twelve hundred and twenty-three feet in length. The piers, which are fourteen, have thirteen large and two small arches, all semicircular. The center arch is seventy-six feet wide, and the others decrease in width four feet on each side.

The admiralty, the treasury, and the horse-guards are expensive buildings; the banqueting-house at White-hall is thus called from there being originally in this place an edifice in which our kings had public entertainments. This structure was erected by the celebrated Inigo Jones, as a small part of a superb palace, of which that great architect had drawn the plan. The outside of this structure has been always esteemed a most admirable work; and the ceiling is painted by Rubens. This great apartment has been many years converted into a chapel.

The architecture of several churches of Westminster and its liberties have been greatly admired, particularly that of St. Martin's in the Fields, and St. Paul's Covent-garden.

The British Museum, which may properly be said to be founded by Sir Hans Sloane, bart. may be justly esteemed an honour and an ornament to this nation, it consisting of an amazing number of natural curiosities, to which were added by his late majesty the royal libraries of books and manuscripts collected by the kings of England.

Amidst the splendid buildings of this city we are sorry we cannot mention the palace of our sovereign, which is a mean structure, unworthy of being the residence of so great a monarch. The meuse, which contains the king's stables, is, however, a more magnificent edifice; but the square in which it stands would admit of great improvements. The new buildings in the liberty of Westminster are daily increasing in the most astonishing manner. The principal squares are those of Hanover,

Grosvenor, Berkley, Cavendish, St. James's, Soho, Leicester, Golden, Red Lyon, Bloomsbury-square, and Lincolns-inn Fields; with many others of less note.

There are in Westminster, as well as in the city of London, a great number of charitable foundations, among which we may reckon the noble infirmaries at Hyde-park-corner, Middlesex hospital, and that called Westminster infirmary, the hospital for exposed and deserted young children, the asylum, several hospitals for lying-in women, and many others.

The civil and ecclesiastical government of this city were vested in the dean and chapter of Westminster; but since the Reformation the civil part has been committed to laymen. The high-steward, who is usually a nobleman of the first rank, is chosen by the dean and chapter, and has an under-steward who officiates for him, and must therefore be versed in the law; but his choice must be confirmed by the dean and chapter. The under-steward, with other magistrates, keeps the court leet, which tries all petty offences, and is commonly a chairman of the quarter-sessions.

Next to the under-steward is the high-bailiff, who is also chosen by the dean and chapter. His power resembles that of a sheriff, for by him juries are summoned; all the bailiffs of Westminster are subordinate to him, and he makes the return at the election of members of parliament. As all fines and forfeitures are his, his place is very profitable.

There is also a high-constable chosen by the court-leet, to whom all the other constables are subject. Here are likewise fourteen burgesses, or magistrates, seven for the city and seven for the liberties, each having an assistant. Their office is much like that of an alderman of London, each having a proper ward, out of these are elected two head-burgesses, one for the city, and one for the liberties.

Besides the cities of London, Southwark, and Westminster, there are included a great number of streets which cannot properly be termed in the liberty of either, and yet are comprehended under the general name of London, they being united to it. Hence the number of streets, lanes, and alleys exceed seven thousand, the houses amount to about a hundred and fifty thousand, and that of the inhabitants cannot be less than a million. Besides St. Paul's cathedral and Westminster abbey, there are a hundred and two parish-churches, and sixty-nine chapels of the established religion; twenty-one French Protestant chapels, eight chapels belonging to the Germans, Dutch, Danes, &c. above a hundred meeting-houses of the Protestant Dissenters; several popish chapels for the use of foreign ambassadors, and three Jewish synagogues. There are also in and near this city one hundred alms-houses, about twenty hospitals and infirmaries, twenty-two prisons, forty-two markets, twenty-seven public squares, besides those within any single building, as for instance in the Temple; eight free-schools for grammar learning, and a hundred and thirty-one charity-schools, which constantly provide education for above five thousand children.

In short, this great metropolis enjoys several advantages which no other great city has in equal perfection; the plenty of water fit for drinking and all other uses, is none of the least. That of the Thames, that of the New River, conducted to Islington by the immortal Sir Hugh Middleton, and that of several other water-works, not only supply this city with that necessary of life, essential also to cleanliness, and consequently to health, but running in streams through pipes under the pavement of every street, is of the greatest use in extinguishing fires: while the common-sewers contribute to keep the streets clean and wholesome, and prevent our ever being greatly incommoded by that element. Add to this, that this great metropolis is much better lighted by night than Paris, or any other great city, and that, by the improvement making in the pavement, it will in this respect also be inferior to no other city.

For the entertainment of people of all ranks there are assemblies for dancing, musical assemblies, two theatres, in which plays are acted, an opera-house, a house of theatrical amusements called Sadler's-Wells, at Islington, several places where there are commodious rooms and plea-

fant gardens near London, where the people meet to drink tea; besides Marybone-gardens, and Vaux-hall-gardens already described in treating of the county of Surry, and those of Ranelagh. The two last are not to be equalled in Europe.

Ranelagh-gardens, are so called from their formerly belonging to the earl of Ranelagh. Though the garden is beautiful, this place is most admired for its amphitheatre in the midst of it. This is a circular building, one hundred and eighty-five feet in its external diameter. Round the whole is an arcade, and over that a gallery with a balustrade, to admit the company into the upper boxes, except where the entrances break the continuity; over this are the windows, and it is terminated by the roof. The internal diameter is one hundred and fifty feet, and the architecture of the inside corresponds with that without, except that over every column between the windows, termini support the roof. In the middle of the area, where the orchestra was at first designed, is a chimney that has four faces; this renders it warm and comfortable in cold weather. The orchestra fills up one of the entrances. The entertainment consists of a fine band of music, with an organ, accompanied by the best voices. The regale is tea and coffee.

Chelsea, in which are the above gardens, is a large and populous village, pleasantly situated on the bank of the Thames, two miles from London. Here is a physic-garden belonging to the company of apothecaries of London, several private buildings worthy of the curiosity of the public; Salter's coffee-house, well known for the great number of curiosities to be seen there; and Chelsea-hospital, a noble edifice, erected for the invalids in the land-service.

Chelsea-hospital, which Charles II. began to erect, was carried on by James II. and completed by William III. was entirely built under the direction of Sir Christopher Wren, and consists of a vast range of buildings. The front towards the north opens into a piece of ground laid out in walks for the pensioners; and that facing the south, into a garden which extends to the Thames, and is kept in good order. This side not only affords a view of that fine river, but of the county of Surry beyond it. In the centre of this edifice is a pediment supported by four columns, over which is a handsome turret, and in this part is an opening which leads through the building. On one side of this entrance is the chapel, the altar-piece of which is adorned with the resurrection, painted by Ricci; and on the other the hall, where is the picture of Charles II. on horseback, and several other pieces as big as the life, and in this room all the pensioners dine. The wings join the chapel and hall to the north, and are open towards the Thames on the south: these are three hundred and sixty feet in length, and about eighty in breadth; they are three stories high, and the rooms are so well disposed, that nothing can be more pleasant. On the front of this square is a colonade, extending along the side of the hall and chapel; and in the midst of the quadrangle is the statue of king Charles II. in a Roman dress, standing on a marble pedestal. There are several other buildings adjoining, that form two other large squares, and consist of apartments for the officers and servants of the house; for old maimed officers of horse and foot, and the infirmary for the sick.

An air of elegance and neatness is observed in these buildings. They are composed of brick and stone, and there appears such a disposition of the parts as is best suited to the purposes of the charity, the reception of a great number, and the providing them with every thing that can contribute to the convenience and pleasure of the pensioners. The expence of erecting them amounted to about one hundred and fifty thousand pounds, and the extent of the ground is above forty acres.

In the wings are sixteen wards, in which are accommodations for above four hundred men; and in the other buildings are a considerable number of apartments for officers and servants. These pensioners consist of superannuated veterans, who have been at least twenty years in the army, or those soldiers who are disabled in the service of the crown. They wear red coats lined with blue, and are provided with all other clothes, diet, washing, and lodging. The governor has five hundred pounds a year;

a year; the lieutenant-governor two hundred and fifty pounds, and the major one hundred and fifty pounds. Thirty-six officers are allowed six pence a day; thirty-four light horsemen, and thirty serjeants, have two shillings a week each; forty-eight corporals and drums have ten pence *per* piece; and three hundred and thirty-six are each allowed eight pence a week pocket-money. As the house is called a garrison, all the members are obliged to do duty in turn; and they have prayers twice a day in the chapel, performed by two chaplains, who have each a salary of one hundred pounds a year. The physician, secretary, comptroller, deputy-treasurer, steward, and surgeon, have also each a hundred pounds a year, and many other officers have considerable salaries. There are likewise between eight hundred and a thousand out-pensioners, each of whom has eight pounds twelve shillings and six pence a year.

These great expences are supported by a poundage deducted out of the pay of the army, with one day's pay once a year from each officer and common soldier; and when there is any deficiency, it is supplied by a sum raised by parliament.

This hospital is governed by the following commissioners; the president of the council, the first commissioner of the treasury, the principal secretary of state, the pay-master-general of the forces, the secretary at war, the comptrollers of the army, and by the governor and lieutenant-governor of the hospital.

Kensington is a large and populous village, about two miles from Hyde-Park-Corner. The palace, which was the seat of the lord-chancellor Finch, afterwards earl of Nottingham, was purchased by king William III. who greatly enlarged it; queen Mary enlarged the gardens; they were farther improved by queen Anne, and queen Caroline completed the design by extending them much farther. These gardens, which are three miles and a half in compass, are extremely pleasant, and kept in great order, and in summer are resorted to by a great number of people. The palace indeed, has none of that grandeur which ought to appear in the residence of a British monarch, it being very irregular in point of architecture; however, the royal apartments are grand, and adorned with pictures by the greatest masters.

Hampton-Court is delightfully situated near the north bank of the Thames, twelve miles to the south-west of London, at a small distance from the village of Hampton. This palace was originally built by cardinal Wolsey: but king William and queen Mary were so greatly pleased with the situation, which rendered it capable of great improvements, and of being made one of the finest palaces in Europe, that while the former caused the old apartments to be pulled down and rebuilt in the magnificent manner in which they now appear, her majesty, impatient to enjoy so agreeable a retreat, fixed upon a building near the river called the water-gallery, and suiting it to her convenience, adorned it with the utmost elegance, though its situation would not allow it to stand after the principal building was completed. Since the pulling down of the water-gallery which stood before the fine stone front that faces the river, the ground to the south-west received considerable improvements. The park and gardens, with the ground on which the palace now stands, are about three miles in circumference. On a pediment at the front of the palace on this side is a bas-relief of the trials of Hercules over Envy, and facing it a large oval basin, answering to the form of this part of the garden, which is a large oval divided into gravel-walks and parterres. At the entrance of the grand walk are two large marble vases of exquisite workmanship, one said to be performed by Mr. Cibber, the father of the poet-laureat; and the other by a foreigner: these pieces are reported to be done as a trial of skill; but it is difficult to determine which is the finest performance. They are beautifully adorned with bas-relieues, that on the right hand representing the triumphs of Bacchus, and the other on the left Amphitrite and the Nereids. At the bottom of this walk, facing a canal which runs into the park, are two other large vases, the bas-relief on one representing the judgment of Paris, and that of the other, Meleager hunting the wild boar. In four of the parterres are four fine brass statues, all after fine originals.

The whole palace consists of three quadrangles; the first and second are Gothic; but in the latter is a most beautiful colonade of the Ionic order, the columns in couplets, built by Sir Christopher Wren. Through this you pass into the third court or quadrangle, in which are the royal apartments, which are magnificently built of brick and stone by king William III. and on the farther side of them are the gardens, with the superb front of stone facing them.

On the opposite side of the quadrangle, that is adorned with a colonade, is the great stair-case, which has iron balusters curiously wrought and gilt, and both the ceiling and sides were painted by Verrio. From the stair-case you pass into the grand chamber, which is upwards of sixty feet long, and forty wide. This room contains arms for five thousand men, placed in various forms.

The next is the king's first presence-chamber, which is hung with rich old tapestry. The ceiling is vaulted, and from the centre hangs a fine lustre of nineteen branches. Fronting the door are the canopy and chair of state, which, as well as the stools, are of crimson damask. On the left hand of the entrance is a fine picture, about eighteen feet by fifteen, by Sir Godfrey Kneller; in which king William III. is represented in armour on a stately grey horse, trampling on trophies of war, and a flaming torch: Plenty, with her cornucopia, offers him an olive branch, and Flora presents flowers. At the top in the clouds, Mercury and Peace support his helmet, decorated with laurel, and a cupid holds a scroll. On the bottom part of the picture appear Neptune and his attendants by the side of a rock, welcoming the hero on shore; and at a distance is seen a fleet of ships, their sails swelled with the wind.

The second presence-chamber is spacious, and has a vaulted ceiling, from the centre of which hangs a gilt chandelier of twelve branches. The tapestry is ancient, but very rich, the lights being all gold, and the shadows silk. The chair of state and stools are of crimson damask, fringed with the same colour. The room is also adorned with several paintings.

The fourth room is very lofty, in the middle hangs a beautiful chased silver chandelier of sixteen branches. Here is a fine canopy of state, with the windows, curtains, chair, and stools, of rich crimson damask, laced and fringed with gold. The tapestry, which represents part of the story of Abraham, is fine.

In the fifth room is also a chair of state and stools; the window-curtains are tissue, with a silver ground, and there are silver sconces fastened to the tapestry. Over the chimney-piece is an admirable whole length picture of king Charles I. and over the doors are two capital pictures; the first is David with Goliath's head, by Fetti; the other the holy family, by Correggio.

In the king's state-chamber is a bed of crimson velvet laced with gold, with plumes of white feathers on the top. This room, which is very spacious, is hung with tapestry, and adorned with eight chased silver sconces. The ceiling, which was painted by Verrio, represents Endymion lying with his head in the lap of Morpheus, and Diana admiring him as he sleeps. On another part of the ceiling is a fine figure of Somnus with his attendants. In the border are four landscapes, and four boys with baskets of flowers, intermixed with poppies.

The king's dressing-room has also the ceiling painted. Mars is sleeping in Venus's lap, while several cupids steal away his armour, sword, and spear, and others are binding his legs and arms with fetters of roses. The room is hung with straw-coloured India damask, and the chairs, stools, and screen, are covered with the same.

The king's writing-closet is of a triangular form. The hangings and stools are of a pea-green India damask. A glass is so placed as to shew all the rooms on that side of the building in one view. Over each door is a flower-piece by Baptift, and over the chimney a fine picture of a great variety of birds, by Bougdane.

Queen Mary's closet is hung with needle-work, said to be wrought with her own hand; there are also an easy chair, four others, and a screen, all said to be the work of that excellent queen. The work is extremely neat, and shows great judgment in drawing.

The queen's gallery, which is about seventy feet long, and twenty-five feet wide, is hung with seven beautiful pieces

pieces of tapestry, representing the history of Alexander the Great, done after the paintings of Le Brun.

The cieling of the queen's state bed-chamber is finely painted: Aurora is represented rising out of the ocean in her golden chariot, drawn by four white horses. The bed is of crimson damask, and, besides other furniture, the room is adorned with a number of fine portraits, and a glass lustre with silver sockets.

The queen's drawing room has the cieling painted by Verrio: in the middle queen Anne is represented in the character of Justice, holding the sword and scales, with Neptune and Britannia supporting a crown over her head. The room is hung with green damask, upon which are placed nine pictures by Andrea Montegna, three on each side of the room, and three at the end. These were originally all in one piece of great length, as may be plainly seen from some of the figures being cut asunder, and placed in different pieces. The whole is a triumph of Julius Cæsar, and was a long procession of soldiers, priests, officers of state, &c. at the end of which that emperor appears in his triumphal chariot, with Victory holding a laurel crown over his head.

The queen's state audience-room has a fine canopy of state, and is hung with rich tapestry, representing the children of Israel carrying the twelve stones to the river Jordan; and has five pictures at full length of the duke, duchess, and marchioness of Brunswic; the duchess of Lenox, and Margaret queen of Scots all by Holbein.

The prince of Wales's presence-chamber is hung with tapestry, and has a canopy of state of green damask; and both this, and the prince's drawing-room, are adorned with a number of portraits by Holbein.

In the private dining-room are four pictures of the defeat of the Spanish armada, by Vandevelde, and over the chimney a very fine one, by Vandyke, of the lord Effingham Howard, lord high-admiral of England.

In the admirals gallery are the pictures of a considerable number of celebrated admirals; and in the room of beauties are the portraits of a number of beautiful ladies of the English court; among which is that of queen Mary.

The cartoons of Raphael Urbino, so called from their being painted on paper, were for a long time the most considerable ornament of this palace; but have of late been removed to the queen's palace in St. James's park.

A great number of the villages in this county are adorned with many seats of the nobility and gentry, and are more worthy of notice than even the market-towns: it will be sufficient to mention one or two of those seats.

Chiswick, is seated on the Thames, on the south-west side of Hammer-smith. In this village is a charity school; and it is adorned with several elegant seats, as the earl of Grantham's, now colonel Elliot's, the earl of Shrewsbury's, the late lord Wilmington's, &c. but the most remarkable is that of the late earl of Burlington's, which was a plain commodious building, but a part of it being destroyed by fire, his lordship erected near it a beautiful villa, which for elegance of taste, equals every thing of its kind in England. The court in the front is kept very neat, and has on each side yew-hedges in pannels, with termini placed at proper distances, and in the front of the hedges are two rows of cedars, the dark shade of which afford a pleasing contrast to the whiteness of the elegant building behind them. The ascent to the house is by a noble flight of steps, on one side of which is the statue of Paladio, and on the other, that of Inigo Jones. The portico is supported by six fine fluted columns of the Corinthian order, with a very elegant pediment, and the cornice, frieze, and architrave, are as rich as possible. Though the other front towards the garden is plainer, yet it is in a bold and masterly style, and has at the same time a pleasing simplicity, as hath also the side-front towards the serpentine-river, which is different from the two others. The octagonal saloon in the middle of the building, which is covered at the top with a dome, through which it is enlightened, is also very elegant. The inside of this structure is nobly adorned, the cielings are gilt and painted, and the rooms ornamented with some of the best pictures in Europe.

The gardens are very beautiful, and laid out in the finest taste: on descending from the back part of the house you enter a verdant lawn planted with clumps of evergreens, between which are two rows of large stone vases. At the end next the house are two wolves in stone, by Scheemaker: at the farther end are two large lions, and the view is terminated by three antique statues, dug up in Adrian's garden at Rome, with stone seats between them, and behind a close plantation of evergreens. On turning to the house on the right hand an open grove of forest-trees affords a view of the orangery; and on turning to the left is an easy slope covered with short grass, which leads down to a serpentine river, on the side of which are clumps of evergreens; and at the farther end is an opening into an enclosure, where are a Roman temple and an obelisk, with grass slopes, and in the middle a circular piece of water. From hence you are led to the wilderness, through which are three straight avenues, terminated by three different edifices; and in the sides are serpentine walks, through which you may ramble near a mile in the shade. On each side the serpentine river are also verdant walks, which accompany the river in all its turnings. On the right hand of the river is a building that is the exact model of the portico of Covent-garden church; on the left a wilderness laid out in regular walks, and in the middle over the river a Paladian wooden bridge. With the earth dug from the bed of this river is raised a terrace that affords a prospect of the adjacent country, which when the tide is up is agreeably enlivened by a view of the boats and barges passing along the Thames.

Gunerbury-house, near Ealing, the seat of the late Henry Furnese, Esq; is a noble and elegant structure built by Inigo Jones, or, as some say, by Mr. Webb, his son-in-law. It is seated on a rising ground, and the approach to it from the garden is remarkable fine. The loggia has a beautiful appearance at a distance, and commands a fine prospect of the county of Surry, the river Thames, and of all the meadows on its banks for some miles; and in clear weather of even the city of London. The apartments are well contrived, and the hall, which is spacious, is on one side supported by rows of columns, and from thence you ascend by a noble flight of stairs to a saloon, twenty-five feet high, and most elegantly furnished. This fine room has an entrance into the portico on the back front, which is adorned with beautiful columns. On entering the garden from the house you ascend a noble terrace, which affords a delightful view of the neighbouring country, and from this terrace, which extends the whole breadth of the garden, you descend by a noble flight of steps, with a grand balustrade on each side, into the garden.

S E C T. XXIII.

Of the County of Essex; its Situation, Extent, Divisions, Representatives, Air, Soil, and principal Places.

ESSEX, which took its name from its being the country of the East Saxons, is bounded on the north by the river Stour, which separates it from Suffolk and Cambridgeshire; on the east by the German sea; on the west by Hertfordshire and Middlesex; and on the south by the river Thames. It extends forty-four miles in length from east to west, and about forty-two in breadth from north to south. This county, which is in the diocese of London, is divided into eighteen hundreds, and contains twenty-seven market-towns, four hundred and fifteen parishes, a hundred and twenty-five vicarages, and eleven hundred villages, with about thirty-four thousand eight hundred houses, and two hundred and eight thousand eight hundred inhabitants. It sends eight members to parliament, namely, two for the county, and two for Colchester, Harwich, and Malden.

The air in the inland parts is healthy; but in the marshes near the sea it produces agues, particularly in the part called the Hundreds. However, the fertility of the unwholesome part is very great, and even the higher grounds of this county are very fruitful. About Saffron

Walden

Walden, the earth, after bearing saffron three years, it is said, will produce good barley for eighteen years successively, without any manure. Its produce, which is very plentiful, consists of corn, most excellent saffron, cattle, fowl, fish, and particularly oysters. The chief manufactures of this county are cloth, stuffs, and particularly baize.

The principal rivers, besides the Thames, are the Stour, which falls into the German sea at Harwich; the Lea, its western boundary, falls into the Thames below Stratford; the Blackwater runs through the heart of the county, and passing by Chelmsford is joined by the Chelmer, and from thence runs into the German sea; the Colne runs by Halsted to Colchester, and so into the sea. All these rivers abound in most sorts of fish.

The principal places in this county are the following:

Chelmsford is thus called from the ford over the river Chelmer, and is seated on the road to Colchester, between that river and the Blackwater, over which there are bridges, twenty-eight miles east-north-east of London. It is a handsome well frequented town, and is governed by a chief constable; but has only one church, which is an ancient Gothic structure, and three meeting-houses. There is here an excellent conduit, which has such a supply of water, that it is said to run above a hog-head and an half in a minute. Here the members for the county are chosen, and the assizes commonly held, as well as the four quarterly sessions. As it is seated nearly in the center of the county, and in the great road to London, it is much frequented by travellers and the neighbouring gentry, for transacting all business relating to the county.

Colchester is a place of great antiquity, twenty-two miles to the east-north-east of Chelmsford, and fifty from London. It is pleasantly and commodiously seated on the south side of the river Coln, which runs through the town, and incloses it on the east and north-east sides: over it are three bridges. It is navigable within three miles of the town for large ships; a little lower it may receive the royal navy; and up to that part called the Hythe it is navigable for hoys and small barks quite close to the houses, here being a long quay. The trade principally consists in making baize and serges, the whole country being employed in spinning wool for this and the adjacent towns. Colchester, including the villages within its liberty, which is of large extent, has been supposed to contain forty thousand people. In the civil wars, during the reign of Charles I. it sustained a severe siege, which was turned into a blockade, in which the garrison and inhabitants suffered the utmost extremity of hunger, and were at last obliged to surrender at discretion, when their two principal officers, Sir Charles Lucas and Sir George Lisle, were barbarously shot in cold blood under the castle wall, to the indelible infamy of Fairfax, the general of the parliament's forces. It was surrounded with a wall, which had six gates and three posterns, besides nine watch-towers; but these are in a great measure demolished. It had sixteen parish-churches; but now only twelve are used, which are not very large, and most of them were damaged in Cromwell's time. There are here also five meeting-houses. The town consists of about three thousand dwelling-houses, most of them ancient buildings; but there are among them many good houses. The streets are not very broad, but are pretty well paved: and the town, which is famous for oysters and eringo-root, imports baize, wine, brandy, coals, deals, &c. Towards the east are the ruins of an old castle, with a fence round it, about two miles in circumference.

Harwich, a sea-port town, situated in the fifty-second degree three minutes latitude, and in the first degree eighteen minutes east longitude, seventy-three miles to the east-north-east of London, is surrounded on three parts by the sea and the river Stour. It is not very large, but is well inhabited, and contains between eight and nine hundred houses, which are generally good and lofty buildings, and the streets are both pretty wide and well paved. The number of the inhabitants amount to about four thousand. The harbour is one of the finest in England, for in it four hundred ships may ride in safety;

and opposite to the town is Landguard fort, and a good battery of cannon. Here the packet-boats are stationed that pass to and from Holland; and here also is a good dock-yard, in which many ships of war are built. The town is governed by a mayor, eight aldermen, a recorder, and twenty-four capital burgeses; but it has only a chapel of ease, and several meeting-houses, the mother church being at Dover-court, at two miles distance. The market is kept on Tuesdays and Fridays.

Dunmow, a market-town thirty-eight miles from London, in which the manufacture of baize flourishes, is particularly remarkable since Henry III's time for the custom of giving a fitch of bacon to any married couple who will swear, kneeling on two peaked stones in the church-yard, that for a year and a day after their marriage they never repented of their choice, nor quarrelled in all that time; and this appears upon record to have been several times actually claimed and delivered.

S E C T. XXIV.

Of the County of Suffolk; its Situation, Extent, Divisions, Representatives, Air, Soil, Produce, and principal Towns.

SUFFOLK was thus called by the Saxons, to denote the Southern people, in opposition to those of Norfolk, or Northfolk; and is bounded on the north by the rivers Waveney and the Lesser Ouse, which part it from Norfolk; on the east by the German ocean; on the south by the river Stour, which divides it from Essex, last described; and on the west by Cambridgeshire. It extends fifty miles in length, twenty-five in breadth, and is divided into seventeen hundreds, in which are twenty-eight market-towns, ninety-five vicarages, five hundred and seventy-five parishes, fifteen thousand villages, thirty-four thousand four hundred and twenty houses, and two hundred and six thousand inhabitants. It sends sixteen members to parliament, namely, two knights for the shire, and two burgeses for each of the following boroughs: Ipswich, Dunwich, Orford, Aldborough, Sudbury, Eye, and St. Edmondsbury, and lies in the diocese of Norwich.

The air is very clear and healthy, even near the sea-coast; the beach being generally sandy and shelly, which either absorbs or shoots off the sea-water, and keeps it from stagnating or forming a noisome and stinking mud, whence physicians esteem the air as good as any in England.

The soil is of various qualities; that near the shore is sandy and full of heaths, yet abounds in rye, peas, and hemp, with numerous flocks of sheep. High Suffolk, or the Wood-lands, which is the inland part of the county, though abounding in wood, has a rich deep clay and marle that yields good pasture-grounds, on which feed abundance of cattle. That part which lies on the confines of Essex and Cambridge also affords excellent pasture; and about Bury St. Edmund's, and so on to the north and north-west, it is fruitful in corn, except towards Newmarket. The seeding of cattle and sheep on turnips is said to have been an improvement first set on foot in this county. Its principal produce is butter and cheese, the latter of which is frequently in this county very much the worse on account of the goodness of the former, and is sometimes of so hard and horny a nature, as to require the force of the hatchet to cut it.

This county is generally divided into two parts, namely, the Franchise or Liberty of St. Edmund, which contains the west part of the county; and the Geldable, which is the eastern, each of these furnishes a distinct grand-jury at the assizes.

The principal rivers are the Waveney, the Deben, the Orwell, by some called the Gipping, and the Stour. The Waveney rises in the northern edge of the county, and running to the north-eastward, after it has passed Beccles, forms two branches, one of which runs to the east almost to Leostoff, where it stops short, without reaching the sea; the other makes an angle to the northward, and falls into the Yare a little above Yarmouth. The Deben rises a little to the westward of Debenham, and running eastward to Wickham, winds round that town, and runs south-

south-south-east to the German ocean. The Orwell rises near Wulpit, and runs eastward to the same sea. The Stour rises in the edge of Cambridgeshire, and running mostly eastward, falls into the German ocean with the Orwell at Harwich.

The principal places in this county are the following:

Ipswich, a place of great antiquity, is seated on the river Orwell, twenty miles to the north-east of Colchester, and seventy-two to the north-east of London, and was once surrounded with a wall, the traces of which are still to be seen. The town forms a half moon upon the bank of the river, and it is remarkable that though ships of five hundred tons may upon a spring-tide come up near the town, yet the river is scarce navigable above the town even for the smallest boats; nor does the tide, which sometimes rises thirteen or fourteen feet, and gives them near the town twenty-four feet water, flow much farther up the river. This may be accounted a very neat and well-built town. It has a very spacious market-place, in the midst of which is a handsome cross. At a small distance is the shambles, with the herb-market; and in a spacious street, at a small distance, is a market for butter, poultry, &c. and another for fish, with which the town is well supplied. The town consists of about four thousand houses, which are generally good buildings and very lofty, formed into streets that are tolerably wide and well paved. It is divided into four wards, and contains twelve parish-churches, with a Presbyterian, an Independent, and a Quaker's-meeting. Here is also a town-hall, with a spacious council-chamber, and other commodious apartments; a county-hall, two hospitals, a free-school, a good library, a custom-house, a good quay, and several alms-houses. It is governed by a bailiff, twelve aldermen, and twenty-four common-councilmen; but no manufacture of consequence is carried on here; yet being a sea-port, and having a large and convenient quay, it has a good maritime trade, though it is not so considerable as formerly.

Bury St. Edmund's, or St. Edmundsbury, so called from Edmund, king of the East Angles, who was murdered in 870, and buried here, is delightfully situated upon an eminence on the west side of the river Lark, or Bourne, seventy miles to the north-east of London, and having a view of a very fruitful country, has been called the English Montpellier. It is regularly built, the streets crossing each other almost at right angles, and is governed by a recorder, twelve aldermen, and twenty-four common-council. It was formerly famed for its abbey, which was said to be the finest and richest of any in England, and stood between the two churches, which are both very large, and seated in one church-yard. In St. Mary's, one of these churches, lies Mary queen of France, who was married to Thomas duke of Norfolk. Besides these churches, it has one Presbyterian, one Independent, and one Quaker's-meeting. The inhabitants are said to amount to about seven thousand. Here is a spacious market-house, a beautiful cross, and a grammar-school. Here are held the assizes for the county. This town is the general rendezvous of all the nobility and gentry from the neighbouring counties.

SECT. XXV.

Of Cambridgeshire; its Situation, Extent, Divisions, Representatives, Air, Soil, &c.

CAMBRIDGESHIRE, which receives its name from Cambridge, so called from its bridge over the river Cam, is bounded on the north by Lincolnshire; on the east by the counties of Norfolk and Suffolk; on the south by Essex and Hertfordshire; and on the west by Huntingdon and Bedfordshire. It is thirty-five miles in length, about twenty in breadth, and near a hundred and thirty in circumference; it lies partly in the diocese of Ely, and partly in that of Norwich. It is divided into sixteen hundreds, and contains eight market-towns, eighty-three vicarages, a hundred and sixty-three parishes, two hundred and seventy-nine villages, with about seventeen thousand houses, and eighty-six thousand seven

hundred inhabitants. It sends only six members to parliament, namely, two for the county, two for the town of Cambridge, and two for the university.

The air and soil of this county vary extremely, some parts, especially the southern and eastern, are pleasant and healthy; but the northern and fen-country are low and watery, and consequently not very healthful. As the fen-country is in a manner the sink of thirteen counties, it is often overflowed; for all the waters of the middle part of England, which do not run into the Thames or the Trent, fall into these fens, and in the latter part of the year, when they are overflowed with water, they appear covered with fogs; so that while the higher grounds of the adjacent country glitter with the beams of the sun, the Isle of Ely appears wrapt in a mist. To clear these fens a number of drains has been made at a very great expence, by which a great deal of ground has been rendered fertile, and the air much improved. The people who are used to live in this watery country are as healthy as those who enjoy a clearer air, except being subject to the ague, which they make light of.

In these fens are abundance of those ingenious contrivances called decoys, and it is incredible what quantities of wild-fowl of all sorts, as duck, mallard, teal, widgeon, &c. they take in them every week during the season. It is said that the neat profits of a decoy near Ely amount to near five hundred pounds a year; there being generally sent to London during the season from that decoy three thousand couples a week.

Cambridgeshire is almost wholly a corn-country, and five parts in six of all they sow is barley, which is generally sold to Ware, Royston, and other great malting-towns in Hertfordshire.

The principal river in this county is the Ouse, which runs from the east to the north-west, and receives the Cam near Thetford.

The chief places in this county are the following:

Cambridge, the capital of the county, and a celebrated university, stands in a spacious, delightful, and fertile plain, fifty-five miles north of London, and sixty north-east of Oxford. The river Cam divides it into two unequal parts; but its situation is low, and the air is generally esteemed not so good as that of Oxford. It contains about two thousand five hundred houses, and the inhabitants are computed at six thousand: but the streets are generally narrow, though pretty well paved; yet, as they lie low, they are in winter very dirty. In the midst of the market-place is a very good conduit, continually running. The town consists of fourteen parishes, and is governed by a mayor, a recorder, twelve aldermen, and twenty-four common-council; and the mayor, when he enters upon his office, takes an oath to maintain the privileges, liberties, and customs of the university, to which he is subservient.

The glory of this town is its university, which is under the government of the chancellor, who is always a nobleman of high rank, and may be elected every three years, or is continued by the tacit consent of the university. The other officers of the university are, II. The vice-chancellor, who is annually chosen on the fourth of November, by the body of the university, out of two persons nominated by the heads of colleges. III. A commissary, who holds a court of record of civil causes for all privileged persons and scholars under the degree of master of arts. IV. A high-steward, chosen by the senate, and holding by patent from the University. V. Two proctors, who are annually chosen; as are also two taxers, who, with the proctors, have the cognizance of weights and measures, as clerks of the market. The university has also a librarian, a register, and other officers.

The vice-chancellor sometimes visits the taverns and other public-houses in person; but it is more frequently done by the proctors, who have power to punish offending scholars, and to fine the public-houses who entertain them after eight at night in the winter, or nine in summer.

The origin of this university is concealed by the darkness of antiquity; it is said to have been restored by Sebert, king of the East Angles, in the year 630, but was afterwards long neglected and overthrown by the

war of the Danes; but at length revived under the Norman government. It has at present sixteen colleges and halls, which here differ only in name, they being equally endowed, and enjoy the same privileges. In these are sixteen masters, four hundred and six fellowships, about six hundred and sixty-two scholarships, two hundred and thirty-six exhibitions; and the whole number of masters, fellows, scholars, exhibitioners, and other students, amount to about fifteen hundred. We shall now give a brief account of these colleges and halls, according to the date of their several foundations.

I. Peter-house, which perhaps took its name from St. Peter's church in its neighbourhood, was founded by Hugh Balsam, bishop of Ely, in the year 1257. It was endowed for a master, fourteen fellows, &c. which number might be increased or diminished according to the improvement or diminution of their revenues; and has at present twenty-two fellows, and four scholars.

II. Clare-hall was founded in 1340 by Richard Badew, chancellor of the university, with the assistance of the lady Elizabeth Clare, countess of Ulster. He had before erected a house called University-hall, in which the scholars lived for sixteen years at their own expence, till it being accidentally burnt, the founder being sensible that the expence of rebuilding it would exceed his abilities, obtained the assistance of the above lady, through whose liberality it was not only rebuilt, but endowed. This structure has been lately rebuilt with free-stone, and is one of the neatest and most uniform houses in the university. It enjoys a most delightful situation, it being seated on the banks of the river, which here forms a kind of natural canal. It maintains eighteen fellows, and sixty-three scholars.

III. Pembroke-hall was founded seven years after Clare-hall, by Mary St. Paul, countess of Pembroke, and maintains five fellows and thirteen scholars.

IV. St. Bennet's, or Corpus Christi-college, was founded about the same time by the united guilds or fraternities of Corpus Christi and the Blessed Virgin. It takes its name from the adjoining church of St. Benedict. Among its modern benefactors the most considerable is Dr. Matthew Parker, archbishop of Canterbury, who gave a curious library, chiefly consisting of scarce manuscripts; he also founded two fellowships, and five scholarships. At present it is able to maintain twelve fellows, and forty scholars.

V. Trinity-hall was founded by William Bateman, bishop of Norwich, about the year 1348; and as he was eminent for his extensive knowledge in the civil and canon law, two fellows and three scholars, placed by him there, were obliged to pursue that particular branch of learning. It has twelve fellows and fourteen scholars.

VI. Gonvil and Caius-college. With respect to this college it must be observed, that in 1348 Edmund de Gonvil, rector of Terrington in Norfolk, founded a hall, called after his name, in the place where are now the orchard and Tennis-court of Bennet's-college: but within five years after it was removed by bishop Bateman to the place where it now stands. In 1607 John Caius, M. D. made such large additions, both to the building and revenues, that he is deservedly considered as the principal founder; and it has of late years received considerable embellishments. It now maintains twelve fellows of the first rank, fourteen of the second, and seventy-four scholars.

VII. King's-college was founded in 1451 by king Henry VI. and afterwards enlarged by Henry VII. and his son Henry VIII. The model first laid down was never completed; only a part of the magnificent plan being executed: however, the chapel is deservedly esteemed one of the finest buildings of its kind in the world. It is three hundred and four feet in length, seventy-three in breadth, and ninety-one high to the battlements, and has not one pillar in it. It has twelve large windows on each side finely painted, and the carving and other workmanship of the numerous stalls surpasses any thing of the kind. It constitutes one side of a large square; for the royal founder designed that the college should be a quadrangle, all of equal beauty; but the civil wars prevented his accomplishing it: however, what has been lately added is not only an ornament to the college, but to the

whole university, and is built with great regularity and beauty. It maintains seventy fellows and scholars, besides chaplains, &c.

VIII. Queen's-college was founded in 1448, by queen Margaret of Anjou, the wife of Henry VI. but finished by Elizabeth the consort of Edward IV. It now maintains a master, nineteen fellows, twelve bible-clerks, four Greek scholars, forty other scholars, besides lecturers of Hebrew, geometry, and arithmetic.

IX. Catharine-hall owes its foundation to Richard Woodlarke, the third provost of King's-college. A great part of it has been lately rebuilt. It is a neat and elegant structure, in which are maintained six fellows and thirty scholars.

X. Jesus college was begun by John Alcock, bishop of Ely, in 1497, who having obtained of Henry VII. and pope Julius II. the revenues of a monastery of nuns, which had been suppressed on account of their scandalous incontinence, endowed and dedicated it to Jesus, the Blessed Virgin, and St. Radegund, patroness of the nunnery. It has now sixteen fellowships, and thirty-one scholars.

XI. Christ's-college was founded by the lady Margaret, countess of Richmond, mother of Henry VII. for a master and twelve fellows, which number agreeing with our Saviour and his twelve apostles was complained of in Edward the Sixth's reign as superstitious, on which the king added another fellowship and some scholarships. A noble building has been lately added to the old house, and the number of scholars amount to fifty-six.

XII. St. John's-college was begun by the same lady about nineteen years after Christ's-college, and was finished by her executors. This college, which in the beginning of the reign of king James I. was greatly enlarged with new buildings, is pleasantly situated near the river, and is no less remarkable for the number of its students and its beautiful groves and gardens, than for its strict and regular discipline. It has a fine stone bridge over the river, and the library is noble and curious. The number of students amount to one hundred, and its fellows to fifty-three.

XIII. Magdalen-college was originally a hall for monks to prepare themselves for academical exercises; but at the dissolution of the monasteries by Henry VIII. a new college was founded here by Thomas Audley, baron of Walden, and it was afterwards enlarged and endowed by Sir Christopher Wray, lord chief justice of England. This college stands by itself on the north-west side of the river, and has been improved and adorned by handsome buildings. It maintains a master, thirteen fellows, and thirty scholars.

XIV. Trinity-college was founded by Henry VIII. who converted three small houses into one college, made a considerable addition to their former endowments, and dedicated this house to the Holy and Undivided Trinity. Queen Mary added largely to the endowment, and by subsequent benefactions it is enabled to maintain sixty-five fellows, and ninety-one scholars. Its library, which many learned men have contributed to enrich, is very noble: the chapels, buildings, &c. justly place this in the first rank of colleges, and render it superior to some foreign universities.

XV. Emanuel-college was founded by Sir Walter Mildmay, chancellor of the exchequer, in 1584, on the same spot where the Dominican friars had formerly a house. It has a very neat chapel, built by the bounty of Dr. William Sancroft, archbishop of Canterbury, and others, who likewise made a fine addition to the library by giving it his fine collection of books. It maintains a master, fourteen fellows, fifty scholars, and ten poor scholars.

XVI. Sidney Suffex-college was founded by virtue of the will of the lady Frances Sidney, countess of Suffex, who died in 1589, and for this purpose left five hundred pounds. Afterwards Sir Francis Clarke, and after him Sir John Brereton, not only erected a set of new buildings, but augmented the scholarships and fellowships; so that it is now enabled to maintain a master, twelve fellows, and twenty-eight scholars.

Among the other buildings in Cambridge is the new senate-house, which is a fine edifice, and, with the schools,

schools, the university-library, and other buildings, form a noble square. This structure is a hundred and one feet in length, forty-two in breadth, and is adorned with fluted columns, a triangular pediment, and other beautiful decorations.

The schools of the university were at first in private houses, afterwards public schools were erected at the expence of the university, in or near the place where they now stand; but the present structure, which is built of brick and stone, was erected partly at the expence of the university, and partly by the contributions of several benefactors.

The university-library was first built by Rotheram, archbishop of York, who with Tonsal, bishop of Durham, furnished it with choice books; after which his majesty king George I. purchased the library of Dr. John Moore, bishop of Ely, which cost him six thousand guineas, and bestowed it upon this university. Soon after the late lord viscount Townshend erected a fine marble statue of his majesty in the senate-hall of King's-college. The same prince also appointed two persons, both in the university of Oxford and Cambridge, well skilled in modern history, and in the knowledge of modern languages, to be nominated king's professors of modern history, one of whom in each university is obliged to read lectures in the public schools at particular times; each of these professors to have a salary of four hundred pounds per annum, out of which each professor is obliged to maintain, with sufficient salaries, two persons at least, well qualified to teach and instruct in writing and speaking those languages gratis, twenty scholars of each university, to be nominated by the king, each of which is obliged to learn at least two of those languages.

Stourbridge, a field near Cambridge, is known for its famous fair annually kept on the seventh of September, and continues a fortnight. This is esteemed one of the greatest fairs in England, many tradesmen going thither from London and other parts to keep shops there. The trade chiefly consists of woollen cloth, hops, iron, wool, leather, cheese, horses, and many other things.

Ely is seated on an island of the same name, seventeen miles to the north of Cambridge, and sixty-nine north-by-east of London. It stands on a hill seated in the middle of a fenny plain, on the banks of the river, which renders it very unhealthy. The soil is exceeding rich, and the city is encompassed with gardens, which furnish all the county for twenty miles round. Great quantities of strawberries are cultivated here, particularly of the white fort. The city consists of about six hundred good houses, and has but one good street well paved, the rest being extremely dirty. The bishop has the same power as in a county palatine; for he appoints a judge, holds the assizes, jail-delivery, and quarter-sessions of the peace for the liberty. The assizes are held there every twelve months. The cathedral is a stately structure, which has a lantern of curious architecture; besides which the city has only one church.

S E C T. XXVI.

Of Hertfordshire; its Situation, Extent, Divisions, Representatives, Rivers, Air, Soil, and principal Towns.

HARTFORDSHIRE, or Hertfordshire, derives its name from Hartford, or Hertford, the county town, is bounded on the north by Cambridgeshire, on the east by Essex, on the west by Bedfordshire and Buckinghamshire, and on the south by Middlesex. It is thirty-one miles in length, about twenty-eight in breadth, and about a hundred and thirty in circumference. This county, which lies partly in the diocese of London and partly in that of Lincoln, is divided into eight hundreds, which contain eight market-towns, fifty-four vicarages, a hundred and twenty parishes, and near nine hundred and fifty villages, with about sixteen thousand five hundred houses, and eighty-two thousand eight hundred inhabitants; and sends six members to parliament, two knights for the shire, with two burgesses for St. Albans, and as many for Hertford.

The air is very clear and salutary, whence it is frequently recommended by physicians as highly conducive to health, and the people have a saying, that whoever buys a house or land in Hertfordshire, pays two years purchase extraordinary for the goodness of the air. The soil is generally rich, and in the northern parts has a marle mixed with it, that makes it produce excellent wheat; but the meadows and pastures are indifferent. The chief commodities are wheat, barley, malt, and wood.

This county is well watered with small rivers, the chief of which are the Lea and the Coln. The principal towns in Hertfordshire are the following:

Hertford, is seated on the river Lea, two miles to the west of Ware, and twenty-one to the north of London, and was formerly much more considerable than it is at present. It is built in the form of a Y, with a castle in the middle of the two horns, and contains several streets and lanes. It had formerly five parish churches; but they are now reduced to two, with several meeting-houses of the dissenters.

It has a corporation, governed by a mayor, nine aldermen, a recorder, a town-clerk, a chamberlain, ten capital burgesses, &c. The chief commodities of its markets are wool, wheat, and malt, and it is said to send five thousand quarters of malt weekly to London, by the river Lea.

Here is a free-school for the children belonging to the town; three charity schools, and also a school belonging to Christ's-Hospital in London; this is a handsome structure, erected by the governors, for such children as either want health, or are too young for that hospital. This town gives the title of earl to the family of Conway, and near it is the seat of the late governor Harrison, pleasantly situated on a hill, that commands a fine prospect, and there are several other seats in its neighbourhood.

Ware, is seated on the river Lea, twenty-one miles from London. The plenty of water about this town gave rise to that admirable project, of cutting a channel from thence, and thus forming a new river for supplying London with water. This river takes its rise from Arnwell, near this town, and was formed by the great Sir Hugh Middleton, who was obliged, in order to avoid the eminences and valleys in the way, to make it run a course of about thirty-nine miles, and to carry it over two valleys, in long wooden troughs lined with lead; that at Buthill being six hundred and sixty feet in length, and thirty in height, under which is an arch, capacious enough to admit the largest waggon loaded with hay or straw. In short, over and under this river, which sometimes rises thus high, and at others is conveyed underground, run several considerable currents of land waters, and both above and below it a great number of brooks, rills, and water courses have their passage.

In the town of Ware is a charity-school, and six or seven alms houses. The school which formerly was for the younger children of Christ's hospital, is removed to Hertford, the air being there esteemed purer. This town has been famous for its great bed, which is much visited by travellers, it being twelve feet square, and is said to hold twenty people. It was kept at the Crown, but now at the Bull.

St. Alban's, a large and ancient town, twenty-one miles from London, received its name from St. Alban, who suffered in the persecution under Dioclesian, and being afterwards canonized, and interred on a hill in the neighbourhood of the town, a monastery was erected to him by king Offa, to atone for his guilt, in causing him to be murdered. King Edward I. erected here a magnificent cross, in memory of queen Eleanor, and king Edward VI. incorporated the town by a charter, granting the inhabitants a mayor, a steward, a chamberlain, and ten burgesses; but the mayor and steward are here the only justices of peace. Here are three churches, besides the ancient church called St. Alban's, belonging to the monastery, which is now a parish church. In this ancient structure is a funeral monument, and the effigy of king Offa its founder, who is seated on his throne. On the east side stood the shrine of St. Alban, and in the south aisle is the monument of duke Humphry, brother to king Henry V. commonly distinguished by the title of the

the Good duke of Gloucester. It is adorned with a ducal coronet, and the arms of France and England quartered. In niches on one side are seventeen kings, but in the niches on the other side there are no statues remaining.

About fifty years ago, in digging a grave, a pair of stairs was discovered that led down into a vault, where a leaden coffin was found, in which the duke of Gloucester's body was preserved entire, by a kind of pickle in which it lay, only the flesh was wasted from the legs, the pickle at that end being dried up. Many curious medals and coins are to be seen in the church, that have been dug out of the ruins of Old Verulam, which stood on the other side of the river Ver or Moore, which runs south-west of the town.

St. Alban's is the largest town in the county, and, besides its four churches, has several meeting houses, two charity schools, and three fairs, and has on Saturdays one of the best markets for wheat in England. It gives the title of duke to the noble family of Beauclerc. The great John duke of Marlborough erected a seat here, called Holloway-house, and several neat alms-houses have been built here by him and his duchess. Near St. Alban's is a fort at a place called by the common people the Oyster-hills, which is supposed to have been the camp of Ostorius the Roman proprætor.

S E C T. XXVII.

Of Bedfordshire; its Situation, Extent, Divisions, Representatives, Air, Soil, and principal Places.

THIS county derives its name from its chief town; it is bounded on the north by Northamptonshire and Huntingdonshire; on the east by Cambridgeshire; on the west by Buckinghamshire; and on the south by Hertfordshire. It is twenty-two miles long, but not quite fifteen broad. This county is divided into nine hundreds, in which are ten market-towns, fifty-eight vicarages, one hundred and sixteen parishes, five hundred and fifty villages, with about twelve thousand one hundred and seventy houses, and upwards of sixty thousand inhabitants. This county sends only four members to parliament, two of which are for the county, and the other two for Bedford.

The air is temperate, clear, and consequently healthy. The soil is a deep clay, and in the northern parts abounds in corn and pasture; but is sandy in the middle, with a ridge of hills, covered with woods. Its commodities are chiefly fuller's earth, which is of the utmost consequence to the clothing trade; it also affords cattle, venison, fowl, timber, wood, wheat, and barley in great plenty, and remarkably good. The chief manufactures here are bone-lace and straw hats.

The chief river in this county is the Ouse, the navigation of which is of great service in the corn-trade. It divides the county into two unequal parts, forming the most beautiful meanders; for in the distance of twenty miles it runs over a tract of seventy.

The principal places in this county are the following: Bedford, a populous and well built town, forty-four miles to the north-west of London, is seated on the banks of the river Ouse, which divides it into two parts. Here are five parish churches, the principal of which is St. Paul's, and also several meeting-houses of the dissenters: a handsome stone bridge, with a gate at each end, to stop the passage occasionally; and its high-street is in particular very handsome and well built, as is also the market-place, which is much improved with new buildings. It is the only market-town on the Ouse, which has been made navigable to it, vast quantities of corn, particularly barley, being carried from hence down the river to Lynn, where it is shipped for Holland; and here being great plenty of provisions, the higlers buy up considerable quantities for the use of the London markets. On which account it has many good inns, tho' it does not stand upon any of the great roads. Here is a well endowed free-school, and a charity-school for forty children. The town is governed by a mayor, twelve

aldermen, a recorder, two bailiffs, a town clerk, and two serjeants at mace.

The soil in the neighbourhood of Bedford is extremely rich, and particularly produces great quantities of the best wheat, which is carried by waggons from hence, and the north parts of the county to Hitchin and Hertford, where it is ground, and the flour brought by land to London. This town gives the title of duke to the noble family of Russell.

Dunstable, a market-town, seated on a dry chalk hill, sixteen miles from Bedford, and thirty-four from London. Here no springs are to be found, unless they dig very deep for them; but there is a large pond in the middle of the town, filled with rain water, and is never dry. It has four streets, answering to the four cardinal points. The church is the remainder of a priory, and opposite to it is a farm-house, which was once a royal palace. The larks of this town are well known to all who study the gratification of their palates.

Woburn, a market-town, seated on a rising ground, on the high road from London to Northampton. It was burnt down in 1724, but has been neatly rebuilt, and has a handsome market-place, with a free-school and a charity-school, founded by the duke of Bedford, who also erected the market-house. Woburn has near it plenty of fuller's earth.

This town was formerly famous for its abbey, which now belongs to the duke of Bedford, and is his seat; it has many noble rooms, particularly a fine library well stocked with books, and fitted up in an elegant taste; and a long gallery adorned with a collection of fine paintings. Before the house is a large bason of water, surrounded with a fine broad gravel walk. In this bason is a beautiful yacht, of between thirty and forty tons burthen, elegantly carved and gilt, is completely rigged, and mounts ten guns, which are fired on occasion of entertainments given on board. There are also a handsome pleasure boat, a wherry, and skiff.

The park is nine miles round, and encompassed with a brick wall ten feet high. It has lofty woods, some of them of fir trees, and other ever-greens: particularly on the north side of the park is a plantation near two miles long, with a fine riding through it, where, in the depth of winter, one may ride in shelter through a perpetual verdure. A noble piece of water at the end of this plantation, has an island in the middle, upon which is a Chinese building, where, in summer, his grace often dines with his company. There are also in this park many gravel roads through the woods, by which means a person may either walk or ride to every part of the park in the wettest season, without meeting with the least dirt.

S E C T. XXVIII.

Of Huntingdonshire; its Name, Situation, Extent, Divisions, Representatives, Air, Soil, Produce, and principal Places.

HUNTINGDONSHIRE, or Huntingtonshire, received its name from the Saxons, who, from its being a sporting country, called it Huntedunscire. It is bounded on the north and west by Northamptonshire; on the east by Cambridgeshire; and on the south by Bedfordshire; extending twenty-five miles in length from north to south, eighteen in breadth from east to west, and near sixty-seven in circumference.

This county, which is in the diocese of Lincoln, is divided into three hundreds, and contains six market-towns, twenty-nine vicarages, seventy-nine parishes, two hundred and twenty-nine villages, about eight thousand two hundred and twenty houses, and upwards of forty-one thousand inhabitants: but sends only four members to parliament, namely, two knights of the shire, and two members for Huntingdon.

The air of Huntingdonshire is good, except in the fenny parts, which are subject to damps and unwholesome fogs. The soil is very fruitful; in the dry lands it yields good crops of corn, and in the lower grounds the meadows

meadows and pastures are exceeding rich, producing fine horned cattle. Hence its chief commodities are corn, cattle, excellent cheese made at Stilton, and called the Parmesan of England; with fowl and fish.

There is something particular in the civil government of this county; for as Cambridgehire and Ely are under the same administration with it, the sheriff is chosen by turns out of these several places.

The principal rivers are the Nen and the Ouse. The Nen, after it has passed Oundle in Northamptonshire, winds round the north-west and north bounds of this county. The Ouse enters it at St. Neot's, and running to the north-east passes Huntingdon, and then leaves the county at Erith.

In the north-east part of the county, is a lake called Wittlesey-Meer, six miles long and three broad; the water is clear, but in the calmest weather is subject to be agitated, as if by a tempest. The air of this lake is thick, foggy, and too often fatal to strangers, who attempt to live in its neighbourhood; but the natives receive no inconvenience from it; on the contrary, this lake abounds in fish, and its banks are remarkably fertile.

The chief places in this county are the following:

Huntingdon, called by the Saxons Hunter's-Down, is pleasantly seated on a rising ground, by the river Ouse, over which it has a handsome stone bridge, fifty-seven miles north-by-west of London. It was once much larger than at present, it having fifteen parish churches, which are now reduced to two, with several meeting houses. In this place the assizes are held, and it is a great thorough-fare on the northern road, on which account it is well furnished with inns. It is governed by a mayor, and confers the title of earl on the noble family of Hastings.

Near the west side of the town is Hinchinbroke, which gives the title of viscount to the eldest son of the earl of Sandwich, and where that nobleman has a seat called Hinchinbroke-house, the gardens of which are very fine.

St. Neot's is a well built town, fifty-six miles to the north-north-west of London, seated on the river Ouse, over which there is a stone bridge: it has a handsome church, with a fine steeple, and the market is very considerable.

St. Ives is an ancient, large, and handsome place, fifty-seven miles north-west of London, and is seated on the river Ouse, over which it has a handsome stone bridge. Here was a priory, which is now in ruins. It has one large church, two dissenting meetings, and a popish chapel, with about five hundred dwelling-houses. The streets are pretty wide, and tolerably well paved.

SECT. XXIX.

Of Northamptonshire; its Name, Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, and principal Towns.

THIS county takes its name from the town of Northampton, which some say was so called from its situation on the north side of the river Ansona, or Nen, while others maintain that it was thus named from its situation with respect to Southampton. It is seated in the middle of England, and as it extends in a narrow tract towards the north-east, borders upon more counties than any other in England; for on the north it is bounded by Lincolnshire, Rutlandshire, and Leicestershire; on the east by Cambridgehire, Huntingdonshire, and Bedfordshire; on the west by Warwickshire and Oxfordshire; and on the south by Buckinghamshire. It extends in length from the south-west to the north-east near fifty-five miles, in the broadest part from east to west it is twenty-six, and a hundred and twenty-five in circumference. It is seated in the diocese of Peterborough, and divided into twenty hundreds, containing thirteen market-towns, eighty-five vicarages, and about five hundred and fifty villages, with about twenty-four thousand eight hundred houses, and a hundred and twenty-nine thousand

inhabitants. Northamptonshire sends nine members to parliament, two for the county, two each for Northampton, the city of Peterborough, and Brackley, and one for Higham-Ferrers.

The air of this county is very healthy, and, except the little corner of Peterborough hundreds, is entirely free from bogs and fens, hence it abounds with the seats of the nobility and gentry. The soil is very fertile, both for tillage and pasturage, and is deficient in nothing but fuel, which is in most parts very scarce; nor can this scarcity be remedied, as they have no coal-pits, nor any navigable rivers to admit of their being supplied by water-carriage. It is observable, that here is but one barren heath, and that the rest of the country is as fruitful in corn and grass as any part of England. The commodities produced by this county are horned cattle, sheep, horses, and corn. The principal manufactures in which the people are employed are serges, tamies, shalloons, boots, and shoes.

The principal rivers of Northamptonshire are the Nen and the Welland; besides which it is partly watered by the Ouse, the Leam, and the Charwell. Three of these, namely, the Nen, the Leam, and the Charwell, rise within a small distance of each other, near Daventry, and there form very different courses; the Leam running westward, the Charwell southward, and the Nen eastward, till it falls into the German ocean. The Welland rises in the north-west side of the county, and divides it from Leicestershire, Rutlandshire, and Lincolnshire, running through a part of the last county till it falls into the sea. The Ouse also rises in this county, but soon enters Buckinghamshire. These rivers are of great service in furnishing this inland county with fish.

The principal towns in this county are the following:

Northampton, an ancient borough town, incorporated by king Henry II. and confirmed by king James I. is seated on the river Nen, sixty-seven miles north-west-by-north of London. It had walls, which are now demolished, and likewise a large castle, which is in ruins; and here several parliaments have been held. It is at present esteemed the handsomest town in all this part of England; but its beauty is owing to a dreadful disaster; for it was so effectually burnt down on the twentieth of September, 1675, that very few houses were left standing: but it is now handsomely rebuilt with brick and stone, and the streets are wide and spacious. It has two bridges over the river: the hall for the assizes is adorned with columns of the Corinthian order, and the market-place is square and spacious. It had seven churches, which are now reduced to four, All Saints, St. Giles's, St. Sepulchre's, and St. Peter's. The first is a noble edifice, adorned with a cupola, and has a grand portico before it of eight lofty Ionic columns. This structure stands in the center where four large spacious streets terminate, and is consequently seen to the utmost advantage. Here are also several meeting-houses of Protestant dissenters. The public buildings are in general extremely handsome: this town has an infirmary, a good free-school, a charity-school, and two alms-houses. It is governed by a mayor, two bailiffs, a recorder, four aldermen, forty-eight common-councilmen, and a town-clerk.

Peterborough, a city of great antiquity, is seated on the river Nen, over which there is a bridge that leads into Huntingdonshire, and is in the eastern angle of Northamptonshire, seventy-six miles north-by-west of London. This is the least city in England; for Wells, Ely, and Carlisle are much bigger. Here are, however, many good houses; for the streets are handsome and well built, and the market-place pretty spacious. It has, however, but one church besides the cathedral, which is one of the most noble Gothic buildings in England: the west end is supported by three noble arches, very curiously embellished; and the windows are finely painted with the histories of the Old and New Testament. In short, the whole structure is adorned with a great deal of curious work. In this church was buried Mary queen of Scots; but her body was afterwards removed by her son James I. to king Henry the Seventh's chapel, in Westminster abbey.

Here

Here also lies interred queen Catharine the divorced wife of king Henry VIII. who has a monument erected to her memory.

This town is governed by a mayor, aldermen, and a recorder, and gives the title of earl to the noble family of Mordaunt.

Wellingborough is pleasantly seated on the ascent of a hill on the western banks of the river Nen, sixty-five miles from London, and is a large, well built, and well inhabited town, with a handsome church, and a free-school. A dreadful fire happened here in July, 1738, which in six hours time consumed above eight hundred dwelling-houses, mostly in the south and east parts of the town; but it has since been rebuilt in a more handsome manner. This town enjoys a pretty good trade.

S E C T. XXX.

Of Warwickshire; its Name, Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, and principal Places.

WARWICKSHIRE derives its names from the Saxons, who called it Weringscire, which signifies a station of soldiers. It is bounded on the north by Staffordshire, on the east by Leicestershire and Northamptonshire, on the south-west by Gloucestershire, and on the south-east by Oxfordshire; extending in length forty-seven miles, and twenty-seven in breadth. This county, which lies partly in the diocese of Litchfield and Coventry, and partly in that of Worcester, is divided into four hundreds and one liberty, and contains seventeen market-towns, eighty-seven vicarages, a hundred and fifty-eight parishes, seven hundred and eighty villages, about twenty-two thousand houses, and two hundred thousand inhabitants. It sends six members to parliament, namely, two knights of the shire, two members for Warwick, and two for Coventry.

The air is allowed to be very mild; pleasant, and healthy, and more so since the wood lands have been thinned and laid more open than formerly, by the great consumption of wood in the iron-works; by which means the wood-landers have been obliged to apply to tillage and pasture. The northern part of the country, called the Woodland, is divided from the south, called the Feldon, by the river Avon; but the soil of both is rich, and produces excellent corn and cheese, the last of which is famous all over England: hence the chief commodities of this county are corn, malt, wood, wool, and cheese. This county also abounds in coals, which in some places lie even with the surface of the earth; and here are many excellent coal-pits.

The principal rivers are the Avon, which rises in Leicestershire, and enters this county a little above Rugby, running chiefly south-west; it passes by Warwick, Stratford, and Bitford, below which it enters Worcestershire. The Tame, which rises in Staffordshire, and entering this county, runs eastward, till it has received the Blythe, and then, turning to the northward, enters Staffordshire. The Arrow rises in Worcestershire, and crossing the west-south-west borders of this county, joins the Avon a little below Bitford. The principal towns in Warwickshire are the following:

Warwick is seated on a rock near the Avon, eighty-four miles to the north-west of London. All the passages to it are cut through the rock; and there is no way to go to it but over water. It was anciently fortified with a wall, which is now in ruins; but has still a strong and stately castle, which is the seat of the lord Brooke. It is a large and handsome town, in which are two parish-churches, with several meeting-houses of the Dissenters. It principally consists of one regular built street, at each end of which is an ancient gate, and over the river is a stone bridge of twelve arches. It is governed by a bailiff and twelve burgesses, and has a handsome market-house supported on stone pillars. It has likewise a good free-school, and an hospital called St. James's, for twelve decayed gentlemen, who have each twenty pounds a year, and the chaplain fifty.

This town was wholly reduced to a heap of ruins by a terrible fire on the fifth of September, 1694; but was rebuilt by act of parliament in so noble and beautiful a manner, that few towns in England make so fine an appearance. It is famous for being the residence of the celebrated Guy earl of Warwick, of whom so many fabulous and romantic accounts have been given, that it is perhaps impossible to distinguish his real actions from those that are fabulous. He flourished in the reign of Athelstan, and decided the fate of the kingdom by single combat with Colbrond, the Dane, a man of gigantic stature, whom he slew, and afterwards led an hermit's life till his death. They show here his helmet and sword.

The castle, already mentioned, stands upon the river Avon, on a solid rock. The terrace, like that of Windsor, overlooks a beautiful country, and you see the Avon running at the foot of the precipice, from above fifty feet perpendicular height. The building is old, but has often been repaired and beautified, and is now a very agreeable structure, both within and without. The apartments are well contrived, and the communication between the remotest parts of the building is well preserved by galleries, and the great hall, which is very magnificent. There are in the castle many curious original pictures, by Vandyke, and other hands, of kings, queens, and other noble personages.

A mile out of town on the side of a hill is a cell called Guy-Cliff, and in a kind of old chapel is a statue of Guy eight feet high. The fence of the court is of solid rock, in which are cut stables and out-houses. Here they shew the cave where Guy died an hermit.

Coventry is a city and county of itself, containing under its jurisdiction nineteen villages and hamlets. It is situated ninety-two miles to the north-west of London, and eleven to the north-east of Warwick. It stands on the little river Sherburn, and is of great extent; but the houses being mostly very old, and chiefly built of wood and plaster, with stories projecting over each other, make but a very indifferent appearance. This is the sister city to Litchfield, and is joined in the title of the see, which was for some time seated here. It was walled and incorporated by Edward II. afterwards its charter was confirmed by king Henry VI. and augmented with several privileges by king James I. Its walls were demolished by order of king Charles II. in the year 1662, and only the gates left standing, from which the beauty and strength of the walls, which were three miles in compass, may be easily guessed at.

It is governed by a mayor, two bailiffs, sheriffs, ten aldermen, a town-clerk, and other officers, who hold pleas for all actions, and it has a jail for felons, as well as debtors. It is divided into ten wards, and has three parish churches, that of the Holy Trinity, St. Michael, and St. John the Baptist, with several meeting-houses; but has no cathedral. The church of St. Michael is a fine structure of Gothic architecture, and has a curious piece of painting for the altar-piece. The spire of the great church, which is very beautiful, is three hundred feet high, and there are two churches in the same yard, where they seem to rival each other. At the south end of the town also stands a tall spire by itself, this being what is left of the Grey Friar's conventual church. In the market-place stood the most stately cross in England, it being sixty-six feet high, and adorned with the statues of several of the English kings, and a variety of curious Gothic sculpture; but it has been lately taken down. The inhabitants have also lately obtained an act for paving, lighting, and cleaning the streets. The town-house is worth seeing, the windows being of painted glass, representing some of the old kings, earls, &c. who have been benefactors to the town.

The story of the lady Godiva, who rode naked thro' the high-street of the city, to purchase its exemption from oppressive taxes, is here so firmly believed, that they will not suffer the truth of it to be questioned, and in memory of it the inhabitants have an annual procession on the Friday after Trinity Sunday, which is held as a fair, when the figure of a naked woman rides on horse-back through the city with great pomp and ceremony, and the picture of the poor fellow who peeped out of a window

to see her, is still kept up, looking out of a window in the high-street. This city has a very considerable manufacture of stuffs, particularly of tamies, and also of ribbons. It gives the title of earl to the noble family of Coventry.

Birmingham is a very large town, seventeen miles to the north-west of Coventry, and one hundred and nine to the north-west of London; it stands on the side of a hill, forming nearly a half-moon. The lower part is filled with work-shops and ware-houses of the manufacturers, and consists chiefly of old buildings; but the upper part contains a number of new and regular streets. It has no corporation, it being governed only by two constables and two bailiffs, and is therefore free for any person to come and settle there, which has greatly contributed both to the increase of the buildings, and the trade, which is the most flourishing of any in England for all sorts of iron-work and hard-ware. It has two churches, one in the lower part of the town, which is an ancient building with a very tall spire; the other is a very grand modern structure, having a square stone tower, with a dome and turret above it. In this town is a fine peel of ten bells, and a set of musical chimes, which play seven different tunes, one for each day of the week. It has also two chapels and meeting-houses for every denomination of dissenters. The houses, which are continually increasing, amount to about seven thousand. There is a free-grammar school, founded and handsomely endowed by king Edward VI. and since rebuilt in a very handsome form. Here is also a charity school, in which are maintained and taught upwards of fifty boys and girls.

S E C T. XXXI.

Of Worcestershire; its Name, Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, and principal Places.

WORCESTERSHIRE derives its name from its capital, called by the Saxons Weagorcestre, which at length became changed to Worcester. This county is bounded on the north by Staffordshire; on the east and north-east by Warwickshire; on the west by Shropshire, and Herefordshire; and on the south by Gloucestershire; extending about thirty-five miles in length, and twenty-seven in breadth.

It is divided into seven hundreds, and two limits, and contains twelve market-towns, fifty-five vicarages, one hundred and fifty-two parishes, five hundred villages, about twenty thousand six hundred houses, and one hundred and twenty-three thousand seven hundred inhabitants. It is in the diocese of Worcester, and sends nine members to parliament; namely, two for the county, and two for each of the following places, Worcester, Droitwich, and Evesham, and one for the borough of Bewdley.

The air of Worcestershire is very healthy, and the soil in the vales and meadows very rich, producing corn and pasture, particularly the rich vale of Evesham, which is justly stiled the granary of these parts. The hills have generally an easy ascent, except Malvern hill, and feed large flocks of sheep. This county had formerly two large forests, but the iron and salt works have in a manner destroyed them; and therefore these works are now chiefly carried on with coal, with which this county abounds. A number of rivers and rivulets water the fine meadows, and give them a richness that is easily perceived in the butter and cheese. Here is plenty of fruits of most sorts, especially pears, which are in many places found growing in the hedges. The chief commodities are coals, corn, cloth, cheese, cyder, perry, and salt.

The principal rivers with which this county is watered are the Severn, which enters Worcestershire on the north-west edge of the county, and running southward by Worcester, receives the Temd, when, passing by Upton, it enters Gloucestershire. The Temd enters Worcestershire on the west border, and runs to the south-east, till it joins the Severn. The Avon enters the east-side of Worcestershire, and running through the vale of Evesham, leaves this county at the southermost point. All

these rivers abound with the usual sorts of fish; but the Severn has lampreys almost peculiar to itself: they resemble an eel in shape, but instead of gills, have nine holes on each side of the neck: they are in season in the spring of the year, when they have a delicious taste, which abates as the summer advances. The principal towns of this county are the following:

Worcester is pleasantly situated on the eastern bank of the river Severn, one hundred and twelve miles to the west-north-west of London. This is a large well built and populous city. It has a handsome stone bridge over the Severn, and from hence rises a gentle ascent, so high as to afford a pleasant prospect over the vale beneath. The Foregate-street is remarkably beautiful and regular, and the whole city is extraordinary well paved. The public buildings make a noble appearance, particularly the Guildhall; but the statues on the out-side are very indifferent; the work-house is also a handsome structure. The cathedral is very ancient, and makes but an indifferent appearance either within or without; the tower being low, without any spire, and only four very small pinnacles at the corners. In it lies buried king John, not where his monument now stands, but under a little stone before the altar of the eastermost wall of the church. On each side of him, on the ground, lie the effigies of two bishops. On the southside of the high altar, is a large handsome chapel, the choir of which is of exquisite workmanship. Here is the monument of prince Arthur, the eldest son of king Henry VII. who died at Ludlow in 1502, and among other monuments is one of the famous countess of Salisbury, who, dancing before Edward III. in his great hall at Windsor, dropped her garter, which the king taking up, it is pretended gave rise to the order of the Garter; but this is generally supposed to be a mistake. The monument is very fine, and it is remarkable, that there are several angels of stone strewing garters over the tomb.

Besides the cathedral and St. Michael's church, which is without the liberty of the city, it contains nine parish churches; it has also three grammar-schools, seven hospitals well endowed, a water-house, and a well contrived quay. It is governed by a mayor, six aldermen, a recorder, two coroners, a sheriff, a sword-bearer, and five serjeants at mace. The inhabitants are generally esteemed rich, being full of business, chiefly occasioned by the clothing trade, of which the city and county carry on a great share: the number of hands it employs in this town and the adjoining villages, in carding, spinning, weaving, fulling, &c. is almost incredible. One part of the city is wholly possessed by the Welsh, who speak their own language, and are employed in this manufacture. There is here also a manufacture of porcelain, which is carried to a very great perfection; so as to equal that brought from China.

Droitwich, is seated on the river Salwarp, six miles from Worcester, and ninety-five from London; it is a corporate and borough town, remarkable for its excellent salt springs, of which is here made fine white salt: the inhabitants have also a manufacture of linen cloth and hats.

Kidderminster, a town seated under a hill, by the river Stour, one hundred and twenty-eight miles to the north-west of London, is particularly famous for its woollen manufacture, called Kidderminster stuffs; but at present here is an extraordinary manufactory of blankets and carpets, equal to those of Turkey, and the inhabitants are said to have no less than one thousand looms constantly employed. Here is a handsome church, a very good free-school, and an alms-house. It is governed by a bailiff, twelve capital burgesses, and twenty-five common council men.

Stourbridge, or Sturbridge, is seated on the river Stour, over which it has a bridge, from whence it has its name, is one hundred and seventeen miles to the north-west of London. The inhabitants have a considerable manufacture of glass of all sorts, and also iron works. Here are also made fine stone pots for glass-makers to melt their metal in, and likewise crucibles, the clay of which these are made being almost peculiar to this place. Here is a good free-school, in which is a library.

Near this town is Hagley-park, the seat of Lord Lyttelton, which is a beautiful spot of ground, intermixed with a pleasing variety of hills, valleys, and woods. The house is esteemed one of the finest seats in the county.

S E C T. XXXII.

Of Shropshire ; its Name, Situation, Extent, Divisions, Representatives, Air, Soil, and Produce. Of the Phenomena of this County ; its Rivers, and principal Towns.

SHROPSHIRE obtained its name from that given by the Saxons to Shrewsbury, which they called Scrobberig, which signifies a town built on a woody hill. It is bounded on the north by Flintshire, in Wales, and Cheshire; on the east by Staffordshire and Worcestershire; on the south by Worcestershire, Herefordshire, and Radnorshire, in Wales; and on the west by the Welch counties of Radnorshire, Montgomeryshire, and Denbighshire. It extends about thirty-eight miles in length from north to south, thirty in breadth, and a hundred and forty in circumference.

This county lies partly in the diocese of Litchfield and Coventry, and partly in that of Hereford; and is divided into fourteen hundreds, in which are contained sixteen market-towns, fifty-two vicarages, a hundred and twenty parishes, six hundred and fifteen villages, with about twenty-two thousand three hundred and eighty houses, and a hundred thirteen thousand six hundred and eighty inhabitants. It sends twelve members to parliament, that is, two for the county, and two for each of the following towns, Shrewsbury, Ludlow, Bridgenorth, Wenlock, and Bishop's-castle.

The air of Shropshire is salubrious, and not very sharp, except on the hills. The soil is generally fruitful, especially in the northern and eastern parts, which produce plenty of wheat and barley; but the southern and western, being mountainous, are less fertile, yet yield sufficient pasture for sheep and cattle. Under the surface are mines of lead, copper, iron, stone, and inexhaustible coal-pits. Over most of the coal-pits lies a stratum of a blackish, hard, porous substance, containing great quantities of bitumen, which being ground to powder in horse-mills, and boiled in coppers of water, there swims on the surface a bituminous matter, which, by evaporation, is brought to the consistence of pitch; or, by the help of an oil distilled from the same stone, and mixed with it, may be thinned to a sort of tar: both these substances serve particularly for caulking of ships, as well, if not better than pitch or tar, it being less liable to crack.

Many authors mention a remarkable phenomenon at Brosely, about six miles north of Bridgenorth. This is a well that exhales a sulphureous vapour, which when contracted to one vent, by means of an iron cover with a semicircular hole, and fired by applying a lighted candle to it, will continue burning with great violence, so as to boil a large piece of beef in two hours; but what is still more extraordinary, a piece of meat broiled in this flame has not the least ill taste from the sulphur. This, however, is not the only phenomenon of the kind, there being another burning well of much the same nature in Lancashire.

The chief rivers of this county are the Severn and the Temd. Both these rivers receive several smaller ones, and all of them are well stocked with a variety of fish, as salmon, trouts, pike, carp, lampreys, eels, &c. As the Severn, which rises in Montgomeryshire, is navigable before it leaves it, that river is of infinite advantage to this county, not only for the communication it affords, but for the commerce it maintains with Worcestershire, Gloucestershire, and Bristol.

The principal places in Shropshire are the following:

Shrewsbury, a beautiful, large, pleasant, populous, and rich town, a hundred and fifty-seven miles to the north-west of London, is supposed to have been built out of the ruins of the ancient Uriconium. In the reign of William the Conqueror, Roger earl of Montgomery built a castle on the north side, and a stately abbey called St. Giles's, or the Holy Cross, at the east end, famous for

being the repository of St. Winifred's body; but only some ruins of it are now to be seen.

Shrewsbury is seated on the Severn, which in part surrounds the town, in the form of a horse-shoe, and over it are two stone bridges, upon one of which is built a very noble gate that has over the arch the statue of the great Llewellyn, whose memory is dear to the Welsh, he being their last prince of Wales. The town is near two miles long, and the streets mostly broad and paved. Here are five churches, and two of them have lofty spires: St. Chad's and St. Mary's are said to have been anciently collegiate; and all the churches, except the last, which is a royal peculiar, are in the diocese of Litchfield and Coventry. There are here a great number of gentry, and this is a place of mirth and gallantry, something like Bury in Suffolk, or Durham in the north; but is much bigger than either of them.

Here is the largest market, the greatest plenty of good provisions, and the cheapest that is to be met with in all the western part of England. Over the market-place is kept a kind of hall for their manufactures, which are chiefly of flannel and white broad-cloth, great quantities of which are weekly sold here. All the inhabitants speak English; but on a market-day you would imagine yourself in Wales.

Here is the most considerable free-school in this part of England, founded by king Edward VI. and endowed by queen Elizabeth, with a sufficient maintenance for a head-master and three under-masters. The buildings, which are of stone, are very spacious, particularly the library, which contains a great many books. The school-masters have also very handsome dwelling-houses; so that the whole has the appearance of a college. The town was incorporated by king Henry I. and is under the government of a mayor, a recorder, a steward, twenty-four aldermen, and forty-eight common-councilmen.

Near this place was fought the bloody battle between Henry Hotspur and Henry IV. king of England, in which the former was killed, and his army entirely defeated; and the place is still called Battle-field. This town is also famous for the reception it gave to Charles I. but the fate of the war afterwards turning against the king, the town was almost ruined; but it has now fully recovered from this disaster, and is one of the most flourishing places in England: the wall and gates are still standing, but useless, and the old castle is gone to ruins. This town gives title of earl to the noble family of Talbot.

Ludlow is seated twenty-nine miles to the south of Shrewsbury, and one hundred thirty-six to the north-west of London, and was formerly defended by a castle, which, now in its decay, gives some idea of its beauty in its flourishing state. This was the palace of the prince of Wales in right of his principality. It enjoys a fine situation, there being a spacious plain in its front, which formerly extended near two miles; but much of it now is enclosed. The country round it is exceeding pleasant and fertile, and nothing can be added by nature to render it a fit place for a royal palace. It is built upon a rock, in the north-west angle of the town, and on the west is shaded by a lofty hill, and washed by the river. The battlements are of great height and thickness, with towers at convenient distances. That half which is within the walls of the town is secured with a deep ditch; the other is founded on the solid rock; but all the fine courts, the royal apartments, halls, and rooms of state lie open, abandoned, and some of them falling down.

The town of Ludlow is likewise fortified with walls, which have seven gates. It is well built, and is a place of good trade. On the south side of the town runs the Temd, over which is a good bridge. The river has several dams across it, on which are placed abundance of mills. Ludlow has a very good church, the windows of which are full of painted glass, pretty entire; the tower is handsome, and has a pleasant ring of six bells. The church is dedicated to St. Laurence, and in the market-place is a conduit, on the top of which is a long stone cross bearing a niche, in which is the image of that saint. The town is governed by two bailiffs, twelve aldermen, a recorder, twenty-five common-councilmen, and other inferior officers. It has the privilege of trying

and executing criminals, and has an alms-house for thirty poor people.

Bridgenorth is pleasantly situated, twenty-one miles to the south-east of Shrewsbury, and a hundred and thirty-six to the north-west of London. The air is healthy, the prospect delightful, and it has a pretty good trade. It consists of two towns, the High and the Low, which are separated by the Severn; but united by a stone bridge of seven arches, which has a gate and gate-house. It has been fortified with walls, and a castle now in ruins; and the area in the last is converted into a fine bowling-green. The streets are broad and paved. In Cowgate-street a rock rises perpendicularly, where are several tenements that have an agreeable, though a grotesque appearance. There is a hollow way cut through the rock, leading from the High town to the bridge, in some parts of the depth of twenty feet, and likewise many vaults and dwellings hewn out of the rock. The town is governed by two bailiffs, twenty-four aldermen, and other inferior officers. It is famous for gunsmiths, and the manufacture of stockings. Here are two churches, St. Mary Magdalen's, which was made a free chapel, and exempted from episcopal jurisdiction by king John; and St. Leonard's, which was burnt in the civil commotions in the reign of Charles I. and lately rebuilt by the inhabitants; but though the parishes are large, and the town very populous, the churches are very indifferently endowed; and this is also the case with the free-school.

Whitchurch is seated on the confines of the county, near Cheshire, about a hundred and sixty-two miles to the north-west of London. It is a pleasant and populous town, and in the Old church, which was lately taken down, was a monument of the great Talbot, first earl of Shrewsbury, called in his time the English Achilles. The New church is a large and handsome structure. The town has a good market, and many gentry near it.

S E C T. XXXIII.

Of Staffordshire; its Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, Lakes, and principal Towns.

STAFFORDSHIRE, which is so named from Stafford, the county town, is bounded on the east and south-east by Derbyshire; on the south by Warwickshire; on the south-west by Shropshire; and on the north-west, north, and north-east by Cheshire and Derbyshire. It extends forty-five miles in length, twenty-eight in breadth, and a hundred and forty-two in circumference. This county, which lies in the diocese of Litchfield and Coventry, is divided into five hundreds, and contains nineteen market-towns, thirty-nine vicarages, a hundred and fifty parishes, and six hundred and seventy villages; with about twenty-three thousand seven hundred and forty houses, and a hundred and forty-two thousand four hundred and forty inhabitants. It sends ten members to parliament, two for the county, and two for each of the following towns, Litchfield, Stafford, Newcastle Under Lyne, and Tamworth.

The air of this county is generally very good, though sharp, especially on the hilly part, which lies between Trentham and Beach. The moor-lands, which are mountainous, and therefore reckoned the most barren, produce a short, but sweet grass, and feed as large cattle as those of Lancashire. The banks of the Dove in particular maintain the great dairies which supply Uttoxeter market with such store of butter and cheese. Great numbers of sheep are fed both in the northern and southern parts; but they are small, and their wool coarser than that of several other counties; but a great deal of it is manufactured in the clothing and felting business. The arable ground is no less fruitful than the pastures, and even the moor-lands, when manured with marl and lime, mixed with turf-ashes, produce good oats and barley. The southern parts, and some of the northern, yield wheat, rye, barley, pulse, flax, and hemp.

With regard to the subterraneous productions, the moor and wood-lands yield copper, lead, iron, marble,

alabaster, mill-stones, excellent coal, salt, &c. In the more fruitful parts are several marls which are used with great success on the lands. Here is likewise brick-earth for red bricks, and others that burn blue; fuller's-earth, potter's-clay, particularly a sort used in the glass-houses; slip, a reddish earth with which vessels are painted yellow, red ochre, and tobacco-pipe clay. It likewise yields fire-stone, rocks of lime-stone, a kind of iron-stone called musk, as big as the crown of a hat, and containing about a pint of a cold, sharp, pleasant liquor, which the workmen are fond of; the best sort of iron-ware are made of this stone; also hæmatites, or blood-stone.

The principal rivers in this county are the Trent, the third river in England, which rises among the moor-lands in the north-west side of the county, and has its waters increased by several rivulets, with the Sow, Eccleshall-water, and other streams, then runs to the eastward into Derbyshire. The Dove rises in the most northern point of Staffordshire, forming the boundary between it and Derbyshire, and joins the Trent a little below Burton. The Sow rises a few miles to the west of Newcastle Under Lyne, and running to the south-east falls into the Trent. They are all well stocked with fish, especially the Trent.

Besides these Staffordshire has plenty of water from its small lakes, as Ladford-pool, Cock-meer, Eccleshall-pool, New and Mare-pools, &c. most of which have rivulets passing through them, or are fed with springs, and abound in fish.

The principal places in this county are the following.

Litchfield, a neat well built city, and county of itself, is seated in a pleasant champaign country, a hundred and eighteen miles to the north-west of London. A brook, which glides slowly through it, divides the city into two parts, one of which is called the Town, and the other the Close. In the first is a fine school, a very handsome hospital dedicated to St. John, and well endowed: this part is the largest and most populous; but the other has the best buildings, and among the rest the cathedral, with the houses of the residentiary clergy, and many other good buildings. The cathedral is esteemed one of the most elegant Gothic structures in England, it is built of a reddish stone, and the west end is adorned with the statues of all the kings who reigned in Jerusalem, from David to the captivity: but the two towers are much too low for their breadth; yet the spires above them are carried up in a beautiful taste, and a tower and spires which rise from the middle of the church are much higher than those at the west end, and equally beautiful. The great window over the middle door is very large, and beautifully adorned. The see is very ancient, it having been once archiepiscopal, with jurisdiction over the kingdoms of the Mercians and East Angles. Besides the cathedral, here are three parish-churches, a free-school, and two hospitals. The jurisdiction of the city extends in a circle near ten miles in compass, and is annually rode round by the sheriff on the eighth of September. The corporation consists of a recorder, who is a nobleman of high rank, two bailiffs, a sheriff, twenty-four burgesses, &c. The market is well supplied with all sorts of provisions on Tuesdays and Fridays. This town gives title of earl to the noble family of Lee.

Stafford, the county town, is seated on the river Sow, which washes it on the south and west, over which is a stone bridge. It stands sixteen miles to the north-west of Litchfield, and a hundred and thirty-five to the north-west of London. It is a neat and well built town, surrounded with meadows: the streets are large, and many of the houses handsomely built. It has a fine square market-place, in which is the county hall, which is a very handsome structure, and under it is the market-house. This town has two parish-churches, and a free-school. It is governed by a mayor and other inferior officers, and here the assizes and sessions are kept. Stafford is much increased and grown rich by the cloathing trade, and it is remarkable that it still retains the ancient custom of Borough English, which is, that the youngest sons inherit the lands of their fathers within the town.

Newcastle Under Lyne is seated on a branch of the Trent, fifteen miles to the north of Stafford, and a hundred

hundred forty-nine to the north-north-west of London. It is a large place, with broad paved streets; but the castle, from whence it receives its name, is quite demolished. It is governed by a mayor, two justices, two bailiffs, and common council; and had formerly four churches, which are now reduced to one. The principal manufacture of the town is hat-making, there being here an incorporated company by the name of felt-makers. The cloathing trade also flourishes here; and about three miles from the town is a manufacture of earthen-ware, which imitates brown china: they also make black tea-pots and other vessels, some of which are neatly figured and gilt, and likewise a prodigious quantity of white earthen-ware.

The adjacent parts yield pit-coal, which shining with a variety of colours, is therefore called peacock-coal.

About three miles south-east of Newcastle is the little town of Trentham, so called from the river Trent, which rises there, where is the noble seat of earl Gower, esteemed the finest in the county: the house is modern, and built on the plan of the queen's palace in St. James's park; but its situation, with the front towards the church-yard, renders the entrance inconvenient. The park is very beautiful; it has two large pieces of water, and the hills which rise from them are finely covered with wood. The park is walled round, and from the high ground in it you have an extensive view of the country on every side.

Wolverhampton, or Woolverhampton, a very ancient, large, and flourishing town, a hundred and twenty miles to the north-west of London, is pleasantly seated on a hill. The houses are pretty well built, and the streets are for the most part broad and well paved. It has an ancient collegiate church annexed to the deanry of Windsor, in which are several ancient monuments, and a very handsome chapel; with a Presbyterian, a Roman catholic, and a Quakers meeting-house. Here the trade of lock-making is carried on to great perfection, as also are the making of most other utensils in brass and iron, which are sent from hence and exported all over Europe. A market for iron-work is held weekly, some of which is made in the town; but the principal part is brought to the market by the farmers for several miles round, where every farm has one forge or more; so that the farmers work at their forges as smiths, when they are not employed in the fields, and what they bring to market is bought up by the great tradesmen who send it to London.

S E C T. XXXIV.

Of Leicestershire; its Name, Situation, Extent, Divisions, Representatives in Parliament, Air, Produce, Rivers, and principal Towns.

THIS county takes its name from Leicester, its capital, which it obtained from its situation on the river Leire, now called the Soar, and is bounded on the north by Derbyshire and Nottinghamshire, on the east by Lincolnshire and Rutlandshire, on the south by Northamptonshire, and on the west by Warwickshire. It extends about thirty miles from east to west, near twenty-five from north to south, and about ninety-six in circumference.

Leicestershire, which lies in the diocese of Lincoln, is divided into six hundreds, and contains thirteen market-towns, eighty-one vicarages, a hundred and ninety-two parishes, ten parks, five hundred and fifty villages, and about a hundred and twelve thousand two hundred inhabitants; but sends only four members to parliament, namely, two for the county, and the like number for the town of Leicester.

The air of this county is very healthful; but the soil is different in different parts: in the south-west it is rich and plentiful, both for corn and pasture; but so destitute of fuel, that the inhabitants are forced to burn dried cow-dung. In this part there are, however, fine meadows on the banks of the Avon. The north-east part, especially about the river Wreke, is mostly barren, mountainous, and rocky; but affords plenty of wood and pit-coal, feeding vast numbers of sheep, which here and in Lincolnshire are the largest mutton with which the London markets are supplied, and have the greatest fleeces

of wool of any in England; nor is the wool less fine on account of its quantity, and, some few places excepted, is the longest staple in the whole island. The sheep-breeding country here reaches from the river Anker, on the confines of Warwickshire, to the Humber, at the farthest end of Lincolnshire, which is near a hundred miles in length; and from the banks of the Trent, in Lincolnshire and Leicestershire, to those of the Ouse, which is above sixty miles in breadth.

The horses fed here are also the largest in England, they being generally the great black coach and dray-horses, of which such numbers are continually sent up to London. Indeed most of the gentlemen are graziers, and in some places it is not uncommon for these to rent from five hundred to two thousand pounds a year.

In short, this county produces wheat, barley, peas, and oats; but its most natural and plentiful crops are of beans.

Its principal rivers, the Avon, the Soar, anciently called the Leire, the Anker, and the Welland, which rise in the west part of this county, form four different courses; for the Avon soon leaves this county, and runs to Warwick. The Soar, the principal river, first runs north-east by Leicester, till having received the Wreke, it turns to the north-west, and falls into the Trent, where the three counties, Leicestershire, Derbyshire, and Nottinghamshire, meet. The Anker runs north-west to Atherston, on the edge of Warwickshire. The Welland runs north east by Harborough to Stamford. The Wreke rises in a part of the county called the Would, and runs westward till it falls into the Soar.

We shall now describe the principal places of this county.

Leicester, the county town, is seated on the river Soar, by which it is half surrounded, ninety-eight miles from London. It is a very ancient place, was once the see of a bishop, and is said to have had thirty-two parish-churches, which are now reduced to five, with several meeting-houses. At present it is the largest and most populous town in the county. In the High-street is an exquisite piece of workmanship in the form of our Saviour's cross, and the hospital built by Henry Plantagenet, duke of Lancaster, still continues in a tolerable condition, it being supported by some revenues from the duchy of Lancaster, and can decently maintain one hundred aged people; but the most stately edifice of this kind at present is the New Bede-house, or hospital, built in the reign of Henry VIII. and endowed by Sir William Wigiston, a merchant of the staple in this town, for twelve poor lazers, which has a chapel and library for the use of the ministers and scholars belonging to the town; there is another for six widows, and a charity-school for thirty boys and ten girls. Leicester has a very spacious market-place, and the streets are paved; but have many old buildings. It is governed by a mayor, &c. and the freemen of Leicester have by their charter the privilege of being exempted from paying toll in all the fairs and markets in England.

Before the castle was dismantled it was a vast building, in which the great Henry, duke of Lancaster, kept his court; the hall and kitchen still remain entire, the former of which is so lofty and spacious, that the courts of justice, which are held here at the assizes, are at such a distance as not to incommode one another. The principal business of the town is stocking-weaving.

Many curious relics have been found in this town, particularly Roman coins; and in the bottom of a cellar was discovered a piece of Mosaic pavement representing the story of Aëdon torn to pieces by his own hounds. This is an admirable piece of workmanship, the stones being only white and brown, and very small. This piece of antiquity is still preserved.

The first law for burning hereticks, by which lord Cobham and others suffered death, was made in a parliament held here, in the reign of king Henry V. declaring the favourers of Wickliff's doctrine heretics and traitors. In the civil wars Leicester was besieged by king Charles I. and taken by storm, on the thirty-first of May, 1645, when his army gave the garrison no quarter, hanged some of the committee, and plundered the inhabitants.

inhabitants. But Sir Thomas Fairfax soon after advancing with the parliament's forces, besieged it again, and obliged the new garrison to surrender upon terms.

Loughborough, is pleasantly seated among fertile meadows, near the forest of Charwood, one hundred and seven miles from London. It stands on the river Soar, over which it has a bridge, and is a handsome town, with one spacious church.

Ashby de la Zouche, is a very considerable market-town, which took its name from the Zouches, its lords; it is seated between Preston-park, and the great park on the skirts of Derbyshire, about a hundred miles from London. It has a large handsome church, near which stand the ruins of the earl of Huntingdon's castle, destroyed in 1648. There is a free-school here, endowed by the earl of Huntingdon, to whom the manor belongs. The town is noted for its large manufacture of hats, in which some hundreds are employed.

S E C T. XXXV.

Of Rutlandshire; its Situation, Extent, Divisions, Representatives in Parliament, Air, Soil, and principal Towns.

RUTLANDSHIRE, the least of all the counties in England, is almost of a circular form, and is bounded on the north and north-east by Lincolnshire; on the south and south-east by Northamptonshire; and on the south-west and north-west by Leicestershire; extending from north to south about fifteen miles, from east to west ten, and about forty in circumference. This county is divided into five hundreds, in which are ten vicarages, forty-eight parishes, one hundred and eleven villages, about three thousand two hundred and sixty houses, and sixteen thousand three hundred inhabitants. It lies in the diocese of Peterborough, and sends only two members to parliament, which are the two knights for the shire.

The air is sweet and salubrious, it being quite clear from fogs and mists. Rutlandshire is extremely well watered, for, besides the Welland, which washes the south and south-east borders, and the Guash or Wash, which intersects the county from east to west, quite through the middle of it; there are abundance of small rivers and brooks, which fall into them on all sides. They all afford plenty of excellent fish, which makes some amends for the want of sea-fish, from which the inhabitants are in a great measure debarred, by their inland situation.

The soil is very fruitful, in corn and pasture, which feeds great numbers of cattle, especially sheep, the wool of which is redder than in other counties, from the peculiar redness of the soil. The vale of Catmos, in which Okeham stands, is not inferior in point of fertility to the vales of White-horse and Belvoir. This county gives title of duke to the noble family of Manners. The principal towns it contains, are Okeham, and Uppingham.

Okeham, the county town, stands in the rich valley of Catmos, ninety-four miles from London. It is pretty well built, has a good church, a free-school, and an hospital. It has likewise an ancient castle, in which the assizes are held. It is said to be a custom in this town, that when a nobleman comes within its precincts, he is obliged to pay homage, by giving a shoe from one of his horses, or to compound for it in money; when the forfeited shoe, or that made in its stead, is fixed with the nobleman's name on the castle-gate. Sometimes they are made very large, and gilt in proportion to the sum of money given instead of the shoe. The castle was built soon after the conquest, by Walkelin de Ferrariis, who bearing horse-shoes in his arms, gave rise to the above custom.

Uppingham, a town of Rutlandshire, is seated on an eminence, and is a pretty compact well built place, with a very good free-school, and an hospital.

Though this county is very small, it contains a considerable number of noblemen's seats.

S E C T. XXXVI.

Of Lincolnshire; its Situation, Extent, Divisions, Representatives in Parliament, Air, Soil, Produce, and principal Towns.

LINCOLNSHIRE, takes its name from the city of Lincoln, which by the ancient Britons was called Lindcoit, and by the Saxons Lincollscire; it is bounded on the north by Yorkshire, from which it is divided by the Humber, on the east by the German ocean, and a small part of Norfolk, on the south by Cambridgeshire and Northamptonshire; and on the west is bounded by Rutlandshire, Leicestershire, Nottinghamshire, and a small part of Yorkshire.

It is generally reckoned almost sixty miles from north to south, and in the middle, where widest, thirty-five; but according to Templeman, it is sixty-seven miles in length, and forty-three in breadth. It is generally divided into three parts, namely, Holland on the south-east side, Kesteven on the south-west, and Lindsey on the north; which last division is the largest, for it includes all that lies north of Lincoln city, and the Fosse-dyke, which king Henry I. cut between the Witham and the Trent. This county is sub-divided into three hundreds, and twenty-five wapentakes, and contains one city, five parliamentary boroughs, thirty-four other market-towns, two hundred and fifty-six vicarages, one thousand five hundred and fifty-six villages, near forty thousand six hundred houses, and about two hundred two thousand nine hundred inhabitants. It is in the diocese of Lincoln, and sends twelve members to parliament, two for the county, and two for each of the following places, Lincoln, Stamford, Grantham, Boston, and Grimsby.

This county is well watered with rivers, the principal of which are the Trent, which washes the western edge of the county, and falls into the Humber, the northern boundary. The Witham, which rising in the south-west of the county, runs northward, till it receives the Fosse-dyke at Lincoln, where it turns to the south-east, and at length falls into the German ocean below Boston; and the Welland, which parts this county from Northamptonshire, running through Holland division also into the German ocean.

With respect to the air of this county, it must be observed, according to its three grand divisions, that of Holland, as it is partly under water, and the rest of it moist and fenny, must be bad. Kesteven is more salubrious, it being less affected with the fogs from the fen country, and its soil more fruitful. Lindsey is generally esteemed healthy, especially on the western side. The soil is in most places very rich, the inland part producing corn in great plenty, and the fens cole-seed, and very rich pastures; whence their breed of cattle is larger than that of any other county in England, except Somersetshire; their horses are also excellent and very large: The hunting hounds and hares are particularly noted for their extreme swiftness. Here are all the common fruits, and they are said to have better pippins than those of Kent, especially such as grow in the division of Holland, and about Kirton, both of which sorts are very wholesome and delicious; yet, being grafted on their own stock, are much improved, and are then called rennets.

The churches of this county are said to be its chief ornaments, it being commonly observed, that no county has better churches and worse houses. The poorer sort of people here wash their cloaths with hog's-dung, and burn dry cow-dung.

The principal places in Lincolnshire are the following.

Lincoln, a city seated one hundred and twenty-eight miles from London, was anciently a Roman colony, called Lindum Colonia. It is pleasantly seated on the top, side, and foot of a hill, on the river Witham, which divides into several streams, and waters the lower part of the city, over which are several bridges. It had formerly fifty churches, which are now reduced to fourteen, besides the cathedral or minster, and meeting houses of every denomination of dissenters. The cathedral is one of the most superb structures of the kind in England, and from its situation on the top of a hill, may be seen from

from five or six counties. It has a double cross or transept, with two spires or towers, and many bells, particularly in the north tower, which has the finest great bell in England, called Tom of Lincoln: it weighs four tons eighteen hundred and ninety-four pounds, and is twenty-two feet eight inches in circumference. The middle or Round-tower is the highest in the kingdom, and when the spire was standing it must, in proportion to the height of the tower, have exceeded that of Old St. Paul's, which was five hundred and twenty feet. The monks were so proud of this structure, that they would have it the devil looked upon it with an envious eye, whence the proverb "He looks as the devil does over Lincoln." Now there are only four very ordinary pinacles, one at each corner. It has two large gates on the west: the cloisters and library are fine, and the latter well furnished with printed books and manuscripts. Two catharine-wheel windows at the ends of the larger transept are remarkably beautiful, and adorned with painted glass.

To the south of the cathedral, upon the very brow of the hill, is the bishop's palace. Though this is the largest diocese in England, the revenue of the bishopric is said now to amount only to fifteen hundred pounds per annum; but was formerly immensely great. In this diocese are contained the counties of Lincoln, Leicester, Huntingdon, Bedford, Bucks, and part of Hertfordshire; and in them twelve hundred and fifty-five parishes, of which five hundred and seventy-seven are impropriations.

In the upper town are good buildings, and several gentlemen have their houses there, besides those of the prebendaries and other clergy. The communication between the upper and lower town is very troublesome; but in the steepest part is the briskest trade, and here the shops are well furnished with commodities; but the buildings are generally old, especially in the lower part. This is a city and county of itself: it is governed by a mayor, twelve aldermen, two sheriffs, &c. whose jurisdiction extends twenty miles in circumference. It has given the title of earl to the noble family of Clinton ever since the reign of queen Elizabeth. Here are four charity-schools, in each of which thirty poor children are taught by clergymen's widows.

Stamford is seated on the Welland, eighty-three miles from London, and is a large and populous borough in the sub-division of Kesteven. It stands on the slope of a hill, and has a stone bridge of five arches over the river, on the confines of Northamptonshire and the county of Rutland. The river is navigable by barges up to the town. Here is a handsome town-hall and six parish-churches, with several good streets and fine structures. It is an ancient town, it being known in the time of the Romans, and had long ago a college whose students removed to Brazen-Nose-college, in Oxford; but though its trade is not very considerable, the inhabitants are numerous and rich; and it being seated upon the York road, is particularly famous for its large and commodious inns. Among the privileges of which the inhabitants boast, is, that the mayor is immediately under the king, and commands the militia, returns writs, &c. and that they have the custom of Borough English, by which the younger sons inherit upon their fathers dying intestate. In this town is a charity-school, in which eighty poor children are taught and employed.

Boston, a large, populous, and well built sea-port town, in the sub-division called Holland, twenty-six miles south-east of Lincoln, and ninety north of London, is built on both sides of the river Witham, at its mouth, and stands part in Lincolnshire and part in Northamptonshire, which are joined by a wooden bridge. It has a commodious harbour on the German ocean, is full of merchants, and enjoys a good trade. The town is supplied with water by pipes from a reservoir made by act of parliament, in a common called the West Fen. The church is without cross ailes, and is said to be the largest parish church in the world; and its tower, which is two hundred and eighty feet from the ground, serves as a land-mark to mariners, not only into this port, but even into the mouth of the Ouse, being seen out at sea to the entrance of the channels, called Lynn-deeps and Boston-deeps, very difficult places. The

living is a vicarage, in the gift of the mayor and burgesses.

Grantham, a neat populous borough of the sub-division called Kesteven, is a place of great resort, and has abundance of good inns, it lying on the north road, a hundred and four miles from London. It has a fine large church, with a stone spire two hundred and eighty feet high, which, by a mere deception of the sight, seems to stand awry. It has also a good free-school, built and endowed by Dr. Richard Fox, bishop of Winchester, who was a native of this town; and here the celebrated Sir Isaac Newton received his first education. In this town there are also two charity-schools, and upon the neighbouring course are frequently horse-races. It gives title of baron to the noble family of Robinson.

Gainsborough, a large and well built town of Lindsey sub-division, is seated on the Trent, a hundred and thirty-seven miles from London; it has a fine large market held weekly on Tuesdays, and gives title of earl to the noble family of Noel. Its church was rebuilt by act of parliament in 1735; and here are several meeting-houses of Dissenters. The Danes landed here when they came up the Trent, which brings up ships of burthen with the tide, though it is forty miles distance by water from the Humber.

S E C T. XXXVII.

Of the County of Norfolk; its Situation, Extent, Divisions, Representatives in Parliament, Air, Soil, Produce, Rivers, and principal Places.

THIS county received its name from its northern situation with respect to Suffolk; it is bounded on the north and east sides by the German ocean, on the west by Cambridgeshire and Lincolnshire, and on the south by Suffolk. It extends about fifty miles from east to west, thirty-five from north to south, and about a hundred and forty-five in circumference.

It is divided into thirty-one hundreds, and contains a hundred and sixty-four vicarages, thirty-three market-towns, six hundred and sixty parishes, near fifteen hundred villages, about forty-seven thousand one hundred and eighty houses, and two hundred and eighty-three thousand inhabitants. This county is in the diocese of Norwich, and sends twelve members to parliament, namely, two for the county, and two for each of the following boroughs, Norwich, Lynn-Regis, Yarmouth, Thetford, and Castle-Rising.

The air of this county is sharp and piercing, which throws the seasons backward than is usual in the same latitude in England. The inland country is thought very healthy; but the soil is observed to have a greater variety in it than is found perhaps in any other county, and from thence has been considered as an epitome of England, it having all the kinds of soil found throughout the kingdom, namely, arable, pasture, wood-lands, meadows, heaths, fens, light sandy ground, and deep clay; but even the worst of these are far from being unprofitable, the sandy heaths feeding sheep and breeding rabbits, and the fens affording rich pasture for cattle. The chief commodities are corn, cattle, wool, rabbits, honey, saffron, herrings in great abundance, with jet and amber thrown upon the sea-coast. The manufactures are worsted, woollens, and silks, in which all the inland part is employed. This county gives title of duke to the noble family of Howard.

The principal rivers of Norfolk are the Ouse, which divides it on the west from Suffolk and Cambridgeshire. The Waveney, which is the boundary between Norfolk on the south-east and Suffolk. The two different courses of these rivers are the more remarkable, as both rise within a very small distance of each other in the southern edge of the county. The Yare, which is peculiar to Norfolk, rises near the center of the county, and runs eastward through Norwich to Yarmouth, where it falls into the German ocean. A little above this last mentioned town the Yare is joined by the Waveney. These three rivers abound with fish, and are

particularly famous for excellent perch; but the Yare has also a fish, called a ruff, peculiar to itself, that exceeds the perch in the delicacy of its taste: it is much about the same size, and the body is all over rough with sharp prickles, from whence it has its name. The back is of a brownish colour, the belly of a pale yellow, and about the jaws it has double semi-circular marks.

The principal towns in this county are the following:

Norwich, a very ancient, large, handsome, populous, and well frequented city, is seated on the banks of the river Yare, which runs through a part of it, a hundred and nine miles north-east-by-north of London. It is encompassed by walls, which have twelve gates, and has a fine old castle, at present used as a prison, and from whence a person may have a view of the whole city. Here also are the ruins of a castle, called by the name of Kett, who lived in the reign of Edward VI. and did much damage to the city, which is very ancient, and has undergone great calamities. It has several bridges over the river, and has thirty-six churches, besides the cathedral, which is a handsome structure, and has a lofty spire steeple: there are here also meeting-houses of Dissenters of all denominations. As the walls are three miles in compass, the whole space within them is not inhabited, they inclosing many gardens and orchards. There are here, however, about eight thousand houses; the streets are pretty wide, and there is a very spacious market-place. It has also a new play-house, a place of entertainment called Vauxhall, and several other curious gardens to which the gentry resort; with an hospital for a hundred poor men and women.

It has a large and flourishing manufactory of camblets, crapes, &c. for which it has a great trade, both at home and abroad. It is a city and county of itself: the bishop has a palace here, as hath also the duke of Norfolk. It is governed by a mayor, a recorder, twelve aldermen, two sheriffs, and twenty-one common-council.

It has been observed of this city, that if a stranger was only to ride through it, or view it on ordinary days, he would be induced to think it a town without inhabitants; but, on the contrary, if he was to view this city either on a Sunday, or on any public occasion, he would wonder where the people could dwell, the multitude is so great: but the case is this, the inhabitants being all busy at the manufactures, are in their combing-shops, as they call them, at their twisting-mills, in their garrets at their looms, and the like; almost all the works they are employed in being done within doors.

Yarmouth, a sea-port town, a hundred and twenty-two miles to the north-east of London, is seated on the river Yare, where it falls into the sea, and is a place of great strength, both by art and nature, it being almost surrounded with water, and defended by a very strong fort. It is an ancient town much older than Norwich, and is well built and very populous. It has the finest quay in England, if not in Europe, and is said to equal at least that of Marseilles; for the ships ride here so close, that for half a mile together they go across the stream with their bowsprits over the land, their bows or heads touching the very wharf; so that one may walk from ship to ship as on a floating bridge all along by the shore side. The quay, which reaches from the draw-bridge almost to the south gate, is so spacious and wide, that in some places it is near a hundred yards from the houses to the wharf. In this pleasant and agreeable range of buildings are some very magnificent structures, and among the rest the custom-house, the town-hall, and some merchants houses which resemble little palaces rather than the dwelling-houses of private men.

The greatest defect of this town seems to be, that tho' it is very rich and increasing in wealth and trade, and consequently in people, there is not room to enlarge it by new buildings. It consists of about fifteen hundred houses, and though there are several pretty wide streets, they are chiefly very narrow, and just wide enough for their little carriages to pass through. It is esteemed the key of this coast; but though the harbour is a very fine one, it is very dangerous for strangers in windy weather. Yarmouth is governed by a mayor, eighteen aldermen,

and thirty-six common-council. This town, though so considerable, has only one large church, which is dedicated to St. Nicholas, and a neat chapel, with a considerable number of meeting-houses. The steeple of St. Nicholas's church is so high, that it serves for a land-mark to those at sea; and it is remarkable, that which way soever this steeple be viewed it appears crooked.

Yarmouth is noted for its red herrings, which are jocosely called Yarmouth capons, and also for its coaches, which are nothing more than sledges drawn with one horse. During the fishing season the land is covered with people, and the river with barks and boats, busy day and night in landing and carrying off the herrings, which are caught here in almost incredible quantities. Our author says, he happened to be there during their fishing fair, as they call it, when he counted in one tide a hundred and ten barks and fishing vessels coming up the river, all laden with herrings taken the night before. After the herrings are cured, they export them to Genoa, Leghorn, Naples, Messina, Venice, Spain, and Portugal; and at the same time carry to those places great quantities of woollen goods. They have also a considerable trade in woollen manufactures to Holland, Norway, and the Baltic, from whence they import timber and naval stores; and have a very great share in the coal-trade between Newcastle and the port of London.

Lynn-Regis, or King's-Lynn, was first called Lynn-Episcopi, as being the property of the bishop of Norwich, till the dissolution of monasteries by king Henry VIII. when that prince becoming its possessor, conferred on it the title of Lynn-Regis. It is a handsome, large, and well built town, ninety-eight miles north-east of London, in the fifty-second degree fifty-five minutes north latitude, and in thirty-two minutes east longitude. It is seated at the mouth of the Ouse, which, by means of the several streams it receives before it falls into the sea, forms a navigation, by which the merchants of Lynn entirely supply Cambridgeshire, Huntingdonshire, the north part of Buckinghamshire, Bedfordshire, and Northamptonshire, with the inland parts of Norfolk and Suffolk; more particularly with coals and wine: and they carry on a considerable foreign trade, especially to Holland, Norway, the Baltic, Spain, and Portugal. The harbour is safe when ships have once entered it; but there are flats and shoals at the entrance, at which buoys are placed; and there are always good pilots ready for steering strangers in.

The town contains about two thousand four hundred houses; and is strong by sea, as it was also formerly by land, where there are the ruins of the works in part demolished in the civil wars, yet not so much but they may be easily repaired; these consist of nine regular bastions, and a ditch nearly in the form of a semi-circle, which make the place about half a mile in breadth; and St. Anne's fort and platform at the north-east end commands all ships that enter the harbour.

It has a spacious and fine market-place, in which is a handsome statue of king James II. with a fine cross, which has a dome, and a gallery round it, supported by sixteen columns; and the market-house is a modern free-stone building seventy feet high, neatly adorned with statues and other embellishments. Four rivulets, over which are fifteen bridges, run through the town; and the tide in the Ouse, which for a mile here is about as broad as the Thames at London bridge, rises twenty feet perpendicular. The town is supplied with fresh water by conduits and pipes from the neighbourhood.

The king's staith-yard is a very handsome square, adorned with a statue of king James II. here the greatest part of the wines imported are landed. The town-house, called Trinity-hall, is an ancient and noble building. The exchange in the middle of the town is an elegant structure of free-stone, adorned with two orders of columns, and within it is the custom-house.

It has two churches, a very large chapel, and two dissenting meeting-houses. St. Margaret's church, which is very large, formerly belonged to an abbey, and has a high lantern, covered with lead: at the west end is a stone tower, with a moon-dial, shewing the increase and decrease

decrease of that planet; and above the tower is a spire, in which is a ring of bells. St. Nicholas's chapel is very ancient, and has a tower and octangular spire.

In this chapel is a library, to which lord Townsend, the late earl of Orford, Sir Charles Turner, &c. were considerable benefactors.

The town is governed by a mayor, a recorder, a high steward, twelve aldermen, and eighteen common-council; and there is here a very laudable custom, which is, that every first Monday of the month, the mayor, aldermen, preachers, &c. meet to hear and determine all disputes in an amicable manner, in order to prevent law-suits. There are here also a free-school, which is a strong and beautiful building, two hospitals, and a charity-school.

SECT. XXXVIII.

Of Nottinghamshire; its Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, and principal towns.

NOTTINGHAMSHIRE takes its name from Nottingham, the county town, called by the Saxons Snottengaham, or a house of Dens, so called from the spacious vaults dug in the rocks, in which the ancient Britons perhaps resided. This county is remarkable for its being bounded on the four cardinal points of the compass, by four single counties, a circumstance which is not found in the situation of any other county in England: on the north it borders upon Yorkshire, on the east on Lincolnshire, on the south on Leicestershire, and on the west on Derbyshire. It extends forty-seven miles in length, and twenty-seven in breadth.

This county, which lies in the diocese of York, is divided into six wapentakes, and contains nine market-towns, one hundred and sixty-eight parishes, ninety-four vicarages, four hundred and fifty villages, about seventeen thousand four hundred and sixty houses, and ninety-five thousand inhabitants. It sends eight members to parliament, namely, two for the county, and two for each of the following boroughs, Nottingham, East-Retford, and Newark upon Trent.

The air of this county is esteemed exceeding healthful, but the soil is various: the eastern side is very fruitful, and yields great plenty of corn and grass; but the western parts are less fertile, being generally very woody, and in some places barren, and only yielding coal. The chief commodities are pit-coal, a kind of stone somewhat like alabaster, but not so hard, which when burnt, makes a plaister harder than that of Paris, with which the inhabitants generally plaister the floors of their upper rooms, instead of boarding them. Their other commodities are malt, wool, liquorice, wood, fish, and fowl. Their manufactures chiefly consist of frame-work knitting, glass, and earthen-ware.

The principal rivers of this county are, the Trent and the Idle. The Trent is one of the capital rivers in England, it running a course of near two hundred miles before it reaches the Humber. Its spring-head is in the highlands of Staffordshire, as hath been already observed, in treating of that county, and from thence it runs through Derbyshire, Nottinghamshire, and Lincolnshire. The name is derived by some from the thirty smaller rivers it receives, and by others from thirty different kinds of fish found in it. It enters this county at the south-west point, where it is joined by the Erwash, and runs to the eastward till it reaches Newark, where it forms an island, and turning to the northward, runs into Lincolnshire. The Idle rises in Sherwood forest, and running through the northern parts of the county to the edge of Yorkshire and Lincolnshire, there joins the Trent. The principal towns in this county are the following:

Nottingham, which is delightfully seated on a rock, one hundred and twenty-two miles north west of London, at the foot of which runs the river Leane, which, at a mile's distance, falls into the Trent, over which there is a handsome stone bridge, and another over the Leane. The town is large and well built; most of the

houses in the market-place and principal streets, have their front supported by lofty stone columns, of the Tuscan order, which not only make a very handsome appearance, but afford shelter in bad weather. The streets are well paved, and from their situation on a rock, are always clean. The market-place, which is large and spacious, has a beautiful cross, in which a kind of dome, is supported by very lofty stone columns, under which is kept the corn-market. In a street at some distance from this market, are several stone steps diminishing as they rise, and on the top stands a very noble column crowned with a ball. This is called the Hen-cross, and here is a market for all sorts of poultry.

It is proper to observe, once for all, that, though what are called market-crosses, take their name from crucifixes being antiently erected in those places, no modern structure of this kind, ever bears any mark of popish superstition.

The rock on which the town stands, is pretty soft, and renders the town remarkable for its cellars, two or three being sometimes under each other, with the steps hewn out of the rock, in some places to the number of sixty or seventy in depth. These conveniencies, together with the goodness of the malt, enable the inhabitants to drink the best malt liquors, and to make a considerable advantage in sending them to most parts of England; for which purpose most of the low lands of this county are sowed with barley. As the meadows, which lie between the town and the Trent, are liable to be overflowed, a good boarded causeway for foot-passengers, extends about a mile long.

The town has three churches; that of St. Mary's is a large and noble gothic structure, with a square tower; and that of St. Peter's is a very handsome building, with a modern painting of the Last Supper, on the altar-piece. It has a lofty spire, and each has a good ring of bells and chimes. St. Nicholas's church is however a mean building. There are also four meeting-houses.

Heavy goods are brought hither from London by sea up the river Trent, and many coal-pits within three or four miles of the town, afford plenty of fuel at a small expence. It is governed by a mayor, a recorder, six aldermen, two sheriffs, two chamberlains, two coroners, and eighteen common-council.

At the south-west end of the town is a steep hill, which has on the south a high precipice fronting the meadows. On this hill stood a castle of such antiquity, that the time of its first erection cannot be traced. It was rebuilt by William Peverel, bastard son to the Conqueror, and afterwards improved by Edward IV. and Richard III. This structure was granted to the earl of Rutland, and afterwards came into the possession of William Cavendish, marquis of Newcastle, who, in 1674, cleared away the old building, and a most magnificent structure was at length erected, which seems to have been modelled after some of the draughts of Inigo Jones. The present duke of Newcastle, in 1760, made a present of this noble edifice to the earl of Lincoln, his grace's nephew. It is built entirely of stone, and has a delightful prospect over the meadows, which extend two or three hundred feet below it, about twelve miles in length, like a level bowling-green, interspersed with villages, and the river Trent winding through it; on the east-end, over the town and the distant country; and on the north, over the park, which is beautifully variegated with hills and valleys.

In this park are the remains of a church or pagan temple, hewn out of the rock, the roof vaulted and supported by a kind of massy pillars, in a very rude taste: the floor, the roof, the pillars, and sides, being all of a piece. In the same ledge of perpendicular rocks, are the remains of several houses, chambers, dove-houses, &c. which might possibly be the residence of some of the ancient Druids.

Newark, is a very handsome well built town, seated on the Trent, seventeen miles to the east of Nottingham, and one hundred and four from London. The market-place is a noble square, and the church is large and spacious, with a handsome lofty spire. The town is under the government of a mayor, and twelve aldermen. Here was once a handsome castle, which is now

in ruins. The Trent here divides itself, and forms an island, to which there is a bridge leading from the town.

Mansfield, a large well built market-town, seated in the forest of Sherwood, thirteen miles to the north of Nottingham, and one hundred and thirty-six to the north-west of London, and carries on a considerable trade in malt.

Retford, is divided into East and West Retford, by the river Idle, which runs through it. This town enjoys many considerable privileges, and is governed by a steward, who is generally a person of quality. In West Retford is a very fine hospital, founded in 1666, by Dr. Dorrel, and since incorporated: it has a master, ten brethren, a steward, and a nurse, who have a garden and orchard divided into ten shares.

S E C T. XXXIX.

Of Derbyshire; its Situation, Extent, Divisions, and Representatives in Parliament; its Air, Soil, and Rivers; with a Description of the Wonders of the Peak, and the principal Towns of the County.

DERBYSHIRE is bounded on the north by Yorkshire, on the east by Nottinghamshire, on the south by Leicestershire and Warwickshire, and on the west by Staffordshire and Cheshire. It extends near forty miles in length, in the northern parts it is about thirty miles broad, but in the southern not above six; and it is computed to be near one hundred and thirty miles in circumference.

This county is divided into five hundreds, in which are contained eleven market-towns, fifty-three vicarages, one hundred and six parishes, near five hundred villages, twenty-one thousand one hundred and fifty houses, and one hundred twenty-six thousand nine hundred inhabitants. It is seated in the diocese of Litchfield and Coventry, and sends four members to parliament, two for the county, and two for the town of Derby.

The air, especially on the east-side, is wholesome and agreeable; but in the mountains of the Peak it is sharp and cold. The north and west parts are hilly and stony; but the southern and eastern have rich lands, that are pleasant and fertile, producing most kinds of grain, particularly barley. Even the north-west part, called the Peak, is not destitute of riches, for the bleak mountains, produce great quantities of the best lead, marble, alabaster, mill-stones, iron, coal, a coarse sort of crystal, and in the intermediate valleys is great plenty of grass.

The principal rivers are the Derwent, the Dove, the Erwasb, and the Trent. The two first rise in the Peak; the Derwent running from north-west to south-east, through the middle of the county, and at length becoming a considerable river, discharges itself into the Trent, about eight miles below Derby. The Dove parts this county from Staffordshire, and falls into the Trent, about five miles to the north of Burton upon Trent. The Trent, of which we have given a particular account in treating of Nottinghamshire, only visits a small space of the southern parts of this county.

It will now be proper to take notice of what are called the Seven Wonders of the Peak, one of the most extraordinary of which is Poole's-hole, a stupendous cavern, at the foot of a great mountain. The entrance is so low and narrow, that you must stoop to get in; but it soon opens into a wide and lofty concavity, that has some resemblance to a gothic cathedral, which reaches above a quarter of a mile in length. Water drops every where from the roof and sides, and being of a petrifying quality, it crusts all the stones with long crystals, in various forms, which, by the help of a strong imagination, are shewn you as lions, lanterns, organs, a fitch of bacon, &c. At length you come to the queen of Scots pillar, which is the boundary of most people's curiosity, and was so named by that unhappy princess, when she visited this place. It is composed of a clear bright stone, like alabaster, or rather like that kind of spar which is found about lead. A stream of water runs along the middle of this cavern among the fallen rocks, with an hideous noise. On the left hand is a sort of chamber, where

they say Poole, a famous robber, lived, and whose kitchen and bedchamber they shew you, after you have crept ten yards on your hands and knees. What appears most extraordinary is, the surprising height of the arch, which Dr. Leigh compares to fret-work, organ, and choir-work, bespangled with stars, which dazzle the eyes, and looks extremely beautiful from the reflection of the lights.

Another of these wonders is Mam-Tor, which signifies the Mother-Rock. From the top of a prodigious precipice, the soft earth being continually crumbling and falling down, raises a mountain below, which visibly increasing without an apparent diminution of the top, the ignorant people imagine, that, though the earth is continually falling, the mountain loses nothing of its bulk.

Another wonder is called by the gross name of the Devil's Arse. Here, or on the steep side of a mountain, is a large opening, almost in the form of an old Gothic arch, above thirty feet perpendicular, and above twice that breadth at the bottom. Several small cottages are built on each side the entrance, whose inhabitants in a great measure subsist by guiding strangers into the cavern. Its width, however, soon diminishes; for, after crossing one stream of water, the roof gradually descends till it is so low, that a man cannot stand upright under it; but, stooping for a little way, and passing over another stream, you find it more lofty. Then proceeding on, you come to a third rivulet, where the rock descends almost to the surface of the water, and prevents all farther search. The vault in several places makes a noble appearance, and being chequered with various coloured stones, its beauty is admired by every spectator.

Another wonder, is called Tides-Well, or Weeden-Well, a spring, which according to some writers, ebbs and flows regularly like the sea. That it does ebb and flow is certain; but it is at very unequal periods, sometimes not in a day or two, and sometimes twice in an hour. The basin of the spring is about a yard deep, and the same in length and breadth. When it flows the water rises with a bubbling noise, as if the air, which was pent up within the cavities of the rock, was forcing itself a passage, it driving the water before it.

The next wonder, as it is called, is Buxton-Wells, which, besides their medicinal use, have this singularity, that within five feet of one of the hot springs, there arises a cold one; but this is not very extraordinary, since hot and cold springs rise near each other, in several places in England, and in other countries. The water of Buxton-Wells is sulphurous, with a small quantity of saline particles; but is not in the least impregnated with vitriol. Hence they are very palatable, in comparison with other medicinal waters. These wells are often recommended by physicians, both for drinking and bathing, especially for scorbutic, rheumatic, or nervous complaints.

The late duke of Devonshire built a large and convenient house for the reception of strangers. The bath-room is arched over, and the whole made handsome, convenient, and delightful. The bath will receive twenty persons at a time to walk and swim in, and the water is of a warmth equal to that of new-milk. These waters were well known in the time of the Romans. Besides the principal springs, which are at the village of Buxton, there are many others that rise unregarded in the neighbouring inclosures, and on the sides of the hill, so that their number can scarce be known.

We shall now proceed to the next wonder. In the midst of a plain open field is a frightful chasm in the earth, or rather rock, called Elden-hole, the mouth of which is about twenty feet over one way, and fifty or sixty another, descending down perpendicularly to a depth that is said never yet to have been discovered, tho' several attempts have been made to find its bottom. Mr. Cotton says he let down eight hundred fathoms of line, which is sixteen hundred yards, or near a mile perpendicular.

The last wonder is that of Chatsworth-house and gardens, belonging to the duke of Devonshire. On the top of a mountain, where mill-stones are dug, is a vast extended moor, which for fifteen or sixteen miles together

has neither hedge, house, nor tree; but appears like a waste and barren wilderness, over which when strangers travel, it is impossible to find their way without a guide. If contraries illustrate each other, here they are seen in the strongest opposition, for nothing can be more surprising to a traveller who comes from the north, when, after a tedious progress through a dismal desert, on a sudden the guide brings him to a precipice where he looks down from a comfortless and barren waste into the most delightful valley, and beholds a noble palace and one of the finest gardens that can be imagined. Before the west front of the house, which is very fine, runs the river Derwent, which, though not many miles from its source, sometimes appears like a large and rapid river, when after a sudden rain the torrents rush down from the mountains. Over this river is a stately stone bridge, with an ancient tower upon it, and in an island in the river is a tower, in the form of a castle. The front to the garden is a regular piece of architecture. The sashes of the second story are seventeen feet high, of polished looking-glass, each square two feet wide, and the wood-work double gilt. The windows, doors, and rooms are adorned with beautiful marble, and the inside with paintings. The chapel is extremely beautiful, the altar-end and the floor are of marble, the seats and gallery of cedar, and the rest of the wall and ceiling finely painted. The gardens abound with green-houses, summer-houses, walks, wildernesses, and orangeries, intermixed with statues, urns, canals, basins, and a great variety of water-works; among which are many curious fountains, an artificial willow-tree, which drops water from every leaf, and a wonderful cascade, where from a neat house of stone, like a temple, a whole river descends the slope of a hill a quarter of a mile in length, over steps, with a roaring noise, till it is at last lost under ground.

The principal towns in Derbyshire are the following:

Derby is situated on the west banks of the Derwent, over which it has a handsome stone bridge, a hundred and twenty-two miles to the north-west of London. It is a pleasant, agreeable, and well built town, inhabited by a great number of gentlemen. The river is navigable up to the bridge, and just above it, is a beautiful artificial island raised out of the water and formed into a garden. This island stands before the celebrated engine-house for making organzine, or thrown silk; by which invention one hand will twist as much silk as could be done by fifty, and that in a truer and much better manner. This engine contains twenty-six thousand five hundred and eighty-six wheels, and ninety-seven thousand seven hundred and forty-six movements, which work seventy three thousand seven hundred and twenty-six yards of silk thread every time the water-wheel goes round, which is three times in one minute, and three hundred and eighteen millions five hundred and four thousand nine hundred and sixty yards in one day and night. One water-wheel gives motion to all the rest of the wheels and movements, of which any one may be stopt separately. One fire-engine likewise conveys warm air to every part of the machine, and the whole work is governed by one regulator. The town is very populous, and contains five parishes and several meeting-houses.

Derby has a large market-place, a beautiful town-house of free stone, and very handsome streets. The principal church is that of All Saints, which has a beautiful Gothic tower a hundred and seventy-eight feet high, and for the elegance of its ornaments, is not to be equalled by any in this or the adjacent counties. According to an inscription in this church the steeple was erected about queen Mary's reign, at the expence of the bachelors and maidens of the town, on which account whenever a maiden, a native of the town, was married, the bells used formerly to be rung by bachelors. The government of this town is under a mayor, an high-steward, nine aldermen, a recorder, fourteen brothers, fourteen capital burgeses, and a town-clerk. The principal trade of the town consists in malt and ale.

Wirksworth is seated in a valley near the spring-head of the river Eccleborn, and is a pretty large populous place, a hundred and eighteen miles from London, and

has a handsome church, a free-school, and an almshouse. The town is remarkable for having the greatest lead market in England, and for having what is called a barmoot-court, to judge controversies among the miners; and to adjust subterranean quarrels and disputes.

Chesterfield is a handsome populous town, situated on a hill between two small rivers, a hundred and twenty-seven miles to the northward of London. It has a handsome large church, which has a spire of timber covered with lead, but warped all a wry; and also several meeting-houses. It is governed by a mayor. Its market is considerable for corn, lead, and country commodities. The houses are for the most part built of rough stone, and covered with slate. The inhabitants carry on a considerable trade to and with all the neighbouring counties in lead, grocery, the malting of barley, tanning, stockings, blankets, bedding, &c. Chesterfield has a large free-school, reckoned the most considerable of any in the north of England, and likewise several almshouses. This town gives title of earl to the noble family of Stanhope.

S E C T. XL.

Of Yorkshire; its Situation, Extent, Divisions, Representatives in Parliament, Air, Soil, and Rivers; with a Description of the principal Towns.

YORKSHIRE, which in extent is equal to some sovereignty, and is bigger than any two of the largest counties in England, is bounded on the north by Westmoreland and the bishopric of Durham; on the east by the German ocean; on the south by Lancashire, Nottinghamshire, and Derbyshire; and on the west by a small part of Cheshire, Lancashire, and Westmoreland. It extends ninety miles in length from east to west, seventy-five in breadth from north to south, and above three hundred and sixty in circumference. This county is divided into three ridings, called the North, East, and West; besides which there is a fourth division, called Richmondshire; and is sub-divided into twenty-three wapentakes, which contain fifty-seven market-towns, two hundred and forty-two vicarages, five hundred and sixty-three parishes, two thousand three hundred and thirty villages, about a hundred and six thousand one hundred and fifty houses, and six hundred and thirty-six thousand nine hundred inhabitants. It lies in the diocese of York, except Richmondshire, in the North Riding, which belongs to the diocese of Chester, and sends thirty members to parliament, namely, two for the county, and two for each of the following boroughs, York, Kingston upon Hull, Knaresborough, Scarborough, Rippon, Richmond, Heydon, Boroughbridge, Malton, Thirsk, Aldborough, Beverley, Northallerton, and Pontefract.

The air and soil of this extensive country vary extremely; the East Riding, on account of its neighbourhood to the German ocean, is less healthy than the other Ridings; but this inconvenience decreases in proportion as the country recedes from the sea. However, where the air is most indifferent, the soil is most fruitful; for on the hilly parts of this Riding, especially in what is called the York Wolds, the soil is generally barren, dry, and sandy. Great numbers of lean sheep are therefore sold from hence, and sent into other counties to be fattened for the market.

The West Riding enjoys a sharp but healthy air, and the soil on the western side is hilly, stony, and not very fruitful; but the intermediate valleys afford plenty of good meadow ground, and also pasture for the largest cattle. On the side next the river Ouse, the soil is rich, producing wheat and barley; and in its worst parts the best oats. Its commodities, besides what have been mentioned, are iron, pit-coal, jet, allum, horses, and goats.

The North Riding in general exceeds the other two in the salubrity and coldness of the air. The worst parts breed lean cattle; but on the sides of the hills, in the valleys, and plains, it produces good corn, and rich pastures for large cattle; nor is it wanting in subterraneous riches,

riches, as marble, pit-coal, copperas, alum, and between the clefts of the rocks on the sea-coast is found the best sort of jet.

The principal rivers are the Ouse, and those which fall into it, as the Dun, or Don, the Calder, the Aire, the Wharfe, and the Swale, which joining their streams form the Humber, which falls into the German ocean, between Yorkshire and Lincolnshire. The Ouse rises in the west-north-west side of the county, and chiefly running to the south-east, at length falls into the Humber. The Dun rises in the hills near the south-west end of Yorkshire, and running to the southward till it has reached Sheffield, turns to the north-east, and having received the Aire, falls into the Ouse. The Calder, has its source in the edge of Lancashire, and entering the south-west side of this county, runs eastward, and joins the river Aire. The Aire has its spring at the foot of a high hill, called Pennigent, and running slow, chiefly to the eastward, discharges itself into the Dun. The Wharfe, or Wherefe, rises among the hills in the west of Yorkshire, and runs with a swift and impetuous current, mostly to the south-east, till it falls into the Ouse. The Swale rises among the north-west hills of Yorkshire, and running chiefly from the north-west to the south-east, joins the Ure, about four miles below Boroughbridge. Besides these, the Tees rises in the bishopric of Durham, and becoming the boundary between these two counties, runs eastward till it falls into the German ocean. The Darwent, which divides the north and east ridings, rises in the north-east of Yorkshire, near the sea coast, and first runs to the south, but soon winding to the south-west, falls into the Ouse. The Hull has its source in the Wolds, from whence it runs mostly to the southward, passing near Beverley, and falls into the Humber. Into these principal rivers a great number of rivulets discharge themselves, and they afford great plenty of fish, particularly salmon, trout, and craw-fish.

We shall now describe the principal places in this extensive county.

York, is seated on the river Ouse, one hundred and ninety-eight miles to the north of London, and is generally esteemed the second city in England, though Bristol now claims that honour, on account of its extensive trade. It is very ancient, and has undergone various revolutions; but is still adorned with many fine buildings, both public and private; it being very populous, and inhabited by gentlemen and wealthy tradesmen. It is surrounded with a good wall, through which are four gates and five posterns, and has a castle, built by William the Conqueror, which was formerly a place of great strength, but is now a prison, in which debtors and felons are confined, in a manner more agreeable to the dictates of religion and humanity, than perhaps in any other prison in the kingdom.

The bridge over the Ouse consists of five arches, of which that in the center is fifty-one feet in height, and eighty-one in diameter.

There are now in this city but seventeen churches in use, with some meeting-houses; though, in the reign of king Henry V. there were forty-one parishes, besides seventeen chapels, and nine abbeys. The cathedral, or minster, is a noble Gothic structure, in which the rules of proportion are better observed than is usually found in other churches of that kind of architecture. The west-end measures a hundred and twenty-four feet in breadth: it is adorned with two regular towers, which diminish by degrees, and have a good effect. Between them is the principal entrance, over which is a magnificent window that cannot be equalled, except by that in the east front, which can never be sufficiently admired. The great arch, under which is the entrance into the church, is said to be the largest of the kind in Europe. The most remarkable deficiency in the building is in the lantern-steeple, which terminates very indifferently: it is however finely ornamented, and has eight stately windows, measuring forty feet from top to bottom. The nave of the church exceeds that of St. Paul's at London, several feet both in height and breadth, but is not quite so high as that of Westminster abbey, though it exceeds it by

upwards of sixteen feet in breadth. The stone screens at each end of the choir are beautifully wrought: the first separates the choir from the middle of the church, the other terminates it behind the altar, which by a gradual ascent of sixteen steps is raised to a graceful height above the level of the body of the church. From the middle of the church is seen the noble window at the east-end, which is upwards of thirty feet in breadth, and seventy-five in height. The masonry of the upper part is beautifully executed, below which, in one hundred and seventeen partitions, is expressed the history of the Bible, on painted glass. The south end of the cathedral is beautified with a circular window, called from the colour of the stained glass, the Marygold-window. The north end is taken up with five lights, which reaching almost from the top to the bottom, may be considered as one stately window, representing a rich embroidery of mosaic needle work. The chapter-house is an octagon Gothic building, sixty-three feet in diameter, with windows of painted glass on each side; the roof, which is sixty-eight feet high, is supported without any pillar, and over the building is a timber spire, covered with lead.

With respect to the modern buildings of this city, the assembly-house is a noble structure, designed by the earl of Burlington, consisting of a stately Egyptian hall, one hundred and twenty-three feet in length, and about forty in breadth and height, and also a common ball-room, sixty-six feet long, with about two thirds of that dimension in height and breadth; with other smaller rooms for cards and tea. The corporation have lately built a mansion-house for the lord-mayor, for so he is stiled here as well as in London: The corporation also consists of twelve aldermen, a recorder, two sheriffs, twenty-four prime common-council-men, eight chamberlains, seventy-two other common-council, &c. The city is a county of itself, whose jurisdiction extends over thirty-six villages and hamlets. This city gives title of duke to his majesty's eldest brother, Edward Augustus.

Hull, or Kingston upon Hull, stands on the west-side of the river Hull, where it discharges itself into the Humber, one hundred and seventy miles north of London. It is very populous; but as its situation will not admit of any additional buildings, the streets are very close, and much crowded. One of the streets resembles Thames-street in London, where pitch, tar, cordage, and sails are to be sold, and where ships come to load and unload their merchandize. The town is very well fortified, and is one of the principal places in England for trade; for here centers the cloth trade from Leeds, Wakefield, and Hallifax; the lead from Derbyshire, butter from most parts of Yorkshire, cheese from Cheshire, Warwickshire, and Staffordshire, and corn from many counties. In return for these, are imported all kinds of goods, not only from other parts of England, but from foreign countries, where the merchants of Hull have great credit. The town contains two parish churches, and several meeting-houses of the dissenters. Among the other public buildings are the Trinity-house, for the relief of seamen, their wives or widows; an exchange for transacting of business among the merchants, and a town-hall. The bridge over the river Hull is of stone, it consists of fourteen arches, and makes a noble appearance. The town, with some contiguous lands, forms a county of itself, governed by a mayor, sheriff, twelve aldermen, &c. They have a sword of state, a cap of maintenance, as marks of their power on land, and an oar of lignum vitæ, to denote their jurisdiction of admiralty, which they enjoy upon the river Humber.

Leeds is seated in the West-Riding of Yorkshire, one hundred and eighty-two miles from London, and stands on the banks of the river Aire, over which it has a handsome stone bridge, which was formerly capacious enough for holding on it the cloth-market; but the trade being much increased, the cloth is now sold in the High-street, beginning at the Bridge-foot. The method in which this branch of trade is transacted, is so extraordinary, as to deserve particular notice. Early on Tuesdays and Saturdays, a great number of tressels are ranged, and covered with boards in the street, at six in
summer,

summer, and seven in winter: The market-bell gives the signal to the clothiers in the several inns, to bring out their cloth, which is done with such expedition, and so little disturbance, that strangers are amazed, to see in a few minutes all the counters covered with pieces of cloth, and the owner standing behind within the treffels. When the bell ceases ringing, the chapmen enter the market, and suit their patterns; the price is asked and bid in a very low voice, and a very few words determine a bargain. Thus, twenty thousand pounds worth of cloth is often sold in about an hour's time. At half an hour after eight the bell rings again, upon which the buyers, sellers, cloth and treffels all disappear, and by nine the market is left clear to the linen-draper, hardware-men, shoemakers, &c. Here is also a great demand for white cloths, which are sold in a magnificent hall. The Guild-hall is also a noble building, adorned with a fine statue of queen Anne. Here are three churches, only one of which is parochial; this is St. Peter's, which has the ceiling finely painted in fresco, by Parmantier: the subject is, giving the law to Moses. The town is governed by a mayor, twelve aldermen, and twenty four assistants. The great trade of Leeds occasioned the river Aire to be made navigable, by which means a communication is opened by water with Wakefield, York, and Hull, to which places, besides its woollen manufactures and other goods exported to Holland, Hamburg, &c. Leeds has the advantage of furnishing York with coals. This town gives title of duke to the noble family of Osborne.

Hallifax, a very considerable town in the West-Riding of Yorkshire, one hundred and ninety-nine miles from London. This is an instance of the immense advantage of our woollen manufactures, it being formerly an inconsiderable village, and has still but one parish; but it is near twelve miles in diameter, and has more parishioners than any other parish in England; for it contains twelve chapels of ease, a number of meeting-houses, and upwards of twelve thousand inhabitants. The houses are built of stone, and formed into good streets. When a person leaves the town, the rest of the parish resembles a continued village, every house having its tenter-ground, with a piece of cloth, shalloon, or kersey, upon it. The women card, spin, and wind: the men weave, and work at dressing or dying the cloth, and throughout the whole parish, there appears such chearful industry, and the good effects of it are so visible, that it affords a very sensible pleasure to all who have any benevolence for mankind in general, or concern for their country in particular. It has been computed, that in the articles of shalloons alone, not less than one hundred thousand pieces are annually made in this one parish only. This town gives title of earl to the family of Montague Dunk.

Scarborough, a town in the North-Riding of Yorkshire, two hundred and four miles to the north of London. Its situation is perfectly romantic, it being built on the top of a steep rock, bending in the form of a crescent to the main ocean, of which you have almost an unbounded prospect from all parts. The summit of this mountain contains no less than eighteen or twenty acres of meadow ground, and on the upper part stood a castle. The town which is populous, is almost encompassed by the sea, and walled where it does not join to the castle, or is not more strongly defended by the sea; and it has one of the best harbours in the kingdom. This town is justly celebrated for its spaw waters, on which account it is much resorted to by the nobility and gentry, who have occasioned many new buildings to be erected. There are now good accommodations for great numbers, even of the highest quality, and there are here assemblies and public balls, in rooms built for that purpose. The spring was under the cliff, part of which fell down in December 1737, and the water was lost; but in clearing away the ruins to rebuild the wharff, it was, to the great joy of the town, recovered. The inhabitants catch prodigious quantities of fish of all sorts, and have some foreign trade. This town gives the title of earl to the noble family of Saunderson.

S E C T. XLI.

Of the Bishopric of Durham; its Name, the Manner in which it became a County Palatine, its Situation, Extent, Divisions, Representatives, Air, Soil, Rivers, and principal Towns.

THE bishopric of Durham received its name from its chief town, called by the Saxons Deorham, or Dunholm, to express its situation on a hill surrounded by a river. On the conversion of the kingdom of the Northumbrians, of which this was a part, this county was bestowed on St. Cuthbert, bishop of Lindisfarn, and his successors for ever. This grant was ratified both by the Danes and Normans, with the addition of several privileges, particularly that of being a county palatine, enjoying the same prerogatives within, as the king did without its bounds, with respect to forfeitures, &c. Thus it was a kind of royalty subordinate to the crown.

It is bounded on the north by the river Tyne, which parts it from Northumberland; on the east by the German ocean; on the south by the Tees, which divides it from Yorkshire; and on the west by Westmoreland and Cumberland. It extends thirty-five miles in length, and thirty-four in breadth. It is in the diocese of its own name, and contains nine market-towns, fifty-nine vicarages, one hundred and thirteen parishes, near two hundred and thirty villages, about fifteen thousand nine hundred and eighty houses, and ninety-six thousand nine hundred inhabitants; but sends only four members to parliament, namely, two for the county, and two for the city of Durham.

The air of this county is wholesome, and though very sharp in the western parts, is milder towards the sea, whose warm vapours mitigate the severity of the winter seasons. The soil is very different, the western side being mountainous and barren, while the eastern and southern parts nearly resemble the south of England, and consist of beautiful meadows, rich pastures, woods, and corn-fields. The inhabitants have their industry rewarded by the immense quantities of coals, lead, and iron, found in the bowels of the earth.

The principal rivers are the Weare, which rises in the western part, and after several turnings falls into the sea at Sunderland. The Tees, which rises within three miles of the head of the Weare, and forms the boundary between this county and Yorkshire. The Tyne, of which we shall give a description in treating of Northumberland.

The principal places in this county are the following:

Durham is pleasantly and commodiously situated on an easy ascent, and almost surrounded by the river Weare, over which are two large stone bridges, two hundred and sixty-two miles from London. It is encompassed by a wall, and has a castle, seated on the highest part of the hill, now used for the bishop's palace. It contains six parish-churches, besides the cathedral, and is governed by a mayor, twelve aldermen, twelve common-councilmen, a recorder, a town-clerk, &c. Its pleasant and healthful situation makes it much frequented by the neighbouring gentry, who, with the prebendaries of the cathedral, make the city look extremely chearful, and money circulate better than could otherwise be expected where there is little or no trade. The cathedral somewhat resembles Westminster abbey, and adjoining to it are the houses of the dean and prebendaries. The bishop, as count palatine, appoints all officers of justice; and, before his prerogatives were abridged by Henry VIII. had a court of chancery and common-pleas; issued out writs in his own name, and coined money. He is still sheriff paramount, and his deputy is not obliged, like other sheriffs, to account with the exchequer, but only with the bishop. The earldom of Sedberg is still annexed to the bishopric, which is esteemed one of the best in England; and as the country about Rome is called St. Peter's patrimony, so that about Durham is called St. Cuthbert's.

Sunderland, a sea-port town, two hundred and sixty-four miles from London, stands in a peninsula almost surrounded by the sea. It is a well built, thriving, and populous

populous town, inhabited by many rich merchants and tradesmen. Its port is capable of containing many hundred sail of ships at one time, and from thence are loaded and sent great numbers of ships with coals, salt, glass, and other merchandize, as well to different places in this kingdom, as to foreign parts. It has a very fine church, with a dome at the east end, under which is the altar, placed beneath a canopy of inlaid work, supported in front by two fluted columns of the Corinthian order. There is here a bathing-house, and a taste for politeness and elegance has been introduced into the town.

Darlington is a pretty large town, two hundred and forty-three miles from London. It is seated in a flat, on the river Skern, which falls into the Tees, and is remarkable for its dirty situation, and its beautiful church, which has a high spire, rising up in the midst of it. It has a good stone bridge of considerable length, over little or no water. However, it is a place of good resort, the market is large and convenient, and is particularly celebrated for its huckabacks, which are made no where else in England, and of which, as well as other linen cloth, it sends up large quantities to London. The water of the Skern is esteemed so good for bleaching, that linen has been sent hither from Scotland to bleach.

At Oxenhall near this town are three deep pits called Hell Kettles, full of water, and which have occasioned many fabulous stories among the country people, who imagine they have no bottom. The most probable opinion is, that they are old coal-pits, rendered useless by the water rising in them.

S E C T. XLII.

Of Northumberland; its Name, Situation, Extent, Divisions, Representatives in Parliament, Air, Soil, Produce, Rivers, and principal Towns.

THIS county received its name from its being situated to the north of the Humber. In the Saxon heptarchy it was a part of the kingdom of the Northumbrians, which contained not only the county now called Northumberland, but also Yorkshire, Lancashire, Durham, Cumberland, and Westmoreland. It is seated in the extremity of England next to Scotland, and is bounded on the east by the German ocean; on the south by the bishopric of Durham and Cumberland; on the west by Cumberland; and on the north-west by Scotland, from which it is separated by the river Tweed. It extends seventy-four miles in length from north to south, and forty-five in breadth from east to west.

Northumberland contains twelve market-towns, nine vicarages, four hundred and sixty parishes, about twenty-two thousand seven hundred and forty houses, and a hundred and twenty-six thousand four hundred inhabitants. It is in the diocese of Durham, and sends eight members to parliament, namely, two for the county, and two for each of the following boroughs, Newcastle upon Tyne, Morpeth, and Berwick upon Tweed.

The air of this county is not so cold as might be imagined from the latitude in which it lies; for its situation between two seas in the narrowest part of England gives it the advantage of having the cold moderated by the vapours of each, and for this reason the snow seldom lies long in Northumberland, except on the tops of high hills. The air is extremely healthful, and the people, who generally live to a great age, are seldom afflicted with sickness. The soil is various, the eastern part, which is fruitful, having very good wheat and most sorts of corn, and has rich meadows on the banks of the rivers; but the western part is generally barren, it being mostly heathy and mountainous. The south-east part abounds with pit coal, of which six hundred thousand chaldrons are computed to be annually shipped from thence for London. There are also large quantities of lead and timber. This county gives title of earl to the noble and ancient family of Percy.

The rivers cause the country to be well watered, and afford great plenty of salmon and trout. The principal of these are the Tyne, the Tweed, and the Cocket; the

former has two arms rising at a great distance from each other, but are united a little above Hexham. South Tyne rises in the north-east edge of Cumberland, but soon entering Northumberland runs northward, and at length bends towards the east. North Tyne has its source in the western part of Northumberland, called Tyne-Dale, then running to the south-east it joins South Tyne near Hexham, from whence it runs eastward by Newcastle into the German ocean. The Tweed is the boundary between this county and Scotland, in which it rises, and having entered Northumberland, pursues its course to the north-east, till it reaches the German ocean at Berwick.

We shall now describe the principal places in this county.

Newcastle upon Tyne, the largest town of Northumberland, stands two hundred and seventy-six miles from London: it is a large and populous town situated between the Picts wall and the Tyne, which is here a fine and deep river, so that ships of a middling burthen may safely come up to the town, though the large colliers are stationed at Shields; and it is so secure an haven, that vessels, when they have passed Tynemouth-bar, are in no danger either from storms or shallows. It is defended by Clifford's fort, which effectually commands all vessels that enter the river. The town may be considered as divided into two parts, of which Gateshead, on Durham side, is one, and both are joined by a bridge of seven arches, on which is a street of houses. The situation of the town is very uneven; it rises on the north bank of the river, where the streets upon the ascent are exceeding steep. Most of the houses are built with stone; but some of them are of timber, and the rest of brick. Through this town went part of that wall which extended from sea to sea, and was built by the Romans to defend the Britons, after they had drawn off all their chosen youth to fill their armies, against the incursions of the Picts. The liberty of the town and the power of the corporation extend no farther than the gate upon the bridge, which some years ago put a stop to a terrible fire, which would otherwise, perhaps have burnt the whole street of houses on that side of the bridge, as it did those beyond it. On the east side of this gate are carved the arms of the bishop of Durham, and on the west side those of the town of Newcastle. The town is defended by an exceeding strong wall, in which are seven gates, and as many turrets, with several cazemates bomb-proof. The castle, which is old and ruinous, over-looks the whole town.

The greatest inconveniencies of Newcastle are its situation on the declivity of two hills, and the buildings being very close and old, which render it improper for those who seek a residence of pleasure; but then, as the river which runs between the two hills renders it a place of great trade, these inconveniencies are abundantly recompensed.

There is here a very noble exchange, and the wall of the town, running from it parallel with the river, leaves a spacious piece of ground before it, between the water and the wall, which being well wharfed and faced with free-stone, forms the longest and largest quay for landing goods, that is to be seen in England, except that at Yarmouth in Norfolk. Here are four parish churches, besides one at Gateshead, and likewise several meeting-houses. St. Nicholas's church stands on the top of a high hill, and has a lofty steeple of curious architecture. There is a great descent from it, and a stream of water in time of drought runs down from a noble conduit, that stands far up in the town, and is of great use to the inhabitants near it. Among the other public buildings is a mansion house for the mayor, who dwells in it during his mayoralty, with his officers and attendants, at the town's expence, who allow him, in order to keep up his state, six hundred pounds for the year. Here is also a hall for the surgeons to meet in, and a large hospital, built by the contribution of the keel-men, for the maintenance of the poor of their fraternity, and several charitable foundations. The town is almost surrounded with coal-pits, which furnish such immense quantities of coals, that several thousand ships are annually loaded with

with them, and they have some manufactures, owing to the plenty of this valuable kind of fuel, particularly the making of hard ware, and salt, which last is indeed performed at Shields, seven miles below the town; but the coals are brought chiefly from thence, and the quantity consumed in these salt works is so great, that a prodigious cloud of smoke rises over the hills, and is so thick, that it is said it may be seen at sixteen miles distance. Ships are also built here to perfection, as to strength and firmness; and there are here a considerable number of merchants, who trade to Holland, Hamburg, Norway, and the Baltic. This town gives title of duke to the noble family of Holles.

Berwick, is pleasantly situated on the south side of an easy declivity, on the Scots coast of the river Tweed, about half a mile distant from its conflux with the sea, and three hundred and thirty-nine miles from London. It is regularly fortified with bastions, flanks, and a ditch, on the north and east; and on the south and west with high walls well built, and planted with cannon, to which the river serves as a moat. The houses make a good appearance, and the town-house is a handsome structure, with a lofty turret, in which is a ring of eight bells. Here is a very stately bridge of sixteen arches over the Tweed. The church, built by the protector Cromwell, is a neat building; but has neither spire nor bells. The barracks form a regular square, and will conveniently contain two regiments of foot. The town is governed by a mayor, a recorder, a town-clerk, and four bailiffs.

Corn and eggs are shipped from this place for London and other ports; but the principal trade consists of the salmon which is taken in the Tweed, and esteemed the best in the kingdom, great quantities of which, being pickled, are put up in vessels called kits, and shipped off for London, where they are called Newcastle salmon. During the months of June and July the best salmon may be bought at Berwick for one penny per pound. Considerable quantities of the smaller fish are sent alive to London in vessels called smacks, built for that purpose, they having a well in the middle, bored full of holes for the free passage of the sea water, and in which the fish live without injury.

This town is particularly mentioned in all laws, proclamations, &c. that comprehend both England and Scotland, as if it was in neither of these countries.

Alnwick is a populous and well built town, seated on the north side of a hill near the river Aln, over which is a stone bridge, at the distance of three hundred and ten miles from London. It has a large town-house, where the quarter-sessions and county courts are held, and the members of parliament elected. It has three gates which are almost entire, and shew that it was formerly surrounded by a wall, and is defended by an old stately Gothic castle, the seat of the earls of Northumberland.

About seven miles to the south-east of Alnwick stands Warkworth, a pleasant village which gives title to the eldest son of the earl of Northumberland; and near it is a remarkable cave, called the Hermitage, cut out of the solid rock. The roof is arched, and the sides adorned with pillars in the Gothic taste. It is divided into two apartments of the same dimensions, one of which seems to have been a lodging-room, and the other a chapel. At the east end of the chapel is an altar, with a cross cut in the rock above it; and in the window the figure of a woman in a recumbent posture at full length. At one end of this figure is another, which seems to be weeping over it, and at the other a bull's head.

The highest mountain in this county, or perhaps in all England, is that of Cheviot, made famous by the old ballad of Chevy Chase. The top, to those who are below, seems to terminate in a point; but has a level plain about a mile and a half in circumference, with a large pool of water in the midst of it. From hence, in clear weather, is an extensive prospect of near fifty miles on every side.

S E C T. XLIII.

Of Cumberland; its Name, Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, and principal Places.

ACCORDING to some authors, this county was originally called Cumbria, which name was at length changed to Cumberland. It is bounded on the north by Scotland; on the east by Northumberland, part of the bishopric of Durham, and Westmoreland; on the south by Lancashire; and on the west by the Irish sea. It extends seventy-five miles in length, and twenty-seven in breadth. Cumberland is divided into five wards, and contains one city, fourteen market-towns, ninety parishes, thirty-seven vicarages, near four hundred and forty-seven villages, about fourteen thousand eight hundred and twenty houses, and eighty-eight thousand nine hundred inhabitants. It lies partly in the diocese of Chester, and partly in that of Carlisle, and sends six members to parliament, two for the county, two for Carlisle, and two for Cockermouth.

The air is cold and piercing, yet less than might be expected from its being situated so far to the north. The mountains feed large flocks of sheep, whose flesh is particularly sweet and good, and the valleys produce corn, &c. This country is generally admired for the pleasant prospects it affords; but these would be more beautiful could trees be brought to thrive here better than they generally do. The principal commodities produced by this county are coal, lead, copper, lapis calaminaris, black-lead, a mineral almost peculiar to this county, which contains more than is sufficient to supply all Europe; wild-fowl, salmon, pearls, &c. The last are found in muscles at the mouth of a brook, called the Irt, which discharges itself into the sea a little to the north of Ravenglass.

This county abounds with rivers and lakes, called by the inhabitants meers; of the former the Eden takes its rise from Ulles Water, and after a course of about thirty miles to the northward turns to the west, and falls into Solway frith. This river is remarkable for a small delicious fish called char. The Derwent runs through the middle of the county, and discharges itself into the Irish sea. This river abounds with salmon.

The chief towns in this county are the following:

Carlisle, a city of great antiquity, is seated at the confluence of several small rivers, which almost encompass it: the river Peterill running on the east, Cauda on the west, and Eden on the north, which soon after falls into the sea. It stands three hundred and one miles from London, and is surrounded with walls, and defended by a castle, which stands on the west side. The houses are well built, and the cathedral is a venerable Gothic pile; besides which there is another church called St. Cuthbert's. The city has three gates, called Scots-gate, Irish-gate, and English-gate; and the walls are so thick, that three men may walk a-breast on them, within the parapet. Over the Eden is a bridge that leads towards Scotland, which is not above six miles off. The city is very small, but has a good trade in fustians. It has suffered the fate of most frontier towns, and has been taken, retaken, burnt, and destroyed several times by the Scots, Danes, and Norwegians; and lay once in ruins for near two hundred years, till it was rebuilt by William Rufus. In 1745 this city was taken by the rebels, and soon after retaken by his late royal highness William duke of Cumberland. It is under the government of a mayor, twelve aldermen, &c. and here begins the remains of the famous wall which the emperor Severus built instead of Hadrian's dyke, or rampart, and which crossed the north end of this county and extended through the southern part of Northumberland, ending at the German ocean, near the mouth of the river Tyne, in order to prevent the Picts invading England. This city gives title of earl to the noble family of Howard.

Whitehaven is seated on a creek of the sea, on the north end of a great hill, where is a quarry of a hard white

white stone, which gives name to the place; and which, with the help of a great stone wall, secures the harbour into which small barks may enter. It stands forty miles to the south-west of Carlisle, and two hundred and eighty-nine north-west of London; and, by the encouragement of the Lowther family, has risen from being a small place to be a very considerable one, it being about one-third bigger than the city of Carlisle, and contains three times the number of inhabitants, who are all well lodged, and embarked in profitable employments; so that there is here a continual scene of industry, and business is carried on with great dispatch, without hurry or confusion. They have a plentiful and commodious market, and the adjacent country is well cultivated and strewed with neat and pleasant houses. There is here a custom-house, and the port is well secured by numerous and costly works. The coal-trade is so increased of late, that it is the most eminent port in England for it, next to Newcastle, for the city of Dublin, and all the towns of Ireland on that coast, with some parts of Scotland and the Isle of Man, are principally supplied from hence; and the late Sir James Lowther was said to have sent from hence to Ireland annually as many coals as brought him in near twenty thousand pounds per annum.

The coal in the mines near this place has several times been set on fire by the fulminating damp, and has continued burning for many months till large streams of water were conducted into the mines, and suffered to fill those parts where the coal was on fire. But more mines have been ruined by inundations from springs bursting into them.

In order to describe these wonders of nature and art, the reader may suppose, says our author, that he has entered the mines at an opening at the bottom of a hill, and has already passed through a long adit hewn in the rock, and arched over with brick, which is the principal road into them for men and horses; and which, by a steep descent, leads down to the lowest vein of coal. Being arrived at the coal he still descends by ways less steep till, after a journey of a mile and a half, he arrives at the profoundest part of the mine. The greatest part of this descent is through spacious galleries, which continually intersect other galleries, all the coal being cut away, except large pillars, which in deep parts of the mine are three yards high, and about twelve yards square at the base; such great strength being required to support the ponderous roof. Those who descend into these mines find them most close and sultry in the middle parts that are most remote from the pits and adits, and perceive them to grow cooler the nearer they approach to those pits and adits that are sunk to the deepest parts of the mines; down which pits large streams of fresh air are made to descend, and up which the water is drawn by means of fire-engines. These mines are sunk to the depth of a hundred and thirty fathoms, and are extended under the sea to places where there is above them sufficient depths of water for ships of large burthen. These are the deepest coal-mines that have been hitherto wrought, and perhaps the miners have not in any other part of the globe penetrated to so great a depth below the surface of the sea; the very mines in Hungary, Peru, &c. being situated in mountainous countries, where the surface of the earth is elevated to a great height above the level of the ocean.

Penrith, or Perith, is a pretty large well built place, seated under a hill called Perith Fell, two hundred and eighty-two miles from London; it has a very good market for all sorts of commodities and cattle; the market-house is convenient and spacious, and the church is a large and very handsome structure. The town is built of red stone, whence it received its name Penrith, which in British signifies a red hill.

This having been a frontier county, the ancient seats of the nobility and gentry are, for the most part, built in the form of castles. We shall here describe Corby-castle, which did lately, if it does not still, belong to Mr. Howard, a descendant of the family of the dukes of Norfolk, and which we chuse, as it will give us an opportunity of describing the natural beauties of this county, as they are here improved by art.

Corby-castle is seated four or five miles to the south-east of Carlisle, and is a neat but plain stone building. The entrance to the house is by a large square court, on the right hand of which are the gardens, and on the left offices for the servants and stabling for horses. It is plentifully watered by springs in several large reservoirs made about the house, which stands near the precipice of a rock, which on the back part is about a hundred feet high. In this rock is cut a regular pair of stairs about six feet wide, with all their ornaments down to the bottom. As you descend these stairs, you pass by several rooms hewn out of the rock, of about sixteen feet square, which have no other furniture than tables and seats made out of the stone. At the bottom of these stairs you ascend another pair about ten feet high, which leads to a terrace made in the form of a semi-circle, by the side of which runs the river Eden. The terrace presents a fine view of another part of the rock of equal height with the former; from the top of which falls a most beautiful cataract. It is at least a hundred feet high, and the water is broken by the pointed ridges of the rock into so many forms, and flies about in so delightfully rude a manner, as affords a surprising instance of the power of art in embellishing nature. From this terrace you have a view of half a mile long of the river on the right hand, and a hanging grove of trees, just as nature has placed them, on the left; and at the end of the walk is a small banquetting-room, with a portico in the front, facing the walk. On the other side of the river, opposite the house, are the remains of an old castle, under which is an hermit's cave.

S E C T. XLIV.

Of Westmoreland; its Name, Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, and principal Towns.

THIS county probably received its name from its western situation, and the meers or lakes it contains. It is bounded on the north and north-west by Cumberland, on the north-east and east by the bishopric of Durham and Yorkshire, on the south-east by Yorkshire, and on the south and south-west by Lancashire. Its extent from north to south is about forty miles, and its breadth from east to west twenty-one. It is generally divided into the baronies of Kendal and Westmoreland: the former is very mountainous, but the latter is a large champaign country. These are the only principal divisions of this county, which contains eight market-towns, twenty-six parishes, two hundred and twenty villages, above six thousand five hundred houses, and thirty-nine thousand inhabitants. It lies partly in the diocese of Chester, and partly in that of Carlisle. The earl of Thanet is hereditary sheriff of the county, which sends only four members to parliament, namely, two for the county, and two for the borough of Appleby. Westmoreland gives the title of earl to the noble family of Fane.

The air is clear, sharp, and salubrious, the natives being seldom troubled with diseases; but generally live to a good old age. The soil is various, that on the mountains is very barren, while that in the valleys is fertile, producing good corn and grass, especially in the meadows near the rivers. In the hilly parts on the western borders it is generally believed there are vast quantities of copper ore, and veins of gold; some mines of copper are worked, but most of the ore lies so deep, that it will not answer the expence.

The principal rivers are the Eden, the Lune, and the Kan. The Eden, which rises in the eastern borders, runs mostly northward, and having received eight small rivers, enters Cumberland. The Lune rises within a few miles of the Eden, and after running a little way to the eastward, turns toward the south, and enters Lancashire. The Kan, or Can, flows from a lake called Kan, or Kent-meer, and running mostly southward, after it has passed Kendal, which takes its name from this river, falls into the Irish sea at the south-west point of the county.

county. These rivers run in rocky channels, and are generally swift limpid streams, well stored with excellent trouts.

Among the mountains in the south part of the county, on the borders of Cumberland lies, Winander-meer, said to be the greatest lake in England, and to be so called by the Saxons from its winding banks. It is about ten miles in length, and paved as it were at bottom with one continued rock. In some parts it is of a vast depth, and is well stored with chare-fish, which is rarely found, except among the Alps. The Ulles-water is a lake also well stocked with fish, and has likewise some chares; but not in such plenty as the former. Both Cumberland and this county lay claim to this lake.

The chief towns in this county are the following:

Appleby is seated on the river Eden, by which it is almost surrounded, two hundred and eighty miles from London. It is a very ancient place but is much decayed, and chiefly consists of only one broad street of mean houses. This is esteemed the county town, and here the assizes are held in the town-hall. At the upper end of the Broad-street is a castle, which was formerly the goal for malefactors, and is surrounded with the river and with a ditch. At the lower end of the town are the church and a school. It is governed by a mayor, a recorder, twelve aldermen, a common council, and sergeants at mace.

Kendal is seated in a valley among hills, on the west side of the river Kan or Kent, two hundred and fifty-six miles from London, and is a rich and populous town which has two bridges of stone, and another of wood, over the river, and at a small distance are the ruins of a castle. The church is a handsome structure, supported by five rows of handsome pillars, and has two chapels of ease. A free school stands on the side of the church-yard and is well endowed, having exhibitions to Queen's college in Oxford. The town consists of several streets neatly paved, one of which is very long, and has a bridge in the middle. The market is plentifully supplied with all kinds of provisions, and with woollen yarn, and the town is famous for its manufacture of cottons, druggets, hats, and stockings.

Lonsdale, or Kirby Lonsdale, is a large well built town, seated on the river Lone, two hundred and thirty-one miles to the north-north-west of London, and has a handsome stone bridge with a stately church, and a fine church-yard, from which and from the banks of the river is a fine prospect of the mountains at a great distance, and of the beautiful course of the river Lone, in a valley far beneath. This town has a good trade in cloth.

S E C T. XLV.

Of Lancashire; its Situation, Extent, Divisions, Representatives in Parliament, and Rivers. A concise Account of the curious Canals forming by the Duke of Bridgewater, for extending the Navigation within Land through this and the neighbouring Counties. Of the principal Towns of Lancashire, a remarkable Cave, and other Objects of Curiosity.

THIS county receives its name from Lancaster its county town. It is bounded on the north by Westmoreland and Cumberland; on the east by Yorkshire, on the south by Cheshire; and on the west by the Irish sea. It extends seventy miles in length, and thirty-five in breadth; it is divided into five hundreds, and contains twelve vicarages, twenty-seven market towns, sixty-one parishes, eight hundred and ninety-four villages, about forty-three thousand houses, and two hundred and sixty thousand inhabitants. It lies in the diocese of Chester, and sends fourteen members to parliament, namely, two for the county, and two for each of the following boroughs, Lancaster, Liverpool, Preston, Wigan, Clithero, and Newton.

The air here is in general very healthful, the inhabitants often living to a great age. The soil may be considered under three different classes; the hilly parts are

stony and barren; the level grounds bear crops of wheat and barley, and there are here also moss ground, which affords little else but turf and fir-trees, that are frequently found lying under the surface. The chief commodities of this county are great plenty of all sorts of provisions; pit coal, of which they have a species called cannel-coal, which far exceeds all other, not only in making a clear fire, but by its being capable of being manufactured into candlesticks, cups, standishes, snuff-boxes, &c. and of being polished so as to represent a beautiful black marble. The manufactures of this county are woollen and cotton cloths of various kinds, tickings, and cotton velvets, for which Manchester is particularly famous.

The principal rivers are the Mersey, which parts Cheshire and this county, and the Ribble which rises in Yorkshire, and enters this county at Clithero, running south-west by Preston into the Irish sea. Besides these there are many lesser streams.

The navigation made by his grace the duke of Bridgewater in this county, is highly worthy of notice. This was begun so lately as about six years ago, and bears vessels of sixty tons burthen, and is carried over two rivers the Muxy and the Irwell. The fough, or adit, which was necessary to be made, in order to drain the water from the coal mines, is rendered navigable for boats of six or seven tons burden, and forms a kind of subterraneous lake, which runs about a mile and a half under ground, and communicates with the canal. This lake which leads to the head of the mines, is arched over with brick, and is just wide enough for the passage of the boats: at the mouth of it are two folding doors, which are closed so soon as you enter, and you then proceed by candle-light, which casts a livid gloom, serving only to make darkness visible.

But this dismal gloom is rendered still more awful by the solemn echo of this subterraneous lake, which returns various and discordant sounds. One while you are struck with the grating noise of engines, which by a curious contrivance let down the coals into the boats: Then again you hear the shock of an explosion, occasioned by the blowing up the hard rock, which will not yield to any other force than that of gun-powder. The next minute your ears are saluted by the songs of merriment from either sex, who thus beguile their labours in the mine.

You have no sooner reached the head of the works, than a new scene opens to your view. There you behold men and women almost in the primitive state of nature, toiling in different capacities, by the glimmering of a dim taper: some digging coal out of the bowels of the earth; some again loading it in little waggons made for the purpose; others drawing those waggons to the boats.

When we behold, says the ingenious gentleman from whose letter we have borrowed this account, a part of our species deprived of sun-shine, the common inheritance of mankind, and buried in a dismal and confined cavern, our feelings prompt us to pity their condition; but when we observe the lively ray of cheerfulness break forth in this scene of darkness and distress; when we behold the glow of health in the midst of damp and suffocation; we then cease to pity them, and begin to examine ourselves: we then discover that our enjoyments above ground serve only to multiply our wants; and are convinced of the truth of that maxim, which assures us, that happiness is every where, or no where.

This navigation has already been of great benefit to the town and neighbourhood of Manchester, by reducing the price of coals to one half less than was usually paid; the poor, in particular, reap vast benefit from it, as coals are retailed to them in such small quantities as one hundred weight, at the rate of three pence half-penny. It has likewise afforded great improvement to the lands through which it have been cut, by means of the subterraneous drains which has been made to convey the waters under the canal. When the navigation shall be extended to Liverpool, whither it is expected to be carried in about four or five years, the towns and neighbourhood of Liverpool and Manchester will have the benefit

fit of boats passing every day between the two places, and of saving half the expence of the water-carriage they now pay.

The principal places in this county are the following.

Lancaster, the county town, is seated near the mouth of the river Lune, two hundred and thirty-three miles from London, and is an ancient, neat, and handsome town; but its port is decayed, and incapable of receiving ships of any considerable burthen. The bridge has five arches and is strong and handsome. The castle is now the county goal, in which the assizes are held, and upon its top at one corner, is a square tower called John of Gaynt's chair, from whence you have a delightful prospect of the adjacent country, and of the course of the river Lune; but more especially towards the sea, where you have an extensive view over it to the Isle of Man. There is a handsome square of neat buildings near the castle; but the town has little trade, and is but thinly inhabited. It has only one church, and is governed by a mayor, &c.

About five miles from Lancaster is a remarkable cave called Dunald Mill-hole. In the middle of a large common a brook, near as big as the New-River, after turning a corn-mill just at the entrance of the cave, runs into its mouth by several beautiful cascades, continuing its course two miles under a large mountain, and at last makes its appearance again near Carnford, a village in the road to Kendal. The entrance of this subterraneous channel has something pleasingly terrible: from the mill at the top you descend about ten yards perpendicular by means of chinks in the rock, and clumps of trees: the passage is then almost parallel to the horizon leading to the right, a little winding, till you have some hundreds of yards thick of rocks and minerals above your head. "In this manner, says our author, we proceeded, sometimes through vaults, so capacious that we could neither see the roof or sides, and sometimes on all four, still following the brook, which entertained us with a sort of harmony well suiting the place; for the different height of its falls were as so many keys of music, which being all conveyed to us by an amazing echo, greatly added to the majestic horror which surrounded us. In our return we were more particular in our observations. The falls from one rock to another broke the rays of our candles, so as to form the most romantic vibrations and appearances upon the variegated roof. The sides too are not less remarkable for their fine colouring; the damps, the creeping vegetables, and the seams in the marble and limestone parts of the rocks, form as many tints as are seen in the rainbow, and are covered with a perpetual varnish from the just weeping springs that trickle from the roof. When we arrived at the mouth, and once more beheld the chearing day-light, I could not but admire the uncouth manner in which nature has thrown together the huge rocks which compose the arch over the entrance; but, as if conscious of its rudeness, she has clothed it with trees and shrubs of the most various and beautiful verdure, which bend downwards, and with their leaves cover all the rugged parts of the rock."

Manchester, a very large and populous town, is seated between the rivers Irk and Irwell, upon a rocky hill, a hundred and sixty-six miles to the north-north-west of London, and is a place of great antiquity. It carries on a very extensive trade in cottons, tickings, velvets, and a number of other manufactures distinguished by the name of Manchester goods; and has increased so much of late years, that though it is neither a city, borough, nor corporation, is supposed to contain upwards of fifty thousand inhabitants. It has a collegiate church, which has a choir of excellent workmanship, and two modern churches, one finished in 1723, and an act passed for building another in 1753. These are very handsome structures. This town also boasts its college, hospital, free-school, and library. The college was founded by Thomas West, lord Delawar, in 1421; it is incorporated by the name of the warden and fellows of Christ's church, in Manchester, and consists of a warden, four fel-

lows, two chaplains, four singing-men, and four choristers. The hospital was founded for forty boys; but its revenue is so much improved, that it at present maintains sixty. The library is well supplied with books, and has a revenue for buying others, and a competent maintenance for the librarian. The free-school has been also much improved. Manchester has likewise many meeting-houses of Dissenters, and a handsome town-house; some new streets have been lately built with great elegance. The chief magistrate is a constable, or headborough. This town gives title of duke to the ancient and noble family of Montagu.

Liverpool, or Leverpoole, is commodiously seated on the river Mersey, a hundred and eighty-five miles from London, in the fifty-third degree twenty-two minutes north latitude, and in the second degree thirty minutes west Longitude, where it has an excellent harbour, ships being admitted into a noble wet dock, secured by large flood-gates. It is much increased and beautified within these few years, and, next to London and Bristol, has the greatest trade of any town in England; and will probably soon, if it has not already exceeded the latter. Here is a handsome town-house, supported by twelve stone pillars and arches, and under it is the exchange for merchants. The houses are generally new and built with brick. It has also three or four churches, which are very noble structures, and one of them has the fronts of the galleries, the pulpit and the altar entirely of mahogany. There are here also several meeting-houses for Dissenters, one of which is built in a circular form, and those who meet there have printed forms of prayer different from those of the church of England, a peculiarity that is in no other dissenting meeting-house in this kingdom; but will probably be imitated by other congregations. The town is governed by a mayor and aldermen. It has a good free-school, a very noble charity-school, supported by the generous contributions of the inhabitants, for fifty boys and twelve girls, who are maintained with cloaths, meat, and lodging. Here are also several alms-houses for the support of sailors widows and indigent persons.

Warrington is a large market-town seated on the river Mersey, a hundred and eighty-two miles from London. It contains two churches, several meeting-houses, and a Romish chapel; and is a large handsome place, whose market is well supplied with corn, cattle, and fish. In this town has been lately founded an academy upon a noble and extensive plan, for the education of youth for the learned professions. Here is a stone bridge over the river, which leads into Cheshire. In this town and the neighbouring villages sail-cloth is made for the royal navy. Here are also copper-works, sugar-houses, and glass-houses, which furnish the industrious with the means of obtaining a comfortable subsistence; and on the banks of the Mersey, which, by means of weirs and locks, is made navigable to Manchester, are paper-mills, gunpowder-mills, oil-mills, iron forges, and flitting-mills.

Preston, a large fine town seated on the river Ribble, two hundred and eleven miles from London. Though it has no manufacture, yet as it has a court of chancery, and other officers of justice for the county palatine of Lancaster, it is full of gentlemen, attorneys, proctors, and notaries. It is a clean, neat, and gay place, to which the gentry many miles round resort in winter, and have assemblies, balls, &c. hence it is vulgarly called Proud Preston. It has a large market-place, and the streets are open, wide, and well paved. On the neighbouring common are frequent horse-races. Near it the duke of Hamilton, who came to rescue Charles I. from imprisonment, was defeated in 1648; as were also the English rebels under general Foster, on the twelfth of November, 1715.

Wigan, a large well built town, seated on the river Douglas, a hundred and ninety-five miles from London, is inhabited by shop-keepers of almost all kinds, and has been noted for its manufacture of coverlets, rugs, and blankets.

Within a mile and a half of this town, says Dr. Gibson, bishop of London, is a well, which at first sight does not appear to be a spring, but rather rain-water.

There

There is nothing about it that seems extraordinary; but, upon emptying it, there presently breaks out a sulphureous vapour, which makes the water bubble up as if it boiled; a candle being put to it, it presently takes fire, and burns like brandy; the flame in a calm season will continue a whole day; by the heat of which you may boil eggs, meat, &c. though the water itself be cold: but by the bubbling the water does not increase; it being only kept in motion by the sudden halitus of the vapours breaking out. The same water taken out of the well will not burn.

S E C T. XLVI.

Of Cheshire; its Situation, Extent, Divisions, Representatives, Air, Soil, Produce, Rivers, and principal Towns.

C HESHIRE is separated on the north from Lancashire by the river Mersey, but just at the north-east point it borders on Yorkshire; on the east it is bounded by Derbyshire; on the south-east by Staffordshire; on the south by Shropshire; on the west by Denbighshire and Flintshire, from which it is separated by the Dee; and on the north-west it is washed by the Irish sea, into which projects a peninsula about sixteen miles in length, and seven in breadth, formed by the mouths of the Mersey and the Dee.

The whole county extends fifty miles in length and thirty-three in breadth, and is divided into seven hundreds, in which are contained thirteen market-towns, twenty vicarages, eighty-six parishes, six hundred and seventy villages, about twenty-four thousand one hundred houses, and a hundred and sixty-four thousand three hundred inhabitants. It lies in the diocese of Chester, and sends only four members to parliament, namely, two for the county, and two for the city of Chester.

As this, as well as Lancashire, is a county palatine, it has a distinct government, which is administered by a chamberlain, a judge special, called chief-justice of Cheshire, a puisny judge, &c.

The air is temperately cold and very healthy; for the generality of the inhabitants live to a good old age. It is very rich in pasture and corn-land; but there are several heaths upon which horses and sheep feed. The country is generally level, and the extensive pastures with which it abounds feed a great number of cows, whose milk is peculiarly rich, and of which is made the excellent cheese well known by the name of Cheshire; and such quantities are made of it, that London alone is said to take annually fourteen thousand tons of it: vast quantities are also sent to Bristol, York, Scotland, Ireland, &c. However, a considerable quantity of what commonly goes by the name of Cheshire cheese is made in Shropshire, Staffordshire, and Lancashire. This county also produces excellent salt, mill-stones little inferior to those of France, fowl, fish, and metals.

The principal rivers of Cheshire are the Mersey, which runs from the north-east, and is the boundary between this county and Lancashire; the Wevel, which rises in Shropshire, and, after running about eighteen miles from south to north, turns to the westward, and discharges itself into the mouth of the Mersey: the Dee, which rises from two fountains in Wales, enters this county at Grafton, and running almost due north to Chester discharges itself by a very wide and extended mouth into the Irish sea. It abounds with fine salmon and trout. The principal towns in Cheshire are the following:

Chester is a very ancient city, a hundred and eighty-two miles north-west of London. It is of a quadrangular form, and the walls which surround it are two miles in circumference, affording a pleasant walk, with very agreeable prospects. The city is square, and the streets which cross each other at right angles are bounded by four gates, which answer the four cardinal points, of which the east gate in particular is very stately. It is remarkable that all the principal streets have a kind of piazza over the ground-floor, in which are the tradesmen's shops: these afford shelter from the rain, and at

the end of every street is a flight of steps to ascend to the piazza. Here is a strong castle on the south side of the city, in which is the county-hall, where all causes belonging to the county palatine are determined. The exchange is a neat building, supported by columns thirteen feet high, each of one stone, and over it is the city-hall. Here is a strong stone bridge over the Dee, which extends into Wales, and by it is a handsome water-house. Chester has ten parish-churches, besides the cathedral, which is a pile venerable for its antiquity; but is in no extraordinary condition. It is governed by a mayor, two sheriffs, and twenty-four aldermen. It was formerly a harbour for ships; but such vast quantities of sand have been thrown up by the sea, that the river would hardly float a small bark up to the city. Great pains have, however, been taken to remedy this inconvenience, and the inhabitants have cut a canal of near ten miles in length at a very great expence, through which ships of considerable burthen may come to Chester. This city gives title of earl to his royal highness the prince of Wales.

Nantwich, or Namptwich, is seated on the banks of the river Wever, which runs through the middle of it, and is a large town, a hundred and sixty-two miles from London. The parish church is a spacious and beautiful structure, with a steeple in the middle of it. The town is well built, and the streets make a handsome appearance. The inhabitants are rich, and carry on a good trade, particularly in salt and cheese; the latter exceeding all that is made in the county from the excellency of the soil. Here are salt springs which lie on the banks of a fresh water stream, of which they make great quantities of white salt. The water brought from the salt springs to the wich-houses, as they are called, by troughs, are received into large casks set in the ground; from hence it is put into the leads, and a fire made for keeping it warm, during which women with wooden rakes gather it as it settles to the bottom. After this it is put into salt-barrows, a kind of wicker-baskets, in the shape of a sugar-loaf reversed, that the water may drop from it and leave the salt dry.

Middlewich, which stands between Nantwich and Northwich, likewise takes its name from its wich-houses, and is also a large market-town, with a spacious church: it is seated on the river Croke, a hundred and fifty-six miles from London; has two excellent salt springs, and is chiefly noted for making salt.

Northwich is likewise famous for the same springs, and is seated a hundred and fifty-nine miles from London. About the end of the last century was discovered on the south side of the town rock-salt, which they still continue to dig up and send in great lumps to the maritime ports, where it is dissolved and made into common salt. The salt mines here are very curious; they descend into them by a bucket a hundred and fifty feet below the surface of the earth, where the mine looks like a cathedral, supported by rows of pillars, and the roof that resembles crystal all of the same rock, transparent and glittering from the numerous candles of the workmen labouring with their pick-axes, in digging it away. This rock-work extends several acres. The church of Northwich is a handsome building, with a fine roof and a semi-circular choir.

Macclesfield is a large handsome town, seated at the edge of a forest of the same name, near the river Bollin, a hundred and fifty-one miles from London: it has a good church, with a high spire, and a college adjoining to it, and also a good free-school. It has manufactures of hat-bands, twist, and mohair-buttons; and some years ago several small silk-mills have been erected here after the model of that of Derby. This town gives title of earl to the noble family of Parker.

We have now gone through our description of England; but, before we proceed to Wales, shall give an account of the Isle of Man, which lies opposite to the coast of Westmoreland and Lancashire.

S E C T. XLVII.

The Isle of MAN.

Its Situation, Extent, Climate, and Produce. The Manners, Language, and Government of the Inhabitants; their Religion and Trade; with a concise Description of the little Islands situated on its Coast.

THE Isle of Man, which Cæsar calls Mona, is situated between England and Ireland, at almost an equal distance from each, and lies between the fifty-third degree fifty-three minutes and the fifty-fourth degree twenty-five minutes north latitude, and in the fourth degree thirty minutes west longitude. It is about thirty miles in length from north to south; in the widest part not above fifteen broad nor less than eight in the narrowest. It is entirely surrounded with rocks, and consequently has a very dangerous coast.

The soil is very different; the limestone ground to the south is as good as any in England; but the mountains are cold and less fruitful. These mountains extend in a ridge almost the whole length of the island, and supply the inhabitants quite round with exceeding good water and excellent peat for fuel. Snafield, the highest of these mountains, rises at least five hundred and eighty yards above the level of the sea, and from thence is a fine prospect of England, Ireland, Scotland, and Wales.

The air is cold and sharp in winter; but where they have shelter it is as mild as in Lancashire, the frosts being short, and the snow never lying long on the ground, especially near the sea. They have no coal-pits; but good quarries of black marble, and other stones for building. They have likewise mines of lead, copper, and iron. The orchards and gardens produce as good fruit, roots, and vegetables, as any in the neighbouring countries.

The horned cattle are generally less than those of England, and the gentlemen have good draught and saddle horses; but there is a very small sort bred in the mountains three feet some inches high, which are very handsome, and run with great swiftness. Here is also a breed of small swine, which run wild in the mountains; these and the wild sheep are esteemed excellent meat. They have no badgers, foxes, otters, moles, hedgehogs, snakes, or any other noxious animals.

The number of inhabitants, besides strangers, amount to about twenty thousand. They are an orderly civilized people, very charitable to the poor, and hospitable to strangers. Their language, which is called the Manks, is a dialect of that spoken in the western isles of Scotland, with a mixture of some Greek, Latin, and Welsh words.

In their habit and manner of living they imitate the English, only the poorer sort wear a kind of sandals made of untanned leather, they being cross-laced from the toe to the instep. Oat-cakes are their common bread. They have mills both for grinding of corn or fulling of cloth. Their staple commodities are wool, hides, and tallow; and they are extremely well situated for a foreign trade.

The island is, in civil concerns, divided into six sheadings, and every sheading has its proper coroner, who is in the nature of a sheriff, and is intrusted with the peace of his district, secures criminals, and brings them to justice. The legislative power is lodged in twenty-four keys, so called from their unlocking, as it were, or solving the difficulties of the law. These represent the commons, and join with the lords court in making all new laws, and with the deemsters or judges in settling and determining the meaning of the ancient laws and customs in all difficult cases. The deemsters are two in number, these are judges in cases of common law, and of life and death; but such controversies as are too trivial to be brought before a court, are dispatched at their houses.

The bishop of Man is suffragan to the archbishop of York, and styled bishop of Sodor and Man; the former being a bishopric in the western island of Jona, or St. Columbus, commonly called Columb-kyle; but the

bishop is a baron of the isle, and has his own courts for his temporalities, in which one of the deemsters sits as judge; but he has no seat in the house of lords. The religion and worship is exactly the same with that of the church of England. The clergy meet in convocation at least once a year, on Thursday in Whitsun-week, and they are dignified with the title of Sir before their Christian names. There are here seventeen parish-churches, and four chapels; with four market-towns.

Douglas is the richest and most populous town of the island. The harbour for ships of tolerable burthen is extremely safe, and has a fine mole which runs out into the sea, which renders this one of the best harbours in any part of the three kingdoms.

The island has been successively inhabited by the Britons, Scotch, and Norwegians; but at last became subject to England, about the close of the reign of king Edward I. or the beginning of that of Edward II. King Henry IV. granted the island, together with the patronage of the bishopric, to Sir John Stanley, and his heirs, in which family it continued, till by marriage it came from the earl of Derby to the duke of Athol, in Scotland, who was styled king in Man.

Its trade was very great before the year 1726; but the late lord Derby farming out his customs to foreigners, the insolence of those farmers drew on the island the resentment of the government of England, who by an act of parliament deprived the inhabitants of a fair trade with this kingdom. This naturally introduced a clandestine commerce, which they carried on with England and Ireland with prodigious success, and an immense quantity of foreign goods was annually run into both kingdoms, till the government, in 1765, thought proper to put an entire stop to it, by purchasing of the duke of Athol the customs of the island, and permitting a free trade with England.

On the little isle of Peele, on the west side of Man, is a town of the same name, with a fortified castle.

Before the south promontory of Man, is a little island called the Calf of Man: it is about three miles in circuit, and separated from Man by a channel about two furlongs broad. At one time of the year it abounds with puffins, and also with a species of ducks and drakes, by the English called barnacles, and by the Scots clakes and soland geese. The puffins 'tis said, breed in the holes of the rabbits, which for that time leave them to these strangers. The old ones, says our author, leave the young ones all day, and fly to the sea, and returning late at night with their prey, disgorge it into the stomachs of their young; by which means they become almost an entire lump of fat. In August, they are hunted as it is called, and no less than five thousand of these young ones are generally taken every year; these are mostly eaten on the island, but many of them are pickled, and sent abroad as presents. About the rocks of this island also breed an incredible number of all sorts of sea fowl.

S E C T. XLVIII.

Of WALES.

Of this Country in general; with an Account of Flintshire; its Situation, Extent, Air, Soil, Produce, Rivers, and principal Towns.

WE are now come to Wales, an extensive and mountainous country, separated from England by a range of almost inaccessible mountains, which to the ancient inhabitants of Britain seemed formed by nature as bulwarks for the defence of liberty. Thither therefore those Britains retired, who, finding resistance ineffectual, disdained to submit to the Romans, and thither they were followed by their countrymen, who were afterwards unable to oppose the victorious arms of the Saxons. Thus these barren mountains became the asylum of liberty, and were inhabited by the brave, who for the sake of that invaluable blessing, liberty, preferred them to their native possessions in the fertile plains of England. By this means they have preserved their race, who still speak the same language, have the same tempers and dispositions

dispositions, and laugh at a pedigree that can be traced no higher than William the Conqueror.

The Saxons gave the country the name of Wallia, and the people that of Welsh, terms by which they used to denote nations and countries, that appeared to them strange and unknown. Hence the people themselves, who are unacquainted with the English, know not that their country is called Wales, or themselves or their language termed Welsh; but instead of Wales use the word Cycary, or the antient country, and call the language Cymraeg. However, people in affluent circumstances, and those who keep inns on the public roads, generally speak English.

It was anciently bounded on all sides by the Severn and Dee, till the Saxons made themselves masters of all the plain country over these rivers, and Offa, king of Mercia, made a great ditch, as the boundary between his kingdom and Wales. The kings of England also, after the conquest, obliged the inhabitants to retire farther westward, and to secure themselves among the mountains. They enjoyed their own laws, lived under their own princes, and maintained their liberties against all the attempts of the English, till in 1282, Llewellyn ap Griffith, prince of Wales, lost his life, in a battle obtained by Edward I. and afterwards sending his queen, who was pregnant, to Caernarvon, where she was safely delivered, summoned a meeting of the Welsh lords, and proffered them the young child, a native of their own country, for their lord and governor, they readily swore obedience to him, and since that time the king's eldest son has been created prince of Wales.

This country is at present divided into twelve counties, which, beginning at the north-east are Flintshire, Denbighshire, Caernarvon, Anglesey, Merionethshire, and Montgomeryshire, called North-Wales; Radnorshire, Cardiganhire, Pembrokehire, Caermarthenshire, Brecknockshire, and Glamorganhire, termed South-Wales.

Flintshire, is bounded on the North by an arm of the sea, which is properly the mouth of the river Dee; on the east by Cheshire, on the south by Shropshire, and on the south-west and west by Denbighshire. It is twenty-nine miles in length, and eighteen in breadth, and is divided into five hundreds, in which are one market-town, twenty-eight parishes, about five thousand four hundred houses, and thirty-two thousand four hundred inhabitants. The greatest part of this county lies in the diocese of St. Asaph, and the rest belongs to that of Chester. It sends two members to parliament, one for the county, and one for Flint.

The air is cold but healthful, it is full of hills, intermixed with a few valleys, which are very fruitful, producing some wheat, and great plenty of rye. The cows, though small, yield a great quantity of milk, in proportion to their size, and are excellent beef. The mountains are well stored with lead, coal, and mill-stones. This county also produces good butter, cheese, and honey, of which last the natives make metheglin, a wholesome liquor, much used in these parts.

The principal rivers are the Clwyd, the Wheeler, the Dee, the Sevlion, the Elwy, and the Alen, which furnish Flintshire with great quantities of fish.

The principal towns in this county are the following.

St. Asaph, an episcopal city, called by the Welsh Lhan Elwy, as being situated at the confluence of the river Elwy with the Clwyd, obtained its English name from Asaph, a devout man, who was bishop of this place. The town though seated in a pleasant vale, and the see of a bishop, is a poor ill built place, even without a weekly market; and the cathedral is far from being an elegant structure: the town has a bridge over each of the rivers above mentioned.

Flint is situated near the river Dee, where is a small harbour, one hundred and ninety-four miles from London; but notwithstanding its advantageous situation for trade, it is a mean place, without any market. The assizes are generally held here, and the town is governed by a mayor, who is styled governor of the castle, which now lies in ruins.

Holywell, a town seated twelve miles to the east of St. Asaph, and two hundred and twelve to the north-

west of London, is famous for St. Winifred's-well, which is one of the finest springs in the world. It pours out such a quantity of a water, that running in the middle of the town down the side of a hill, it is made use of by every house as it passes, after which it turns several mills. Over the spring, where there is a handsome bath, is a neat chapel, which stands upon pillars, and on the windows are painted the history of St. Winifred's life. About the well grow some mosses, which people foolishly imagine to be St. Winifred's hair. And as she is reputed a virgin martyr, who they tell you being ravished and murdered, was interred here, on which this water sprung out of her body when buried, the well is much frequented by popish pilgrims out of devotion, as well as by those who come to bathe in it, for medicinal purposes. Almost all the houses of the town are either let into lodgings, or public houses, and the Romish priests who attend here are very numerous, and appear in disguise.

Caerwis, the only market-town in the county, is seated five miles to the east of St. Asaph, on an ascent, but is a small place not worthy of a particular description.

S E C T. XLIX.

Of Denbighshire; its Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and principal Towns.

DENBIGHSHIRE, is bounded on the east by Flintshire and Shropshire, on the south by Merionethshire, on the west by Caernarvonshire, and on the north by the Irish sea. It extends thirty-nine miles in length, and fifteen in breadth. This county is divided into twelve hundreds, which contain four market-towns, fifty-seven parishes, about six thousand four hundred houses, and thirty-eight thousand four hundred inhabitants. It is partly in the diocese of St. Asaph; but the greatest part of the vale of Clwyd is in the diocese of Bangor. It sends two members to parliament, one for the county, and one for the borough of Denbigh.

The air of this county is very wholesome, but sharp, it being continually agitated by the winds which blow over the snowy tops of the mountains. The soil is various; for the famous vale of Clwyd is a fruitful, pleasant, and delightful spot, said to be equalled by few places in Europe, and takes up so great a part of the county, that it extends near seventeen miles from north to south, and from east to west about five. The east side of the county is not very fertile, and the west is in a manner entirely barren. The inhabitants generally live to a great age, and those who dwell in the above vale are remarkable for retaining great vivacity to the longest period of life. The chief commodities this county affords are lead, horned cattle, sheep, goats, fish, and fowl.

The valleys are well watered by rivers; the Clwyd rises in the middle of the county, and taking a compass to the south-east, then turns to the northward, and having entered Flintshire falls into the Irish sea. The Elwy rises in the south-west edge of the county, and runs chiefly to the north and north-east, till it enters Flintshire, immediately after which it falls into the Clwyd. The Dee enters this county from Merionethshire, and becomes the boundary between this county and Cheshire. The Conway is the boundary between Denbighshire and Caernarvonshire.

The principal places in this county are the following:

Denbigh, the county town, is seated on the side of a rocky hill on a branch of the river Clwyd, twenty-seven miles to the west of Chester, and two hundred and nine to the north-west of London. It was formerly walled round, and secured by a castle, thought to be impregnable from its advantageous situation. It gives title of earl to the noble family of Fielding; it is governed by an alderman, two bailiffs, twenty-five capital burgesses, &c. Its market on Wednesdays is plentifully supplied with corn, cattle, and other provisions. The town is pretty large and populous, and a considerable trade is carried on by the tanners and glovers.

Wrexham, which is esteemed the largest town in North Wales, is seated on a river that falls into the Dee, and has

has been much extolled on account of its church, the steeple of which has been much admired. It is indeed adorned with imagery; but the work is mean, and the statues without fancy or spirit; and as the stone is of a red and crumbling kind, it is greatly disfigured by time. The church is large; but they are much mistaken who pretend that it is one of the finest in England. The town is well built and populous; and, besides the church, there are two large meeting-houses, in one of which, it is said, they preach in Welsh one part of the day, and in English the other. There is here a considerable manufacture of flannel, which is sent in large quantities from hence to London.

Ruthen is seated in the vale of Clwyd, ten miles to the south-east of Denbigh, and a hundred and ninety-nine north-west of London, and had once a large castle, which is now in ruins; it is a pretty large corporation town, well inhabited, and has an hospital and a free-school.

S E C T. L.

Of Caernarvonshire; its Situation, Extent, Divisions, Air, Soil, Produce, Mountains, Rivers, and principal Towns.

CAERNARVONSHIRE, or Carnarvonshire, called by the Welsh Sir Gaernarvon, is bounded on the north by the Irish sea, on the east by Denbighshire, on the south-east by Merionethshire, and on the west and south-west by Anglesey and the Irish sea; extending fifteen miles in length, and thirteen in breadth. This county is divided into ten hundreds, in which are six market-towns, sixty-eight parishes, about two thousand seven hundred and seventy houses, and upwards of sixteen thousand inhabitants. It is seated in the diocese of Bangor, and sends only two members to parliament, one for the county, and one for Caernarvon.

The air is cold and piercing, which may be attributed to the snow, which, on many of the mountains, lie for nine or ten months in the year. The soil is particularly stony, and rises in vast mountains one above another, from whence this county has not been improperly called the English Alps. The highest mountain, which is called Snowdon-hill, is boggy on the top, and has two lakes that abound with fish. The sheep which feed on the sides of this mountain yield the sweetest mutton in Wales. The most remarkable mountain, next to that of Snowdon-hill, is Penman Mawr, which hangs perpendicularly over the sea at so vast a height, that few spectators would be able to look down the dreadful steep. On the side next the sea is a road cut out of the side of the rock, about six or seven feet wide, which winds up a steep ascent, defended on one side by a slight wall, in some parts about a yard high, and in others by only a bank, that scarce rises a foot above the road. The sea is seen dashing its waves forty fathoms below, and the mountain rises as much above the traveller's head. This, dangerous and tremendous as it must appear, is the high road to Holy-head, over which the lord lieutenant of Ireland passes in his way to that port. Indeed the author of *The Tour through Great Britain*, says, there is no danger, it being every where defended by a wall; and another author says, it is breast high, but they are both mistaken. This county is also remarkable for the great number of its lakes; and the continuator of Camden says, that there are here no less than fifty or sixty of them. Between the hills are fruitful and pleasant valleys, whose beauties are much heightened by the rude prospects and dreary wastes, with which they are encompassed. The principal commodities are the cattle, including sheep and goats, wood, and plenty of fish both from the lakes and rivers, and lead, which is found in the mountains.

The principal river is the Conway, which parts Caernarvonshire from Denbighshire. It rises from a lake where the three counties of Caernarvonshire, Denbighshire, and Merionethshire join, and running northward falls into the Irish sea at Aberconway. Here are many other smaller rivers, dispersed in various parts of the country. The chief towns are the following:

Bangor is seated thirty-six miles to the west of St. Asaph, and two hundred and thirty-six to the north-west of London: though the see of a bishop, it is an old mean looking place; yet was so considerable in ancient times, that it was called Bangor the Great, and was defended by a strong castle. It has a market on Wednesdays, and its principal buildings are the cathedral and the bishop's palace. The cathedral is by some thought to be the most ancient in Britain; but it now makes a very mean appearance: there is here also a free-school. The town is governed by the bishop's steward, who holds the courts.

Caernarvon borders on the sea, by which, and two rivers, it is surrounded on all sides, except the east: it stands seven miles to the south-west of Bangor, and two hundred and fifty-one to the north-west of London. It had a strong castle, which is now in ruins, and has one parish-church; the houses and streets are tolerably handsome. The constable of the castle is always mayor of the town by his patent; besides whom there is always an alderman, two bailiffs, a town-clerk, &c. It was built by king Edward I. to secure a passage into the isle of Anglesey, and here was born king Edward II. the first English prince of Wales; here was likewise established the chancery and exchequer for North Wales.

Aberconway, or Conway, is seated at the mouth of the river Conway, fifteen miles to the north-west of Denbigh, and two hundred and nine from London. It is a large walled town, with a castle, and the houses are tolerably well built. Near the town corn, timber, and oak-bark, are in great plenty; and they clear out at the custom-house from eleven to twelve thousand bushels of grain every year. A vast body of marcasite is found up the river, of which copperas is made; and it is thought that there are veins of copper ore near it. This town was formerly famous for a pearl-fishery; but though there are still plenty of pearl muscles, they are neglected. Here is one church, in which they preach one Sunday in English, and the other in Welsh; it has a remarkable epitaph to the following purpose: "Here lieth the body of Nicholas Hookes, of Conway, gent. who was the one and fortieth child of his father, William Hookes, Esq; by Alice his mother, and the father of twenty-seven children. He died the twentieth day of March, 1637."

S E C T. LI.

Of the Isle of Anglesey; its Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and principal Towns.

THE isle of Anglesey, or Anglesea, the most western county of North Wales, was called by the ancients Mona, and was the seat of the Druids; but being reduced by the English in the reign of Edward I. it received the name of Anglesey, or the English Island. It is surrounded on all sides by the Irish sea, except on the south-east, where it is divided from Britain by a narrow freight called Meneu, which in some places may be passed on foot at low water. Its extent from Beaumaris on the east to Holyhead on the west is twenty-four miles, and from Abermana's ferry on the south to Llanbaderig on the north, where broadest, is about seventeen.

It is divided into six hundreds, in which are two market-towns, two chaces, seventy-four parishes, eighteen hundred and forty houses, and upwards of twelve thousand persons. According to Camden it formerly contained three hundred and sixty-three villages. It lies in the diocese of Bangor, and sends two members to parliament, one for the county, and one for Beaumaris.

It in general enjoys a pretty good air, except when it happens to be covered with the fogs and exhalations that arise from the sea, which are apt to occasion agues, especially in autumn. The soil of Anglesey is much more fertile than one would imagine from its stony, rocky, and mountainous bottom. It particularly abounds in wheat, which is said to be the best in all Wales, and likewise in cattle, fowl, and fish. From the mountains are dug mill-stones, and grindstones. Near Kemylyn

harbour

harbour is a quarry of a beautiful marble, among which is found the asbestos, called here salamanders wool; it is a substance like flax, and will bear a common fire without being consumed. Not far from this is a yellow sulphureous copper ore, and about three miles to the eastward is a vein of stony ochre of various colours, as red, yellow, and blue.

The principal rivers are the Brant, the Alow, and the Keveny. The first has its source on the east side of the island, and runs mostly southward, till it falls into the Meneu. The Alow also rises in this county, and, after several windings, falls into the Irish sea. The Keveny issues from the high hills to the north of Coydana, and falls into the sea, on the south-west side of the island.

Among the antiquities of this island are two circles of stones, like those of Stone-henge on Salisbury-plain. This island gives the title of earl to the family of Annesley.

Among the other popish customs still retained in North Wales, it is here usual, after morning service on Sunday, for the people of a whole parish to go to foot-ball; and when the afternoon service is done they go to the ale-house, which is frequently kept by the parson of the parish, and there they play at all sorts of games.

The principal place in this island is

Beaumaris, the county town, where all the public affairs of the island are transacted. It is seated on the east side of Anglesey, nine miles to the north of Bangor, and two hundred and forty-one north-west of London. It was built by king Edward III. to secure his conquests here, who for that purpose began a castle; but it does not appear that it ever was finished. The town receives its name from its standing in a fine moorish plain. It is at present a populous place, in which the sessions and county goal are kept. It has a good harbour for shipping; and as it lies in the direct road to Holyhead, this contributes to its trade, by the passengers who go through it in order to set sail for Ireland; but, notwithstanding its harbour, it has little or no foreign trade. It principally consists of two handsome streets, and has a church, in which are some fine monuments. The market, which is on Wednesdays and Saturdays, is well furnished with provisions. The corporation consists of a mayor, a recorder, two bailiffs, who are also justices of the peace, and twenty-one burgesses.

Holyhead is seated twenty-four miles to the west of Beaumaris, and lies opposite to Dublin: from hence is the shortest and safest passage over St. George's channel, it being the most westerly point of Anglesey. It is a little island of itself, joined to Anglesey by a stone bridge. It has a village called in the Welsh Kaer Gybi, which consists of a few straggling thatched houses, built on the rock; yet several of them have good accommodations for travellers. The packet boats from Dublin arrive here three times a week, if the wind permits.

On the rocks grow the herb of which is made kelp, a fixed salt used in making glass and in alum-works. In the neighbourhood is a large vein of white fuller's-earth, and another of yellow, which might be of use to fullers. Large flocks of puffins are often seen here; they all come in one night, and depart in the same manner.

S E C T. LII.

Of Merionethshire; its Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and principal Towns.

MERIONETHSHIRE is bounded on the north by Caernarvonshire and Denbighshire; on the east by Montgomeryshire; on the west by St. George's Channel, or the Irish sea; and on the south by the river Dyffi, which parts it from Cardiganshire; it extending forty-seven miles in length, and twenty-five in breadth.

This county is divided into six hundreds, in which are five market-towns, thirty-seven parishes, about two thousand five hundred and ninety houses, and seventeen thousand one hundred inhabitants. It lies in the diocese of Bangor, and sends one member to parliament, namely, a knight for the shire.

The air of Merionethshire is very sharp in winter, on account of its many high barren mountains. The soil is as bad as any in Wales, it being very rocky and mountainous. However, this county feeds large flocks of sheep, many goats, and large herds of horned cattle; which find pretty good pasture in the valleys. Besides these, among their other commodities may be reckoned Welsh cotton, deer, fowl, fish, and especially herrings, which are taken on this coast in great plenty.

Some learned authors mention a surprising phenomenon, which they tell us this part of the country has sometimes fatally experienced; this is a livid vapour arising from the sea, which spreading itself on the land sets fire to all combustibles in its way, as barns, stacks of hay and corn; after which the grass and herbage being all blasted by this pestilential exhalation, a great mortality of cattle, sheep, horses, &c. generally ensued; but on firing a gun, upon seeing it approach, it is easily dispersed. See the Philosophical Transactions, and a description of it in Camden's Addenda.

This county is watered by several rivers, the principal of which are the Dee, the Avon, and the Drurydh. The Dee has two spring-heads in the eastern part of the county, which being united, is supposed to run through the lake called Pimble-meer, without mixing its waters with those of the lake; at least the fish seem not to mingle; for it is said, that though the Dee abounds with salmon, none are ever taken in the lake out of the stream of the river; nor does the Dee carry off any gwiniads, a fish peculiar to the lake, which resembles the whiting, but tastes like a trout. This river, after leaving the lake, runs by a north-east course into Denbighshire. The Avon rises in Berose-wood, on the east side of the county, and running mostly south-west, falls into St. George's Channel. The Drurydh issues from a lake in the north of Merionethshire, and running to the south-west, also falls into the Irish sea.

Harlech, the principal town in this county, is seated on a steep rock on the sea-shore, and is but a poor place, though it is the county town. It had formerly a strong handsome castle, which had a garrison for king Charles I. in the civil wars, on which account it was afterwards demolished by the parliament. The town is governed by a mayor, and has a weekly market on Saturdays.

Dolgelly is seated at the foot of a great rock called Cader Idris, which is extremely high, a hundred and eighty-seven miles to the north-west of London, and is washed by the river Avon. It is but an ordinary town, and yet has not only a market on Tuesdays, but a considerable manufacture of Welsh cottons.

S E C T. LIII.

Of Montgomeryshire; its Situation, Extent, Divisions, Air, Soil, Rivers, and principal Places.

MONTGOMERYSHIRE, the last county in North Wales, is called by the Welsh Sir Trevalwyn, and is bounded on the north by Merionethshire and Denbighshire; on the north-east and east by Shropshire; on the south by Radnorshire and Cardiganshire; and on the west by the last-mentioned county and part of Merionethshire. It extends thirty-five miles in length, and thirty-four in breadth. This county is divided into seven hundreds, and contains six market-towns, sixty-eight parishes, about five thousand six hundred and sixty houses, and thirty-three thousand nine hundred and sixty inhabitants. It lies in the three several dioceses of St. Asaph, Bangor, and Hereford; but sends only two members to parliament, one for the county, and one for the town of Montgomery.

The air is pleasant and salubrious: but this county being extremely mountainous, is not very fertile, except in the vallies, which afford some corn, and plenty of pasture; however, the south, south-east, and north east parts being much more level, are extremely fruitful, especially a pleasant vale through which the Severn glides in beautiful meanders. This county has long been famous for an excellent breed of horses, which are larger

here than in any other part of Wales. The county likewise abounds in horned cattle, fowl, fish, and corn.

It is watered by several small streams which fall into the Severn, a river that is the principal beauty of this county: its source is a small lake on the vast mountain of Plinlymmon, and in its course receives so many small streams, that it becomes navigable before it leaves the county. The rivers Rhydel and Wye have their sources on the same mountain: but these last soon leave Montgomeryshire. The Tanat rises towards the north-west side of the county, and running eastward, forms part of the northern boundary between Montgomeryshire and Denbighshire; falling into the Severn at the north-east point of the county. The Turch rises on the west side of Montgomeryshire, and running eastward till it reaches the foot of Mount Golway, turns to the north, and, after receiving the Wurway, falls into the Tanat.

Montgomery, the county town, is pleasantly seated in a fertile soil, and a healthful air, on the ascent of a hill, twenty-four miles to the south of Shrewsbury, and about a hundred and sixty-eight to the north-west of London; it had once a castle, which was demolished in the civil wars; but it at present contains only about a hundred houses, and has a market on Tuesdays.

Welshpool is seated in a rich vale on the bank of the Severn, seven miles to the north of Montgomery, and a hundred seventy-six to the north-west of London. It is the largest and best town of the county, and has a very good trade. The market is considerable for cattle, provisions and flannels. The castle, now called Powis-court, is built of a reddish stone, and is a large stately structure.

S E C T. LIV.

Of Radnorshire; its Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and principal Towns.

WE now come to South Wales, and shall begin with Radnorshire, called by the Welsh Sir Vaes y Ved. It is bounded on the north by Montgomeryshire, on the east by Shropshire and Herefordshire, on the south and south-west by Brecknockshire, and on the west by Cardiganshire; extending thirty miles in length, and twenty-five in breadth.

This county is divided into six hundreds, in which are contained four market-towns, fifty-two parishes, about three thousand one hundred and sixty houses, and eighteen thousand nine hundred and sixty inhabitants. It is seated in the diocese of Hereford, and sends two members to parliament, one for the county, and one for the town of Radnor.

The air of this county is in winter cold and piercing. The soil in general is but indifferent; yet some places produce corn, particularly the eastern and southern parts; but in the northern and western, which are mountainous, the land is chiefly stocked with horned cattle, sheep, and goats.

With respect to the rivers of Radnorshire; besides the Tame, or Temd, which, on the north-east, divides this county from Shropshire, and the Wye, which waters the west side, it has the Ithon, which rises in the northern borders of the county, forming its winding course to the southward, and, after having received several rivulets, falls into the Wye. Several other small rivers rise in the middle of the county, and run into Shropshire and Herefordshire; by which means this county is supplied with plenty of fish.

The principal towns in this county are the following:

Radnor, the county town, is seated near the spring-head of the little river Somergil, a hundred and forty-nine miles to the west-north-west of London. It stands in a pleasant valley at the foot of a hill, where a castle formerly stood, which was destroyed by Owen Glendour, when, upon the deposition of Richard II. he assumed the title of prince of Wales. The town is governed by a bailiff and twenty-five burgesses, and has a court of pleas for all actions, without being limited to any par-

ticular sum; yet the assizes are not held here, nor has the town a market.

Presteign is seated in a rich and pleasant valley, a hundred and forty-nine miles from London, and is a handsome town, with regular well built streets. It has several convenient inns, and its market is remarkable for barley, of which a great deal of malt is made. Here the assizes are held, and the county jail is kept.

S E C T. LV.

Of Cardiganshire; its Situation, Extent, Divisions, Air, Soil, and principal Towns.

CARDIGANSHIRE, called by the Welsh Sir Aberteivy, is bounded on the north by a small part of Merionethshire and Montgomeryshire, on the east by Radnorshire and Brecknockshire, on the south by Carmarthenshire and a small part of Pembrokehire, and on the west by Cardigan bay in St. George's Channel. It extends forty-two miles in length and twenty in breadth, and is divided into five hundreds, which contain four market-towns, sixty-four parishes, about three thousand one hundred and sixty houses, and thirty-five thousand three hundred inhabitants. It lies in the diocese of St. David's, and sends two members to parliament, one for the county, and one for the town of Cardigan.

The air is milder here than in most part of Wales. To the south and west are plains fruitful in corn; but the northern and eastern parts are a continued ridge of mountains, which, compared with the rest, are bleak and barren: yet in the worst parts of this county there are pastures in which are bred flocks of sheep, and large herds of cattle. Here is also plenty of tame and wild fowl: also near the rivers are found great numbers of otters. In the valleys are several lakes, and this country is well supplied with sea and river fish. However, coals and other fuel are scarce; but the mountains abound with veins of lead and silver ore; a ton of which last will yield seventy or eighty ounces of silver. The mines have been worked several times to great advantage; and particularly Sir Hugh Middleton is said to have cleared two thousand pounds a month, for several years together, which enabled him to bring the New River water to London: however, some private adventurers have attempted to work them, but have failed for want of a sufficient capital.

The principal rivers are the Teivy, which rises from a lake of the same name, at the foot of the mountains on the eastern edge of Cardiganshire: at first it wanders, lost, as it were, among the rocks and stones with which this part of the country abounds, till beginning to have a regular channel, it runs to the south-west, and falls into St. George's channel below Cardigan. This river is famous for its great plenty of excellent salmon, and for its abounding with otters. The Rydal has its spring on the south-west side of Plinlymmon mountain, and runs south and south-west, till it falls into St. George's channel, jointly with the Istwyth, which rises beyond the lead mines on the north-east side of Cardiganshire.

Cardigan, the principal town, is called by the Welch, Aberteivy, from its being situated at the mouth of the Teivy, it is seated one hundred and ninety eight miles to the west-north-west of London, and is a large, ancient, and populous borough, with a good stone bridge over the river leading into Pembrokehire. The tide flows up to the town, and the chief trade of the inhabitants is to Ireland, to which, and other parts, they export lead. Cardigan was once defended by walls and a castle, but they are in ruins. It gives title of earl to a branch of the noble family of Montagu. The town is governed by a mayor and aldermen; here the county business is transacted, and the assizes held. The church is a handsome structure, as is also the town-hall.

Aberistwyth, a populous town seated on the river Rydal, near the place where it falls into the mouth of the river Istwyth, thirty miles to the north-east of Cardigan, and one hundred and ninety-nine to the west-north-west of London. It is but a poor town, consisting

consisting of about a hundred houses; yet has a considerable market on Mondays. It had formerly a castle and walls; but they have long since been decayed.

S E C T. LVI.

Of Pembrokeshire, its Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and principal Towns.

PEMBROKESHIRE, called by the Welch Penbroshire, is bounded on the north-east by Cardiganshire; on the east by Caermarthenshire; on the south by the mouth of Bristol channel; and on the west and north by St. George's channel; extending thirty-seven miles in length and eighteen in breadth.

This county is divided into seven hundreds, which contains one city, nine market towns, one hundred and forty three parishes; about four thousand three hundred houses, and twenty-five thousand nine hundred inhabitants. It lies in the diocese of St. David's, and sends three members to parliament, one for the county, one for Haverford-west, and another for Pembroke.

The air is better than is generally experienced in countries so much exposed to the sea. The soil is fertile: its few mountains, which are chiefly in the north-east part, yield pretty good pasture for cattle, and the parts near the sea afford plenty of good corn, and rich meadows. It likewise abounds in goats, and fowl, particularly in excellent falcons, in fish, and in pit-coal.

It is well watered with rivers; for besides the Teivy, which parts it from Caermarthenshire, are the Clethy, which rises at the foot of Wrenywaur hill, and running southward, joins the Dougledye. This last has its source near the middle of the county, and running towards the south-west, joins the Cledhewen, after which, turning towards the south-west, and passing by Haverford-west, it at length receives the Clethy, and at last falls into Milford-haven.

The principal places in this county are, St. David's, a city which stands on the most western promontory of all Wales, two hundred and seventy miles from London. It was not at first an episcopal see; but afterwards in the reign of king Arthur, became the metropolitan of all the churches in Wales, and thus continued till the reign of Henry I. when it became suffragan to the see of Canterbury. It was once a considerable city defended by walls; but these are demolished, and it is at present a small town thinly inhabited, without so much as a market. The cathedral is the remains of a venerable building; the west end which contains the choir, is still in good repair; but the east end has suffered so much from time and neglect, that the roof has fallen in.

From the point of land on which St. David's stands, may be distinguished in a clear day, the coast of Ireland, though it is near forty miles distant. Before this point lie several dangerous rocks called the Bishop and his Clerks, on which many ships have been lost. Near these is a little island named Ramsey, two miles in length, and a mile and a half in breadth.

Haverford-west is commodiously seated on the river Dougledye, over which is a stone bridge, fifteen miles south-by-east of St. David's, and two hundred and sixty-nine miles to the westward of London: is a large handsome place, with several good houses, and contains three parish churches, among which St. Mary's is a neat building, with a high spire. There is also a fourth church in the out parts. Haverford has a considerable trade and several ships belonging to it. It had formerly a wall and a castle, which are now demolished. The assizes and county jail are kept here, and it is governed by a mayor, alderman, and twenty-four common council; it has also a sheriff, a town clerk, two bailiffs, serjeants at mace, and other officers. The town and neighbourhood abound with gentry, who in politeness emulate Caermarthen, as that now does Haverford-west for trade and merchandize. There is here a free-school, a charity-school for boys and girls, and an alms-house.

Milford-haven, on which this town stands, is a large, safe, and most commodious harbour, capable of containing

a thousand ships at one time, without any danger of their running foul of each other. It has thirteen roads, sixteen creeks, and five bays, all of which have their particular names; and it has several years been improving and fortifying by order of the government, considerable sums having been granted by parliament for that purpose. The entrance into it may be known by three small islands on the north-west, all in sight, and the isle of Lundy on the south-east.

Pembroke, the county town, is commodiously seated on the innermost creek of Milford-haven, over two branches of which there are two handsome bridges. It stands two hundred and fourteen miles to the westward of London, and is surrounded with a wall which has three gates, and is also defended by a strong castle seated on a rock. It is well built and has two churches; as it is happily situated for commerce, the inhabitants carry on an extensive trade, and employ near two hundred ships on their own account; and besides merchants, several other considerable families reside there. It gives the title of earl to the noble family of Herbert, and is governed by a mayor and aldermen.

S E C T. LVII.

Of Caermarthenshire; its Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and a Description of Caermarthen.

CAERMARTHENSHIRE or Carmarthenshire is bounded on the north by Cardiganshire; on the east by Brecknockshire, and Glamorganshire; on the south by St. George's channel; and on the west by Pembrokeshire; extending forty-eight miles in length and twenty-five in breadth. It is divided into six hundreds, in which are contained eight market towns, one hundred and forty-five parishes, about five thousand three hundred and fifty houses, and seventeen thousand inhabitants. It lies in the diocese of St. David's, and sends two members to parliament, one for the county, and the other for the town of Caermarthen.

The air is generally esteemed salutary, and more mild in winter than in most of the neighbouring counties. As the land is less incumbered with rocks and mountains than the other parts of Wales, it is more fertile; it produces great plenty of corn and grass, and the rich meadows feed very fine cattle. This county also abounds in wood, pit coal, fowl, and fish, especially salmon, which is remarkably good here.

The principal rivers are the Toway, which rises in Cardiganshire, and entering the north-east side of this county, runs south and south-west, and at length falls into Bristol-channel. The Cotley rises near the north borders of Caermarthenshire, and running mostly southward joins the Toway. The Tave, or Teivy, rises in Cardiganshire, but soon becomes the boundary between that county and Caermarthenshire, till being joined by the little river Keach, it parts Cardiganshire and Pembrokeshire.

Caermarthen, or Carmarthen, the county town, is pleasantly seated, on the banks of the Toway, two hundred and fifty-one miles to the north west of London. The town is well built, populous, and daily encreasing. Hither the gentry of South Wales chiefly resort, invited by its pleasing situation, handsome buildings, and the plays and assemblies held here. It has a convenient quay for the lading and unlading of goods, and a handsome stone bridge over the river; but the inhabitants suffer from the sands thrown up by the sea in the mouth of the harbour. The town is governed by a mayor, two sheriffs, chosen out of the sixteen aldermen, a recorder, &c. who on solemn days appear in their scarlet gowns, with the sword, cap of maintenance, and two maces. It was once fortified with a wall and a strong castle, and at present gives title of marquis to the duke of Leeds, of the name of Osborne.

This was the birth-place of Merlin, the ancient British prophet, who flourished in 480, and about a mile from the town, by the road side, almost opposite to the bishop of St. David's palace, is Merlin's grove. The people

people in and about this town are reckoned the wealthiest and politest in all Wales.

S E C T. LVIII.

Of Brecknockshire; its Name, Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and principal Towns.

THIS county is called by the Welsh Breckiniauc, which the English have changed to Brecknock. The Welch name has been derived by some authors from Brechimus, a British prince famous for his twenty-four daughters, who, from the sanctity of their lives, were after their death esteemed saints. It is bounded on the north by Radnorshire, on the east by Herefordshire, on the south by Glamorganshire, and on the west by Caermarthenshire and Cardiganhire, extending thirty-nine miles in length, and twenty-seven in breadth.

This county is divided into six hundreds, and contains four market-towns, sixty-one parishes, and about thirty-five thousand three hundred inhabitants. It lies in the diocese of St. David's, and sends two members to parliament, one for the county, and one for Brecknock.

The air of this county, except on the mountains, is remarkably mild. It is indeed extremely mountainous, which renders travelling through it so disagreeable and dangerous, that the English who ride through it, ludicrously, but not very improperly, call it Break-neckshire; however, towards Radnorshire it is somewhat more low and level. The air on the mountains is, during the winter, extremely sharp, but salubrious. The valleys produce plenty of corn, and from the mountains great herds of cows and oxen are brought to England; this county also produces goats, some venison, and plenty of fowl.

The principal rivers in Brecknockshire are, the Usk, which rises from a spring on the side of the Black-mountain, on the south-west borders of the county, and running first to the north, and then to the east, passes into Monmouthshire. The Wye is the north-east boundary between this county and Radnorshire, after which it enters Herefordshire. The Irvon rises among the mountains on the north-west, and running first to the southward, and then to the north-east, falls into the Wye. Both these and the smaller rivers, are well stored with fish, particularly the Usk and the Wye, which abound with salmon and trout.

We ought not here to omit Brecknock-meer, a lake in the middle of the county, between two and three miles over, so full of fish, that the inhabitants commonly say, that there are only two thirds of water to one of fish.

We shall now give a concise description of the chief towns of this county.

Brecon, or Brecknock, the capital of the county, is called by the Welch Aber-Hodney, it being seated at the confluence of the Hodney and the Usk, one hundred and sixty-one miles to the westward of London. It is an ancient and large town, containing three churches, one of which is collegiate, and stands at the west end. The houses are well built, it has a good stone bridge, and it had formerly a wall with three gates, and a stately castle. The assizes are kept here, and it has a pretty good trade in woollen manufactures. It has a market on Saturdays, which is well supplied with corn, cattle, and provisions.

It is governed by two bailiffs, fifteen aldermen, two chamberlains, two constables, and a town-clerk.

Bealt, Bealth, or Builth, is pleasantly seated in a woody country, on the banks of the river Wye, sixteen miles to the north of Brecknock, and has a wooden bridge over the river, leading into Radnorshire. The inhabitants are chiefly employed in the stocking manufacture. The market is well supplied with cattle on Mondays, and on Saturdays with corn, and all sorts of provisions.

Hay, called by the Welch, Tregelly, is seated on the Wye, near the borders of Herefordshire, one hundred and thirty-four miles to the westward of London, and is a pretty good town, with a market on Mondays, well supplied with provisions.

S E C T. LIX.

Of Glamorganshire; its Situation, Extent, Divisions, Air, Soil, Produce, Rivers, and principal Towns.

GLAMORGANSHIRE, the last county in Wales we have now to describe, is bounded on the north by Brecknockshire, on the east by Monmouthshire, on the south by Bristol-channel, and on the west by that channel and Caermarthenshire, extending twenty-seven miles in length, and twenty-five in breadth.

It is divided into ten hundreds, in which are contained nine market-towns, one hundred and eighteen parishes, twenty-five castles, about ten thousand houses, and fifty-eight thousand inhabitants. It lies in the diocese of Landaff, and sends two members to parliament, one for the county, and one for the town of Cardiff.

On the north side of this county, where it is mountainous, the long continuance of the snow renders the air sharp; but the country being more level on the south side, it is milder, more populous, and bears very large crops of corn, with very sweet grass; whence it is called the Garden of Wales. Cattle abound in all parts, there being fruitful valleys among the mountains, that yield very good pasture. Its other commodities are lead, coals, butter, and fish.

The principal rivers of this county are the Avon, which rises among the mountains in the north of Glamorganshire, and falls into Bristol-channel. The Rumney, which rises in Brecknockshire, but soon entering this county, is the boundary between it and Monmouthshire, and falls into the mouth of the Severn. The Taff, Taffe, or Tave, which also rises in Brecknockshire, and runs near the eastern side of Glamorganshire, to the mouth of the Severn. The Ogmore rises from a spring in the northern borders of this county, and running to the southward, through the middle of Glamorganshire, falls into Bristol-channel. The Tavye rises at the foot of the Black-mountain in Brecknockshire, and entering this county at the north-west, runs mostly southward, till it enters Bristol-channel at Swansey. These, with the many rivulets running into them, render this county so fertile, and at the same time supply the inhabitants with great variety of fish.

The principal places in this county are the following:

Landaff, is seated on an ascent, by the river Tave, near Cardiff, one hundred and sixty-three miles to the west of London: but though it is the see of a bishop, and is therefore stiled a city, it has not so much as a market. The cathedral is however, a neat ancient building.

Cardiff, or Caerdiff, is seated on the river Tave, two miles to the south of Landaff, and is a handsome, populous trading town. It has a castle, a wall, and four gates, with a bridge over the river. The neighbouring country is fruitful, and four miles below the town is a commodious haven in Bristol-channel, from which small vessels may come up to the bridge. It contains two parishes, and about three hundred houses, formed into broad paved streets. The constable of the castle is chief magistrate, and called mayor, besides whom there are a recorder, twelve aldermen, twelve common-council, two serjeants at mace, and eight constables. Here the assizes and sessions for the county are held. The town carries on a considerable trade with Bristol.

Caerfilly, or Caerphilly, is seated between the rivers Tave and Rumney, five miles to the north of Landaff. It stands in a moorish ground among the hills; and the many Roman coins dug up here, render it probable that the walls were built by the Romans. The castle is one of the noblest pieces of ruins in the whole island. It was larger than any castle in England, that of Windsor excepted; and from what remains of it, was extremely beautiful. One half of a round tower has fallen quite down, but the other over-hangs its basis more than nine feet, and is as great a curiosity as the leaning tower of Pisa in Italy.

Neath, is seated on a river of the same name, over which there is a bridge, one hundred and ninety-five miles

miles to the westward of London. It is an ancient and pretty large town, governed by a portreve, who is sworn in by the deputy constable of the castle of Neath. Small vessels come to this town to load coals, which are here in great plenty. On the other side of the river are the ruins of a fine monastery; but a large structure belonging to it is kept in good repair.

Swansey is a sea-port town, commodiously seated on the sea-shore, near the mouth of the river Tavye, in the fifty-first degree forty minutes north latitude, and in the fourth degree five minutes west longitude. It is a large, clean, and well built town, governed by a portreve, a chief, twelve aldermen, two chamberlains, and sixty or seventy common-council-men. The streets are broad and paved, and it has two churches, and an old castle. It has the best trade of any town in the county, especial-

ly for coals, which are sent by sea to Somersetshire, Devonshire, Cornwall, and even to Ireland; a hundred sail of ships being often seen here at a time loading of coals. Mineral waters were some years ago discovered at Swansey, which are said to be of great efficacy in fluxes, hæmorrhages, diabetes, palsies, rheumatisms, and other distempers.

Among the many antiquities of Glamorganshire, one of the most singular is in the western part of the county called Gower, where, on a mountain named Kevyn-Bryn, is a stone of an immense size, computed to weigh near twenty ton, laid upon several others by way of supporters. They are all of the mill-stone sort, and though the upper one is of such a prodigious size, several tons have been broke off for mill-stones. It is commonly known by the name of Arthur's stone.

C H A P. XXX.

OF NORTH BRITAIN, or SCOTLAND, with its Islands.

S E C T. I.

Its Situation, Extent, Face of the Country, Air, Soil, Produce, Lakes, and Rivers.

SCOTLAND, which since the Union has been called North-Britain, is the northern part of this Island, which in the fifth of queen Anne, in 1707, was by the consent of the parliaments of both kingdoms united to England; and they being thus joined, the whole island is stiled Great-Britain.

Thus all the northern part of this island beyond the counties of Cumberland and Northumberland, belongs to Scotland, together with a multitude of islands, which amount to about three hundred; but some of them are very inconsiderable. This country is bounded on all sides by the ocean, except on the south, where it is separated from England, beginning at the east, by the river Tweed, Cheviot-hills, the river Ersk, and Solway Frith. It is generally reckoned to extend three hundred and eighty miles in length, from Aldermouth-head, near the isle of Mull, to Buchaness, and one hundred and ninety in breadth, where broadest. The coast is much indented, and the land in several places nearly cut through by bays, gulphs, and rivers, the first of which form excellent harbours, and the latter abound with fresh water fish.

North-Britain, exclusive of its islands, lies between the fifty-fourth degree forty minutes, and the fifty-eighth degree thirty minutes north latitude, and between the first degree thirty minutes, and the sixth degree west longitude. The longest day is upwards of eighteen hours, and the shortest five hours forty-five minutes: but the brightness of the northern lights in a great measure remedy the inconvenience of the short days of winter.

The air is very temperate, and not half so cold as might be imagined from its being seated so far to the north. This, as in England, is owing to the warm vapours and moderate breezes that continually come from the sea; which also serve to purify the air, and put it in such a constant agitation, as preserves the inhabitants from any remarkable epidemic diseases.

Great part of the country, particularly towards the north and west, is mountainous, and covered with heath; this is called the Highlands, but these in several places yield good pasture: between the higher grounds are many rich valleys, which produce corn and cattle. Indeed the south parts of Scotland are far preferable to the north parts of England, and there are every where all things necessary for human life; and not only sufficient for the inhabitants, but also to export. They do not want wheat, but the grain mostly cultivated is oats, as it will grow in the mountainous parts. The productions in

Scotland are in general much the same as in England. In the Lowlands there is little timber, but in the more northern parts there are forests of fir-trees, that might afford masts for the largest men of war; but it is difficult to bring them to the sea-side. There are also many large woods of oaks, ashes, and elms, fit for building, and abundance of fruit-trees in their gardens and orchards. The soil likewise in many places produces great plenty of hemp and flax. They have coal-pits, which afford excellent coal, great quantities of which are brought to London, where it is known by the name of Scotch-coal. This is their fuel in several parts; but in the Highlands they burn wood, and in other places turf, peat, heath, broom, and furze. They have likewise mines of lead, with quarries of free-stone, and the latter in such plenty, that most of the principal towns are built with nothing else.

The country abounds in flocks of sheep, many of which are sent into England, as is the greatest part of their wool. It has also great herds of cattle, which are generally black, except in corn soils, and these are much larger than those bred in other parts: but in general, their sheep and horned cattle are much smaller than those of England, and their flesh is very sweet. The Highlanders annually bring great numbers of them into the Lowlands, where some are fatted; but the bulk of them, with many of those bred in the Lowlands, are sent into several parts of England, especially to St. Faith's, near Norwich, where they turn to good account.

They have also many hogs, and an incredible number of goats, particularly in the north and the Highlands; the latter they eat themselves, but the hogs they for the most part pickle and export, as they likewise do great quantities of salt beef. In the southern parts there are no deer, except in gentlemen's parks; but every where else they are in great plenty.

They breed great numbers of horses, especially in Galloway and the Highlands. These, tho' small, are hardy and capable of great fatigue, and are therefore extremely proper for a mountainous country, which in many places will not admit of carriages and teams: these will thrive upon what would starve other horses. However, in many places of the Lowlands, they breed horses fit for coaches and other carriages, and for war.

Scotland has not only plenty of the domestic fowl common in other countries, but many other kinds, especially in the islands, where they are so numerous, that the inhabitants can neither consume nor vend half of them. Their fowl and eggs afford a considerable trade for food, and their feathers for bedding, and other uses. Their fat is likewise used by the inhabitants, not only in many cases where it is necessary, but likewise for physic.

Besides the fresh-water fish found in the lakes and rivers, several of the islands are frequented by whales; and cod, ling, haddock, sturgeon, turbot, mackerel, skate, sea-urchins, cat-fish, &c. are caught in great plenty on all their coasts. Lobsters, crabs, and oysters, are found in vast quantities on the Western Islands; and cockles, mussels, limpets, wilks, scallops, and spouts, are cast by the tide in such numbers on the isles, that the people cannot consume them.

In this country springs of clear and wholesome water are every where in plenty, not only on the sides, but on the tops of many of the mountains. These in their descent swell into pleasant rills, and augmenting their streams become rivers. Many of these meeting with hollow places in their passage, expand themselves into lakes, till finding a proper channel they resume their form of rivers, and, as the nature of the soil directs, sometimes expand themselves again and again, or continue their progress in the same form to the sea.

The most remarkable lochs or lakes in Scotland are Lochtay, Lochness, and Lochleven, which send forth rivers of the same name with themselves; Lochlomond, which sends forth the river Lomond; and Lochiern, from which flows the river Iern. There is a lake in Straitherrach, which never freezes, however severe the frost, till February, and then in one night it freezes all over, and if it continues two nights, the ice grows very thick. Another lake at a place called Glencanich, is seated on a high ground between the tops of two mountains, and it is remarkable that the middle of this lake is always frozen throughout the summer, notwithstanding the strong reflection of the sun-beams from the mountains, which melts the ice at the sides of the lake. Round the lake the ground has a constant verdure, as if it enjoyed a perpetual spring; and by feeding on that grass, cattle grow sooner fat than any where else.

In Linlithgowshire is a lake called Lochcoat, from whence a stream runs under a neighbouring mountain, and after it has pursued its course about two hundred paces, issues with great force from a spring about three feet broad, when it forms a stream that turns a mill.

The capital rivers, particularly the Forth, Clyde, Tay, and Ness, &c. divide the country into peninsulas; these running so far within land as to be intercepted only by a small isthmus, or neck of land. These and the other rivers, which are very numerous, will be particularly treated of in our description of the countries through which they pass.

SECT. II.

Of the Government, Religion, Fisheries, and Trade of North Britain.

THE parliament of Scotland being now mingled with that of Great-Britain, there are sixteen peers chosen out of the nobility who represent that body, and forty-five members who represent the following shires and districts.

The shires which since the Union send one member each to parliament, are, 1. Aberdeen, 2. Aire, 3. Argyle, 4. Bamff, 5. Berwick, 6. Bute and Caithness, by turns, 7. Clackmannam, 8. Dumbarton, 9. Dumfries, 10. Edinburgh, 11. Elgin, 12. Fife, 13. Forfar, 14. Haddington, 15. Inverness, 16. Kincardine, 17. Kircudbright, 18. Lanerk, 19. Linlithgow, 20. Nairn, 21. Orkney and Zetland, 22. Peebles, 23. Perth, 24. Renfrew, 25. Ross, 26. Roxburgh, 27. Selkirk, 28. Stirling, 29. Sutherland, and 30. Wigton.

Besides these there are the following fifteen districts of royal burghs, which alternately send one member to parliament. 1. Aire, Irwin, Rothsay, Inverary, and Campbell-town. 2. Bamff, Elgin, Cullen, Kintore, and Inverury. 3. The city of Edinburgh. 4. Forreß, Nairn, Inverness, and Fortrose. 5. Pittenweem, East-Anstruther, West-Anstruther, Craile, and Kilrennie. 6. Inverkeithing, Stirling, Dumferling, Culroß, and Queensferry. 7. Brunt-island, Dysert, Kirkaldy, and Kinghorn. 8. Dundee, Perth, St. Andrew's, Cowpar, and Forfar. 9. Montrose, Aberdeen, Brechin, Aberbro-

thock, and Inverbervey. 10. Kircudbright, Dumfries, Lochmaban, Annan, and Sanquhar. 11. Lanerk, Linlithgow, Selkirk, and Peebles. 12. Renfrew, Glasgow, Ruglen, and Dumbarton. 13. Dingwall, Tayne, Dornock, Weik, and Kirkwall. 14. Jedburgh, Haddington, Dunbar, North-Berwick, and Lauder. 15. Wigton, Whithorn, New-Galloway, and Stranroer.

The courts of civil judicature in Scotland are,

The college of justice, commonly called the session, which consists of a president, and fourteen fixed senators or judges, called ordinary lords of session, with two extraordinary lords. Under these are seven clerks of session, and six inferior officers. Before this court are tried at stated times, all civil causes, which they determine by acts of parliament, and the custom of the nation; and where these are defective, they decide according to the civil law, and the rules of equity. There lies no appeal from this court but to the parliament; and the presence of nine judges is required to make their decrees valid.

The justiciary, usually called the justice or criminal court, consists of five lords of the session, the justice-general, and justice-clerk. These are joined by a pannel of fifteen out of forty-five, cited like juries in England, by whom all causes of a criminal nature are tried. They hold assizes all over the kingdom twice every year, and from thence are called lords of the circuit.

The court of exchequer, which is like that of England, and consists of a chief and four other barons, &c.

The court of chancery. The officers of state are, the keeper of the seal, the lord privy-seal, the lord clerk-register, and the lord advocate.

Besides the above national judges, every county or shire has a chief magistrate or his deputy, who is ordinary judge in all civil and criminal causes; but, in most cases, an appeal lies from this magistrate to the session and court of justiciary. The sheriff is in effect the supreme justice of peace, to whom the law principally intrusts the securing the quiet and tranquility of that part of the kingdom of which he is sheriff. Bailiffs, stewards, and constables, in their respective districts, have the same liberty as sheriffs in their shires.

There are two sorts of burghs, namely royal burghs, and burghs of barony, each of which is a corporation, and holds courts, though none but the royal burghs send members to parliament. The royal burghs are one entire body, governed by one general court, called, The Convention of Burrows, which is generally held every year at Edinburgh, and has cognizance of every thing relating to the trade and interest of all the burghs in general. As to the burghs of barony, every one that holds a barony of the crown, has a court, in which lesser causes, both civil and criminal, are tried.

The court of admiralty is a supreme court, in which all maritime causes, crimes, trespasses, quarrels, &c. may be tried before the lord high admiral's judge, for he himself never judges; he forms his decisions on the civil law, and the customs of Scotland.

There are also in Scotland what are called commissariot courts, which are a kind of ecclesiastical courts, in which causes are tried by commissaries. The principal of these is at Edinburgh. The four commissaries of that metropolis particularly try causes of matrimony and adultery, in order to a plenary divorce, so that the innocent person may marry, as if the offending party were naturally dead.

The established religion is called the Presbyterian; it being a church government by pastors, teachers, elders, and deacons. The ecclesiastical courts are the four following:

I. The General Assembly, which is the highest ecclesiastical court in the kingdom, meets annually in May, and sits about ten days. A lord commissioner, who is always a nobleman of the first quality, presides here, as a representative of the king's person. All the members are annually elected, and the moderator of the last year's assembly opens the new sessions with a sermon.

II. The Provincial Synod, which is composed of the members of several adjacent presbyteries, meets twice a year, at a principal place within the bounds, and is opened by a sermon. Their business is to receive correspondents;

respondents from the neighbouring synods, who are a check upon one another; to determine appeals from the presbyteries within their district; and to enquire into and censure the behaviour of the presbyteries themselves. They have likewise power to remove a minister from one place to another: but appeals lie from this synod to the general assembly.

The Presbytery, which consists of a minister and one elder from five to ten or more neighbouring parishes, who, being assembled, chuse one of the ministers to be præses, or moderator. Here are tried appeals from the Kirk-session; and here they inspect into the behaviour of the ministers and elders within their respective bounds. They supply vacant parishes, ordain pastors, examine and license school-masters and young students for probationary preachers; and judge when or on whom to inflict the greater excommunication.

IV. The Kirk-Session consists of the minister, elders, and deacons in each parish, who consider the affairs of the parish as a religious society. They judge in all lesser matters esteemed scandalous, can suspend from the communion, and regulate every thing relating to public worship and the poor.

The number of kirks or churches in Scotland amounts to about nine hundred and fifty, besides a few chapels, which make up sixty-eight presbyteries, included in thirteen provincial synods.

The law of Scotland has provided against pluralities, and throughout the whole country there are no benefices worth less than fifty pound sterling per annum; which in that country is a good maintenance, nor any that exceed a hundred and fifty pounds a year.

There are here however several sects of dissenters from the established worship, the principal of which are the Episcopalians, who use the form of prayer of the church of England: but the nonjurors among these are not permitted to have public meeting-houses, but are only suffered to preach and read the divine service to very small congregations; while those who take the oaths, and pray for his majesty in express terms, have meeting-houses. There are also the Erskinites and Gibbonites, so called from the ministers of those names, who have broke off from the church of Scotland, and upon that account they are also called Seceders. There are likewise Mountaineers, thus named from their preaching in the open fields, and on the mountains; these are also called Covenanters.

From the government and religion of North-Britain, we shall proceed to its trade. The Scots plaids are a manufacture in which they exceed all other nations, both as to colour and fineness; they have likewise manufactures of various other woollen stuffs; but the principal articles are linen cloth, which is greatly encouraged and improved; cambricks, muslins, striped, flowered, and plain. The salt of Scotland, which is principally made in what they call pans or caldrons, is said to be better and stronger than that of Shields and Newcastle, and cures fish to greater advantage; whence it is so valued abroad, that great quantities of it are annually exported to Norway, Germany, and the Baltic.

The fisheries of Scotland are very considerable, and of great advantage to the people, particularly that of salmon, cod, and herrings, all of which employ a vast number of hands, and are barrelled and exported in great quantities to the continent. Indeed Scotland has the advantage of catching herrings sooner, and curing them at a less expence than England: their situation for exporting them is likewise extremely commodious, so that they can be sooner at market than the Dutch; those belonging to the Glasgow merchants sooner arriving on the coasts of Spain, Portugal, and up the Streights, as the merchants of Dundee, Aberdeen, &c. can sooner reach the Baltic.

As it was agreed at the Union that the subjects of the united kingdom shall have free trade belonging to either, to be regulated as in England, the Scots merchants not only trade to all parts of Europe, but to our plantations in America; from whence they bring great quantities of tobacco, sugar, drugs, &c. and what they do not sell at home, export to the different countries of Europe.

In short, Scotland is said to have this advantage to boast, which neither England nor any nation in Europe

has, namely, that in every branch of its trade with other countries, the balance is on its side, that is, the Scots send out to every country more commodities than they receive back, and consequently the difference or overplus must be made good in specie.

We shall now refer our readers for a farther account of Scotland, to the beginning of the account we have given of Great Britain in general, and conclude this section with observing, that Scotland is divided into thirty-three shires, or counties; these are the shires of Berwick, Haddington, Edinburgh, Roxborough, Selkirk, Peebles, Lanerk, Dumfries, Wigtown, Aire, Dumbarton, Bute, Caithness, Renfrew, Sterling, Linlithgow, Perth, Kincardin, Aberdeen, Inverness, Nairne, Cromartie, Argyle, Fife, Forfar, Bamff, Kirkcudbright, Sutherland, Clacmanan, Kinross, Ross, Elgin, and Orkney.

SECT. III.

Of Berwickshire; its Situation, Extent, Divisions, Soil, Produce, and principal Towns.

THIS county received its name from Berwick upon Tweed, which once belonged to it; but it was originally termed the Mers, or March, from its being the boundary between England and Scotland. It lies to the south-east of all Scotland, and is bounded on the east by the North sea; on the south by the Tweed and Tiviot-dale; on the west by Tweedale, in Peebleshire; and on the north by East Lothian, in Haddingtonshire; extending about thirty miles in length, and containing two presbyteries, and thirty-five parish-churches.

This county is divided into three parts, namely, Mers, Lammermoor, and Lauderdale. The Mers is a pleasant low ground, open to the influence of the sun, and guarded from storms by Lammermoor; hence the soil is fruitful, abounding with corn and pulse, but especially hay.

Lammermoor is a tract of hills on the north side of the shire, above sixteen miles long, and at least six in breadth, which, though to appearance barren, feed multitudes of sheep and black cattle. In the summer season it is particularly noted for pasturage, and for affording plenty of moor-fowl, partridges, plover, dotterels, and other game.

Lauderdale is a tract lying on each side the water of Lauder, abounding in hills, woods, and pleasant valleys. It belongs to the crown, and is governed by a bailiff; which office is annexed to the noble family of Lauderdale.

In short, the shire of Berwick is in general very fertile in corn and grass. It abounds with black cattle, sheep, and horses. The most fruitful and populous parts are those that lie on the Tweed, and the lesser rivers White-water, Black-water, and the Eye. The fuel of the common people is turf and peat, but the gentry have coals from Northumberland.

As the duke of Richmond derives his title of earl of March from the marches or borders of Wales, so this county of the Mers, or March, the borders of Scotland, gives title of earl to the noble family of Douglas.

It is observable, that on entering the borders of Scotland, the first town you reach is almost as perfectly Scots, as if you were a hundred miles north of Edinburgh; and there is very little appearance of any thing English, either in the customs or habits of the people, or their way of living, eating, or behaviour: nor are there many English families to be found among them. On the contrary, in the towns of Northumberland and Cumberland, next to Scotland, there are abundance of Scotsmen, Scots customs, words, and habits.

We shall now describe the principal towns in this shire.

Duns, a burgh famous for giving birth to that celebrated schoolman John Duns Scotus, who was born in 1274, became the greatest scholar of that age, and was styled The subtle doctor. It is seated twelve miles to the west of Berwick upon Tweed, and is a pretty large populous town, which has the best trade of any in the county.

county. It stands on a rising ground in the center of the shire, and is the seat of a presbytery, to which belong eleven parishes. Its market is said to be the best in all Scotland for horses, cows, and sheep.

Coldingham stands near the coast, and is famous for an ancient abbey, built about the year 1100, the remains of which are used for a parish church. Ebba, its lady abbess, on there being a Danish invasion, slit her nose, cut off her upper lip, and persuaded all her nuns to do the same, that their deformity might prevent their being ravished by the Danes; upon which those barbarians were so exasperated, that they fired the nunnery, and burnt them all alive. This abbess was afterwards sainted, and a neighbouring promontory is from her called St. Ebba's-head, and by the sailors St. Tabbe's. In the adjacent moor there is not a hedge or tree to be seen for the space of eight miles.

Greenlaw, the chief burgh of the shire belonging to the earl of Marchmont, stands about five miles from Duns; and in its neighbourhood that nobleman has a fine seat.

Lauder, an ancient royal burgh, the capital of Lauderdale, is pleasantly seated on a river of the same name, which runs through it, twenty-two miles to the south of Edinburgh. It has a bridge over the river, is the seat of the commissariat, and has a good market.

From the long valley of this name on both sides the river Lauder, the family of Maitland takes the title of earl; and there is a stately seat on the river, in the neighbourhood of the town, called Lauderforth, which belongs to the earl of Lauderdale.

S E C T. IV.

Of Haddington, or East Lothian; its Situation, Extent, Produce, and principal Places.

THIS shire is bounded on the north and east by the Firth; on the south by the hills of Lammermoor, in Berwickshire; and on the west by Mid Lothian, or Edinburghshire. According to some authors it is only thirteen, and according to others twenty-two miles in length, and twelve in breadth.

East Lothian produces corn of all sorts, and has plenty of grass, coal, and limestone, with some considerable woods. It feeds a great number of sheep, especially about the hills of Lammermoor and by West Lammerlaw; and from the west part to the sea it abounds with rabbits. A great deal of salt is made here, and there was a considerable manufacture of broad-cloth made by English workmen, and with English wool; but after the Union the English clothiers poured in such quantities of cloth, that they underfold the Scots, and thus the manufacture was dropt; yet the people employ themselves in spinning, dying, weaving, &c. Here are several convenient harbours, with the advantage of some fishing-towns; and particularly there is every year a herring fishery after Lammas at Dunbar, where they take enough both for home consumption and exportation.

The principal towns in this shire are Haddington and Dunbar.

Haddington, or Hadina, the shire town, is a royal burgh, pleasantly seated on the Tyne, over which it has a handsome bridge with three large arches. It stands eighteen miles to the west of Edinburgh, and is pretty large, well built, with some very good houses; the streets are well paved; it has a good market, and is the seat of a presbytery, consisting of sixteen parishes. Here are the remains of an ancient nunnery, and of a good church built of hewn stone, to which adjoins the chapel of the family of Lauderdale, with theirs and other very noble tombs, but the choir of the church is pulled down. This town gives title of earl to a branch of the noble family of Hamilton, which has large possessions and fine seats in the neighbourhood. No place in Scotland is surrounded with more little towns and houses of the nobility and gentry than this; among which Yester, the mansion-house of the earl of Tweeddale, deserves particular notice.

There is here a noble plantation of fir-trees, which is said to take up six thousand acres. The park itself is about six miles round, and encompassed by a very handsome wall. This noble palace stands about half a mile from the park-gate, to which you go by a paved coach-way through a thicket. The building is of free-stone, a hundred and twenty feet in front, and sixty feet deep, with a pavilion or wing. The offices under ground are very noble and vaulted, with paved galleries of communication. There is an ascent to the house of six or eight steps, which lead to a large hall thirty-six feet high; behind it is a saloon from the garden of the same height, and at the top is a gallery for music, which opens into both, exactly as at Blenheim-house, near Woodstock. The rooms of state, which run on each side of this saloon fronting the garden, are very noble and of an exact symmetry. A mathematical stone staircase, with an iron balustrade, leads up to the apartments above.

The garden behind the house is very spacious, rising up by an easy ascent to the park. In the middle of the parterre is a handsome basin with a jet-d'eau, and four good statues, one at each corner. There are abundance of ever-greens, and green slopes; and to the west of the garden, on an artificial mount, is a pleasant summer-house. The green-house joins the pavilion to the west, as does the laundry to the east. A pretty large stream runs by the house, and from its murmuring as it passes through the thick groves in the park, gives the whole a very rural appearance. By the river side is a pretty bowling-green. The coach-houses, stables, and hen-house are at a distance in the park, as is the custom at the seats of the nobility in Scotland: for every nobleman's house has what is called the Mains, where their labourers, grooms, and every body belonging to the stables and poultry reside.

Dunbar, a royal burgh, is seated on the south side of the mouth of the river Firth, where is a good harbour, twenty-five miles to the east of Edinburgh. The town is handsome and well built; the houses, as in most of the principal towns, being all of stone covered with slate. It has been defended by a strong wall, which is now decayed; and on the opposite side of the haven are the ruins of a castle, almost covered with the sea at high tide: it was once remarkably strong, and was the seat of the earls of March, afterwards stiled earls of Dunbar. This fortress was often won by the English, and as often recovered by the Scots; but was demolished in 1656 by order of the commonwealth, to prevent its affording a retreat for the royalists. The port is very considerable, and of great advantage to all ships in the river, in case of stress of weather. The inhabitants have here a very considerable herring-fishery, and also one for whales.

Between the town and the great road stands a pleasant and agreeable seat of the duke of Roxborough, called Broxmouth. It is seated in the middle of a fine park, planted with large groves of trees between the building and the sea, and consists of a body and two wings, between which is a fine paved court; before the building is a good avenue, and behind is a spacious parterre adorned with statues.

From the town of Dunbar to Edinburgh the country may be reckoned as fruitful, rich, and pleasant, as any in Scotland, or indeed as most in England. The sea is on the east at a moderate distance, and the hills on the west are still farther off; these feed large flocks of sheep, and have many open roads over them leading towards England.

S E C T. V.

Of Mid-Lothian, or Edinburghshire; its Situation, Extent, and Produce; with a Description of Edinburgh, and of the other Places worthy of Notice; with an Account of the Island of Bass, and of the Solan Geese which resort thither.

THIS is the principal county in North Britain, both on account of its fertility and its containing the capital. It is bounded on the east by East Lothian for thirteen miles together; on the south-east by Berwickshire

shire for about four miles; on the south by the shire of Selkirk and Tweedale, in Peeblesshire, for thirteen miles; on the south-west by Lanerkshire for six or seven miles, and by the same on the west for two miles; on the north-west by Linlithgowshire for fourteen miles; and on the north by the Frith, or Forth, for eight miles: extending about twenty-one miles in length, and in some places sixteen or seventeen in breadth; but in others not above five or six.

Mid-Lothian is so fertile that it yields a great deal of corn of all sorts, with good pasture for cattle, and is provided with all necessities in abundance, particularly coals, limestone, and a kind of soft black marble; and near the water of Leith, some miles distance from Edinburgh, is a copper mine.

Edinburgh, the metropolis of North Britain, is situated in the fifty-fifth degree fifty-seven minutes north latitude, and in the second-degree fifty-five minutes west longitude; fifty-four miles west-north-west of Berwick upon Tweed, seventy-two north of Carlisle, two hundred and one north-north-west of York, and three hundred and ninety-three miles north-north-west of London. It is a city and county of itself, and was formerly the royal seat of the kings of Scotland. In this city also the parliaments were held, as are still the supreme courts of judicature. It stands two miles to the south of the port of Leith, and is seated upon the side of a high hill, or rather a narrow ridge. At the extremity of the east end of the city is the palace of Holy-Rood-house; leaving which a little to the left, you come through a populous suburb to the entrance, called the Water-port, and from hence proceeding to the west, the street goes on in a straight line, through the whole city, to the castle, extending above a mile in length; and is, perhaps, the largest, longest, and finest street for buildings and the number of its inhabitants in the world. From the gate of the palace, which stands on a level with the plain country, the street begins gradually to ascend; but is no where steep; yet the ascent being continued so far, the upper part must necessarily be very high; for the castle, which stands at the extremity west, as the palace does east, has on every side, except on that which joins it to the city, very steep and frightful precipices. The street is extremely well paved; but the ridge or top of the ascent is so narrow, that the street and the row of houses on each side take up the whole breadth; so that which way soever you turn, you immediately go down a steep descent; and these side lanes are called wynds. The houses are very large, and some of them so lofty, especially in the High-street, that five or six stories are but an ordinary height. Most of the houses being parted into tenements, they have as many landlords as stories. The fronting of houses with timber is now prohibited, on account of the many fires that have happened; and about eighty years ago the inhabitants were at the expence of bringing one of the best springs in Scotland into the city, by leaden pipes laid from a hill at three miles distance.

We shall now consider more particularly the buildings of the city. The royal palace, called Holy-Rood-house, from its being originally an abbey of that name, was first converted into a palace by king James V. and rebuilt by king Charles II. all but two towers on the north side of the entrance. It is a magnificent stone building in the form of a square, adorned with the several orders of architecture, and divided into four courts. The entrance is very grand, and over the gate is a large apartment, which the duke of Hamilton claims as hereditary keeper of the palace. Within this entrance is a large irregular court, where are coach-houses and stables. The entrance from the great outer court is adorned with columns, which support a cupola in the form of an imperial crown, balustraded on each side at the top. The inner court is very magnificent, and has piazzas all round, which lead into very noble apartments, richly furnished; among which is a gallery said to be adorned with the pictures of all the kings of Scotland, from Fergus their first king, three hundred and twenty years before the birth of Christ, to the Revolution. This palace is encompassed by beautiful gardens.

From the palace-gate westward the street is called Canongate, from the canons of the abbey formerly re-

siding there. This is a kind of suburb, in which are several magnificent houses of the nobility, with spacious gardens behind them. The city is parted from this suburb by the Netherbow-port, or gate, which was rebuilt in 1716, and adorned on both sides with towers, and a spire at the top. The city is enclosed on all sides, except towards the north, with a wall, where it is secured by a lake; and has six gates besides that just mentioned.

The great church, which was the cathedral, is a large and stately structure, in the form of a cross, now divided into four churches; here also the magistrates assemble, and the judges in their habits in time of session. In a large chapel in the south-west part of this church the general assembly hold their sessions, as does also the commission of the assembly, in the interval between the general meetings. This structure is adorned with a very high steeple, the summit of which resembles an imperial crown. Here they have a set of bells which are not rung as in England, for that is a manner of ringing unknown in this country; but all manner of tunes are played very musically upon them, and the city gives a man a yearly salary for playing upon them, from twelve to one every day, Sundays and holidays excepted. The four churches in this structure, with the rest, and the chapel in the cathedral, make twelve in all. There are also about twenty meeting-houses of the episcopal party.

On the south side of the great church is a square of very fine buildings, called the Parliament-close; the west and south sides of which are mostly taken up with the parliament-house, the several courts of justice, the council-chamber, the exchequer, the public registers, the court for the royal burghs, the lawyer's library, the post-office, &c. The east and part of the south side is built into private dwellings, which are magnificent and lofty, they being seven stories high to the front of the square; and the hill they stand on having a very steep descent, some of them are backwards no less than fourteen stories high. In the middle of this square is an equestrian statue of king Charles II.

The castle, which, as hath been already said, is seated at the west end of the city, is inaccessible on the north, west, and south; and the entrance from the city is defended by a round battery, and an out-work at the foot of it. In this structure is a royal palace, magnificently built with hewn-stone, in which are kept the regalia and the records of state. Here also is the magazine for the arms and ammunition of the public; and there are deep vaults in the rock, which are said to be bomb-proof. It is furnished with water by two wells in the rock; and has a chapel for the use of the garrison. The governor is always a person of the first quality, and general of the forces; and both he, the lieutenant-governor, foot-major, and other officers, have very handsome apartments. From the castle is a delightful prospect over the city and neighbouring country.

Near the Potter-row-port stands the college, or university, which consists of three courts, two lower and one higher, equal to the other two. These courts are encompassed with neat buildings, for the use of those students who choose to lodge in them; for they do not reside together nor live in common, but only attend their classes at certain hours. The public schools are large and commodious, with accommodations for the students, handsome dwellings for the professors, and fine gardens for their recreation. This university was founded in 1580 by king James VI. who established there a primate, or principal, a professor of divinity, four regents, or masters of philosophy, a professor of philology, and a regent of humanity. In 1640 the town added a professor of mathematics; to which have been lately added professors of ecclesiastical history, civil law, theoretical and practical medicine, chemistry, &c. They have a good library; which is kept in great order, the books given by its benefactors are kept by themselves, and over them is the donor's name in letters of gold; and above the books hang the pictures of several princes, with the most eminent reformers at home and abroad. Here is also a noble museum, in which is contained a prodigious number of curiosities both of art and nature. Under the library is a royal printing house, where they are chiefly employed in printing Bibles.

The physicians, who were incorporated in 1682 by king Charles II. have their college in Fountain-clofe, near the Netherbow. They are deservedly esteemed for their learning and abilities, in which they are at least equal to the physicians of any other country. They have a noble museum, called from its founder, Sir Andrew Balfour, M. D. Museum Balfourianum; and on the north side of the city they have a neat physic garden, containing some thousand exotic plants.

On the south side of the city is a large building belonging to the surgeons and apothecaries, in which is a spacious hall hung round with the pictures of all the eminent surgeons of Edinburgh that have flourished since this building was founded. They have a theatre for dissections, and a museum, in which are the skeletons of uncommon animals, a mummy, and other curiosities.

In this city are several hospitals, the chief of which is Heriot's, a large and beautiful building, said to be the most magnificent of the kind in the world. It is an exact square, with piazzas all round the inside. At the corners are square towers, adorned with little turrets. This is a nursery for an indefinite number of the sons of freemen, who are maintained, cloathed, and educated in useful learning, till they are fit to be put out apprentice, or to go to the university, where they are allowed handsome salaries. The gardens, which consist of a flower-garden, kitchen-garden, and orchard, are kept in great order, and, with the house, contain between nine and ten acres.

There are here also St. Thomas's hospital, in which old decayed citizens and their widows are maintained, and have their own chaplain; and a maiden hospital, a neat building close to the college, founded and endowed for the relief and education of the female orphans of decayed freemen. Another hospital of the same kind has been lately founded by the tradesmen and artificers of Edinburgh.

A royal infirmary has likewise been erected here, after the example of those of London, Bath, &c. by the liberal contribution of many well disposed persons; to this work the proprietors of quarries contributed stone and lime, the merchants timber, the farmers engaged to carry materials gratis, and even the journeymen masons and labourers contributed a certain portion of their labour.

The city is governed by a provost, whose office is much the same with that of the lord mayor of London; four bailiffs, who, besides the power of aldermen in the government of the city, have that of sheriffs; there is also a common-council, which usually consists of twenty-five persons, but on extraordinary occasions of thirty-eight. All these are chosen annually; and the provost, dean of guild, and treasurer, are to be merchants; or if any inferior tradesman be chosen, he must quit his trade, and not return to it without leave of the magistrates and town-council.

There are fourteen incorporated trades, each of which has its deacon, or master of the company; these are the surgeons, goldsmiths, skinners, farriers, hammermen, wrights, masons, taylor, bakers, butchers, cordwainers, weavers, wakers, or fullers, and bonnet-makers. But none of the merchants or traders are to make any by-laws, without the consent of the magistrates and town-council, except to choose their own deacons at the appointed time, to make persons free of their trade, or to try their work.

The trained-bands of the city consist of sixteen companies; besides which they have a standing company of town-guards.

There is in Edinburgh a very useful kind of black-guard boys, who attend at taverns, coffee-houses, and other places to go on errands, and know every body of any note in the town. Though they are in rags, and lie every night in the streets, or upon the stairs of the houses, yet they are considerably trusted, and seldom prove unfaithful. They are subject to a kind of magistrate, called the constable of the cawdies, who generally punishes them for any neglect or misdemeanor by a fine of ale or brandy; but sometimes corporally. Most of them are very acute, and execute whatever employment is assigned them with great speed and address.

Now leaving Edinburgh, we shall take a view of the other places in this county most worthy of notice.

Leith, which is the port of Edinburgh, is a large flourishing town in the fifty-fifth degree fifty-eight minutes north latitude, and in the second degree fifty-nine minutes west longitude, two miles to the north of Edinburgh. It lies on the firth of Forth, upon a river called the Water of Leith, which falls into the firth on the west side of the town. The river runs through the middle of the town, and over it is a stately stone bridge of one large arch, to which ships of burthen may come, and at high-water lay their sides close to the shore. Here is a very fine quay, well wharfed with stone, and fenced with piles. At the mouth of the harbour is a very long and well built pier, which runs out a great way beyond the land, and prevents the entrance of the harbour being filled with sand. It is also secured by strong ranges of piles, or counter-piers; and a beacon or mast is set up at low-water mark, for the convenience of navigation. The buildings on the south side opposite to the water are very lofty and handsome, they being generally about six stories high, with large sash windows. Here are commodious cellars and ware-houses for laying up goods, the merchants of Edinburgh having the bulk of all their commodities here in order to be ready for carriage either by land or sea: so that Leith is very properly called the ware-house, as well as the port of the city. Here are likewise glass-houses and saw-mills.

North Leith, which lies on the other side of the harbour, has docks for building and repairing of ships; with the ruins of a citadel built by Oliver Cromwell, and in part demolished by Charles II. The citizens of Edinburgh often come to Leith in coaches, or a-foot, for a walk on the mole, or other recreations; and at the numerous inns are good accommodations, at a reasonable rate.

Dalkeith is a pretty large and pleasant town, defended by a castle; it stands at the confluence of the two rivers Esk, six miles to the south-east of Edinburgh, and is the seat of a presbytery that contains ten parishes. Here is a noble palace built by the late duchess of Buccleugh; this is said to be the model of that which belonged to king William at Loo, in Guelderland, only this is of stone and that of brick. It stands on a rising ground by the North Esk, and commands the view of a large park, beautified with a canal and water-works. The front is adorned with columns of the Corinthian order, and it has a double wing at each end. Between the palace and park is a spacious court, surrounded with iron balustrades between pillars of free-stone. The grand staircase of the house is supported by marble columns, and every stair curiously inlaid with walnut-tree. This staircase leads into a noble room adorned with the pictures of all the beauties of the age, at whole length, in pannels. The offices of the palace join to the town.

We shall conclude this section with a description of the island of Bass, which stands within the Forth, about a mile from the south shore, forty-five miles to the east of Edinburgh. It is about a mile round, and is on every side a steep rock, it being only accessible by one at a time. It rises high above the sea in the form of a cone. At the top was a fort mounted with cannon; but since the Revolution it has been neglected. In the lower part the force of the tide has worn a hole almost through.

This rock is resorted to in May and June by incredible flocks of fowls, and then the surface of it is almost covered with their nests, eggs, and young birds. The best tasted of these different sorts of wild-fowl is the Solan geese. Before these birds come it is said they send some before to fix their mansions, for which reason they are called scouts. The inhabitants take care not to disturb them till they have built their nests, after which no noise will fright them. They lay but one egg in a year, and fix it so dexterously to the rock by one end, that if it be removed it is impossible to fix it again. They are said to hatch it with their foot, and scarce leave it till that be done. They are of an ash colour, but the old ones are all white. Their neck resembles that of the crane, and they have a strong sharp bill, between three and four inches long, which they strike through their prey with such

such violence, that it often sticks so fast in a board baited with a herring, that being unable to pull it out again, they are taken. They leave this place in September, but whither they retire in winter is unknown. People make great profit of the young ones, which are taken from their nests by a man let down the rock with a rope. When they come to be as big as ordinary geese they are very good meat, and yield a considerable profit by their flesh and feathers, which are used for beds.

S E C T. V.

Of the Shire of Roxburgh, Rosburgh, or Teviotdale; its Situation, Extent, Divisions, Face of the Country, Produce, and principal Places.

THIS is a sheriffdom hereditary in the family of Douglas, by the title of sheriff of Teviotdale, it being thus called from the river Teviot running through it. It is bounded on the east by Northumberland, on the south-east by part of Cumberland, on the south and south-west by Anandale, and on the west by Tweeddale; extending thirty miles in length from east to west, and fifteen in breadth. It is divided into Teviotdale, Liddesdale, and Eusdale, or Eskdale, and has three presbyteries, to which belong twenty-five parishes; and, with the Mers, makes up a provincial synod of six presbyteries and seventy-one parishes.

This district has many mountains, of which the most famous is Cockraw, from whence runs a chain of hills westward, dividing Scotland from England, and in many places impassable; some of them are very high, but furnished with excellent grass, and have plenty of lime and free-stone. In short, this country produces good corn, particularly oats, great quantities of which are sent from hence to England: it has also excellent pasturage, and abounds with large black cattle, sheep, and horses.

The principal towns in this shire are Kelso and Jedburgh.

Kelso, which is a burgh of barony, is a large and very handsome town, pleasantly seated by the river Tweed on the borders of England, two hundred and fifty-six miles to the north-north-west of London. It is the seat of a presbytery, and a great thorough-fare from Edinburgh to Newcastle. It has the best trade of any town in this part of the country, and has a very good market kept in a large square of handsome houses: it has also some good streets, and a parish-church, that is the remains of an abbey of Cistercian monks. The duke of Roxburgh, who is stiled lord of the town, has a house in it, and a noble seat called Fleurs, with pleasant gardens, near the influx of the Teviot into the Tweed.

Jedburgh is a royal burgh, seated near the confluence of the Tefy and the Jed, from whence it takes its name, thirty miles from Edinburgh. It is a pretty large town, well inhabited, and the seat of a presbytery. It has a handsome church and town-hall, where the sheriff keeps his courts; with a good market for corn and cattle. It gives title of lord to the eldest son of the marquis of Lothian; and many persons of quality have seats in its neighbourhood.

The town of Roxburgh, which gives title of duke to the chief of the noble family of Ker, was antiently a royal burgh; but in the wars between England and Scotland its castle was razed, the town ruined, and its royalty transmitted to Jedburgh.

Melrofs, or Mailrofs, stands on the Tweed about nine miles from Jedburgh, and is the seat of a presbytery and a royalty belonging to the earl of Haddington. An abbey was founded here in 1136, and possessed by the Bernardine monks, and appears by its ruins to have been one of the noblest abbeys in Europe: the window over the great gate of the abbey, which is still intire, is larger than that of York minster, and round the top are the statues of our Saviour and the twelve apostles. The choir of the church, which is still visible, is a hundred and forty feet long.

S E C T. VI.

Of the Shire of Selkirk; its Situation, Extent, Produce, and a concise Description of the Town of Selkirk.

THIS county is bounded on the north by Tweeddale; in Peebleshire, and Mid-Lothian; on the east and south by Teviotdale, in Roxburghshire; on the west by Teviotdale, and part of Anandale, in the shire of Dumfries. According to Cambden its diameter is sixteen miles every way; but, according to others, it extends twenty-two miles in length, and only ten where broadest.

This county is also called the sheriffdom of Ettrick forest, from the river Ettrick, which runs through it, and is one of the principal rivers in the country; its other rivers most worthy of notice are the Yarrow and the Gallo-water.

The hills in Selkirkshire feed great herds of black cattle and flocks of sheep, with which the inhabitants carry on a good trade to England, and the meadows on the banks of the rivers produce corn and hay. It is said that in Glangebar-water in this county, and in other places, pieces of gold have been found in the shape of birds eyes and eggs. Here are several gentlemen's seats, and the chief families are the Pringles, Scots, and Kers.

Selkirk, which gives name to the shire, is a royal burgh on the banks of the river Ettrick, thirty-three miles to the south of Edinburgh, and gives title of earl to a branch of the noble family of Hamilton. It is the seat of a presbytery, which has eleven parishes under its jurisdiction, and here the sheriff keeps his court. The town has a handsome parish-church, a weekly market, and several fairs. The chief employment of the inhabitants is the making of boots and shoes.

In this shire are likewise Philiphaugh and Gallafields, each of which has a weekly market.

S E C T. VII.

Of Peebleshire, or Tweeddale; its Situation, Extent, Air, Mountains, Lakes, and Rivers; with a Description of the Town of Peebles.

THE shire of Peebles is called also Tweeddale, from the river Tweed, which rises at a place called Tweed's-cross, and runs from west to east through this country. Peebleshire is bounded on the east by the shire of Selkirk; on the south by Anandale, in the shire of Dumfries; on the west by Clydsdale; and on the north by Mid-Lothian; extending about twenty-eight miles in length, and eighteen where broadest. It contains seventeen parish-churches, which are all included in the presbytery of Peebles.

It enjoys a temperate and clear air. It is generally swelled with hills, many of which are as verdant as the downs of Sussex, and intermixed with pleasant vallies, fruitful in corn and grass. The chief mountain here is Braidalb, from whence may be seen the seas on both sides of the island. This shire has plenty of limestone; the grain is chiefly oats and barley: the inhabitants have black cattle, milk, cheese, and butter. The sheep feed in vast flocks on the hills, and are much prized both for their flesh and wool.

Several rivers which fall into the Tweed supply the country with plenty of salmon; and a lake, called the West Water-loch, so abounds with eels, and other fish, in the month of August, that, during the west wind, they are said to enter the river Yarrow, which runs from the lake, in such shoals, that they are ready to overturn the people who go in to catch them. There is another lake called Lochgenen, from its being seated on a hill named Genen, and from it a river runs that falls from a precipice into Anandale, the height of two hundred and fifty paces, so that fish are frequently killed by the fall of the water.

The only town of note here is Peebles, a royal burgh and market-town, seated in a very pleasant plain on the banks

banks of the Tweed, over which it has a stone bridge of five arches, and near a river of its own name, upon which it has two bridges. It stands twenty-two miles to the south of Edinburgh, and was formerly remarkable for its three churches, three gates, three streets, and three bridges; but the town is at present small, not very well built or inhabited, though it has some good houses, as well as a handsome parish-church, and is the seat of a presbytery.

S E C T. VIII.

Of the Shire of Lanerk, or Clydsdale; its Name, Situation, Extent, Divisions, Rivers, and Produce; with a particular Description of the City of Glasgow, and the other Places worthy of Notice.

THIS shire, which is called Lanerk from its shire town, and Clydsdale from the river Clyde, is bounded on the east by the shire of Linlithgow; on the south-east by Anandale; on the south by Dumfriesshire; on the south-west by that of Aire; on the north-west by that of Renfrew; on the north by that of Dumbarton; and on the north-east by Shropshire. It is generally reckoned forty miles in length, about twenty-four where broadest, and sixteen in the narrowest part. It is divided into two wards, the Upper and Nether ward; the one called the shire of Lanerk, and the other the barony of Glasgow: the one hilly, heathy, and fit for pasture; and the other level, and proper for corn.

The river Clyde, which runs through this shire into its own firth, arises in Errick-hill, in the Upper ward; and from the same hill rise the river Anan, which runs into the Irish sea, and the Tweed, which near the mouth of the firth falls into the German ocean.

This is a pleasant fruitful country, and, though in some places mountainous and in others woody, is well inhabited, especially near the Clyde. It abounds with coal and limestone, and has some profitable lead mines; gold has also been found in great quantities, though it does not appear that any of that valuable metal is ever found at present; and abundance of lapis-lazuli is dug up there, particularly in Crawford-moor.

The principal places in this shire are the following:

Glasgow, the second city in Scotland, is pleasantly seated on the side of a hill sloping to the river Clyde, in the fifty-fifth degree thirty two minutes north lat. and in the fourth degree five minutes west longitude, thirty-five miles to the west of Edinburgh. It has a noble and beautiful stone bridge over the river, which sometimes overflows its banks; and as one third of the city lies in a flat next the river, it is then overflowed. In the centre of Glasgow is the Tolbooth or town-house, a very magnificent structure of hewn stone, lately rebuilt, with noble apartments for the magistrates, and a very lofty tower, with bells which chime every hour. From this town house and the adjacent market place run the four principal streets of the city in the form of a cross, dividing the city into four equal parts, each adorned with several public buildings, and each said to be larger and finer than any one street in London; the houses being uniformly built of free stone, six stories high, and some more: they are for the most part adorned with columns of the Doric order, have beautiful piazzas, and are well fashioned. From the centre the whole city may be seen; and the streets are spacious, straight, and well paved.

In the higher part of the city, and at the end of one of the streets, stands the cathedral, a vast pile dedicated to St. Mungo, who was bishop here about the year 560. It is divided into two churches, one over the other, called the upper and lower; and its several rows of pillars and exceeding high towers, with the tall spire, the highest in Scotland, rising from one of the towers, shew the extraordinary skill of the architect. Here are five other very good churches, all of them neatly built, with handsome steeples. Besides these places of worship there are convenient apartments for the meeting of the presbytery, which consists of nineteen parishes, and for the provincial synod, which consists of 127.

Near the cathedral is a ruinous castle, which in the time of Episcopacy was the palace of the archbishop, who was lord of the city, and gave it its first charter. It is fenced in with a very high wall of hewn stone, and has a fine prospect of the whole city.

The glory of the city is its university, which indeed consists of only one college; but it is by far the best, the most spacious, and the finest built in Scotland. It consists of two large squares of noble and lofty stone buildings, adorned with a high tower, and many fine turrets, and is separated from the rest of the town by a very high wall. The front towards the city is a noble piece of architecture. This university was founded by king James I. in 1453. By the first foundation it was under the government of a rector, a dean of the faculty, a principal or warden, who was to teach theology, three professors of philosophy, and afterwards some of the clergy taught the civil and canon law. King James VI. granted it a new charter, and in 1617 established a principal, three professors of philosophy called regents, four pursers, a steward or surveyor to furnish the table, &c. and several of the succeeding kings ratified its privileges, and were benefactors to the university. The library is furnished with many curious printed books and valuable manuscripts. The precincts of the college are enlarged by some acres of ground, purchased by the king and parliament; these are converted into well planted walks and gardens, one of which is for medicinal plants. The university makes use of the same arms as the city, which are a salmon with a gold ring in its mouth; an oak, with a red bird upon it, and a bell. The scholars wear scarlet gowns, and here lodge in the college, which at Edinburgh they do not. The principal, regents, and masters, have all handsome apartments, and good salaries.

Though the river is navigable for small vessels up to the town; yet New-Glasgow at the mouth of the Clyde, is the harbour for all those that are of considerable burthen, it having a good quay and a custom house for all the coast; ships are also laid up here and refitted, and the goods are brought from thence to the city in lighters. The merchants of Glasgow annually send about fifty ships to Virginia, New England, and other English colonies in America. They have also a very considerable trade in herrings, which they export to Spain and Portugal. The city has likewise a manufacture of plaids and muslins. It gives title of earl to the honourable family of Boyle; and in this city has been lately erected a noble foundation under the name of the Glasgow charitable marine society, in order to provide for such seamen as shall become old and disabled in the merchants service, and to afford relief to their widows and children.

Hamilton is seated near the confluence of the Avon and Clyde, eleven miles to the south-west of Glasgow, and is a well built town, with a bridge over the Avon, and a handsome parish church. It is larger than most of the royal burghs, and the houses, which are built with free stone, are supported on pillars: but its principal ornament is the noble seat of the duke of Hamilton, which has a magnificent front intirely of free stone, adorned with different orders of architecture, and very deep wings. The apartments are truly noble, and the pictures, furniture, and other decorations, are exquisitely fine. The offices of this structure join the town; it has a very beautiful garden, consisting of seven terrace walks down to the river side; with a wood on the opposite side. In some of the walks are grottos and banquetting houses. The great park is about seven miles in compass, and well planted with lofty oaks, firs, pines, &c. It is walled round with stone, and stocked with deer. The lesser park is also well planted with trees.

Lanerk is a royal burgh in the division called the Upper ward; it is situated on the Clyde, nine miles to the south-west of Hamilton, and is the seat of a presbytery which consists of thirteen parishes.

It has a remarkable bridge, built by the inhabitants at a great expence; but was subject to such frequent repairs on account of the rapid current of the water, that they have been obliged to obtain an act for making all who pass over it pay a small toll.

A little below the town the river Douglas falls into the Clyde, and gives the name of Douglasdale to the lands near it. In a vale near this river stood a very old castle, which had been the paternal seat of the family of Douglas for above a thousand years: but though the apartments were very fine, the frequent additions to the building rendered the whole such an irregular mass, that at a distance it rather resembled a little town than a single structure; but in December 1758 this ancient castle was consumed by a fire which began in a room where nobody slept, and was got to such a height before it was discovered, that it was impossible to prevent its progress; whence the family, who were waked out of their sleep, with difficulty saved their lives, but most of the fine paintings and valuable furniture were destroyed.

S E C T. X.

Of Dumfries-shire, including Annandale and Nithsdale; its Situation, Extent, Rivers, Produce, and principal Towns.

DUMFRIES is bounded on the north by part of Clyddale, Tweeddale, and Teviotdale; on the west by Teviotdale, and Eskdale; on the south by Solway firth; and on the west by Galloway and Kyle; extending about thirty-five miles in length, and thirty-four in breadth.

Annandale, which signifies the dale or valley on the river Annan, lies in the east part of the shire between Nithsdale on the west, and Eskdale on the east; extending twenty-four miles in length, and fourteen in breadth. The river Annan runs through the middle of the shire, and falls into Solway firth, after a course of twenty-seven miles, in which it has received several small rivers, that run on both sides through pleasant woods and fruitful fields abounding with pasture. This division is a stewartry, that gives title of marquis to the family of Johnston.

Nithsdale, or Nidisdale, on the west side of Annandale, is so called from the Nith or Nid, which runs through it; it has both pasture and arable lands; for though it is encompassed on all sides with a ridge of rocks, the bottoms produce abundance of corn.

The river Nith or Nid issues out of a lake called Lochcure, and runs into Solway firth.

Nithsdale is divided into the Overward, which contains the parishes in the presbytery of Pent-pont; and the Netherward, containing those of Dumfries presbytery. Here were formerly woods and forests, which are now much exhausted; and pieces of gold have after great rains been found in some of the brooks.

Annand, the chief town of Annandale, was an ancient royal burgh and sea-port at the mouth of the Annan, where it falls into Solway-firth, seventy miles to the south of Edinburgh. It had once a castle and a pretty good trade; but being often taken by the English, and burnt to the ground in the reign of Edward VI. most of the merchants removed to Dumfries, and it has never since recovered itself. It has however a weekly market, with a handsome bridge over the river.

Dumfries, the chief town of Nithsdale, and the capital of the south-west part of the kingdom, is a pleasant and thriving place, whence it has been called the Liverpool of Scotland: it stands eight miles from the mouth of the Nith, in the fifty-fourth degree fifty minutes north lat. but the tide flowing up brings small ships quite up to the quay, and about four miles lower, the largest ships may ride in safety. It has spacious streets, with a stately church, and a castle, which, though old, is pretty strong. It has also four gates and a noble bridge of free stone over the river, leading to Galloway: this bridge has thirteen arches, and is esteemed the finest in Britain next to those of Westminster, London, and Rochester. In the middle of it is a gate which bounds the shire of Dumfries and the stewartry of Galloway. A street leads from it by an easy ascent to the castle, which is on the east side of the town, and commands a prospect of the town and the adjacent country; and from the castle a spacious high street runs by an easy descent to the church, which is half a mile distant. On each side of the high street are

good stone buildings, those on the north side having gardens next the river; and about the middle of it are the exchange and the town-house. It has likewise a large market place, with a noble cross. The town gives title of earl to the ancient family of Crichton. It is the seat of a presbytery, to which belong eighteen parishes, and is the place where the provincial synod meets, which consists of four presbyteries, that have under them fifty-four parishes.

The country round the town is very pleasant, and adorned with many seats of gentlemen, all finely planted with trees.

Drumlantic lies seventeen miles to the north of Dumfries; it has a weekly market, and gave title of earl to the duke of Queensberry, who has here a noble palace, adorned with twenty-eight turrets, grand avenues, gardens, and terrace walks, besides a stately stone bridge over the river Nith. Like Chatsworth in Derbyshire, it stands in a wild rocky country, and is environed with mountains. It is a square free-stone building, and has hanging gardens cut out of the rock down to the river, adorned with water-works and grottos, with a plantation of oaks six miles in length.

S E C T. XI.

Of the Stewartry of Kircudbright, or Lower Galloway; its Situation, Extent, Produce, and principal Towns.

THIS and the Stewartry of Orkney and Shetland differ only from the shires in the title of the chief officer, who is here called the steward, and in the other the sheriff. Galloway is divided into two parts; this stewartry, which is towards the east, being called Lower Galloway; and the westernmost Upper Galloway, or Wigtown. Lower Galloway begins at the middle of the bridge of Dumfries, and lies between Nithsdale on the east, and the water of Cree on the west; and is bounded on the north by a part of Kyle in the shire of Ayr; and by the Irish sea on the south. According to Templeman, it extends forty-three miles in length, and thirty-two in breadth.

The country seems one continued heath, except here and there a grove of trees; yet vast herds of small black cattle, and flocks of sheep, are grazed here, and sent in great numbers to England.

Kircudbright, which gives its name to this shire, stands in a bay at the mouth of the river Dee, eighty-three miles to the south-west of Edinburgh, and is an ancient royal burgh, the seat of a presbytery, to which belong sixteen parishes, and the place where the steward holds his courts. It has a weekly market, and a good salmon fishery on the river Dee, which rises in the mountains near Carrick; and it is so full of turnings and windings, that though it is not above seventy miles in a line, it runs near two hundred. It has a commodious harbour sufficient to hold all the British navy, and the largest first rates may cast anchor by the church-yard. It is also land-locked from all winds, which, together with the waves, are broke by Ross island at its mouth. The town stands in a perfect amphitheatre, like Trent on the confines of Italy: not surrounded with high mountains, but with a rocky and stony crust, which in this country is called crags; a distinction being here made between mountains, hills, and crags: the first are very high, rocky, and covered with heath; the hills are high, but not rocky, and covered with grass, which affords good pasture, and the crags are stony rocks, not high, and very thinly covered with grass. In the midst of this craggy country is seated this little town, which consists of tolerable good streets, and all the houses are built with stone: but neither its buildings, nor the manners, dress, or the countenance of the people resemble the English: the common sort wear bonnets instead of hats, and it is said, that though some of the townsmen have hats, they wear them only upon Sundays and extraordinary occasions. There is nothing of English gaiety, but a sedate gravity, which is visible in every face; and notwithstanding the excellence of their harbour, they have no notion of trade.

New Galloway is a royal burgh on the river Ken, fourteen miles from Kircudbright, with a good weekly market, well frequented for corn and other provisions; and it has a good salmon-fishery in a lake called Loch-ken, which abounds not only with salmon, but other fish: this lake is about five miles long, and in some places about a mile broad, containing several islands.

S E C T. XII.

Of Upper Galloway, or the Shire of Wigton; its Situation, Extent, and principal Towns.

UPPER Galloway extends from the water of Cree, which divides it on the east from Lower Galloway, to the point called the Mull of Galloway and the Irish sea. According to Templeman, it is thirty-seven miles in length, and twenty-six in breadth; but is much indented by Loch-rian on the north, and the bay of Glen-luce on the south.

This is a hilly country, more fit for breeding cattle than bearing corn. The inhabitants follow fishing, not only in the sea, but in the rivers and lakes that lie every where under the hills; in which, about the middle of September, they catch an infinite number of eels. Though the people have been censured for not applying to commerce, they having several good harbours on the coast, yet they are not idle, for they are great husbandmen and graziers; and, including horses, they annually send about fifty thousand head of cattle every year to England. Galloway had anciently its own princes, but it now gives title of earl to a branch of the family of Stuarts.

The principal towns of this shire are the following:

Wigton, a royal burgh, a market town, and the capital of the country, is seated near the mouth of a river, on a bay of its own name, ninety-five miles to the south-west of Edinburgh. This bay is eleven miles in length and breadth: it is a good port, which has a very narrow entrance. At this town the sheriff holds his courts, and it is the seat of a presbytery that consists of ten parishes. It gives title of earl to the chief of the ancient and noble family of Fleming.

Port-Patrick is a market town beyond the river Loffie, a hundred and ten miles to the south-west of Edinburgh, and has a safe harbour called the Rine or Beak of Galloway. It lies opposite to Donaghadee, in Ireland, and is a dirty poor place, where the packet-boats go for Belfast, and other ports of that kingdom, to which coast it is but a short passage, and of which there is a full view all the way: but little use is made of the harbour, except for the packet-boats and a few fishing vessels. A neighbouring hill affords a plain view of Ireland to the south-west; of the coast of Cumberland and the Isle of Man to the south-east; with the Isle of Ilay and the Mull of Kintyre to the north-west.

S E C T. XIII.

Of the Shire of Aire; its Situation, Extent, Divisions, Produce, and principal Towns.

THE shire of Aire is bounded on the north by that of Renfrew; on the south by Galloway; on the east by Clydsdale; and on the west by the frith of Clyde. It is divided into Carrick, Kyle, and Cunningham, which are esteemed the three great baileries, and are thus called from their being governed by bailiffs. According to Templeman, there are seven hundred and ninety-five square miles in the baileries of Kyle and Carrick, and two hundred and twenty-nine in the division called Cunningham.

In this county is a considerable lake called Dun, six miles long, and two broad, with an island in it, upon which is an old house called Castle-Dun. Upon the water Dun, or Dawn, issuing from this lake, is a bridge of one arch ninety feet wide, which is much wider than the Rialto at Venice, or the middle arch of the great bridge at York.

We shall begin with Carrick, which is bounded on the north by Kyle, on the east by Kyle and Galloway, on the south by the latter alone, and on the west by the Frith of Clyde; extending thirty-two miles along the frontiers of Galloway, where it is longest, from east to west, and twenty-five, where broadest, from north to south.

The land is here more fruitful and better cultivated than that of Galloway, and is less mountainous; but has not so many cattle, especially sheep and horses. It gives one of the titles of honour to the prince of Wales.

The chief rivers of this district are the Stineher and the Girven, which abound with salmon and other fish. Here are also many lakes and woods. Though there is no considerable port in this part of the country, the people towards the coast are great fishermen, and are employed by the merchants of Glasgow and other places to catch herrings for them.

The principal town in the earldom of Carrick is Bargeny, which has a market, and gives title of lord to a branch of the family of Hamilton.

Kyle is separated from Carrick by the river Dun, and from Cunningham by the Irwin; it has Cunningham on the north; part of Clydsdale on the east; Nithsdale, Carrick, and part of Galloway on the south; and the frith of Clyde on the west; extending thirty-four miles from east to west, and twenty-six from north to south. It is divided by the river Aire into two shewtries: that on the south side as far as the river Dun is called King's Kyle, and is under the jurisdiction of a sheriff; and Kyle Stuart, which is under the prince of Wales.

The river Aire has the longest course of any in the county; its banks are adorned with woods, castles, and gentlemen's seats; and the river, after running (besides its many turnings and windings) twenty-four miles from east to west, falls into the sea.

Aire, the chief town of this division, and the capital of the whole country, is seated at the mouth of the river of its own name, sixty-five miles to the south-west of Edinburgh. It has a good harbour near the frith of Clyde, and is well situated for trade. It is an ancient town distinguished by its privileges, its jurisdiction extending sixty-four miles from the mouth of the Clyde to the borders of Galloway. The river turns several mills in the middle of the New Town; this is joined to the Old Town, which stands on the south side of the river, by a stone bridge of four arches. The Old Town is seated in a sandy plain, amidst pleasant fertile fields, with delightful greens, that afford a good prospect winter and summer. It was formerly reckoned next to Glasgow, the principal market town in the west of Scotland, and has a stately church. It is the seat of a presbytery, to which belong twenty-eight parishes, and, with Glasgow, constitutes a provincial synod: but its trade is said to be much decayed.

Cunningham, the last division of this county, is bounded on the east by Renfrew and Clydsdale, on the south by Kyle, and on the west and north by the frith of Clyde. Its greatest length from the south-east to the north-west is about twenty-nine miles, and its greatest breadth from east to west about twelve. It is divided from Kyle by the river Irwin, and is a much finer country and less mountainous than that.

Irwin is the best town of this district; it stands at the mouth of the river of the same name, sixty-three miles to the south-west of Edinburgh; but its port is so shallow, and so choaked up with sand, that it is only capable of receiving small vessels: yet it has much more business than Aire, and consists of two pretty good streets, with well built houses, and a quay from whence the inhabitants carry on a coal trade to Dublin. There is a handsome stone bridge over the river; and in 1736 an act was passed for restoring the harbour, and repairing the town-house, church, jail, &c. This town gives title of viscount to the family of Ingram. On the twenty-sixth of November, 1740, there was here such a storm of thunder and lightning, that the people who were not struck down by the lightning fell to the ground, apprehending that the day of general judgment was come.

S E C T. XIV.

Of the Shire of Renfrew, or Reinfraw; its Situation, Extent, Produce, and principal Towns.

THIS county is called the barony by way of eminence; it having given the title of baron to the prince of Scotland before the Union, as it does now, together with Snowden, to his royal highness the prince of Wales. It is bounded on the south by Cunningham, on the east by Lanerksire, on the north by Lenox, and on the south by the shire of Dumbarton; it extending, according to Templeman, thirty miles from north to south, and thirteen where broadest from east to west.

That part of the county next to the Clyde is fruitful and pleasant, with only a few small eminences; but that to the south, south-west, and west, is more barren and mountainous: it abounds with all necessaries, enjoys a healthful air, and at the same time the convenience of the frith of the Clyde, in which there is very safe riding upon all the coast, has much improved these parts, which are populous, and adorned with many gentlemen's seats. It is watered by several small rivers, the chief of which are the White-cart and the Black-cart, which unite their streams before they fall into the Clyde.

The principal towns of this county are the following:

Renfrew, the shire town, and a royal burgh, is seated on a branch of the Clyde, called the Cathcart, forty-six miles to the west of Edinburgh. It is a small but ancient town, where the sheriff holds his courts.

Pasley, or Paslay, is seated on the river White-cart, six miles to the west of Glasgow, where is a pearl-fishery; and though no royal burgh, is much bigger than Renfrew, and is the seat of a presbytery composed of sixteen parishes. Here is a bridge over the Cart, and there are still to be seen the remains of an abbey founded in the year 1160: the remains of which, together with its church, gardens, orchard, and a little deer-park, are enclosed by a stone wall, about a mile in compass.

On a high ground in the lands stiled New-yards, at a small distance from Pasley, is a spring famous for its ebbing and flowing with the tide.

Greenock, a handsome well built town on the firth of the Clyde, twenty-six miles to the west of the Clyde, has a good road for ships that come into and go out of Glasgow. It is the chief place in the west of Scotland for the herring-fishery; and the merchants of Glasgow, who are concerned in it, employ the vessels of the inhabitants for catching and curing the fish, and for carrying them abroad to market afterwards. Here are many rich trading families, and the town is noted for good seamen and excellent pilots.

S E C T. XV.

Of Dumbartonshire, or Lenox; its Situation, Extent, Produce, and principal Towns.

THIS county, which lies on the other side of the Clyde above Glasgow, runs far north among a cluster of hills, and is bounded on the south by the firth and river of Clyde; on the east by Menteith and Sterlingshire, it being separated from the latter by the water of Blane; on the north by the Grampian-hills; on the north-west by Argyleshire; and on the west by the lake called Loch-long, and a water of the same name that falls into it. According to the editor of Camden, it extends only twenty-four miles in length, and twenty in breadth; but Mr. Templeman makes it forty-one miles long, and twenty-seven broad. Its bounds were formerly larger than they are at present, especially on the east side; and it has now only twelve parishes.

The lower part of Dumbartonshire, which lies to the east, is very fruitful in corn, especially towards the rivers; and the upper, which is hilly, is fit for pasture, especially at the beginning of the Grampian-hills, and feeds numerous flocks of sheep. It has also a noble herring-fishery in two bays, named Loch-long and Loch-fyn, that break into it from the mouth of the Clyde.

Levinia, the Latin name for Lenox, is derived from the river Levin, which runs from Loch-lomond into the Clyde. This loch, or lake, spreads between the mountains, twenty-four miles in length, and eight in breadth; though at the narrowest part it is but two. It abounds with fish, particularly with a delicious sort of the eel kind, called pollac, that is said to be peculiar to this lake, whence its banks are lined with the cottages of fishermen. It contains thirty islands, three of which have churches, and many of the rest are inhabited, particularly Inchmurin, which is fruitful in corn and grass, and abounds with deer. Several of them are called floating islands: these are said to be artificial, and formed of beams fastened together and covered with earth and turf; upon some of these are forts, into which the natives used to retire in time of war. The shire of Lenox, together with the town of Richmond in York-shire, give the title of duke to the family of Lenox, descended from king Charles II.

Dumbarton, the principal town of this shire, from which it takes its name, is seated at the confluence of the Leven and the Clyde, fifteen miles to the north-west of Glasgow, and was once considerable for its trade, which is now much decayed; but is still remarkable for its castle, which is thought to be one of the strongest in Europe; it being seated on the top of a craggy rock, very steep on all sides, except to the Clyde. It has only one narrow steep ascent, where steps are cut out of the rock, passable by only one man at a time. The river Leven on the west, and the Clyde on the south, serve it for ditches; and to the westward lies a morass, which is overflowed by every tide. As this is at one of the great strong passes between the low country and the highlands, a governor and a garrison are constantly kept in it.

S E C T. XVI.

Of the Shire of Bute and Caithness; their Situation, Extent, Produce, and principal Places.

THE shire of Bute contains Bute and Arran, two of the Western islands, and is now joined with Caithness in sending one member to the parliament of Great Britain alternately.

These islands are tolerably fertile, and their produce much the same as that of the other Western islands. They lie in the firth of Clyde, and have Argyleshire on the north; Cantyre on the west; and Renfrew, Cunningham, and Kyle on the east. The island of Bute, which is about twelve miles in length, and five in breadth, with an area of twenty-seven miles, is separated on the north by two narrow freights from Argyleshire, and on the west from the isle of Arran; it lies six miles to the west of the coast of Cunningham, and but half a mile from Argyleshire.

The northern parts of this island are mountainous, but afford good pastures and some wood. The others produce oats, barley, and peas. The island has a quarry of red stone. It enjoys a healthful air, and its inhabitants live to a great age. There is a considerable herring and cod-fishery on the coast. The earl of Mont-Stuart is its chief proprietor and heretable coroner.

The chief town of the shire is Rothsay, which stands near the middle of the island, on the east side, seventy miles to the west of Edinburgh; the inhabitants subsist chiefly by fishing and agriculture. It is a royal burgh, and has two forts, one called the castle of Rothsay, the other the castle of Kermes.

The isle of Arran lies about four miles from the south part of the isle of Bute, and six to the east of Cantyre, extending, according to the General Atlas, twenty-four miles from north to south, and nine, where broadest, from east to west; but Mr. Mackay, a native of the island, in his journey through it, says it is but twelve in circuit. The air is cold and moist, but cleared by frequent breezes from the mountains. The island is fruitful in grain, and has good pastures. The middle of the island is mountainous, and the highest part, called Capra, abounds with deer. Here are many horses and black cattle, both of a middling size, with abundance of small sheep and goats,

land and sea fowl. Here are also found fullers-earth, and crystal. On the coast are several caves, one of which is large enough to hold a hundred men; and at the farther end of it is a pillar cut out of the rock, with a deer and a double hilted sword carved upon it; and the natives pretend that Fune Machkowie, a giant, who distinguished himself by his great exploits, lodged in these caves with his attendants. A minister sometimes preaches in one of them to such as live at a distance from the church. Here are many large stones, from six to fifteen feet high, set up on end, some singly, and others in a circular form, supposed to have been the remains of pagan temples, or of places for administering justice.

This island has several rivers which abound with salmon, as the sea all round does with cod, herrings, ling, whittings, and shell-fish. But the adjacent sea is tempestuous and dangerous, especially when a strong south or south-west wind blows.

The inhabitants are generally of a brown complexion, healthy, vigorous, and ingenious. In the island are five churches, with several castles; among which the most noted is Brodich, a pleasant summer seat at the north-east corner of the island. These, and almost the whole island, belong to a branch of the noble family of Hamilton.

The shire of Weik, or Caithness, though united in some measure to Bute, by sending a member alternately to parliament, is as far distant from the islands just described as possible, it being seated in the north-east extremity of Scotland: it has therefore the Northern ocean on the east, Strathnaver and Sutherland on the south and south-west, and on the north is divided from the Orkney islands by Pentland frith. It comprehends all the country beyond the river Ness and the lake into which it flows, and extends thirty-five miles from north to south.

The land is much indented by the many windings and breakings of the shore, and the whole coast, except the bays, consists of high rocks and many promontories. The sea is here very dangerous, especially in calm weather, except at stated times, on account of the many vortexes, owing to the repulse of the tides from the shore, and their passage between the Orkney islands. The inland country is mountainous; but towards the coast it is low, and produces corn enough both for the natives and for exportation; but the soil being moist and clayey, their harvest is late, and the corn not so good as that of Ross and Sutherland. There is plenty of pasture in the fields and valleys, with good fowling and hunting on the mountains, and fishing in the lakes and rivers, as well as the sea. In the forests of Moravins and Berridale is great plenty of red deer and roebucks, and many cows, goats, and sheep. In several parts are copper, iron, and lead ore; but the inhabitants chiefly subsist by grazing and fishing.

This county is populous, and has many little towns and villages, with a presbytery of twelve parishes, and gives title of earl to a branch of the ancient and noble family of Sinclair; but the earl of Braidalbin, who has a great estate in the county, is hereditary sheriff.

Provisions, especially corn, cattle, and fish, are so plentiful here, that this is said to be the cheapest market in the world, and that a man can live better here for fifty pound a year, than he can in the south of Scotland for two hundred: but the firing is turf, for want of coals. The rocks on the coast are much frequented by eagles, hawks, maws, herons, and other fowl of various kinds, like those of the Orkney and Shetland islands; and the people take the young fowls from their nests by a hook and line. There is a particular sort called snowfleets, which resort to this country in February by thousands in a flight, and go away in April. They are of about the size of a sparrow, but exceeding fat and delicious eating. They have also great plenty of moor fowls and plovers.

The inhabitants are so industrious, that in some places, where there is no harbour or bay, but a continued hard rugged rock, they have procured harbours by art and dint of labour, and made passages in many places by forming steps or stairs from the top of the rock to the bottom, where their fishing boats lie; and at the top of the rock have their houses, to which they carry up their fish, and there salt and dry them for the market.

The principal towns in this county are Wick, or Weik, and Thurso.

Weik, from whence this is called the shire of Weik, is a royal burgh, and market town, where the courts are kept. It stands on the east side of the county at the mouth of Murray frith, where it falls into the north sea; but it is not much frequented.

Thurso lies opposite to it on the west side of the county, about twelve or fourteen miles from Weik, and is so defended by the promontory called Holborn-head, that it is a secure place for ships to ride in. It is more populous, and better built than Weik, and has the best church in the shire. A small river called the water of Thurso, runs by the east side of the town, in which is a good fishery for salmon, which keep in this river all the year; so that they are to be had in winter by breaking the ice.

S E C T. XVII.

Of Sterlingshire, or Striveling; its Situation, Extent, and Produce; with a Description of the Towns of Sterling and Falkirk.

THIS country is bounded on the west by part of Lenox and Clyddale; on the north by Menteith; on the south and south-east by Lothian; extending twenty miles in length and twelve in breadth.

The south part is mountainous; but that which lies upon the Forth is very fertile, and also abounds with coal. The produce of this shire consists of corn, grass, black cattle, sheep, and horses; besides salmon and other fish, with which it is supplied by the rivers. The Forth, which is the most famous, though not the largest river in Scotland, rises near the foot of the mount Lomond, and runs from west to east into the Firth of Edinburgh.

Sterling, the capital of the county, to which it also gives name, stands thirty miles to the north-west of Edinburgh, upon the descent of a deep rock, at the foot of which runs the Forth; and takes its name from the Saxon word *ster*, which signifies a hill, and *lin*, a water.

The situation of Sterling is much like that of Edinburgh, with a castle on an eminence, and the town extending up the ascent, with a principal street that is large and handsome. It is inclosed with a wall, except towards the north, where it is washed by the river Forth, over which is a bridge of hewn stone, with an iron gate, and four stately arches, to which ships come up at full tide, and a little below it is the haven. The castle is strengthened on every side with batteries and ramparts, and has a considerable number of great guns for defending the passage of the bridge: for in times of trouble the chief magazine of the nation is usually conveyed hither, it lying upon a considerable pass between the north and south parts of Scotland, and almost in the centre of the kingdom. It is indeed the only place to which people can come from all parts of the nation, except from the islands, without crossing some bay or frith of the sea, which has rendered it of such importance, that it is always kept in a good condition, and the garrison generally consists of two hundred men, besides officers. It has six rooms of state, which are extremely noble, from their extraordinary height, length, and breadth, adorned with fine carved work on the wainscot and ceiling. At the top of it the late earl of Mar made a very convenient apartment of twelve rooms on one floor, for the governor's lodgings. It has a large park walled round; but it has little or no wood in it. This castle has been the residence of the kings of Scotland, at which time parliaments were frequently held in it.

Sterling has a spacious church in the upper part of the town, which has a very high tower. It has also a spacious market place and a handsome town-house. Opposite to it is the late earl of Mar's fine palace, on the top of the hill: the duke of Argyle has also a fine seat near the castle, from whence to the bottom of the town, it is above half a mile, all upon the descent, with good houses. As Sterling stands in a commodious situation for commerce, so it has one way a fine prospect of Edinburgh frith and castle, and of the mountains of Argyleshire

shire and Dumbartonshire another, as well as of the various windings of the Forth. It is the seat of a presbytery, which consists of twelve churches, and has a considerable manufacture of serges. Joining to the church is a neat hospital for decayed merchants. It was founded by James Cowen, merchant, and richly endowed. His statue as big as life is at the top of the gate, and in the garden of the hospital is a pleasant bowling-green.

Falkirk is a handsome ancient town, seated on the south side of the Forth, eight miles to the south of Sterling, and is a clean market town, noted for being the place where the rebels defeated the king's forces on the 17th of January, 1746.

S E C T. XVIII.

Of Linlithgow, or West-Lothian; its Situation, Extent, Produce, and principal Towns; with a concise Account of the Roman Wall built across this Part of Scotland.

WEST-Lothian is bounded on the north by the Forth; on the east and south by Mid-Lothian; on the west by part of Clydesdale; and on the north-west by Stirlingshire; extending about fourteen miles in length, and thirteen in breadth.

It is in general a pleasant country, and abounds with corn and pastures, coal, limestone, and salt; with great plenty of fish, with which it is supplied by the sea and rivers. In the reign of king James VI. a mine was discovered here which yielded a great deal of silver.

The principal places in this county are the following:

Linlithgow, from which the shire takes its name, is situated on the side of a lake, sixteen miles to the west of Edinburgh, and is remarkable for its ancient palace, seated on an island in the midst of the lake, which has an ascent of several steps in the form of an amphitheatre. The palace was magnificently built of hewn stone by several kings, and completed by James VI. The porch bears the name and arms of King James V. incircled with the orders of the Garter, St. Andrew, St. Michael, and the Golden Fleece, of all which James V. was a companion. In the inner court, which is larger than that of Hampton Court, is a fountain adorned with several statues, and at each of the four corners a tower, with fine apartments. Adjoining the palace is St. Michael's church, a noble structure with a lofty steeple.

In the town is also a quadrangular court adorned with a curious fountain: on the south side is the Tolbooth or town-house, neatly built of hewn stone, with a very high steeple, in which are bells and a very fine clock. In this structure the sheriff and magistrates of the town keep their courts. This place is the seat of a presbytery consisting of nineteen parishes. There is a large street half a mile in length, from the one end of the town to the other, adorned with handsome buildings, from each side of which several lanes open a passage to pleasant gardens.

The lake itself is a mile in length and a quarter of a mile over, and abounds with perch and other sort of fish; and on the north side is a park belonging to the palace.

The town has the appearance of great trade, with a harbour for ships near the castle of Blackness, where is a large custom-house, with other houses for the use of merchants. Here is a manufacture of linen, which the water of this lake is reckoned so extraordinary for bleaching, that a great deal of it is brought from other parts hither to be bleached.

Blackness is a strong castle in a peninsula on the coast. It belongs to the crown, and has been often used for a prison of state; but is at present neglected, and is said to resemble at a distance a great ship unrigged.

Queen's-Ferry is a royal burgh on the south side of the river Forth, ten miles to the west of Edinburgh, where the queens of Scotland generally embarked when they went to their palaces on the other side of the Forth; and it is now a common passage at all times of tide from Lothian to Fife.

Severus's or Adrian's wall, which extended across this part of Scotland, began at the Forth near Queen's Ferry, and extended thirty-six Scots miles to Dumbarton at the firth of Clyde, for covering the provincial Britons against the incursions of the Picts. It was built with stone ten feet thick, and had watch-towers within call of one another, where centinels kept watch day and night; it had also a court of guard to lodge a sufficient number of soldiers against any sudden alarms, and strong forts able to receive a whole army; with a good ditch of twelve feet wide before it.

S E C T. XIX.

Of the Shire of Perth; its Situation, Extent, Produce, Rivers, Divisions, and principal Towns.

THIS is a large, plentiful, and rich country, bounded on the east by Angus; on the south-east by Kinross-shire and Fife; on the south by Clackmannan-shire, Stirlingshire, and the river and firth of Forth; on the west and south-west by Argyleshire, Lenox, and Dumbartonshire; on the north-west and north by Lochaber and Badenoch; and on the north-east by Marr. According to Camden, it extends fifty-two miles in length from east to west, and about forty-eight in breadth from north to south. It contains Perth Proper, part of Gowry, Strathern, Athol, Braidalbin, and Menteith, in which are five presbyteries, and eighty-eight parish churches.

This county, whose hereditary sheriff is the duke of Athol, is fruitful both in corn and pasture, the former in the low lands and the latter on the high grounds; and is interspersed with fruit-trees, groves, lakes, and rivers.

The principal rivers of this county are the Tay, which is the longest in all Scotland, and rises in the mountains of Braidalbin; and after spreading itself into a lake of the same name, fifteen miles in length, and near six in breadth, it runs near forty miles, exclusive of its turnings and windings, into the firth of Tay. The Keith, which is famous for its salmon fishery, and has a cataract near the Blair of Dromond, the noise of which is so loud as to stun those who come near it. The river Ern rises from the lake called Lochern, which is about seven miles in length, and one broad, in the mountainous country of Strathern, and falls into the Tay, after a course of thirty-four miles from east to west, and being joined by several rivers in its passage.

Perth Proper, the first division of this shire, has the Carse of Gowry on the north-east; Angus on the east; Strathern on the west; Athol on the north; and the Firth of Tay on the south. It is about twenty miles from the north-west to the south-east, and fifteen where broadest. The principal places in this division are the following.

Dunkeld stands on the north side of the Tay, after it has received the Almond, twelve miles to the north of Perth, and about forty from Edinburgh. It is seated at the foot of the Grampian hills and is surrounded with woods. This is the chief market-town of the Highlands, and has been much adorned with stately buildings by the duke of Athol. It is the seat of a presbytery containing twenty parishes.

Perth is a royal burgh, and the county-town where the sheriff keeps his courts. It is frequently called St. John's town, from a church built there dedicated to St. John, and stands thirty miles to the north of Edinburgh, agreeably seated between two meadows on the south bank of the Tay, and at a full tide vessels of burthen may come up to it. Parliaments have often been held there, and it is at present the seat of a presbytery containing twenty-one parishes. Here is a fine town-house. St. John's church, which stands in the middle of the town, is divided into two. The inhabitants carry on the linnen manufacture, and the merchants have a considerable trade to the Baltic. About a mile from Perth is Scone or Scoon, which is seated on the north bank of the Tay, and is thought to be in the centre of the kingdom. It was anciently famous for its abbey, founded by king David I. for the monks of the order of St. Augustine, where the kings of Scotland were crowned. There is

also a fine palace, belonging to the crown, the front of which towards the chapel is two hundred feet long, the dining-room forty feet in length, and all the apartments spacious and magnificent, but built after the ancient manner. The gallery of this palace is one hundred and seventy-five feet long, and the ceiling painted above two hundred years ago. It was in the chapel belonging to this palace that king Charles II. took the covenant.

The Carse of Gowry, the next division, is esteemed the beautifullest spot in Scotland: it extends fourteen miles in length, and from two to four in breadth, on the north side of the Tay, from Dundee to Perth, which is all a perfect garden.

Strathern, the third division, has Menteith and part of Fife on the south; Braidalbin and Athol on the north; part of Menteith on the west; and Perth Proper on the east; extending above forty miles from east to west, and twenty from north to south. It takes its name from the river Ern running through it. The Ochil hills, which extend along the south part, abound with metals and minerals, particularly copper, lapis calaminaris, and lead; there is here also excellent peat, and abundance of wood. What is properly called Strathern, is a fine valley, about four miles broad, between the mountains, extremely fruitful, and strewed with gentlemen's seats, which stand on the side of the hills, and with their plantations of trees render the valley more agreeable.

Abernethy stands in the south-east corner of this division, at the confluence of the Ern and Tay, somewhat above twenty-four miles from Duplin. It is an ancient town, and is said to have been the seat of the Pictish kings, as well as of an archbishop, afterwards removed to St. Andrews.

There are two castles on the banks of the Ern, one of them Tullibardin, the ancient seat of the Murrays, which gives title of marquis to the eldest son of the duke of Athol; and the other is Duplin castle, the seat of the earl of Kinnoul, to whom it gives title of viscount; the house is adorned with the finest paintings and carving, and his lordship has a park well planted with trees, and walled round.

Menteith, the next division, is bounded on the north by Braidalbin and Strathern; on the east by Fife; on the south by Lenox and Stirlingshire; and on the west by Lenox; extending forty-four miles from east to west, and twenty-eight where broadest. This territory is said to derive its name from the river Teith, and reaches to the mountains that enclose the east side of Loch-lomond.

The only place of note in this division is the pleasant little town of Dumblain, on the west side of the river Allan, where king David once erected a bishopric, and the ruins of the bishop's house and that of the regular canons are still to be seen. There was also a magnificent church, part of which remains entire. The town is a perfect amphitheatre, in a fine bottom surrounded with hills, and gives title of viscount to the duke of Leeds.

The fifth division is Braidalbin, a country among the Grampian-hills, bounded on the north by Athol and Lochaber; on the east by Athol; on the south by Strathern and Menteith; and on the west by Lochaber, Lorn, and Knapdale; extending above thirty-two Scots miles from east to west, and about thirteen from north to south. It is inhabited by the Highlanders, who retain their ancient language.

Athol, the most northern division, is bounded on the north by Badenoch; on the west by Lochaber; on the east and south-east by Marr and Gowry; on the south by Strathern and Perth Proper; and on the south-west by Braidalbin; extending in length from the north-west to the south-east forty-three miles, and thirty-one where broadest. Here are many mountains, and the valleys are full of woods. It gives title of duke to the noble and ancient family of Murray; but contains no place of importance.

S E C T. XX.

Of Kincardineshire, or Mearns; its Situation, Extent, Produce, and principal Towns.

THIS county is bounded on the east by the Northern ocean; on the south by the North Esk; on the

west by the Grampian-hills; and on the north by Aberdeenshire, from which it is divided by the river Dee; extending about twenty-seven miles in length, and twenty in breadth.

The country is pretty level, and enjoys a rich soil fruitful in corn and pasture. There are said to be about five millions of fir trees in this county; besides a prodigious number planted by the gentry about their seats. Upon the sea-coasts are several convenient creeks and some good harbours.

Kincardin, once the county-town, stands on the river Dee, eighteen miles to the east of Aberdeen, and is the seat of a presbytery consisting of fifteen parishes.

Stonehive, the present county town, has a very good harbour, secured by a stone pier. Near this town is Dunnotyre, where once stood a castle fortified with strong walls and towers upon a high inaccessible rock, washed by the sea on three sides, and joined to the land by a narrow isthmus. By the entrance of the harbour is a huge rock near forty ells high, which seems every moment ready to fall; and at a small distance is a dropping cave, where the water petrifies. This castle was for a long time the seat of the Keiths, the hereditary earl marshals of Scotland.

Fourdon, or Mearns, stands twenty-one miles from Kincardin, and is the seat of a presbytery consisting of sixteen parishes. In the times of popery it was famous for the reliques supposed to have been deposited there of St. Palladius, the first bishop in Scotland, who was sent over by pope Celestine in the year 431 to preach the Gospel to the Scots, and confute the Pelagians.

S E C T. XXI.

Of Aberdeenshire; its Situation, Extent, Divisions, Produce, and principal Towns.

THIS county is bounded on the south by the river Dee and the Grampian-mountains, which divide it from Angus, in the shire of Forfar, and Kincardineshire; on the east by the Northern ocean; on the north by part of Murray; on the north-west by Bamff; and on the north by Murray; extending, according to Templeman, seventy-three miles in length, and twenty-eight in breadth. It contains Mar, with its appurtenances, Strathdee, Strathdon, the braes of Mar and Cromar, with the greatest part of Buchan, Garioch, and Strathbogy. The south part contains Mar, with its subdivisions, from whence it was formerly called the shire of Mar.

This county would be in general pretty fruitful, was it properly cultivated. It produces corn, particularly rye, and oats in great abundance, with some beans, peas, roots, and herbs, both for food and physic. The hilly parts, especially the craigs of Pennau, where the eagles build their nests, are covered with woods of oak and fir, and have plenty of game and pasture, therefore feed abundance of black cattle, sheep, deer, and horses. There are here also quarries of spotted marble, limestone, and slate, with a species of small stones peculiar to this country, called elf-arrow-heads, which seem of a flinty kind, and are of different shapes; but most of them resemble the head or point of an arrow or spear. In the rivers are found mussels, which contain large pearls of a fine colour and shape. Here are springs of allum-water, and veins of stone from which allum is boiled.

The air of this country is cool, but healthful; and the fuel of the inhabitants is peat, turf, and wood. The winter is much less severe than might be expected so far north, and the inhabitants are reckoned of a mild temper, though with as much good sense as their neighbours.

Aberdeen, a city and university, has its name from the Don, it standing at the mouth of that river, in the fifty-seventh degree six minutes north latitude, and the first degree fifty-eight minutes west longitude, eighty miles from Edinburgh. There are two towns, the Old and New. Old Aberdeen was the seat of a bishop, it having a large and stately cathedral, generally called St. Machar's. On the south side of it stands King's-college, in which

which is a principal and sub-principal, with three other regents or professors of philosophy. There are also professors of divinity, civil law, physic, the mathematics, and the oriental tongues. Close to the church is a library well furnished with books. This college is not inferior to any in Scotland. The church, with its turret or steeple, is of hewn-stone, and the top vaulted with a double cross arch, surmounted by an imperial crown.

New Aberdeen is about a mile distant from the Old, and is seated at the mouth of the river Dee. It is the county town, and consequently the seat of the sheriff's courts. It exceeds all the cities in the north of Scotland in extent and beauty. Aberdeen stands in a wholesome air, has a great revenue from its salmon-fishery, and the inhabitants are in general gay, rich, and courteous. It is seated on three hills, the main parts upon the highest; the skirts of it extending into the plain. The market-place is beautiful and spacious, and the houses, which are neatly built, are generally four or five stories high, with handsome sash windows, and have for the most part gardens and orchards belonging to them, which render the city pleasant and healthful, and the prospect of it beautiful at a distance. The streets are extremely well paved.

Besides the other public buildings, there is in the High-street a church neatly built of free-stone. The church of St. Nicholas is also a handsome edifice of free-stone, with a lofty steeple resembling a pyramid: it was formerly divided into three churches; and the body of it is adorned with a tower and a steeple with pinnacles. The people of Aberdeen, and indeed of almost all this part of the country, are generally of the Episcopalian persuasion; so that were it not for the legal establishment, the Presbyterian preachers would have but slender incomes: almost every parish has a meeting-house, where the liturgy is read: at Aberdeen they have beautiful chapels, and even organs.

The principal of the public buildings is the college, founded by George Keith, earl marshal, in 1593, and from him called the Marshallian college; but since his time the city has adorned it with several additional buildings. In this college, which is an university of itself, are a principal, four professors of philosophy, a professor of divinity, a professor of mathematics, and a professor of medicine. It has a good library, which was founded by the city, and enlarged by the gifts of several learned men, and is also furnished with mathematical instruments.

In this city is also a grammar-school, founded by Dr. Dune, which has a master and three ushers. There is also a music-school. Here are likewise a prison and work-house, three hospitals, and an alms-house. Near the harbour stands the custom-house.

The bridge over the Don consists of one immense arch of stone, sprung from two rocks, one on each side, which serve as abutments; so that it may be said to have a foundation coeval with nature, and that will last as long. The other bridge is upon the river Dee, a mile to the west of New Aberdeen, and has seven stately arches. This city gives title of earl to an ancient branch of the family of Gordon.

There is very good anchoring in the bay, from seven to nine fathom water. It is a tide-haven, with a very difficult entrance; for though the river is large, the channel is narrow, and the bar often shifting, so that no ship of any consequence ventures in without a pilot.

The quantity of salmon and perch taken in both rivers is astonishing. The proprietors of this fishery are united into a company, there being so many shares, of which no person can enjoy above one at a time. The profits are very considerable, the salmon being sent abroad into different parts, particularly into England, France, and the Baltic. As to the herring-fishery, it is a common blessing to the whole eastern shore of Scotland; and enables the Aberdeen merchants to carry on a profitable trade to Dantzic, Konigsberg, Riga, Narva, Wybourg, and Stockholm.

This city has also a good manufacture of linen, and also of worsted stockings. Its pork is reckoned the best cured for long voyages of any in Europe, and they ex-

port a good deal pickled and packed up in barrels, which they sell chiefly to the Dutch, for victualling their East India ships and men of war.

Peterhead, which stands on the south side of the water of Ugie, is a market-town and sea-port of considerable trade in the north-east part of the county, upon the promontory called Buchanness, and is noted for the Pretender's landing there in 1715, and has a road which will hold a hundred sail of ships.

Garioch is the seat of a presbytery, consisting of fifteen parishes, and gives name to a district that extends near fourteen miles from east to west, and eight from the north-west to the south. It lies in a valley watered by two large and several smaller rivers, with several fertile hills on both sides; particularly Mount Bennachy, which rises so high as to be seen at sea, though it is near fourteen miles from the coast.

Strathbogy, which signifies the valley upon the Bogy, stands twenty-four miles from Aberdeen, and has a market, with a bridge over the Doern near its confluence with the Bogy. It is the seat of a presbytery, containing eleven parishes. This valley, which is fruitful in corn and pasture, has black cattle, sheep, and horses, not only for the use of the inhabitants, but for exportation; and is remarkable for the fine linen yarn spun by the women here, and sold to the merchants.

SECT. XXII.

Of the Shire of Fife; its Situation, Extent, Produce, and principal Towns.

THIS county consists of a fine peninsula inclosed between the Forth and the Tay, bounded on the east by the Northern ocean; on the south by the firth of Forth; on the west by the Ochil-hills, Kinross-shire, and Perthshire; and on the north is divided by the firth of Tay from Gaury and Angus; it being commonly reckoned thirty-two miles in length, and about seventeen in breadth.

The east part is the most level, and the west the most mountainous. The north and south parts are very fruitful in corn, and full of towns which have good bays and harbours; while the middle of the country is more fit for pasture, and has plenty of cattle, especially sheep, whose wool is much esteemed; as are also the hides of their black cattle, deer, and goats. On the south side are coal-pits, and much salt is made. The Ochil-hills on the west also afford good pasture, and the pleasant and fruitful vallies between them have fields of corn. There is a quarry of excellent free-stone at Dalgate; near the water of Ore are lead-mines; and at the Bin and Orrock are many fine crystals of several colours.

There are here also several mineral waters at the spaw at Kinghorn and Ballgrig. The principal rivers are the Leven and the Edin, which abound with salmon and other fish.

This coast is well planted with little towns that are nurseries for seamen; and the sea, besides herrings and other fish, which are taken in great quantities in August and September, yields abundance of oysters and other shell-fish.

The earl of Rothes is hereditary sheriff. No county of Scotland sends so many members to parliament, or is inhabited by a greater number of the nobility.

The principal towns are the following:

Bruntislan, or Burnt Island, a royal burgh, ten miles to the north-west of Edinburgh; it lies opposite to Leith, and a passage-boat goes thither from hence every day. The town stands in the middle of the north side of the river Forth, and enjoys a fine prospect of Leith road, and of the city and castle of Edinburgh, with a safe harbour, where ships lie with their heads to the very houses. It is so land-locked, that such as are driven up the firth by storms, or contrary winds, come hither for safety; and ships trading on this coast often winter here, the water being commonly eighteen, and at spring-tides twenty-six feet deep within the harbour, which has room enough for a hundred sail of ships, and is capable of receiving and careening the largest men of war. The

town

town has a handsome church, with a large town-house and prison; and a considerable manufacture of linen cloth.

Kirkaldy is seated on the same coast, ten miles north of Edinburgh, and is a market-town and royal burgh, the seat of a presbytery, containing seventeen parishes. It is larger and better built than the former, it extending a mile in length. It consists of two parishes, and is a place of good trade, here being some considerable merchants and large dealers in corn, who export great quantities of it both to England and Holland; others trade with linen to England, and make returns in the necessary foreign manufactures. Here is a convenient yard for the building and repairing of ships; several houses for the making of salt; and in the neighbourhood are coal-pits.

St. Andrews had its name from St. Andrew, whose bones are said to have been brought hither from Patras, a town in Peloponnesus. This is an ancient, and was once a flourishing city, the metropolis of all Scotland; the seat of its first university, and, before the Revolution, was the see of an archbishop. It is situated thirty miles to the north-east of Edinburgh, and is surrounded with extensive corn-fields, abounding in excellent wheat and barley; with the pleasant downs called the Links lying on the sea-side towards the north. The town formerly consisted of four large streets, which extend from east to west, almost parallel to each other: but the northernmost, formerly the principal, is entirely ruined, and not a house remaining; each of the other three terminates to the eastward on the cathedral, which is now in ruins. This was esteemed one of the largest and most beautiful Gothic structures in the world, it being three hundred and seventy feet in length from east to west, the cross from south to north a hundred and eighty, its breadth sixty-five, and its height a hundred feet: the beauty of its pillars, with the symmetry and proportion of the whole building, have been greatly admired.

Near the ruins of the cathedral are still remaining the wall of the most ancient chapel of St. Rule, with the spire, a hundred and five feet high, which is still entire. On the north side of the city are the ruins of its ancient castle, of which nothing remains but the walls.

Though the town was formerly about two miles in circumference, there are now hardly a thousand houses; and of these near two hundred are become ruinous. The number of the inhabitants still amounts to above four thousand. It is a place of no trade, and its harbour is capable of receiving only small vessels. Near the town is plenty of free-stone, of which all the houses are built.

Here is only one parish church, that of the Holy Trinity, remaining, and two chapels. This church is an ancient stately edifice, built with fine free-stone, in the form of a cross, with a handsome spire in good repair. In it is a fine monument of archbishop Sharpe, who was assassinated upon a moor as he was coming home in his coach.

This city is particularly famous for its university, consisting of three colleges, of which, during the continuance of episcopacy, the archbishops were chancellors. The rector is chosen annually, and by the statutes ought to be one of the principals of the three colleges, which are called St. Salvator's, St. Leonard's, and the New-College.

St. Salvator's college was founded by James Kennedy, bishop of St. Andrews, in 1448, who erected the edifice, furnished it with costly ornaments, and endowed it with sufficient revenues for a doctor, a bachelor, and a licentiate in divinity, four professors of philosophy, and eight poor scholars. It has also a good library, founded by Dr. Sheen. The edifice itself is a stately pile of fine hewn stone; it has a large vaulted chapel covered with free-stone, and over it is a lofty spire. The common hall and schools are very large; and the cloisters and private lodgings for the masters and scholars have been very magnificent, but the college revenue is not sufficient to keep it in repair.

St. Leonard's college was founded by John Hepborne, prior of St. Andrews, in the reign of James V. with salaries for a principal or warden, four professors of philo-

sophy, and eight poor scholars; another professor of philosophy has since been added, with a handsome salary, and also a library. By an act which passed in the twentieth year of the reign of his late majesty, these two colleges were united.

The New College was founded by archbishop Bethune, uncle to the cardinal of that name, with endowments for a principal, a professor, and some students in divinity, which is only taught in this college. As the two last colleges have a better revenue than that of St. Salvator, they are in much better repair. In the latter king Charles I. held a parliament, in a spacious room able to seat four hundred persons in regular order; and it still retains the name of the parliament-room.

The last place we shall mention in this county is Falkland, which is a pretty neat large town, almost in the center, seated at the foot of Lomond-hill, which is said to be full a mile in height, and covered with the finest pastures for sheep. From the top there is not only a prospect of Fifeshire, but of the country all round it, to the south beyond Edinburgh and the Lothians almost to Berwick; to the west as far as the hills by Stirling; and to the north into Perthshire and Angus. Near this town James V. built a palace, which, by its ruins, especially the two sides yet standing in the inner square, appears to have been a large and noble structure. It consists of two stories, adorned with rows of round marble pillars set in sockets of stone; it has basso relievos between every window, and on the top of every pillar a statue as big as the life. The entrance to it is like that of Holyrood-house, between two stately towers; and on the right hand is a chapel, with niches on the outside, in which are statues as big as the life. Here were also spacious gardens, and a park eight miles round, well planted with oak and stocked with deer.

S E C T. XXIII.

Of the Shire of Angus, or Forfar; its Situation, Extent, Produce, and principal Towns.

THIS county is divided on the north from the brae of Mar by the ridge of the Brinchinnin-mountains; on the east it is bounded by Mearns; on the south by the firth of Tay and the Northern ocean; and on the west and north-west by Perthshire; extending thirty-four miles in length, and twenty-six in breadth.

The shire of Angus, as it is generally called by the Scots, produces wheat and all other sorts of grain, and is diversified with large hills, lakes, forests, pastures, and meadows. It is a good country along the coast, but is there very narrow; yet spreads wide among the mountains, which are inhabited by Highlanders, and abound with harts, hinds, roebucks, and fowl. They have also some mines of lead and iron.

The principal towns of this county are Forfar, Dundee, and Montrose.

Forfar is a royal burgh, a market-town, and the seat of a presbytery containing ten parishes. It stands fourteen miles west of Montrose, is governed by a provost and bailiff, and was anciently the seat of several parliaments, and had a royal palace, though scarce any remains of it are now left.

Dundee is seated in a pleasant plain at the foot of a hill on the north side of the Tay, near its entrance into the ocean. It is a pretty town and a royal burgh, the seat of a presbytery, containing seventeen parishes. This is esteemed the best town in the shire for strength, situation, and trade. The town is two miles in compass, and better built than most in Scotland. Its market-place, from whence run four large streets, inhabited by many merchants, is almost as spacious as that of Nottingham, it being the largest and finest in North Britain, except that of Aberdeen, and has a town-house built with free-stone. It has a great church, formerly collegiate, which is an exact cross, larger than that of St. Giles's at Edinburgh; it is a lofty square building, and a great ornament to the town. The west end next the steeple was beat down by Cromwell's army, and the other three parts are

are now divided into three separate churches. The steeple has a fine tower, like that at Wrexham in Wales, and very lofty. The church-yard is without the town, and adorned with fine monuments. There are here also one or two meeting-houses for the Episcopalians.

The town is populous, and one of the gayest in Scotland. The houses are not high, but well built, chiefly of stone, in a very beautiful manner, which, together with its fine situation, and the splendor in which the inhabitants live, have given it the name of Bonny Dundee. The inhabitants, who carry on a foreign trade, are generally rich, and for those that are fallen to decay there is a large handsome hospital, with gardens that run down to the rivers.

The harbour, which is two or three leagues within the mouth of the Tay, has three entrances; it has also two or three small piers, and is capable of containing two or three hundred sail of ships of small burthen. From the harbour is a pleasant walk paved with flag-stones, and shaded with rows of trees on each side, which serves for an exchange to the merchants and masters of ships; and on one side are also large ware-houses for goods and granaries for corn. The river itself is a good harbour, with safe riding, good ground, and deep water.

As this is one of the best ports for commerce in all Scotland, it has a considerable inland trade, especially for corn and linen, which the merchants buy up for exportation, and which enriches all the adjacent country.

Montrose is seated at the mouth of the river Esk, on the Northern ocean, forty-six miles to the north-east of Edinburgh. It is well situated for trade, and has a harbour for ships of considerable burthen; hence the inhabitants carry on a good foreign trade, particularly to Norway. The town is adorned with many fine buildings, and principally consists of one long handsome street, which runs parallel with the shore. It gives the title of duke to the chief of the family of Graham, and is famous for the escape of the Pretender, who took shipping here privately in 1716, for fear of a visit from the late duke of Argyle and general Cadogan.

S E C T. XXIV.

Of Invernesshire; including Badenoch, Lochaber, with a small Part of Ross and Murray; their Situation, Extent, and Produce; with a Description of Inverness, and some Account of Fort William and Fort Augustus.

INVERNESS-SHIRE, which was formerly much more extensive than it is at present, is bounded on the north by Ross and Cromarty; on the east by Murray-land; on the south by Lorn, Broadalbin, and Athol; and by the Western sea on the west; extending about sixty miles from east to west, and forty-five, where broadest, from north to south.

This shire abounds with iron ore; it has some woods fifteen miles long, and large woods of oak. It also contains several remarkable lakes: one of the most extraordinary of these is seated upon a very high mountain; it extends about thirty fathoms in length, and six in breadth; yet no stream is observed to run either to or from it, it being entirely fed by its own springs, though so deep that it has never been fathomed. It is equally full at all seasons of the year, and, though the water is always cold, it never freezes. About seventeen miles to the west, on the north side of a mountain called Glenitea, is a lake called Lochanwyn, or the Green-lake, which is covered with ice all the year round.

Badenoch has part of Murray on the north, Lochaber on the west, Athol on the south, with part of Murray and the Braes of Mar on the east, extending, according to Templeman, forty-nine miles in length, and twenty-two in breadth in the widest part. This tract particularly abounds with deer.

Lochaber is bounded on the north by Badenoch, on the east by Athol and part of Badenoch, on the south by Lorn and Broadalbin, and on the west by a mountainous tract towards the coast; extending, according to Mr. Templeman, fifty-seven miles in length, and fifty-one in breadth.

This extensive tract abounds with pastures, woods, deer, and goats; and has some veins of iron, but not much corn; for though very pleasant, it is reckoned one of the most barren countries in Scotland.

Inverness, from which this county has its name, is its principal town, and is seated at the bottom of the firth of Murray, where it receives the Ness, a hundred and six miles to the north of Edinburgh: from that river and Euner, which in the ancient Scots tongue signifies an harbour, the town derives its name. It is a royal burgh, a market-town, the seat of a sheriff, and of a presbytery containing thirteen parishes. It stands on the south side of the Ness, over which it has a bridge of hewn-stone, with seven arches, that leads into what is properly called the North Highlands. It is conveniently situated for trade, of which it has a considerable share, with a harbour for small ships, a church for the Highlanders, and another for the Lowlanders, and the ruins of a castle in which the kings of Scotland formerly resided, and standing on a hill that affords a fine prospect of the town and the adjacent country, which is very fertile. It is reckoned a well built, clean, and pleasant town; it has in particular two very good streets, with coffee-houses and taverns, and the people are more polite than in most towns of Scotland. For Oliver Cromwell, who erected forts, and, like the Romans, placed his stationary legions in the most eminent parts of the country for keeping the people in awe, built a strong citadel here, in which he left a garrison; the soldiers of which settling in the country after the peace, and applying themselves to the culture and improvement of the land, there is here spoken less of the broad Scots dialect than farther to the south, and is more of the English method of husbandry; but it only reaches a little way, for the mountains intersecting the pleasant valleys, the rudeness of the Highlanders soon succeeds. Though Oliver's fort was demolished after the Restoration, it was restored after the Revolution, and king William III. always kept a garrison in it, on account of its being one of the most considerable passes between the Low-countries and the Highlands.

Innerlochy, Inverlochy, or Fort William, stands in the center between the North and West Highlands, at the mouth of the river Aber, a hundred miles to the north-west of Edinburgh. It is a regular fort erected after the Revolution, and received the name of Fort William in honour of William III. It is intended as a curb on the Highlanders, and has a large garrison. It is so situated that if it be ever so much straitened by a blockade, or siege by land, it may receive constant supplies by sea.

Fort Augustus is a regular fortification built by general Wade near the south end of Lochness, to awe the Highlanders, and to prevent their disturbing the soldiers he employed in making a road here, which, with extraordinary pains, they carried through mountains and morasses that seemed almost impassable. By this road the king's forces may easily enter and traverse the country; which was before inaccessible to all but the Highlanders.

S E C T. XXV.

Of Argyleshire, or Inverary, including Argyle Proper, Cawal, Lorne, Knapdale, and Cantyre; with the Situation, Extent, and Produce of each, and a Description of the principal Islands belonging to Argyleshire.

ARGYLESHIRE is bounded by Lochaber on the north-east, by Perthshire on the east, by the Irish sea and the firth of Clyde on the south, and by several islands on the west and north. It extends a hundred and twenty miles in length, and forty in breadth.

This county comprehends Argyle Proper, Cawal, Lorne, Knapdale, Cantyre, and many of the Western islands. It is the seat of a provincial synod, containing five presbyteries and forty-nine parishes, and gives title of duke to the noble family of Campbell. It abounds with castles and gentlemen's seats, most of which belong to branches of that family, which are famous for having suffered for their steadfast adherence to the Protestant religion and the liberties of their country, particularly

ticularly from the time of the Reformation to the Revolution.

The country is mountainous, and the inhabitants, who speak Erse, the ancient language of Scotland, live mostly by hunting and fishing; for it has seven great lakes, with other lesser ones, that abound with fish. The coast is covered with high rocks, and bleak mountains covered with heath, which feed great numbers of black cattle, deer, and other wild beasts; for their cattle generally run wild, but are excellent meat.

The district of Argyle Proper has Knapdale and Cowal on the south, Lenox and the Grampian hills on the east, Lochaber on the north, and Lorne on the west. It lies between Loch-fyn, which is sixty miles long and about four broad, and Loch-aw, a fresh-water lake, twenty-four miles in length, and one in breadth. This last lake contains twelve islands, and from it runs a river named Aw, which, after a course of six or seven miles, enters Loch-ediff, which abounds with salmon, and falls into the Western sea near the isle of Mull.

Cowal, the next division, lies between Loch-fyn on the west, the firth of Clyde on the east, the isle of Bute on the south, Argyle Proper and the Grampian-mountains on the north, and abounds with lakes and bays.

The principal place it contains is Deroan, formerly a seat of the bishop of Argyle, and now of a presbytery consisting of eight parishes.

Lorne, the third division, is a level country, the pleafantest and fruitfulest part of Argyleshire, especially in barley; and it has also many lakes. It is bounded on the east by Broadalbin; on the south by Loch-leaven, a lake of great extent; on the west by the Western Islands; and on the north by Lochaber; extending about thirty miles in length from north to south, and about nine, where broadest, from east to west.

In this district Lochaber runs so far into the land from the Western sea, that it is only disjoined from Loch-ness, which runs into the Eastern ocean, by a very narrow ridge of hills which run between them.

Knapdale is bounded on the east by Loch-fyn, which separates it from Cowal, on the south by Cantyre, on the west by the Western Islands, on the north by Lorne, and on the north-east by Broadalbin. It is twenty miles from north to south, and thirteen where broadest from east to west. It is joined to Cantyre by a neck of land scarce a mile broad. This part is also full of lakes, in some of which are islands with castles; but it is in general fitter for pasture than corn.

The principal town in this division is Inverary, which is seated on Loch-fyn, seventy-five miles to the north-west of Edinburgh, and forty-five from Glasgow. It is a royal burgh, a market town, and the seat of a presbytery consisting of twelve parishes. Near it is a fine large castle, adorned with gardens and a park, and is the chief residence of the duke of Argyle.

Cantyre, or Kintire, which signifies the Land's-Head, is the most southern division of this shire, and is a peninsula that extends thirty-seven miles from north to south, and seven in breadth. From the point of land, called the Mull of Cantyre, it is scarce sixteen miles to the Fair Foreland in Colerain, on the north-east of Ireland. It is a very fruitful populous tract, inhabited both by Highlanders and Lowlanders, and for the most part by the former, brought hither by the Argyle family, who have taken extraordinary care in civilizing the inhabitants.

The principal place here is Campbell-Town, which is seated on the lake of Kilkerran, on the eastern coast, ninety-seven miles from Edinburgh, and thirteen from the Mull of Cantyre. It has a weekly market, is the seat of a presbytery consisting of ten parishes, and has a safe harbour.

The principal of the Western Islands belonging to Argyleshire are Ila, or Ilay, Jura, and Mull.

Ilay, or Ila, is seated fifteen miles from Cantyre, and is reckoned the most westerly of all the islands of Britain. It extends twenty-four miles in length, and from eight to eighteen in breadth; is not so healthy as Jura; but abounds with corn, black cattle, and deer; has several rivers and fresh-water lakes. The lake called Loch-linlagen, in the center of the island, is three miles round,

and discharges itself into the sea. In this lake is a small island, called The Royal Seat of the great Macdonald, who was crowned and anointed king of the Isles by the bishop of Argyle and seven priests, in the presence of all the heads of the tribes of the isles and continent. The ruins of his palace, and the houses of his courtiers and guards, are still to be seen. Here are also many caves, one of which is big enough to contain two hundred men. Here are also six churches and a chapel. There are a multitude of little islands on the coast, some of which are inhabited.

Jura is twenty-four miles long, and seven broad. It is separated by a narrow freight from Ilay, one mile in breadth, and is reckoned one of the most healthful places in Scotland; it has a clear air from the middle of March till Michaelmas, and the inhabitants live to a great age. It belongs to the duke of Argyle, and the east coast is well inhabited. It is famous for its medicinal waters, and its rivers which abound with salmon. The east coast is well inhabited, and abounds with deer, horses, black cattle, sheep, goats, wild and tame-fowl; and on the western shore are found coral and coroline. In the middle of the island are four very high mountains, the two highest of which are called by seamen The Paps of Jura; they are covered with heath and some grass that affords pasturage for the cattle. Between the north end of Jura and the little isle of Scarba is a whirlpool, that has an impetuous current not to be paralleled any where about the island of Great Britain; yet the smallest fishing-boat may cross it at the last hour of tide without the least danger. There is only one church in the island. The inhabitants are all Protestants, but speak Erse, and wear the Highland habit.

Mull, the largest of these islands, lies at a small distance to the north of Jura, and is twenty-four miles in length, but in the broadest part is as much in breadth, and is divided from Lochaber by a channel not half a league broad. The air is temperately cold and moist. A ridge of mountains run through the middle of the island, and one of them is so high, that it is seen from all the western islands and from a great part of Scotland. The island is well watered with rivulets, and affords good pasturage: the horses and black cattle are small but sprightly, and the latter very good meat. It has also a great number of sheep, goats, deer, and wild fowl; with barley, oats, great variety of plants, some wood, and plenty of turf and peat. The coast, especially Lechleffin bay, abounds with herrings, cod, ling, oysters, cockles, mussels, clams, &c. Here are also seals and otters. Several of the rivers abound with salmon and pearl mussels, and some fresh-water lakes have plenty of trouts and eels. The isle of Mull has several bays, and places for anchorage, of which that of Duart, on the east side, is most frequented. It has three castles, of which castle Duart, on a promontory near the south-east corner of the island, is the principal.

The inhabitants, who, except a very few, are Protestants, have, according to Mr. Martin, only two parish-churches, and a little chapel. The late duke of Argyle became its proprietor, upon its being forfeited by the family of Maclean.

On the western coast of Mull are many little islands, among which is Jona, which is but two miles long and one broad; yet on several accounts is worthy of notice. Marble is found upon it of various colours, with very beautiful veins. The east side is all arable and plain, abounding in corn and grass, and has nine ports for landing; but the western coast is exceeding bad, and full of rocks; the tides here are also very violent.

This island had two monasteries, and has a church famous for the burial of the kings of Scotland, of whom here lie no less than forty-eight; and is also famous for being the residence of Columbus, the apostle of the Picts, from whose cell this island, says Bede, was called Columb-hill. After the Scots left the isle, a bishop's see was erected in Sodor, a little village, from which all the islands within his diocese were called Sodorensis. Its church, first dedicated to St. Columbus, now called St. Mary's, was formerly the cathedral, and is a beautiful structure: the steeple is large, the doors and windows curiously

curiously carved, and the altar of the finest marble. There are likewise two other churches in the island. Here are what are termed black stones, though their real colour is grey. On these black stones, it is said, Macdonald king of the Isles kneeled, and with hands lift up to heaven, delivered the rights of their lands to his vassals in the isles and continent, solemnly swearing that he would never recal the privileges he then granted.

SECT. XXVI.

Of the Shires of Nairn and Cromarty; their Situation, Produce, and principal Towns.

NAIRN is in some measure united to Cromartyshire, by their sending alternately one member to parliament. Nairn is bounded on the north by Murray firth; on the east by Elgin; and on the west and south by Inverness comprehending the west part of Murray, which lies between the river Findorn and Nairn; extending in its greatest length twenty miles, and in its greatest breadth fourteen.

The air is very wholesome, and the winters pretty mild. The lower part of the country bears much corn, which is soon ripe; but the high country is fitter for pasture. It has many woods of fir and other trees, especially in the south-west part of the shire, on the banks of the river Nairn. It has many lakes and mountains, yet abounds with little towns and villages.

Nairn, the principal town, is a royal burgh, one hundred and four miles from Edinburgh, and had formerly a harbour, which is now choaked up with sands that cover the ruins of an ancient castle.

Cromartyshire is but a small country in a peninsula, separated on the south from Nairnshire by a part of Murray firth which runs up to Inverness; and on the north from Rossshire by the firth of Cromartie; it being bounded on the west by the shires of Inverness and Ross; and only twelve miles long and three where broadest.

Cromarty, the capital, is delightfully seated fourteen miles from Inverness, on the branch of the Murray firth called the firth of Cromarty; a road where the whole royal navy might securely anchor, and have sea room enough; though it is not much used either by the natives, or by any one else. At the entrance to this firth are dangerous rocks called the Craigs: and at this town is a ferry which crosses into Rossshire, from which the inhabitants are supplied with peat for fuel. It is a market town, and has spacious links, or a level green strand. It gave title of earl to an unfortunate nobleman, who was also hereditary sheriff of the county: but both titles are now fallen to the crown.

SECT. XXVII.

Of the Shire of Bamf; its Situation, Extent, Produce, and principal Towns.

THE shire of Bamf comprehends that part of Buchan north of the river Ugie, with the districts of Strathavern, Euzie, Boyne, Balvenie, Strathyla, and Strathavin. On the north it is bounded by Murray firth; on the east by the river Dovert and the northern ocean; on the south by the river or water of Ugie, which separates it from Aberdeenshire; on the south-west by the Braes of Badenoch and Braemar; and on the west by the water of the Spey and Elginshire. Its dimensions are variously given: but, according to Templeman's survey, it is fifty miles in length from east to west, and its greatest breadth eighteen.

The climate and soil are nearly the same as in the neighbouring country of Aberdeenshire.

That part called Buchan, extends north from the river Ugie to the sea, and west as far as the river Dovert, that is, nine miles from north to south, and twenty from east to west. It is watered by abundance of brooks and rivers, and consists of corn-fields and little hills; it being the most extensive tract in the whole kingdom free from mountains. The Boyne is a little district that extends

along the firth of Murray, and is fruitful near the shore, but in other parts mountainous, and has large quarries of spotted marble.

Balveny is a mountainous tract on the west side of the shire; it extends along the river Spey, and abounds with pastures and woods. It is famous for a rock that produces hones and whetstones sufficient to serve the whole island; so that the people use them as slates, for covering their houses. Here are also springs of alum water, and veins of a stone from which alum is extracted.

Strathyla, which lies to the north-east of Balveny, is fruitful in corn and grass, and such plenty of limestone, that the inhabitants build their houses with it. They are also considerable gainers by selling their lime for cattle and fine linen yarn at a weekly market in the village of Keith, on the river Dovert.

Strathavin is a district seated on the river Avon; Strathdovert also receives its name from its extending along the river Dovert.

The principal places in this county are the following:

Bamf, the county-town, is seated at the mouth of the Dovert, one hundred and ten miles to the north of Edinburgh; but has no port, and consequently little trade, except for corn and salmon: for the townsmen are fonder of tillage than of commerce. It is a royal burgh, and here the sheriff holds his courts. It has the ruins of a castle, and of an abbey which belonged to the Cistercian monks.

Tureff is seated seven miles from Bamf, on a river that falls into the Dovert; it is a market town, and the seat of a presbytery. The adjacent country is very pleasant, and abounds with gentlemen's seats.

Frazerburgh, is a sea-port on the coast of Murray firth, fifteen miles from Bamf, and is reckoned the chief town of the district of Buchan; it has two piers of free-stone, which renders the harbour so safe and commodious, that thirty ships may securely winter here at a time.

Upon the banks of the Spey, which runs through this county, is Gordon castle, the noblest palace in the North, it being the duke of Gordon's chief seat, adorned with pleasant gardens, a great park, and fine canal, with an agreeable fountain and statues. The castle is so large, that it appears more like a little town than a nobleman's seat.

SECT. XXVIII.

Of the Shire of Sutherland; its Situation, Extent, Produce, and principal Towns.

THIS county, including Strathnaver, has Caithness and the Northern ocean on the east; Ross on the south; the country of Assynt to the west; and the Northern ocean to the north; extending, according to Mr. Templeman, eighty-eight miles in length, and forty-two in breadth:

The country is very mountainous, but less so than Ross, and according to Camden, is more fit for breeding of cattle than bearing of corn. The valleys, however, are pleasant, fertile, and well inhabited. It abounds with black cattle, sheep, deer, and wild-fowl; and it is said that all the deer bred on the mountain Arkil have forked tails. It has three remarkable forests, and many other woods that afford hawks and plenty of game, which the inhabitants are fond of hunting. Here are hills of white marble, and a great deal of free-stone, lime-stone, iron-stone, and good slate. It is remarkable, that though this county is seated so far north, saffron grows in it very well.

There is one sort of bird said to be peculiar to these most northern districts, which the inhabitants call a knag: it resembles a parrot, and digs its nest with its beak in the trunk of trees.

In this county are above sixty lakes, abounding with swans, geese, ducks, and other fowl of various kinds, and are full of fish. The largest is Loch-fin, which is fourteen miles long. In many of them are very pleasant islands. In short, this country is so full of bays, rivers, and lakes, that there is scarce a town in it that is not washed with salt or fresh water, and both its bays and coast

coasts abound with seals, salmon, and shell-fish of all sorts. It gives title of earl to the chief of the noble family of Sutherland, who has the titles of hereditary sheriff and admiral. It has many commodious harbours, from which the inhabitants export barley, salt, coal, beef, hides, tallow, skins, wool, butter, cheese, salmon, &c.

The north part, called Strathnaver, is separated from the rest by mountains, and bounded on the north and west by the ocean; on the east by Caithness; and on the south by Assynt and Sutherland. It is so called from the river Naver, which runs thro' it; it extends thirty-four miles from east to west, and twelve from north to south; but in others no more than six.

The snow lies a long time upon the high mountains. It has good harbours and many woods, with great herds of black cattle, sheep, horses, and goats. The inhabitants take their fat cattle and colts to the neighbouring fairs; but export their salt beef, hides, skins, tallow, butter and cheese. Here is also great plenty of venison, and the inhabitants despise those who do not delight in hunting.

It is observed that the people of this and the neighbouring countries are strong, courageous, frugal, capable of fatigue, civil to strangers, chearful, and sincere.

The day here in summer is computed at eighteen hours, and when the sun is set, it is much more than twilight till it rises again; but the nights are as long in the midst of winter: however, the air is even then illuminated by the aurora borealis, or the northern lights. It is also observed, that the winters here are in general more temperate than they are farther to the south, and that some of the rivers, particularly the Ness, never freeze; which is ascribed by naturalists to the salt and mild vapours from the neighbouring sea, which fill the air, and as it were smother the acute particles of the cold; and for the same reason the snow in the vallies neither lies so deep, nor stays so long on the ground, as in other places.

Dornoch, the capital of the county, is seated on the bank of the firth of Murray, one hundred and thirty miles to the north of Edinburgh, and was formerly the see of a bishop; here was also a cathedral for the diocese of Caithness, with a castle for the earl of Sutherland, and the family burying-place. Dornoch is the seat of a presbytery containing nine parishes, and has four annual fairs, which are much frequented. It has, however, at other times little or no trade, and is now remarkable for nothing but its antiquity.

Brora is a burgh of barony at the mouth of a river of its own name; in the neighbourhood are mines of excellent coal, and a great deal of salt is here made and exported.

SECT. XXIX.

Of the Shire of Clackmanan; its Situation, Extent, Produce, and principal Places.

CLACKMANANSHIRE is bounded on the north by the Ochill-hills, on the south by the firth of Forth, on the east by part of Perthshire, and on the west by part of Sterlingshire. It is about eight miles long, and where broadest but five,

This is a plain fertile country toward the firth; but the rest is fitter for pasture; however, the lands below the Ochill-hills abound both with corn and pasture. About Alloa and Clackmanan are many coal-pits; and the inhabitants export great quantities of coal, not only to Edinburgh, but even to England, Holland, and France; for it yields the best and the greatest quantity of coal of any part of Scotland, it being that distinguished in England by the name of Scots coal. This county joins with the shire of Kinross in alternately sending a member to parliament, though Kinross is generally included in Fifeshire.

Clackmanan, the county town, stands on a rising ground, upwards of thirty miles from Edinburgh, and has a noble castle, adorned with fine gardens.

But the most considerable place is Alloa, or Alloway, a sea-port, five miles to the east of Sterling, and the last on the Forth, where that river falls into the arm of the

sea called the Firth. This town, though a village, is larger and better built than most of the borough towns in the kingdom. There is in particular one street that runs down to the harbour, the broadest and best paved of any next to Edinburgh, with rows of lime-trees on each side, as at Dundee and in the towns of Holland. Alloa has a very considerable foreign trade, and several manufactures are erected there, all of which have some relation to navigation. They particularly make excellent sail cloth, which is said to be as good as that of Holland. There is a large rope-walk and ware-house of naval-stores, as hemp, tar, &c. imported from Russia, Livonia, Norway, &c. from which last place deals are also imported, and here are several saw-mills employed in cutting or splitting them. A factory has likewise been settled here for the merchants of Glasgow, who have erected ware-houses for stowing their tobacco, sugar, and other goods imported from the British colonies in America, in order to be ready for exportation to Holland, Hamburgh, Bremen, the Baltic, London, or where-ever they are wanted; and also for stowing such commodities as they import from Sweden, Russia, &c. The river is here as broad as the Thames at London-bridge, the water deep, and the tide flows so strong, that ships may lay their sides to the wharf, and load and unload their goods without the least difficulty. There are salt-houses all along the shore for boiling of salt, which is fetched away in great quantities by ships that bring other goods from Hamburgh, Bremen, or the Baltic.

The earl of Mar had a seat here, formerly called Alloway-castle, encompassed with fine plantations; the gardens taking up forty-two acres, and the wood, with the vistas cut through it, a hundred and fifty. The entrance from the town on the west is by a pair of fine gates, through a spacious avenue, which leads to the area fronting the house, in the midst of which is a gladiator, and on the right hand of the area a spacious garden, with a fine terrace and bowling-green, adorned with lofty evergreens. On the south side of the house is a spacious parterre, beautifully adorned with statues and vases; and from thence to the river runs a fine avenue, from which and from the parterre are thirty-two different vistas, each terminating on a remarkable seat, or mountain, at some miles distance; one of them shews Sterling-castle, which though but four miles from hence by land, yet from the various windings of the river is twenty-four by water. In the middle of the terrace is a fine basin of water, in the midst of which is a group of Cain killing Abel; and at the end of the river is a pair of pyramidal gates, where a ship of three hundred tons burthen may unload. There is a very long and wide avenue to the east through the wood, and between each vista from the parterre are wildernesses and little grottos. The earl of Mar lost this fine seat by his rebellion in 1715, and the government, to whom it was forfeited, ordered it to be kept in good order.

SECT. XXX.

Of the Shire of Ross; its Situation, Extent, Produce, and principal Towns and Islands; as Sky, Lewis, and Harris.

THE shire of Ross in general, including Tayn and Cromarty, for the last, though a small county of itself, is also considered as a part of Ross-shire, has the Western sea and the isle of Sky on the west, Strathnaver and Sutherland on the north and north-east, Cromarty and Murray firth on the east, and Inverness on the south. The form is very irregular, it being much contracted on the north-east and south by the neighbouring counties; but according to Mr. Templeman, it is eighty miles in length, and seventy-eight in breadth.

This extensive country is for the most part mountainous and woody towards the Western ocean; but on that side next to the German sea it is better cultivated, more fruitful in corn, fruit, and herbs, than could be expected in a country so far north, and abounds in pasture. The straths, or valleys near the rivers, are covered with woods, particularly upon the Charron and the water of Braan; and near Alfarig are woods of fir, fifteen

or twenty miles in length. It feeds great numbers of black cattle, horses, goats, and deer; has abundance of land and sea fowl, and is well supplied with fresh water fish by its lakes and rivers. The lochs, or lakes, on the west coast, in the proper season, abound with herrings, particularly Loch-eu, which is divided into two parts, one a bay of the sea, and the other a fresh-water lake, extending about nine miles in its greatest length, and three where broadest. There are extensive woods on its sides, where abundance of iron was formerly obtained. Loch-bryan, on the same coast, is another bay, that runs ten miles up the country; is three miles broad at its mouth, and is also famous for herrings. It receives several rivers, and on the north side are many villages.

Coygach and Aflynt are two mountainous districts north from hence, but abound with deer, and have huge rocks of marble, with several gentlemen's seats towards the coast.

The middle part of the county, called Ardros, is mountainous and scarce inhabited; but affords some pastures. The north-east parts, on the rivers Ochill and Carron, and the firth of Tayn, are pretty fruitful, and abound with villages. This firth runs near twenty-five miles up the east side of the county, dividing Ross from Sutherland, and is seven miles broad at its mouth; but its quicksands render it unsafe for navigation.

Another district, called Ardmeanach, forms a part of a peninsula which lies between the bays of Cromarty and Murray, extending thirteen miles and a half from east to west, and five and a half, where broadest, from north to south. It has high mountains, some of which are both pleasant and fertile.

There is likewise an inland tract called Strathcarron, from a river which divides it. This is a woody country, especially in firs, and abounds in horses and black cattle.

This county has some mountains so high, that they are covered with snow all the year round.

The principal places it contains are the following:

Channeriy, or Chanoury, a market-town so called from a college of regular canons that flourished there. It stands on the peninsula between the bay of Cromarty and Murray, among pleasant and fertile hills, and has a ferry over the firth into Murray. It was anciently the see of a bishop, and had a large cathedral, a part of which is yet remaining, and a castle in which the bishop resided. It is at present the seat of a presbytery, consisting of seven parishes; and has a stately house belonging to the earl of Seaforth.

Dingwell, a market-town and royal burgh, seated at the bottom of the firth of Cromarty, fifteen miles west of the town of Cromarty, is the seat of a presbytery, containing thirteen parishes.

Tayne, a royal burgh and market-town, stands in a fruitful country, twelve miles to the north of Cromarty, and is the seat of a presbytery, containing nine parishes. It is pretty well inhabited, and has a tolerable good trade, from its communication with the Western islands and its herring-fishery.

We shall now give an account of the principal of the Western islands generally included in the shire of Ross.

Skie, or Sky, the largest but one of all the Western islands, is divided from Rosshire by a strait thirty-five miles in length, but in some places so narrow, that a man may be easily heard from one side to the other, especially if the wind be favourable. It extends sixty miles in length, and about twenty in breadth; and the coast is cut into a great number of gulphs and promontories. The soil is generally a black mould, though there is some of a red colour, in which iron is found. In some places there is fine white marble, black and white marcasites, agate, and variegated stones of all colours, crystals also of different colours, plenty of free-stone and limestone, and after great rains stones of a purple colour rowl down the rivulets.

Though the channel which separates it from Scotland is navigable by the largest men of war, yet the current is so violent, that no ship is able to sail against it, be the wind ever so fair: yet in the narrow ferry, called the Kyle, they make cows swim over; for this purpose they tie a withy about the cow's lower jaw, and thus bind

five of them together, after which a man in a boat holds the withy that ties the foremost, and thus rows over; and in this manner takes over three or four hundred cows in the space of a few hours.

It is very high land both on the coast and within the country, where are seven high mountains, that lie near each other almost in the center of the island. The soil is fruitful enough in the lower grounds, and produces corn and cattle, as horses, cows, sheep, goats, and hogs: but the black cattle have seldom any thing to feed upon in winter except sea-weeds, and therefore watch the ebb very strictly; by this means, and by their being exposed to the rigour of the coldest seasons, the cows become such skeletons in the spring, that many of them are unable to rise from the ground without help; but as the grass grows up they recover their strength. The island supplies the neighbouring continent with barley and oats. Cod and ling are common upon the coast, and herrings in great abundance, for the taking of which they have many convenient bays and harbours, with about thirty small rivers that afford salmon and other fish, and abundance of fresh-water lakes well stored with trouts and eels. They have land and water-fowl in great abundance, and among the rest eagles and hawks. They have likewise otters and seals, and of the former are a large species with a white spot on the breast; but these are very scarce, and hard to be killed. They have likewise serpents of several kinds.

The island is divided into three parts, belonging to three different proprietors; is the seat of a presbytery, and has ten parish-churches. Both the proprietors and all the people are Protestants, except some of the meaner sort, who are of the Romish religion.

Lewis and Harris, which have been supposed to be two islands, form only one, which lies sixty-eight miles west of the main-land of Scotland, and twenty-two in the same direction from the Isle of Sky. It is subdivided into Lewis and Harries, or Harris, by a narrow channel, which runs so far within the country, that it is only joined by a small neck of land: the whole extending near a hundred miles in length from north to south, and ten or twelve in breadth, it being commonly called the Long Island. It is healthy, especially in the middle. The soil is arable for about sixteen miles on the west coast, and in some places on the east; but it is generally sandy, except the muirs or heaths, which are partly of red and partly of black clay; of which the women here make vessels for boiling their meat, and for preserving their ale. It produces barley, oats, rye, flax, and hemp. Their manure is sea-weeds, foot, and peat-ashes. The island also abounds with cows, horses, sheep, goats, and hogs: their black cattle are small, but very prolific, and make excellent meat: their horses are likewise smaller than on the main-land, but as serviceable for all domestic uses, and live very hard, having little to feed on in winter but sea-weeds.

All the coast and numerous bays abound with cod, ling, herrings, and every other kind of fish taken in the Western isles: but the fishery is very much interrupted by whales, the young ones of which are eaten by the common people, who reckon their flesh very good food. They yield also plenty of shell-fish, as scallops, oysters, cockles, mussels, limpets, periwinkles, and spout-fish; of which last they are said to have such multitudes every seventh year, that the inhabitants manure the ground with them. On the shore are many caves, which shelter vast numbers of sea and land-fowl, otters, and seals; and the last they esteem nourishing food.

The inhabitants are of a good proportion and stature, generally of a ruddy complexion, healthy, strong, and long-lived. The small-pox proves very fatal to the young people; but seldom comes among them. The most common disease here is a cough. They are in general very acute and sagacious, have a mechanical genius, and when they have an opportunity shew that they have no despicable turn for the sciences: some of both sexes are skilled in poetry and music, and some elegant specimens of the former have been translated and published in English from the original Erse. The natives are likewise very dexterous at swimming, and are such stout mariners, that they will tug at the oar a whole day with no other

refreshment

refreshment than only a little bread and water, except their favourite snuff: but the sea on their coast is very tempestuous, and subject to sudden squalls, by which the light vessels they use in visiting the neighbouring islands are frequently overset. The natives are extremely hospitable, but poor. Once every summer they visit the neighbouring islands, to purchase fowls, eggs, down, and feathers; and, as soon as they come on shore, turn round with the sun, uncover their heads, and return thanks to God.

Here are several natural and artificial forts, with heaps of stones upon the heaths, supposed to be monuments of persons of note, or a general memorial for all who fell there in battle; and in the village of Clafernesh is a druidical temple, as is supposed. It consists of a circle of twelve obelisks, each seven feet high, and six feet distant from each other. In the center stands a stone thirteen feet high, exactly resembling the rudder of a ship: directly south from the circle stand four obelisks, running out in a line: another like this goes due east; and a third to the west: the number and distances of the stones being the same in the wings. But towards the north is a kind of avenue in two straight ranges of obelisks of the same size, and at the like distance as those of the circle: yet the ranges themselves are eight feet asunder, and consist of nineteen stones each, the thirty-ninth being at the entrance of the avenue. It is observed, that this temple stands astronomically, as denoting the twelve signs of the zodiac, and the four principal winds on the wings subdivided each into four more; by which, and the nineteen stones on each side the avenue, representing the cycle of nineteen years, it appears to have been dedicated to the sun, and subordinately to the elements and seasons, particularly the winds and the sea, as is manifest from the rudder in the middle.

S E C T. XXXI.

Of the Shire of Elgin; its Situation, Extent, Climate, Produce, and principal Towns.

THIS county comprehends the west parts of Murray, and is bounded on the east and south-east by the river Spey, by Aberdeenshire and Badenoch on the south, and by the shire of Nairn and the Northern ocean on the west and north, it being about twenty-four miles in length, and twenty-one in breadth. The south side is called the Braes of Murray, and the south-east the Strath or valley of Spey.

The air is salutary, and the winter mild; for Murrayland, which includes this shire, Nairn, and a part of Inverness-shire, is thought to enjoy the best climate and soil of all the north of Scotland; so that the inhabitants boast that they have forty clear days in a year more than their neighbours.

The south side of the country is mountainous, but abounds with pasture, as the low country does with corn, which is soon ripe. Here are several woods of firs and other trees, that extend ten miles in length, with some large woods of oak. The soil is generally sand mixed with clay, and very fruitful when manured: whence it produces whatever is to be found in the other parts of the kingdom, none being more plentifully provided with bread, meat, fruit, and fish. The common drink here is ale; they have also French wine, and spirituous liquors of their own making.

The chief rivers of this county are the Spey, which next to the Tay, is the most considerable in the north of Scotland, and the most rapid in the whole kingdom. It rises in Badenoch, and after a course of seventy-six miles, besides its turnings and windings, falls into the North sea. It has an excellent salmon fishery, and in the heat of summer is observed to swell by a west wind, though there be no rain.

The Ness, which has likewise a good salmon fishery, rises from a lake called Caich, near the Irish sea, and is for some miles called Coich, after which running north-east it falls into the lake called Loch-garrif, afterwards into a lake called Eawic, and then turning to the south-east, falls into the Loch-ness, which is twenty-four miles

in length, and of an unknown depth. It is observed that this river never freezes, but smokes, and dissolves ice thrown into it during the greatest frost; the same is observed of the lake from which it rises.

The Lossie rises a few miles above Elgin, and falls into the sea, a few miles below it. It abounds most with salmon of any river in the island, except the Dee and the Don, eighty or a hundred lasts being annually pickled and exported, all taken in a few summer months and within the space of one mile. It abounds with fish indeed up to its source, but most of these are used for home consumption, and taken either with spears by day, or in wicker baskets, or little boats covered with hides, by night.

The principal places in this county are the following:

Elgin, a royal burgh seated in a pleasant plain, one hundred and four miles to the north of Edinburgh. It is washed on the east and north by the river Lossie, over which it has a bridge, and consists of one very long street, and several shorter, with a neat church in the middle. The houses are almost all built upon arches, which, with their intermediate pillars, form agreeable piazzas, and serve to defend the inhabitants from the rain, wind, or sun. It is also famous for the ruins of one of the most stately cathedrals in the kingdom: most of the end walls are still standing, and many noble pillars which shew its former grandeur. At the other end of the town are the ruins of an ancient castle, though demolished by the Danes. These ruins are upon a large mount, which affords a fine prospect all over the town, and of the adjacent country even to the sea, and of the winding course of the river. The sheriff keeps his court here. It has a weekly market, and is the seat of a presbytery, consisting of thirteen parishes. The highland gentry come to reside here every winter; and in this part of the country there are some commoners of the best estates in all Scotland; it being a rich country almost all the way from hence to Strathern.

Forres, a market town and royal burgh, pleasantly seated on the west side of the county on a river that falls into the Findern, ten miles from Elgin, and at the end of several ridges of mountains, and consists of one long street, with a church, a tolbooth or town-house, and the ruins of an old castle, in which it is said, the kings of Scotland used to reside. It is the seat of a presbytery, containing ten parishes. Near the town is a large pillar of one stone adorned with basso relievos, much obscured by time; this is a monument of a victory obtained by Malcolm Mackenneth over Sweno king of Denmark.

S E C T. XXXII.

Of the Isles of Orkney and Shetland. Their Situation, Extent, Climate, Soil, and Produce, with the Manners, Customs and Trade of the Inhabitants.

THE Orkades or Orkney islands, with those of Shetland, make one stewartry, and send one member to parliament; the former lie north of Dungsby-head, in Caithness-shire, the most northern promontory of Scotland, between fifty eight degrees twenty-seven minutes, and the fifty ninth degree, ten minutes, of north latitude, and between the first degree thirty minutes, and the second degree fifty minutes west longitude. They are divided from the continent by the streight called Pentland firch, which is twenty four miles long, and from twelve to sixteen in breadth. They are reckoned about thirty in number, and, according to Mr. Templeman, contain an area of six hundred square miles; but they are not all inhabited, a considerable number, which are called Holms, being only used for pasture for sheep and goats.

The longest day among them exceeds eighteen hours by some minutes, and for the greatest part of June, one may see to read at midnight without a candle. The winters have less snow than rain, which sometimes falls in violent spouts, and the wind is often very boisterous. But nothing can be a finer sight in calm weather, than to see the sea in the narrow sounds and passages between the islands; where the different tides run as from a sluice,

as well one way as the other, and the boats flying along those rapid currents, like an arrow out of a bow; it being as impossible to row against them, as to shoot London bridge against the steep fall at low water.

In Pentland firth, behind the island Swinna, are two great whirlpools called the Wells of Swinna, which swallow up any vessel that comes within their draught, and the passage of that streight itself is very dangerous, from the many strong tides, which are no less than twenty-four, and upon the least contrary wind, make the sea run very high.

As these islands are larger, and have more towns and inhabitants than those of Shetland, so the soil is also better, and more improveable. The fields in summer every where abound with a variety of plants and roots, the latter of which are generally very large; but in winter and spring, when grass is scarce, their horses are fed with sea-weeds: but there is scarce a tree or shrub except myrtle, juniper, wild roses, heath, and some fruit trees, with others in their gardens. These islands produce corn in abundance, but the chief of it is oats, barley, and beer; for they have no wheat, rye or pulse, except in the gentleman's gardens. Their corn land is every where inclosed; but their sheep, swine, and most of their cattle feed at large, without a herdsman to look after them.

Their ewes commonly bring forth two lambs at a time, and some three or four; but they often die of a disease occasioned by a little animal about half an inch long breeding in their liver. Their horses are very small, but hardy and serviceable. They have all sorts of wild fowl, as partridges, moor-fowl plover, ducks, teal, widgeon, &c. with numbers of eagles and kites, and the former are said to seize sometimes upon young children and carry them a great way; and therefore if any one kills an eagle, he may, by law, claim a hen from every house in the parish where it is killed. Hawks and falcons have nests in several parts of the island, and the king's falconer comes annually and takes the young, for which he has a salary of twenty pounds, and a hen or dog out of every house in the country, except some houses that are privileged. The country also abounds with swans, geese, ducks, and solan geese; but there are no venomous animals, and it is said that if any be brought here they immediately die.

There are many small whales round the coast, with those amphibious animals otters and seals. They have also an amazing plenty of herrings and other sea fish, with abundance of oysters, mussels, crabs, cockles, &c. Though it cannot be expected that they should have any large rivers in a country divided into so many small islands, yet there are some rivulets full of trouts, and many lakes; but they are of no other use than to supply their cattle with water, and turn their mills.

As to minerals, there are some mines of silver, tin, lead, and perhaps of other metals, but none of them are improved. There are in many places quarries of freestone, with grey and red slate, and some marble and alabaster.

The inhabitants are well proportioned, and of a healthy constitution; but as they feed very much, especially the poorer sort, upon salt meat and fish, they are subject to the scurvy: but living with great frugality, they generally enjoy life to a great age, and seldom die of the doctor. The generality of the people speak English, with the Scots accent, but many of them use the Danish or Norwegian tongue among themselves, which they have retained ever since the Norwegians first peopled these islands. The people of distinction are hospitable and obliging, and even the vulgar are generally civil. They dress like the Lowlanders, only some of them wear a kind of sandals made of seal skin, which they tie about their feet with leather thongs. They are able and stout soldiers; and the common people, who are very laborious, undergo great hazards as well as fatigues at sea. To prevent the frequent incursions of the Norwegians, and those of the western islands, each village was formerly obliged to fit out a large boat well manned; and all the inhabitants were forced to appear in arms upon an alarm

from the beacons that were set on the top of the highest hills and rocks.

Several gentlemen have estates in these islands; but the king is proprietor, and one half of the whole belongs to the crown, besides the bishop's rates, which amount to about nine thousand marks scots per annum. There is here a yearly roup, or sale by auction, of Orkney rents, and the highest bidder is preferred to be the king's steward for the time, and as such is principal judge of the country.

The churches of both the Orkney and Shetland islands were formerly under the government of a bishop, whose cathedral was St. Magnus, in Kirkwall. There are in all thirty-one churches, and about a hundred chapels in the country, making up in the whole about eighteen parishes.

The trade of the Orkneys differs from that of Shetland, only in not depending on the resort of strangers, but on their own produce. They annually export a very great quantity of corn, black cattle, swine, and sheep, as also of butter, tallow, and salt, together with selch skins, otter-skins, lamb and rabbit skins, &c. great quantities of down, feathers, quills, hams, and wool. Their corn, in particular, is sold as far as Edinburgh, from whence they bring what goods they want in exchange. But the chief of their commerce consists in their fishing for herrings and white fish, and in their corn and cattle. But as they have not merchants to export their fish, when taken, they most commonly fish for the Dutch, and the merchants of Inverness; and though this sometimes obliges them to go far from home, yet being an adventurous hardy people, they make no difficulty of fishing in the darkest nights, at a distance from the islands, and in boats that are none of the best.

The principal of the Orkney islands are the following. Hoy is about twelve miles long, and six where broadest. The east part called Waes, is fertile and well inhabited, and it has some good harbours, with fresh-water lakes and rivers abounding with trout and other fish. About the summer solstice the reflection of the sun may be seen all night, as if covered with a cloud. There are here valleys so deep and gloomy as to strike terror into the mind of a traveller, the rocks rising to a prodigious height, and meeting so near at the top, that very little of the sky can be seen below. In one of the valleys is a stone called the Dwarf-stone, thirty-six feet long, eighteen broad, and nine thick, in which is a square hole about two feet high for an entrance, with a stone of the same size for a door. Within this entrance is the resemblance of a bed, with a pillow cut out of the stone, big enough for two men to lie on. At the other end is a couch, and in the middle a hearth, with a hole cut out above for a chimney. It lies in a heath about a mile from any house, and is supposed to have been an hermitage. On the tops of the mountains are wild sheep, and in a promontory here called Lyre-head, a bird called a lyre, builds its nest: it is about the size of a duck, very fat, and such delicious eating, that the natives climb for it at the hazard of their lives; and, like the bird-catchers we have mentioned in treating of Norway, are let down by ropes two hundred fathoms in search of the nests and the young ones, which when they find, they put in a bag, and sell for a very good price. Here are also hares as white as snow. The minister of Hoy has two churches, one at Hoy, and the other at Gramsey, a pleasant island about one mile long to the north of this; and the minister of Waes, in the eastern part of the isle, has also two churches, one at Waes, and the other in the little pleasant island of Flotta.

Pomona is the largest of all the Orkney islands, and on that account is called the main-land. It is twenty-four miles in length, and from six to nine broad. It has nine parish-churches, several mines of white and black lead, and has four remarkably good harbours, Kirkwall, Deic Sound, Grahamshall, and Kairston. The east part, called Deirness, is a peninsula joined to the other by a small neck of land. The island is, in general, very fertile, and both parts pleasant and well inhabited. It has lakes and rivulets abounding with salmon and other fish, and several bays and promontories. The cape at the north

north end, called the Mule, is very high, and the sea in a tempest beats against it with such force, that it rises higher than its top. In this island are two temples, where the natives believe the sun and moon were worshipped: these are one on the east and the other on the west side of a lake. The largest is a hundred and ten paces in diameter, and the other is semi-circular.

The only good town in the Orkneys is Kirkwall, which is seated forty-five miles from Dungsby-head, and is a royal burgh, narrow, but near a mile long. The houses are of stone covered with slate, and the inhabitants are governed by a provost, four bailiffs, and a common-council, like the other burghs of Scotland. Its cathedral, called St. Magnus, is now a parish-church, built of free-stone, and is larger than St. Giles's at Edinburgh. Its roof is supported by fourteen pillars on each side, and its steeple, in which is a good ring of bells, by four large pillars. The three gates of the church are chequered with red and white polished stones, embossed and elegantly flowered. There is here a public grammar-school, and several others for reading and writing. The seat of justice is kept here for all the rest of the islands; and here the the steward, sheriff, and commissary keep their separate courts. Its ancient privileges are still kept up, and they have a power to arrest by their own officers, to imprison, to make by-laws, to chuse their own magistrates, &c. yet they cannot try in capital causes, that part of justice being left to the lords of justiciary. This island has a large safe harbour in a bay on the north side of the island.

Beyond these, and still farther to the north, lies Sanda, the soil of which is very dry, and exceeding sandy, from whence it received its name. It is eleven or twelve miles in length, but very narrow, and well stored with corn. It is in short reckoned the most fruitful and beautiful of all the Orkney islands. Here is not only variety of fish, but of black cattle, sheep, corn, hay, and pasture, plenty of rabbits, which, next to fish, are the chief food of the natives; but they are in great want of fuel. Here are many buildings, two churches, and two pastors.

Fair is an island seated nine leagues from the Orkneys, and five from Shetland, and is seen from both. It is fruitful in corn and cattle, and abounds in all sorts of fish. This island has three very high rocky promontories, inaccessible, except on the north-east, where the land is lower, and forms a safe harbour. Its hawks are reckoned the best that are to be found, and go as far as the Orkneys for moor-hens and other prey. On the north-west side is a vast rock, which rises like a tower, is covered with grass, and feeds many sheep. The island has but few inhabitants, they being often plundered by the mariners who come this way to fish. The Dutch East India ships that chuse to come north-about pass by this island, where they often find men of war sent from Holland to wait for and convoy them home.

We now come to the Shetland or Zeland isles, which are about forty-six in number, with many holmes, or little uninhabited islands, on which cattle are fed, and barren rocks. They lie to the north-east of Scotland, between the fifty-ninth degree fifty minutes and the sixtieth degree forty-eight minutes north latitude, and between fifty minutes east and one degree fifty minutes west longitude.

There are only about twenty-six of these islands inhabited, and of these there are only three or four of note, whose principal towns are little better than villages, frequented by the many strangers employed in the fishery: yet some learned men have contended for these being the Ultima-Thule of the ancients, in which they placed their Elysian Fields; and the surprising length of the days during the months of June and July, when the people can see to read by the midnight-lights, probably raised an opinion, that the inhabitants enjoyed everlasting day. In the mean time it must be observed, that these islands, which, during four months in the year, enjoy almost perpetual day, are during our winter involved in darkness, and encompassed by ice, storms, and tempests: not a ship is to be seen near them, their sea not being navigable in most of the sounds; but when the sun returns to their coasts with his warm enlivening beams about the middle of May, or the beginning of June, a most chearful scene

succeeds this solitary gloom; the sea is covered with ships and boats, two thousand sail frequently crowding into their ports, and as it were covering the sea, spreading their nets for the herrings in all the sounds and channels among the islands. It is to this concourse of foreigners, and particularly of the Dutch, who often come with fifteen hundred, and sometimes with two thousand busses, all the trade of Shetland is owing. The Dutch, for the sake of trade, set up booths on shore, as in a fair, where they sell many useful things, especially wine, brandy, and spices; and, in return, receive flesh and vegetables. During this fair, as it may be called, the islanders enrich themselves by selling several sorts of Scots manufactures to the Dutch seamen, as well as all sorts of provisions; and also by fishing with their own barks and cobsles, and taking great quantities of fish on their own accounts, which they sell to the English or Dutch.

Though the air of winter is extremely cold, yet many of the natives live to a great age. Whatever were the original inhabitants, they are said to be at present mixed with Scots Lowlanders, dress like them, and talk English. They are a plain good-natured people, and often make feasts to compose quarrels. The people in general seem to be of a religious disposition, and are almost all of them Protestants. The shortness of their days, with the length of the nights in the winter, and the tempestuous state of the weather at that season, render them generally ignorant of whatever passes in the world from October till May: thus they knew nothing of the revolution which happened in November 1688, till May 1689, when being told of it by a fisherman, they put him in prison for high-treason; but the news was confirmed soon enough to restore the poor man to his liberty.

The natives live so much upon salt-fish, that they are very subject to the scurvy, against which nature has furnished them with plenty of scurvy-grass; and they cure the jaundice by mixing powder of snail-shells in their drink; for they have neither physicians nor surgeons. No corn agrees with the soil so well as barley, and therefore barley-bread is most in use. Their common drink is whey, which the natives barrel up, and keep in cold cellars: some drink butter-milk mixed with water; but those in more affluent circumstances have beer, ale, and wine. They make their oil, which they burn during their long winter nights, of the livers of fish. The inhabitants of the lesser isles maintain themselves in summer by catching fowl, and taking their eggs; and get considerably by selling their down and feathers. They catch them by climbing the rocks, at which they are very dexterous, and also by being let down from the top by ropes, while they sit in a basket. Their fuel is turf, peat, and heath. They make coarse cloth, knit stockings and gloves for their own use and for sale to the Norwegians; but their most profitable export is fish.

They have abundance of little horses, called skeltries, fit both for the plough and saddle, being naturally pacers, very sprightly, and strong enough to carry double, though they have small legs, and are so light that a man may lift them from the ground. They are of two sorts, the pyed and the black; but the latter are the best. They are never housed, and when they have no grass, live upon sea-weeds, which can only be had at the tide of ebb; yet live to thirty years of age, and are all the while of service.

They have fowl of many sorts, particularly geese and ducks of several kinds; but though Shetland abounds with heath, yet heath-cocks and other fowl that frequent heaths will not live there. There are sometimes such numerous flights of sea-fowl, that they darken the air. The several species of them build and hatch apart. These commonly arrive in February, and after they have hatched their young, and find they can fly, go away together to some unknown place.

The chief island, called Shetland, and also the Mainland, is above sixty miles in length, and twenty where broadest; but is much indented by bays. It is for the most part full of bogs and mountains, except on the shores, and is therefore fitter for pasture than corn, with which the inhabitants are chiefly supplied from the Orkneys; but they have barley and oats of their own.

The

The principal town is Lerwick, on the east side of the island, which is encreased by the fishing-trade to about three hundred families.

On the west side is a small town called Scalloway, the inhabitants amounting to only about a hundred: yet this is the only place for administering justice, and had antiently a castle, which is fallen to decay. This little town has likewise the only presbytery in all the Shetland isles.

Brassa, to the east of the Main-land, and opposite to Lerwick, is five miles long, two broad, and has some arable land, and two churches. It is famous for the herring-fishery in its sound. The Hamburgers and people of Bremen come hither about the middle of May, set up shops and exchange linen, muslin, bread, &c. for fish, mutton, fowls, stockings, &c. The natives are at this time considerable gainers by letting out their houses and ground to the seamen for shops.

The Skerries are two dangerous little islands, on which ships are often cast away; they lie about seventeen miles to the north-east of the Main-land.

Yell is sixteen miles in length, and the coast is indented in such a manner, as to make it resemble a figure of eight; it also lies north-east from the Main-land, and has three churches, with several little chapels; but the country is so moorish, that the minister is obliged to go near eight miles to church wading almost up to the knees in mire.

SECT. XXXIII.

A Description of the most remarkable of the Western Islands not included in the Shires of Scotland; with a particular Description of St. Kilda.

THE Western islands were by the ancients called *Æbudæ* and *Hebrides*, and have been computed at three hundred in number. No country abounds more with the necessaries of life, they having flesh and fish in prodigious plenty. Their cattle of all sorts, as cows, sheep, hogs, and goats, are exceeding numerous and prolific, small indeed, as are their horses, but of a delicious taste, as are their deer, which freely range on the mountains. The natives salt their beef in cow-hides, which they think contribute to preserve it, and give it a better taste than casks; they send a great deal of it to Glasgow, where it is barrelled up and exported to the West Indies.

Here are large eagles and hawks, which are very destructive to the lambs and fawns; but no place in Europe can compare with them for tame and wild-fowl, as pheasants, moor-fowl, swans, tarmagans, plovers, pigeons, with many sorts extremely beautiful and rare, or utterly unknown elsewhere; among the latter is a fowl called *colk*, somewhat less than a goose, that has beautiful feathers, or rather down, of various colours; it has a tuft on its head, and its tail is longer than that of a house-cock. There is another named *gawlin*, which is somewhat less than a duck, and is said to sing always before good weather; and some of the Highland pipers have formed an agreeable tune of its notes. Another, called a *rain-goose*, is said always to make a doleful noise before rain. Another extraordinary bird is called the *bishop of Carara*; it is as large as a goose, and has a white spot on its breast; it is party-coloured, and its fat is used by the natives against the sciatica. Another bird is called *sereachanaitin*, which shrieks most hideously: it is as big as a large mull, but longer in the body, of a blueish colour, and its bill of a carnation: it is observed to be extremely fond of its mate, for when either the cock or hen is killed, the other makes a lamentable noise about the place for eight or ten days after. A bird called *faskidor*, about the size of a sea-mew, flies very swift after other birds, forcing them to drop their food, which it catches before it falls to the ground.

These birds are very common in most of the Western islands, particularly in those we are going to describe.

The principal of those properly called the Western

Islands, are a range of narrow islands, extending from north to south, namely, Lewis and Harris, already described, as making a part of Ross-shire, and Vift, which is divided into North and South; and behind them, farther to the west, the isle of St. Kilda, which, though smaller than the other, merits a more particular description.

Vift, which lies to the south of Harris, is a long slip indented with several bays. North Vift is nine miles in length from north to south; it is in part mountainous and heathy, yet serves for pasturage; but the west side being plain and arable, is exceeding fruitful in barley, oats, and rye, and feeds abundance of cows and sheep. This, with the island of Benbecula and South Vift, are by some geographers esteemed one island, because at low water there is an easy passage from one to the other, either upon dry sands or by wading; and together they are about thirty-three miles in length, and contain such a multitude of fresh-water lakes, bays, and islands, that it is said to be impossible to number them, and most of the lakes abound with fowl and fish. North Vift has an excellent harbour on the south-east side in a bay called *Lochmaddy*, famous for a great fishery of cod and ling, and where such quantities have been taken, that four hundred vessels have been loaded with them in one season.

North Vift is separated from a little island named Benbecula on the south by several rocks, and a channel about three miles broad. This small island is only three miles long, and the same broad; but has a harbour for small vessels, and several fresh-water lakes, well stocked with fish and fowl; but in its neighbourhood are several dangerous islands.

South Vift is separated from Benbecula by a channel, which, though two miles broad, is at ebb not above knee-deep. It is twenty-one miles in length, and three or four miles in breadth: the east side is mountainous; but the west, being level, bears good crops of barley, oats and rye, and abounds with cattle. The natives live to a very great age, and speak the Erse tongue in perfection.

We now come to St. Kilda, a little island that may be ranked among the greatest curiosities of the British empire; and therefore, notwithstanding its small extent, deserves particular notice, on account of the genius of its inhabitants, their manners and customs, and the constitution of their little commonwealth.

All the territories belonging to the inhabitants of St. Kilda are no more than three small islands, and five naked rocks. The principal island, together with the rest, is situated in about fifty-eight degrees thirty minutes north latitude, eighteen leagues to the west of North Vift, just described. The length of the whole island is not much more than nine miles, and its breadth does not much exceed six. It is encompassed by an inaccessible barrier of rocks, two places excepted, one to the north-west, and the other to the north-east. The latter has a large bay, formed by two promontories, the first running out to the north-east side of the island, and the other to the south end.

The hand of Nature has divided this island into four distinct parts by five mountains, which to the sea-side are faced with frightful precipices; particularly that which rises gradually from the head of the bay, and may not improperly be called the British Teneriff. Its top in a clear day commands a prospect of land and sea above a hundred and forty miles in length. On the north side it hangs over the deep in a most frightful manner; where a view of it from the sea fills a man with astonishment, and a look over it from above strikes him with horror; yet a St. Kildian will stand or sit on the very brink of this stupendous precipice with the most careless indifference; though its perpendicular height is no less than eighteen hundred yards.

The ground of St. Kilda, like the greatest part of that of the Highlands, is much better calculated for pasture than tillage, and all the arable land scarcely exceeds eighty acres; but a great deal more might be added, was industry and a desire of improvement sufficiently encouraged: but all the lands already cultivated lie very com-

partly together within the precincts of the village in which the whole community dwells. In the lower grounds are many excellent plots of grass, which is in some places intermixed with a beautiful variety of the richest plants, on which the cattle feed luxuriously during the summer season; and here yield more than ordinary quantities of milk. All the arable land is divided into many unequal plots, and each of these is inclosed by the stones picked out of the land; these boundaries are esteemed sacred, and have been kept up for many ages; whence it would be impossible for a St. Kildian, however cunning or avaricious, to encroach on his neighbour's farm. Every inch of ground within these inclosures, is cultivated; which they thus perform; after turning up the ground with a spade they rake or harrow it very carefully, picking out every stone, every noxious root or weed that falls in their way, and pound to dust every clod with a mallet. They then sow their little fields, strew them over with a manure of turf and peat ashes, and having harrowed them over again, leave them, to speak in their own stile, in the hands of Providence, with a firm persuasion that their honest industry will be amply rewarded.

Tho' this island is situated so far north, the harvest is commonly over before the beginning of September, and should it fall out otherwise, the whole crop would be almost destroyed by the equinoctial storms, which, with the excessive quantity of rain that falls generally throughout seven or eight months in the year, are the most disadvantageous circumstances of their situation.

Thus they raise their oats, and their barley, which is larger than in any other of the Western islands: but they have not one tree in all the island. Their horses and cows, though very small, are also somewhat larger than in the adjacent islands.

The St. Kildians owe a great part of their felicity to their sheep and wild fowl. They have considerable flocks of sheep; which are all of the smallest kind, and their wool is short and coarse. Every one of them has two horns, and many of them four.

The wild fowl appear here in innumerable flocks, and according to the Rev. Mr. Macaulay, from whose history we have extracted this account, it is literally true, without any exaggeration, that in summer time several of the rocks are totally covered with solan geese and other fowls, and appear at a distance like so many mountains covered with snow. The nests of the solan geese are so close, that when one walks between them, the hatching fowls on either side can always take hold of one's cloaths, and they will often sit still till they are attacked, rather than expose their eggs to the danger of being destroyed by sea gulls; at the same time an equal number fly about and furnish food for their mates that are employed in hatching. The solan geese repair hither in the month of March, and continue till after the beginning of November. Before the middle of that month, they and all the other sea fowl that are so fond of this coast, retire much about the same time, into some other favourite regions; so that not a single fowl is to be seen from the beginning of winter to the middle of February.

Another sea-fowl highly esteemed in this island, is the tutmer, which the inhabitants say, furnishes oil for the lamp, down for the bed, the most salubrious food, and the most efficacious ointment for healing wounds. It is of the size of an ordinary barn-door fowl, but its legs and wings are much longer. The back, wings, and tail, are of a light grey; round the breast and neck of a lighter colour: his head is round, his neck short and thick; his bill is made for strength, bending inwards, pointed like that of an eagle, and in length about an inch and a half. He is a most ravenous fowl, and feeds only on sorrel and the fat of fish. Pieces of whale and seal blubber are often found in his nest. The young tutmer is no sooner attacked in his nest, than he endeavours to disconcert the fowler by spouting a quantity of oil out of his wide nostrils directly into his face and eyes: which frequently gives him an opportunity of making his escape. But those who are versed in this diversion take all possible precautions to surprize him; for thinking his oil incomparably precious, they exert all their skill and dexterity to save it. Every

tutmer yields near a pint of this liquid substance, which drops out of the nostrils of the fowl while warm, and a considerable quantity of it is annually preserved. Of the fowls themselves every family has a great number salted in casks for winter provisions.

The third species are the lavie, which being the earliest visitants in February, no sooner appear, than the most considerable persons in this state assemble together to congratulate each other, on seeing these harbingers of plenty and happiness; and to divide the people into parties made up of their ablest fowlers. The lavie in size resembles a duck, though rather longer. He is black above, but the whole breast and belly white, with a circle of the same colour round the neck; the bill is black and sharp at the point, and the egg beautifully variegated with black, white and red, blue, green and yellow; but scarce any two are alike. This fowl builds no nest, and like several other species of water fowl, lays but one egg, which she fixes in so nice a manner, that if once touched, one will find it impossible to fix it in the same place again; and if the fowls are surprized so as to start away in a hurry, they tumble down into the sea in thick showers.

These are caught by letting down a man with ropes into the well-known shelves of the rocks, each having a broad piece of linen, or any thing remarkably white fixed on his breast. This is done in the night, when the bird mistaking an object so conspicuous for a part of the rock, endeavours to cling to it, and is immediately caught and dispatched. Thus employed the fowler continues till the dawn, when making the wonted signal by pulling the rope, his companions pull up, by another rope, the prey he has taken, which sometimes consists of four hundred lavies, and then pull up the fowler, whom they care for his courage and dexterity.

They have also a great number of puffins; and too frequently a large sea-gull which is detested by every St. Kildian, it destroying every egg that falls in its way, very often the young fowl, and sometimes the weakest of the old. It is hardly possible to express the hatred with which those otherwise good-natured people endeavour to exterminate these gulls; if one happens to mention them, it puts their whole blood into a ferment. To eat any of its eggs, though amongst the largest and best the island affords, would be most a flagitious action; they therefore extract the meat out of the shell, and leaving it empty in the nest, the gull sits upon it till she pines away.

Among the land birds are very large ravens, a few eagles, with herons, curlews, plovers, pigeons, starlings, larks, wrens, and sparrows.

Every one of the natives of St Kilda who is possessed of a bit of land there, has a proportionable share of the rocks in which the fowls hatch. The divisions are made with singular exactness, and the smallest encroachment on a St. Kildian's property in these rocks, is by an ancient custom severely punished.

The whole body of this little people live together like the inhabitants of a town or city, their houses being built in regular rows forming a street: these habitations are built with stone without either lime or mortar, from eight to nine feet high. All their dwellings are divided into two apartments by partition walls. In the division next the door, which is much the largest, they have their cattle stalled during the winter season; the other serves for kitchen and bed-chamber. There are also a prodigious number of little cells dispersed over the island; these consist intirely of stones, and in them they secure their eggs and wild fowl.

The men are stout and hardy, short, thick and clumsy; but are remarkably strong, will carry heavy burthens, and tug at the oar for many hours, with an almost undiminished vigour: but the women are mostly handsome: their complexions are fresh and lively, and their features fine and regular.

The cloathing of the people is quite coarse, and made for warmth. All the colours known among them, till of late, were black, white, grey, and brown, the natural colours of their sheep; and yellow was their only artificial one. All the linen manufactured among them

is a mere trifle, and extremely coarse: one holiday shirt will satisfy the ambition of the greatest beau among them; and what they wear next their skin, on ordinary occasions, is made of wool. The weavers are but indifferent workmen. Every man is the taylor and shoe-maker of his own family: all the leather in the island, and those nearest to it, is tanned with the tormentil root, and done to great perfection.

The St. Kildians speak a corrupt dialect of the Galic, with a little mixture of the Norwegian: their manner of pronouncing is very singular, for every man, woman, and child, has an unconquerable lisping.

These people are extremely fond of music, whether vocal or instrumental; to a bad violin indifferently played they will dance with rapture, and even the old women will bear a part in these assemblies. They delight much in singing, and their voices are abundantly tuneful. The women, while cutting down the barley in the field, or grinding their corn with their hand-mills in the house, are almost constantly employed that way; and the men, if pulling at the oar, exert all their skill in animating each other by singing some spirited songs adapted to the business in hand; and indeed some bright sparks of fire, and some noble flights of fancy, may be discovered in their otherwise homely compositions. The subjects handled by the bards of St. Kilda, in their odes, are the beauty and accomplishments of their favourites among the fair sex, the heroic actions of their friends, their dexterity in climbing rocks, their superior skill in fishing, their extraordinary vigour, skill, and constancy while at the oar; besides the common topics of personal advantages, and intellectual merit.

They all in general possess the virtue of hospitality in an eminent degree, and behave with the utmost generosity, humanity, and respect, to the strangers who come among them.

They marry early, and their gallantries are generally innocent: impurities fashionable elsewhere, if committed here, are never unattended with infamy; and, as Tacitus observes of the ancient Germans, "No one makes a jest of vice; to debauch, or be debauched, is not called the way of the world." Here wives with great portions never rule their husbands: here a cruel step-mother never persecutes her guiltless step-son for the sake of pelf: here the nuptial tie is always held sacred. An honest desire of preventing or removing the inconveniences of a single life, or pure disinterested love, are the ruling passions in the advances they make to matrimony. If a young fellow be possessed of a spade, rake, creel, and fowling-rod, he marries without the least fear or solicitude, will maintain himself, his wife, and children, live contentedly on a small spot of ground, and pay his rents to the proprietor's steward with barley and feathers.

Drunkennes is not yet introduced here; but the St. Kildians have a most violent passion for tobacco. They buy an annual store of this favourite plant from the steward; which, in spite of their fondness for it, they must manage with the most exact œconomy, as it is impossible to procure a new supply, till the market of another year returns with him. For this universally bewitching article, and for some other goods indispensably necessary, particularly salt, iron, and timber, they barter away their cows, sheep, grain, and feathers. Their riches consist in these commodities; they have scarce any wants, and consequently scarce any desires of the pecuniary kind.

It appears that Christianity was very early introduced into this island. The largest church was dedicated to Christ, and called his temple. It was built of stone without any cement. It is twenty-four feet in length, and its breadth fourteen. This was in former times the principal place of worship in the island, and here they continue to bury their dead. At the distance of a mile from the village is a chapel, which has an altar within, and some monkish cells without. The people have for some time been Protestants of the church of Scotland, and a minister from thence is sent thither. They are devout; attend Divine worship regularly every Sunday; but, with all their virtues, make no scruple of lying, and using all the arts of cunning to deceive the steward, when he makes them his annual visit to receive a heavy tax they are obliged to pay him in proportion to the stock of various kinds they possess; and, among other things, every second he lamb, every seventh fleece, and every seventh she lamb.

The present proprietor is a gentleman named Norman Macleod, whose ancestors have possessed the island for at least two hundred years. He has given a lease of this island, and of every thing belonging to it, to a cadet of his own family, for the yearly rent of about eleven pounds sterling. This is the person called the steward, who before this, or his own rent can be made effectual, must be at the annual expence of fitting out a large Highland boat, to bring his grain, feathers, or any other perquisites that fall to his share, or any commodities he buys from the people, to Harris, where he generally resides.

To conclude the moral character of these people; being at a distance from the seats of justice, they are absolute strangers to the chicanery and delay of the law. And though they are ignorant, and so illiterate, that few of them can read, they firmly believe the existence and providence of a Supreme Being, the immortality of the human soul, the obligations of morality, righteousness, and temperance.

C H A P. XXXI.

Of I R E L A N D.

S E C T. I.

*Of IRELAND in general.**Its Situation, Extent, Air, Soil, Produce, Rivers, and Lakes.*

THIS is a large, and in general a fertile island, seated to the south of the little isles just described; to the west of England and Scotland, from which it is divided by St. George's Channel and a strait about fifteen miles broad, which separates it from part of Scotland: it has the mouth of St. George's Channel on the south; and the great Atlantic ocean, which lies between it and the frozen region of Newfoundland and Labrador, or New Britain, in North America, on the west. It is seated between the fifth degree ten minutes and the tenth degree thirty-seven minutes west longitude from London, and between the fifty-first degree sixteen minutes and the fifty-fifth degree fifteen minutes north latitude. It is allowed to be above half as large as England, and is two hundred and eighty-five miles from Fairhead, the north point of Antrim, to Mizenhead, the south point of Cork, which is its greatest length; but it is much indented on the south-east by St. George's Channel; and on the west and north by the Atlantic ocean, which renders its length very unequal. The greatest breadth, which is from the east part of Down to the west part of Mayo, is a hundred and sixty miles: but in the middle, from Dublin on the east, to the west of Gallway, it is only a hundred and forty-six.

The air is much the same with those parts of England that lie under the same parallel; only in some parts it is more gross and unhealthy, especially to strangers, on account of its many lakes, bogs, and marshes; but in this particular also it agrees with England; where the marshes of Kent, Cambridgeshire, and Sussex, are at least equally unhealthful. It has been observed, that the air is warmer in winter and cooler in summer than in England, but the difference in this respect is not very great. The air is also allowed to be more moist than in England; but this is probably true only of Dublin, and the other places near the sea and the lakes, which occasion more frequent rains.

In general it is a level country, watered by many lakes and rivers, and the soil is in most places very good and fruitful; even those where the bogs have been drained are good meadow ground. Their pastures feed prodigious numbers of cattle; but in several parts they are not so large as in England, on which account a bounty has long been given for the importation of English bulls, and large stone-horses, which have mended the breed. Indeed the far greatest part of the land is used for grazing, whence they are enabled to supply the ships of all the European nations, particularly the English and Dutch, with beef and butter; but advantageous as this trade is, it is carried to an excess that is very prejudicial to Ireland, as it causes agriculture to be neglected, which would employ many more hands, and prevent their being frequently obliged to purchase great quantities of corn from England; from whence it is also not uncommon to purchase ship loads of potatoes, which in many places supply the want of bread. They also raise flax and hemp; and the gardens of Ireland produce all the fruits and vegetables fit for the kitchen, that are to be found in Great Britain, though fine fruit is dearer there than in England.

It ought not to be omitted, now we are treating of the soil, that there are some bogs in this country so deep, as entirely to swallow up a man and horse, who sink an unknown depth, though they are covered with turf which seems to promise solid ground; however, roads have

been made for horses and carriages over these dreadful bogs, by ranging rows of faggots fastened together, and covered with earth, which forms a kind of bridge that shakes under the feet of the passenger. There are other bogs that have too strong a crust of turf to be easily broken, and are constantly passed in safety, though they shake and quiver at every step of the foot.

The turf which grows upon many of the bogs is taken off, dried, and sold for fuel; and is of great use where coals are scarce. There are, however, several pits of excellent coal, and navigable canals are forming in order to convey it by sea to Dublin, and all the other towns on the coast. This country has likewise quarries of several kinds of beautiful marble, also free-stone, a beautiful kind of hard white stone fit for building, full of shining particles which glitter in the sun, and slate; with mines of copper and iron.

The principal rivers of Ireland are the following:

The Shannon, which rises in Loch-Allen, in the province of Connaught, which it divides from Leinster and Munster, and running from north to south, after forming several lakes, turns to the west and falls into the Atlantic ocean, after a course of one hundred and forty-five miles. This river is in most parts wide and deep, and has within it several fine and fruitful islands, with a fertile soil on both its banks: but it is not navigable above fifty miles for ships, on account of a cataract.

The Suir, the Neor, and the Barrow, rise from branches of a mountain named Slieu-Bloom. The Suir has its source in the branch called Bein-Duffe, in the county of Tipperary, and making first a south-east, and then a southerly course for upwards of forty miles, it turns to the north and afterwards to the east, and at length unites its streams with the Neor and the Barrow.

The Neor rises out of the same branch, and taking a south-east course, unites its stream with the Barrow.

The Barrow rises out of the same mountain in Queen's county, and after taking a northerly course, turns to the south, and before it arrives at Ross is joined by the Neor, from whence it continues a southerly course under the name of the river of Ross, and being joined by the Suir, they all lose themselves in the sea at the mouth of the harbour of Waterford.

The Black-water, sometimes called the Broad water, rises out of a mountain in the county of Kerry, from whence being swelled with many streams, it takes first a southerly, and then an easterly course, till at length turning suddenly to the south, it pursues that course till it falls into the bay of Youghall. There are several other rivers in Ireland called the Black-water, one of which falls into the Boyne, another into the Shannon, and another in the county of Wexford, falls into the sea.

The river Bann, famous for its pearl fishery, but more so for its salmon, arises from the mountains in the county of Down, from whence it flows northward, and after a course of about thirty miles, falls into the lake called Lough-neagh, and passing through it, continues its course to the north, dividing the counties of Antrim and Londonderry, and falls into the sea a little to the north-west of Colerain.

The Lee rises out of a lake in the county of Cork, and taking an easterly course of about twenty-six miles, is enlarged by its receiving several rivers and rivulets, till at length passing by Cork, it discharges itself into the sea.

The Liffey is only remarkable for having the metropolis of the kingdom seated on its banks. It rises in the county of Wicklow, and making a circling course through that county and the counties of Kildare and Dublin, discharges itself into Dublin bay, a little below that city;

IRELAND.
from the best
Observations.

Princed sculp.

city; being navigable for barges no higher than the tide reaches.

The Boyne is a much more considerable river than the Liffy: it rises in the King's county, is famous for its excellent salmon, and falls into the sea at Drogheda.

In Ireland are more lakes than perhaps in any other country of the same extent; and these abound more in the provinces of Ulster and Connaught, than in any other parts of the kingdom. They are properly ranked under two denominations, fresh-water lakes, which have no access of the tide or mixture of the sea, and salt lakes, into which the tide flows twice a day, and may more properly be called inlets of the sea.

Of the fresh water lakes, one of the most extraordinary is Lough-lene, in the county of Kerry, which is remarkable for its singular beauties. It is about six miles in length, and, at a medium, near half as much in breadth; and is interspersed with a variety of beautiful islands, many of them rich in herbage, and well inhabited. Eagles and osprays are here in great numbers, and the islands and rocks around the lake are adorned with groves of the arbutus, which for the greatest part of the year bears a scarlet fruit, like the strawberry, with blossoms, leaves, and berries, green or yellow, according to the different stages of their approach to ripeness. The trunks of these trees are frequently four feet and a half in circumference, and nine or ten yards high. In short, the beauties of this lake are not to be described or seen without rapture.

Lough-erne and Lough-neagh are by much the largest in Ireland. The former is divided into two branches, the upper and lower, which are separated by the water being contracted into the compass of a considerable river for some miles, after which enlarging itself, it forms the lower lake. This lough, in both its branches, takes its course through the whole length of the county of Fermanagh, from the south-east point to the north-west, dividing it almost into two equal parts, extending about thirty miles in length, but of an unequal breadth. It is diversified with so many little pleasant fertile islands, that they are said to amount to about four hundred, most of them well wooded; several of them inhabited by husbandmen, and others covered with cattle. It likewise abounds with a great variety of fish, as pike of a prodigious size, large bream, roach, eels, and trout; but it is chiefly valued for its salmon, which are caught in great draughts by nets, in the river which flows out of the lake, the fishing of which is valued at five hundred pounds a year.

Lough-neagh is somewhat of an oval form, but indented on every side. It is esteemed the largest lake in Ireland, and is exceeded by few in Europe; it being twenty miles long from the north-west point to the south-east, near fifteen miles from the north-east to the south-west, and ten or twelve broad at a medium. Within these dimensions is not included a small lake called Lough-beg, or the Little-lake, which is joined to the north-west end by a narrow channel, and is four miles long and as many broad. Lough-neagh communicates its benefits to five several counties, Armagh, Tyrone, Londonderry, Antrim, and Down; the latter of which it only touches by a small point on the south-east side. It receives six considerable rivers, four of lesser note, and several brooks; yet has but one narrow out-let to discharge this great flux of water. This lake is remarkable for its salutary effects in curing ulcers and running sores on those who bathe in it; and for incrusting the wood which lies in it with stone. On the shores of this lake have been found a variety of beautiful pebbles, crystals, cornelians, and agates. It also abounds with fish of various kinds, in innumerable quantities, and of a large size. It is particularly remarkable for two sorts of trouts, one called the dologhan, which is said to be from fourteen to eighteen inches in length, which it never exceeds, and always spawns in the rivers that supply the lake: the other is called the bodach, or churl, some of which have been taken that weigh thirty pounds weight.

There are a considerable number of such lakes as may more properly be called inlets of the sea; among these are,

Loch-foyle, a large oval lake, about fourteen miles long, and from six to eight miles broad, into which

the sea flows by a channel not much more than a mile over.

The lake of Strangford, in the county of Down, which extends from Newtown in the north to Strangford in the south, about thirteen Irish miles; and in some places it is three, in others four, and in others five miles broad. There are dispersed in it fifty-four islands, small and great, known by particular names, and others nameless. On the side of it, near the coast of the barony of Dufferin, is a group of small islands called the Scatterick islands, some of which are noted for restoring and fattening distempered horses; others are stocked with rabbits, and to others resort a multitude of swans, wild-geese, widgeon, teal, and four or five sorts of divers.

There is perhaps no country in the world that abounds more with spacious and commodious harbours than Ireland; yet there are few countries to which less benefits arise from trade: but these harbours will be mentioned in treating of the several provinces and counties of this kingdom.

S E C T. II.

The Persons, Character, Habits, Genius, Temper, Dress, Religion, Government, and Trade of the Irish.

THE Irish are in general a strong-bodied, nimble, active people; many of both sexes are tall, handsome, and genteel; but this is far from being a characteristic of that nation, since a still greater number are deficient in these natural endowments, and are as clumsy, as ill-shaped, and have as disagreeable features as the majority of other nations. The men are bold, hardy, and far from being deficient in true bravery and manly courage: but those who are well-bred have an assured address, a fluency of speech, and a flow of compliments, especially when in the company of the ladies, that is not easily acquired by the more bashful English; who are too apt to want that graceful assurance which is necessary to set their own merit in a proper light. It will not be doing injustice to the character of the Irish to say, that they are haughty, vain glorious, quick in resenting a supposed affront, and violent in all their affections. On the other hand, they have generally a fund of good-nature, and all ranks are particularly remarkable for their hospitality. However, the morals of children are less attended to in their education, than they generally are in those of people of the middle rank in England; and hence a disregard for truth, and many other faults, are too often suffered to take root in their ductile minds; those at least of the lower class have been frequently charged with having little or no regard to the sacredness of an oath. Indeed evil dispositions often arise from trivial causes; it is customary in the meaner trades, if any thing be missing, for the master to make each of his journeymen swear that he has not taken it, by handing the Bible or the mass-book to each, and for a drunken fellow, when severely lectured by his wife, to take up his mass-book and kissing it, swear never to enter a public-house for a stated time; these resolutions are seldom kept; and thus perjury, being rendered familiar, all idea of the awful solemnity of an oath is entirely lost, and the unhappy wretch is prepared, for the sake of the smallest profit, to practise in a court of judicature what he has too often performed at home. But, notwithstanding this, there are in Ireland many persons of the strictest integrity, humanity, virtue, and honour.

The Irish have been reproached for want of genius, and by the ignorant have been frequently termed a nation of blunderers; but these aspersions are very unjust, since Ireland has produced many persons whose genius and learning would have done honour to any nation: among which are the learned Dr. James Usher, that great philosopher, the honourable Mr. Robert Boyle, several of the earls of Orrery, Mr. Molineaux, the friend of the great Mr. Locke, Sir Richard Steel, dean Swift, &c.

The ancient habit of the Irish was a doublet and close breeches, over which they wore a frize cloak, with a fringed or shaggy border. The women wore a kind of mantle, or a blanket called a caddah over, their head and shoulders

shoulders, and underneath a long gown; and both men and women had a kind of shoe without a heel made of half tanned leather, called a brogue: but at present all sorts of persons conform to the English dress, except in the brogue, which is worn by the poor in the country, and sometimes the caddah. But it is very common for the lowest of the people to wear neither any sort of shoes, nor stockings, except when they are dressed: particularly when they travel on foot, they usually walk without their shoes and stockings, which they put on before they enter any town, and pulling them off, when they have left it, put them in their pocket. This they alledge keeps their feet cool, and prevents their losing their time by picking their way through the dirt, or going round to escape crossing a rivulet.

The Irish tongue bears some affinity to the Welch and Erse; and all three are supposed by some to be only different dialects of the same language, more particularly the first and the last. Some of the Irish characters are very different from ours; however, very few of those who speak the language very fluently, are able either to write, or even to read it. Business is principally transacted in English, and in the great towns the chief traders are descended from the English and Scots, and are intirely ignorant of the Irish tongue.

The established religion in Ireland is the same as in England. The church is under the government of four archbishops, namely, the archbishop of Armagh, who has the title of primate of all Ireland; the archbishop of Dublin, who is stiled primate of Ireland; and those of Cashel and Tuam. Under these four archbishops are nineteen bishops; namely, under Armagh are the bishops of Meath, Clogher, Down, Kilmore, Dromore, Raphoe and Derry. Under the archbishop of Dublin, the bishops of Kildare, Ossory and Ferns. Under the archbishop of Cashel, the bishops of Limerick, Waterford, Cork, Cloyne, and Killaloe. Under the archbishop of Tuam, Elphin, Clonfert, and Killala. These several prelates have their deans, and other dignitaries, except Meath, which has neither dean, chapter, nor cathedral; but the archdeacon is the head officer of the diocese, the affairs of which are transacted by a synod in the nature of a chapter, who have a common seal, which, by a vote of the majority, is annually lodged in the hands of one of the body.

Dissenters of all denominations are tolerated in Ireland, particularly Presbyterians, Baptists, and Quakers. But the far most numerous body are the Papists, who have their bishops and other dignitaries like the established church; but neither they, nor the inferior clergy of that communion, have any other revenues than the voluntary contributions of the laity. It is supposed that throughout Ireland there are about eight Papists to one Protestant; but in the capital the disproportion is only as four to one.

For the promotion of learning in Ireland, there is one university, and several free-schools erected for the education of youth; and for promoting the principles of real Christianity among the poor Popish natives of Ireland, and enuring them from infancy to industry, and obedience to their sovereign, is instituted the incorporated society for promoting English Protestant working schools.

With respect to the constitution of the Irish government, it is nearly the same with that of England. The power of the lord lieutenant, who represents the king, is in some measure restrained, and in others enlarged, according to the king's pleasure, or the exigencies of the times. On his entering upon this honourable office, his letters patent are publicly read in the council chamber; and having taken the usual oath before the lord chancellor, the sword, which is to be carried before him, is delivered into his hands, and he is seated in the chair of state, attended by the lord chancellor, the members of the privy council, the peers and nobles, the king at arms, a serjeant at mace, and other officers of state, and he never appears publicly without being attended by a body of horse-guards. Hence with respect to his authority, his train and splendor, there is no viceroy in Christendom that comes nearer the grandeur and majesty of a king. He has a council composed of the great officers of the crown, namely the chancellor, treasurer, and such of the archbishops, earls, bishops,

barons, judges, and gentlemen, as his majesty is pleased to appoint.

The parliament here, as well as in England, is the supreme court, which is convened by the king's writ; but the representatives of the people enjoy their seat in the house during life, or till the death of the king. The laws are made in Ireland by the house of lords and commons, after which they are sent to England for the royal approbation; when, if approved by his majesty and council, they pass the great seal of England, and are returned. Thus the two houses of parliament make laws which bind the kingdom; raise taxes for the support of government, and for the maintenance of an army of twelve thousand men, who are placed in barracks in several parts of the kingdom. The house of lords consists of the four archbishops, thirty-five earls, forty-five viscounts, eighteen bishops, and thirty-five barons; and the house of commons of three hundred members.

For the regular distribution of justice there are also in Ireland, as well as in England, four terms held annually for the decision of causes; and four courts of justice, the chancery, king's-bench, common pleas, and exchequer. In the first the king's chancellor and keeper of the great seal alone presides; but in the courts of king's bench and common pleas, are three judges in each; and in the exchequer, a treasurer, chancellor, and three barons, and in all of them several subordinate officers. Here is likewise a court of Exchequer chamber for correcting errors in the other courts; in which the lord chancellor and lord treasurer preside, with other assistant judges. Here are also judges of assize and jail delivery; these are those of the supreme courts, who take their circuits twice a year, into the several counties, that of Dublin excepted, for the trial of prisoners, and suits of nisi prius between party and party; as also a court of admiralty, which has jurisdiction, in maritime affairs, and is administered by commission from the admiralty of England.

Besides these there are spiritual courts; as the courts of prerogative, where a commissary, judges of the estates of persons deceased, whether in estate or by will; and in every diocese is a consistory court, from whence appeals lie to the supreme court of prerogative, and from thence to a court of special delegates appointed by the king.

There are likewise governors of counties, and justices of the peace, appointed by the king's commissions, through the several counties, to preserve the peace in the place where they reside; and also high and petty constables, and other officers, instituted for the same purpose: but the chief officer of every county is the high sheriff, who was formerly chosen in the county court by the suffrages of the people, but is now nominated by the chief governor.

With respect to the trade of Ireland, the discouragement laid upon it by the act of navigation and other laws made in England, are so numerous, that it cannot be expected it should flourish to such a degree as its natural situation, extended coasts, commodious harbours, bays, and rivers seem to promise; a discouragement that will ever continue, till the English shall become sensible that it is for their interest to allow Ireland a free trade, which will probably be one time or other the case, as it will be for the advantage of both kingdoms; since this will enable Ireland to pay greater taxes, and the wealth of that country must in a great measure center in this. The chief exports of Ireland consist of linen cloth and yarn, lawns and cambricks, which are manufactured to great perfection, and exported to considerable advantage; the English laws giving great encouragements to this branch of trade, which, with a few exceptions, may be said to be the source of all the wealth in Ireland. To these may be added wool and woollen yarn exported to England only; beef, pork, green hides, some tanned leather, calf-skins dried, great quantities of butter, tallow, candles, ox and cow horns, ox hair, a small quantity of lead, copper ore, herrings, dried fish, rabbits-skins, and furr, otter-skins, goat-skins, salmon, and a few other particulars. Wool and yarn are allowed to be exported only to England, but from the thirst of gain, all hazards are run to send them by stealth to France, to the great detriment of the English woollen trade; and perhaps the best method of preventing it for the future, would

would be to restore the woollen manufacture to Ireland, at least in the coarse branches of it, and to make it the interest of the Irish to employ their wool at home.

The Irish, notwithstanding the discouragements laid on their woollen manufactories, import considerable quantities of broad-cloth, which they certainly might make at home; also all kinds of groceries, coals, brads, hardware, and a great number of other particulars; besides a considerable quantity of wine from France, Spain, and Portugal.

We shall conclude this section with observing, that Ireland is divided into four provinces, which, beginning at the south, are Munster, Leinster, Connaught, and Ulster; the first and last of which extend from one sea to the other.

S E C T. III.

Of the Province of Munster, containing the Counties of Cork, Waterford, Tipperary, Limerick, and Kerry; their Situation, Extent, Produce, Rivers, and principal Towns.

THE province of Munster is bounded on the east and south-east by the province of Leinster and St. George's Channel, on the south and west by the Atlantic ocean, and on the north by the provinces of Connaught and Leinster. It extends a hundred and thirty miles in length from Waterford haven in St. George's Channel to the west point in Kerry, and a hundred and twenty in breadth from the north parts of Tipperary to Baltimore in Cork; but from Baltimore to the north parts of Kerry it is only sixty-eight miles. The circumference, including the great windings and turnings, is above six hundred miles.

It is divided into five counties, namely, Cork, Waterford, Limerick, Kerry, and Clare, which are subdivided into fifty-two baronies, containing one archbishoprick, and five bishopricks, seven market-towns, eighty parishes, and twenty-five boroughs.

It enjoys a mild temperate air, has many excellent bays, havens, and good towns. The soil is in some parts hilly and woody, mixed with wild solitary mountains; but the vallies are adorned with pleasant meadows and corn-fields. Its principal commodities are cattle, wood, wool, and fish, especially herrings and cod.

Cork was formerly a kingdom, and contained all the country between Lismore and Brandon-hills, in Kerry, where it faces Desmond to the west, and includes a part of it. It is bounded on the east by Waterford; on the west by Kerry, where it is also washed by the sea; on the north by Limerick; and on the south and south-east by the Atlantic ocean and St. George's Channel. The form is very irregular both in length and breadth.

It is divided into fifteen baronies, and is partly woody and mountainous, and partly fenny; yet it has many good towns, and abounds in fine rivers, and good harbours: the inhabitants are industrious, and the county is both rich and populous. A copper mine has been discovered near Cork. This county gives title of earl, as well as Burlington in England, to the noble family of Boyle, and sends twenty-six members to parliament, namely, two knights for the shire, and two burgesses for each of the following towns, the city of Cork, Youghal, Kinsale, Bandon-bridge, Moyallow, Baltimore, Cloug-wikelty, Shareville, Castlemartyr, Middletown, Rathcormach, and Doneraile.

The principal places in this county are the following:

Youghal, a considerable sea-port, seated at the mouth of the Broadwater, is not very large, but is walled round, and divided into two parts. The upper part, which extends to the north, and is the largest, has a church within the town, and a little abbey without the walls. The lower part towards the south has another abbey. The convenience of the harbour, its good quay, and the fertility of the adjacent country, draw so many merchants to it, that the town is pretty populous and rich. It has in particular a good fishery; but before the harbour is a bar, which can only be passed at high-water.

Cork, a large, populous, and wealthy city, is seated on the river Lee, in the fifty-first degree forty-five minutes north latitude, and in the seventh degree thirty minutes west longitude, a hundred and twenty-nine miles north-west of Dublin, and is of an oval form, inclosed with walls and the channel of the river, which also crosses it. It is said to contain above eight thousand one hundred houses, chiefly inhabited by English Protestants, who, by their industry, have so far improved their estates, and their trade, that it is esteemed the richest city in Ireland, next to Dublin. It stands about seven miles up the river from the sea, where the mouth of the harbour is two miles broad. Large ships generally ride at a place called Passage, but smaller vessels come quite up to the quay. This is the chief port for merchants in the kingdom; and there is, perhaps, more beef, butter, and tallow, shipped off here, than in all the other ports of Ireland put together. Hence there is a great resort of ships to this port, particularly of those bound from England to Jamaica, Barbadoes, and all the Caribbee Islands, which put in here to victual and compleat their lading. This city, with its liberties, is about three miles round, and forms a county of itself. It has two gates, one to the north, and the other to the south. The cathedral and the red abbey are on the south side of the town; St. Francis's abbey and Shandon church on the north side. Here is also a steeple, supposed to have been built by the Danes, and to have been at first used by them as a watch-tower; and near the river is a custom-house and store-house.

Five miles below Cork, the channel of the river dividing, forms a large and pleasant island, on which are several villages.

Kinsale is a neat, handsome, populous, and rich town, seated in a fruitful soil, near the mouth of the river Bann, a hundred and eighteen miles from Dublin. It has an admirable harbour, and a good bay, with a light-house upon a peninsula called the Old Head of Kinsale, which forms the bay, and guides the ships in the night to the mouth of the river. There is a bar before the port, but the pilots find from three and a half to four fathoms water in the shoalest place upon the bar at low-water, so that ships of any burthen may go over it when the tide is up; and even at the quay, where is the custom-house, is twenty feet water. This is reckoned the second town in the county, many ships belonging to it; and great quantities of provisions are exported from hence to Flanders, Holland, France, and the English islands in the West Indies. Within two miles from the quay, below the town, are two very strong forts, one on each side of the river, almost opposite, which effectually secure the harbour from all attacks by sea: the town is also so fortified with good lines and out-works, as to be safe from any sudden alarm by land. It gives title of baron to the ancient family of Courcy.

Cape Clear is an island so called from its Cape, where is a castle for the security of ships, which take shelter under its cannon; for it is far advanced into the sea, and is of great advantage from its being an opening to the south coast, whence, in war-time, there are generally some men of war stationed to cruize and keep the coast free from privateers; this being the southernmost island, as Mizen-head to the west is the southernmost land of Ireland. Between this and the mouth of the Shannon are innumerable bays and creeks, harbours and roads for shipping.

The county of Waterford is so surrounded by the Blackwater, the Suir, and the sea, that it forms a peninsula.

It is divided on the east by its haven from the county of Wexford, in the province of Leinster; on the south it is bounded by the ocean; on the west by the county of Cork; and on the north by the river Suir, which separates it from Tipperary and Kilkenny. It extends forty-six miles in length, and twenty-four in breadth; though in some places it is pleasant and fertile, yet for the most part it is mountainous, and has a very indifferent soil. It is subdivided into six or seven baronies, and, as well as Wexford and Shrewsbury, gives title of earl to the ancient and noble family of Talbot. It sends ten members to parliament, namely, two for the county, and

and two for each of the following towns, the city of Waterford, Lismore, Dungarvan, and Tallow.

The principal places in this county are the following :

Waterford, the only city in the county, is conveniently seated for trade, seventy-five miles from Dublin ; but has a thick air, and barren soil. It lies four miles and a half from the mouth of the river Suir, where it joins with the Nure and the Barrow ; these together form the haven, which runs about nine miles up the country, and is all the way deep and clear. It is commanded by Duncannon fort, and on the west side of the town is a citadel. There are likewise a block-house and store-house on the south side of the quay. The city and its liberties, which take up a great extent, form a county of themselves. The town is close built, and has a handsome cathedral. It also encreases in fine buildings ; and as ships of burthen come up close to its fine quay, which is a very noble work, it has a very great foreign trade.

Dungarvan is seated upon a bay of its own name, twenty-one miles from Waterford, and ninety-two from Dublin. It is a walled town, defended by a castle ; but though it has a commodious road for ships, it has now but little trade, and is a place of no great consequence. It gives title of viscount to the earl of Cork.

Lismore is seated on the river Broadwater, thirteen miles from Dungarvan, and is adorned with the chief seat of the earl of Cork and Burlington, which has a noble park. It was formerly the see of a bishop, and has a handsome cathedral ; but most of its possessions being alienated, it was long ago annexed to the see of Waterford. It has also a free-school, and an alms-house.

Tallow is seated near the borders of Cork, in a fine fruitful vale, five miles from Lismore, and is a handsome, flourishing town. It stands near the river Bride, which being navigable from hence to Youghal, renders it a place of good trade.

The county of Tipperary is bounded on the east by Queen's-county and the county of Kilkenny, on the south by those of Cork and Waterford, on the west by the county of Limerick and the river Shannon, and on the north and north-east by King's-county and the territory of the O'Carrolls. It is of a very irregular form, but is computed to be sixty miles in length, and thirty-six in breadth.

This county is subdivided into fourteen baronies, and has four boroughs, with several other market-towns. It sends eight members to parliament, namely, two for the county, and two each for the city of Cashel, and the boroughs of Clonmel and Fethard.

The south part of this county being fruitful, produces much corn, and is well inhabited ; both that and the west point abound in good pastures, and fine sheep-walks, which furnish the greatest and best flocks of sheep in Ireland ; but the north part is barren, and very mountainous.

Cashel, the only city of this county, and the see of an archbishop, stands eighty miles south-west of Dublin. The cathedral is seated without the city, on a steep rocky hill ; but the height of its situation exposes it too much to the wind. In the ascent to it is a great stone, at which, it is said, every new king of Munster used to be publicly proclaimed. The city gives title of viscount to the family of Moore, but is ill inhabited, and is a place of no consequence.

Clonmel is a rich, populous, neat, and pretty strong town, seated on the Suir, on the borders of Waterford, twelve miles from Cashel, and eighty-two from Dublin. It is walled round, and has barracks for two troops of horse. It is the county town, and has a fine court-house and jail.

Carrick is also a fine town on the same river, and has barracks for horse. It stands ten miles from Clonmel, and had one of the seats of the late duke of Ormond, with one of the finest parks in the world.

The county of Kerry is bounded on the south and east by the county of Cork, and on the west by the Atlantic ocean, extending sixty miles in length, and forty-seven in breadth. It is subdivided into eight baronies, and sends eight members to parliament, namely, two for the

county, and two for each of the boroughs of Dingle, Trailey, and Ardfert.

It is in general a woody mountainous country, but has in many places good corn and grafs.

The principal places it contains are Trailey and Dingle.

Trailey, or Trally, the county town, where the assizes are kept, stands near a large bay of the same name, four miles from the sea, and a hundred and thirty from Dublin, and is a thriving place.

Dingle stands almost at the end of a peninsula, near a bay of its own name, upwards of a hundred and sixty miles from Dublin. It has a good convenient harbour for trade, is walled round, and is the chief market-town of the county, as also the most westerly town of note in the kingdom. The bay, which is one of the largest of Ireland, runs twenty-eight miles up the country, is fifteen miles broad, and has several harbours.

S E C T. IV.

Of the Province of Leinster; containing the Counties of Lowth, East-Meath, West-Meath, Longford, Dublin, Kildare, King's-County, Queen's-County, Wicklow, Catherlogh, Kilkenny, and Wexford ; their Situation, Extent, Divisions, and Produce ; with an Account of their principal Towns, and a particular Description of Dublin.

THIS province is washed on the south and east by the sea, and is much indented by the provinces of Munster, Connaught, and Ulster ; the two former of which bound it on the west and south-west, and the latter on the north. It is separated from Connaught by the Shannon, and from a part of Munster by the Suir ; extending in length about a hundred and twelve miles from the most northern parts of East Meath to the southern point of Wexford, about seventy in breadth from Wicklow to the most western part of the King's-county ; and the circuit, including the turnings and windings, is computed at about three hundred and sixty miles.

This province is divided into the counties of Lowth, East-Meath, West Meath, Longford, Dublin, Kildare, the King's county, the Queen's county, Wicklow, Catherlogh, Kilkenny, and Wexford ; containing ninety baronies, and nine hundred and twenty-six parishes, under one archbishop and three bishops, with forty-seven parliamentary boroughs. The market towns, and other places of trade, amount to sixty three.

The principal rivers of this province are the Barrow, the Boyne, the Nure, the Liffey, the Slaine, and the May in Queen's-county, which falls into the Shannon.

This province has a temperate, clear air, with a soil fruitful in corn and pasture, and tho' some parts of it are woody, it in general abounds with cattle, fowl, milk, butter, cheese, fish, and those little ambling horses called hobbies.

The county of Lowth, which was formerly reckoned a part of Ulster, is washed on the east by St. George's channel ; and on the south-east by Meath, from which it is parted by the Boyne ; on the west, it has Monaghan and East Meath ; and on the north Armagh and Carlingford bay. This is the least county in the kingdom, it being only twenty-five miles from north to south, and thirteen, where broadest, from east to west ; but in many places is much shorter and narrower. It is divided into four baronies : besides the town and liberties of Drogheda, which are a distinct county, it sends two members to parliament, namely, two for the county, and two for each of the following burghs, Atherdee, Carlingford, Dundalth, and Dunleer. It is fruitful in corn and pasture. The places of most note, as they lie from north to south, are those which follow.

Carlingford, one of the best harbours in Ireland, is seated on the south side of a large bay of its own name, where the road is exceeding good, quite to the sea, as is also the harbour, which has room for the whole royal navy of Great Britain, since it extends three leagues up the country, is two miles broad where narrowest, and has from ten to twenty fathoms water. There is a bar, indeed, across the mouth of the main port or bay, but it

is even there nine or ten feet deep at low water, and two fathom more at high tide. However, the town being a little out of the way of business, has not a trade equal to the extent of its harbour. It stands forty-nine miles from Dublin, has a well frequented market, and is far from being a despicable or poor place, there being some merchants here and trade with their own ships, built in the dock of this town, and use them in the coal trade to Whitehaven, as also in the fishery, which is the life of trade in all this side of Ireland. Carlingford has likewise a considerable trade in linen and linen yarn. The town is rather neat than fine, and rather large than populous; and though it is not a place of strength, is strong enough to defend itself in ordinary cases, particularly on the sea-side. It has barracks for a company of foot, and is famous for being an important pass between the northern and southern counties.

Dundalk is seated on a large open bay, but its haven is so shallow at low water, that people may walk over it dry shod. It is seated forty miles from Dublin, and was formerly walled and defended with fortifications, but is now an open place; it is the county town, and has a good market. It has a manufactory of cambricks, which is brought to great perfection, and corn is frequently sent from this port to Dublin. An infirmary has been lately erected here. Near the town are several salt works, which employ a great number of hands.

Drogheda is the largest town in the county, and seated on a bay of its own name, twenty-two miles from Dublin. It has a good harbour, but it is of difficult entrance, and requires the assistance of a pilot. It is a handsome well built town, is very populous, has a town house, and is divided into two parts by the river Boyne, over which is a good bridge. They have a good trade here to the north parts of England, and the inhabitants are supplied with a great quantity of coals from Whitehaven, which they send by land to all the country round, as well as up the Boyne. It gives title of Earl to the family of Moore.

The county of East-Meath is bounded on the north and north-east by those of Cavan and Lowth; on the east by St. George's channel; on the south by the counties of Kildare and Dublin; and on the west by Longford and West-Meath; extending thirty-two miles from north to south, and twenty-five from east to west. It is subdivided into eighteen baronies, and six boroughs, which send two members each to parliament, besides those for the county; these are Trim, Athboy, Navan, Kells, Duleck, and Ratoath.

This is a plain, fruitful, pleasant, and populous county, which feeds many herds of cattle, and abounds in corn. It gives title of earl to the family of Brabazon.

The principal town in this county is Trim, which has a small market on the Boyne. It had formerly a castle, and was walled. It stands twenty-three miles from Dublin. This and the town of Navan have each of them barracks for a troop of horse.

The county of West-Meath is thus called from its being situated to the west of the former, and extends west to the Shannon, which parts it from Roscommon: it also lies between Longford on the North, and King's-county on the south. According to some it extends forty miles in length, and twenty in breadth, while others say that it is only thirty miles either way. It contains thirteen baronies, and sends ten members to parliament, namely, two knights of the shire, and two burgesses each for Mullingar, Fore, Athlone, and Killbeggan.

Mullingar, which lies in the center, is forty miles from Dublin, and is a market-town of considerable note, with barracks for a troop of horse. This is the head of the county by act of parliament, and here the sessions of the county are held.

Athlone is seated about fifty miles from Dublin, on the banks of the Shannon, over which it has a bridge, which leads into the county of Roscommon, in which is part of the town, and is defended by a castle. It is a place of considerable strength, it being reckoned the key of Connaught. General Ginkle, for the valour he shewed at the siege of this town, was erected earl of Athlone, by

king William, and the title is still enjoyed by his descendants.

The county of Longford is bounded on the east and south by West-Meath; on the west by the Shannon, which separates it from Roscommon; on the north-west by Leitrim; and on the north by Cavan; extending twenty-seven miles in length, and sixteen in breadth. It is subdivided into six baronies, and contains twenty-four parishes, four boroughs, and sends ten members to parliament, namely, two for the county, and two for each of the following towns, Longford, Granard, Laneshorough, and St. Johnstown. It has some bogs and fenny pastures, yet is in the main a rich pleasant country, and has several lakes, which abound with fish. The principal towns are Longford and Laneshorough.

Longford stands on the banks of the Camlin, and is the capital of the county. It has a castle and barracks for a troop of horse.

Laneshorough is also seated on the Shannon, is sixty-six miles from Dublin, and has also barracks. It gives title of viscount to the family of Butler.

The county of Dublin is bounded on the east by St. George's Channel; on the south by the river Bray, which parts it from Wicklow; on the west by the county of Kildare; and on the north by East Meath and the river Nanny. Its greatest extent from north to south is twenty-six miles, and from east to west fifteen.

It is divided into six baronies, and sends two members to parliament, namely, two for the county, two for the city of Dublin, two for its university, two for the borough of Swords, and two for that of Newcastle.

The south parts are but little cultivated, being somewhat mountainous, but the rest is level and fruitful, and abounds with fish, tame and wild fowl, besides deer in the noblemen's parks.

Dublin is pleasantly seated at the mouth of the little river Liffey, in the fifty-fifth degree twelve minutes north latitude, and in the sixth degree fifty-five minutes west longitude, sixty-four miles to the west of Hollyhead in Wales, and two hundred and sixty-eight to the north-west of London. This is the mart and center of commerce for the whole kingdom, excepting such ports as are eminent for some particular branch of trade; though its harbour is so far from being commodious that it has a bar at its mouth, so that ships of great burthen cannot venture in; nor can those which are able to pass the bar, come up loaded to the quay, they being obliged to lie at Poolbeg, three miles below Dublin, and to deliver their goods by lighters. Great pains and expence have, however, been bestowed in order to render this bay as safe and commodious as possible: banks faced with stone have been extended for a considerable length on both sides, and particularly, a new wall has been lately built on the south. By these means, a great extent of land which used to be overflowed every high tide, has been taken from the bay, in order to render the harbour deeper; and to prevent ships leaving the proper channel, a durable row of piles has been fixed, between which ships may sail in the utmost security.

The Castle of Dublin, which twenty years ago was an ancient structure, consisting of several round towers of stone, mouldering into ruins, has been rebuilt in a magnificent manner; and contains many stately apartments. Before it is a handsome area, with a very fine street, leading down to Essex-bridge, which has been lately rebuilt after the model of that at Westminster, though the Liffey, over which it is extended, is not more than one fourth as broad as the Thames. Just below the bridge, on the south side of the river, is a very noble Custom house, with the front supported by piazzas. Before it is a handsome and spacious quay, with conveniencies for landing of goods. Besides the bridge just mentioned, there are several others of stone; but these are not worthy of a particular description.

To the eastward of the castle is a spacious area, on one side of which is the parliament house, the front of which is supported by very lofty columns; these are extended on each side in the wings, which reach to the street. These columns rise almost to the top of the building,

is only terminated by a very large and grand entablature, that seems to want a balustrade, which if adorned with statues or vases, would render the building compleat, and for want of which it seems unfinished; though it must be acknowledged to be a magnificent structure. In the area before the parliament house, is an equestrian statue of king William the Third.

Near the parliament house is Trinity college, which was founded by queen Elizabeth in 1591, and made an university by that princess. Its revenue has been since increased by several donations. The building consists of two squares, one behind the other: in the first is a noble library. The university has also an elaboratory, and a great number of skeletons and curiosities relating to anatomy, particularly a mummy remarkably perfect. The front, and all the old parts of this structure, have been lately rebuilt in an elegant manner with stone.

Near the other side of the area, behind the houses which front the parliament house, is the round church, which in the inside is very beautiful, it being covered with a dome, and adorned with a great deal of carved work and gilding. The form of this rotunda has a very pleasing effect, and its elegant decorations render it still more agreeable to the eye of the beholder.

At a small distance to the south, is St. Stephen's Green, a very fine square, in which are many noble buildings, and a large area in the middle. This affords a very pleasant walk, a mile in circuit.

Among the churches, the cathedral, dedicated to St. Patrick, is a fine old Gothick structure, famous for its curious workmanship within, arched roof, and high steeple, and also for its moveable pulpit, which till the people are seated, and divine service is ready to begin, stands in a corner of the church; but to the surprize of the stranger, is removed into the great aisle frequently without being observed; and he sees a minister in the pulpit, where a minute or two before was an open space. To this church belong a dean, a chanter, a chancellor, a treasurer, two archdeacons, and twenty-two prebendaries.

In the heart of the city is the collegiate church, called Christ-church, though it was dedicated to the Holy Trinity. This is a handsome structure in the inside, but it has nothing remarkable without. Thither the lord lieutenant and lords justices always go in state, on solemn occasions, though there is a church belonging to the castle.

Among the other churches there are several very beautiful structures.

At the west end of the town are the Barracks, which are very handsome and extensive stone buildings, raised upon an eminence, and ranged in several fronts and wings, joined together, with a very beautiful prospect of the open country before it. A neat chapel, with a steeple, has been lately added, where divine service is duly performed.

A little beyond the Barracks is the Phoenix-park, which consists of a pleasing variety of hills and vales, is planted with trees, and stocked with deer. A commodious road extends through it to the ring, where it encircles a very fine Corinthian column, bearing on the top a phoenix in the flames, erected by the earl of Chesterfield when lord lieutenant of Ireland. Hither a train of the nobility and gentry go in their coaches on the fine summer evenings, and make a very splendid appearance, there being frequently two hundred coaches and upwards, many of them drawn by six horses, with the servants of the greatest number of them in rich liveries; these coaches are drove round the ring, as was formerly the custom in Hyde-park: and as there is room for several coaches to go abreast, persons frequently converse together through the windows. In the park there are also very handsome seats for those who walk.

Opposite the Barracks, on the other side of the river Liffey, at a considerable distance, stands the Royal Hospital, founded by king Charles II. a very noble structure, in which there are apartments for old and disabled soldiers, five hundred of whom are maintained here, with their officers, much after the manner of Chelsea.

At a small distance from the above edifice is Stephens's hospital, founded by Dr. Stephens and his sister, a maiden

lady, for the cure of all sick and wounded persons who are objects of charity. This is a neat and elegant structure, and is endowed with a great revenue.

Near it is the hospital for idiots and lunatics, erected in pursuance of the will of the late dean Swift, celebrated for his wit and his writings.

Besides these truly charitable and humane endowments, there are three hospitals, or infirmaries, for the sick and wounded, namely, the Charitable infirmary, Mercer's hospital, and the Meath hospital; with one particularly appropriated to the use of incurables; a Lying-in-hospital, lately built in a superb manner, and in imitation of which the Lying-in-hospitals in the cities of London and Westminster were founded.

One of the most considerable of the charitable foundations of this city is the Poor-house, in which a great number of old and decayed persons are maintained; infants are also received, brought up, educated, and inured to labour. The girls in particular are taught to spin, and the boys to dress flax. The Blue-coat-hospital and Free-school was erected in 1680 by king Charles II. for educating, maintaining, and putting out apprentices to trades or sea-service the sons of the reduced citizens of Dublin, and contains about a hundred and sixty boys.

The city is governed by a lord mayor, who is granted a considerable sum to enable him to support the dignity of his office, and wears a collar of SS. and by twenty four aldermen. Every third year the city and its suburbs are surveyed by the lord mayor and the twenty-four corporations, which are, 1. The merchants, 2. The taylor, 3. The smiths, 4. The barber surgeons, 5. The bakers, 6. The butchers, 7. The carpenters, 8. The shoemakers, 9. The sadlers, 10. The cooks, 11. The tanners, 12. The tallow-chandlers, 13. The skimmers and glovers, 14. The weavers, 15. The sheer-men and dyers, 16. The gold-smiths, 17. The coopers, 18. The felt-makers, 19. The stationers, cutlers, and paper-stainers, 20. The bricklayers and plaisterers, 21. The curriers, 22. The hosiers, 23. The brewers and maltsters, 24. The joiners and wainscoters. All these several companies vie with each other in making a splendid appearance, and several of them have very fine pageants, consisting of large and beautiful carriages, in which are exhibited some remarkable particulars, or circumstances, relating to the company to which they belong. Thus, in that belonging to the stationers, of whom the printers make a part, is sometimes a printing-press, in which men work off a poem in praise of printing, and throw off every sheet to the mob: the weavers work at the loom: the smiths have their Vulcan: the furriers a man dressed in skins; and the upholsterers one in feathers.

We now come to the county of Kildare, which has those of Dublin and Wicklow on the east, the King's and Queen's-counties on the west, Catherlogh on the south, and East-Meath on the north; extending twenty-three miles from east to west, and thirty-seven from north to south; but both are very unequal, it running in a narrow slip between the counties of Dublin and Wicklow, and between the latter and Queen's-county.

This is an open, pleasant, and plentiful country, abounding in corn and pasturage; and is well watered by the Barrow, Liffey, and other rivers. It is divided into ten baronies, gives title of earl to the noble family of Fitzgerald, and sends ten members to parliament, namely, two for the county, and the same number for each of the following towns, Kildare, Naas, Haristown, and Athy.

Naas is the county town, but Kildare is the capital of the county. It is seated twenty-seven miles from Dublin, and is the see of a bishop. It is a pretty good town, and has some trade. Near it is a plain called the Curragh, large enough for a camp of ten thousand men, and in which is a celebrated course, where are frequent horse-races.

The King's-county was formerly called Offaly, but had its present name in honour of Philip of Spain, queen Mary's husband. It is bounded on the east by Kildare; on the south by Tipperary and the Queen's-county; on the west by part of Tipperary and Galloway, from which last it is separated by the Shannon; and on the north

by West-Meath. According to some authors it is thirty-seven miles from north to south, and twenty-eight from east to west; but, according to others, is forty-eight miles in length, and fourteen in breadth; however, it is very unequal both ways, and runs with a narrow slip between Tipperary and Queen's-county. It is a populous and well improved country, divided into eleven baronies, and sends six members to parliament, namely, two for the county, two for Philipstown, and two for Banagher.

Philipstown, or Kingstown, is the capital of the county, and is seated twenty-eight miles from Dublin. It has barracks for a company of foot, and gives title of baron to the lord viscount Molesworth.

Bir is said to be much the best town in the county: it stands on the borders of Tipperary, on a river that runs into the Shannon; has a considerable trade in wool, and employs a great number of hands in the woollen manufacture.

Queen's-county is so called in honour of Mary, the sister of queen Elizabeth, in whose reign it was made a county. It is bounded on the east by Kildare and Catherlogh, on the south by Catherlogh and Kilkenny, and on the north and west by King's-county and part of Tipperary; extending thirty-five miles in its greatest length from north to south, and near the same from east to west. It is divided into seven baronies, and sends eight members to parliament, two for the county, and two each for Portarlington, Maryborough, and Ballynekil.

Maryborough, or Queen's-town, stands seventy-two miles from Dublin. It was so called in honour of queen Mary, and has barracks for a troop of horse. It gives title of baron and viscount to the lord Molyneux.

The county of Wicklow, which was once a part of that of Dublin, is bounded on the east by St. George's Channel, on the south by the county of Wexford, on the west by Kildare and Catherlogh, and on the north by Kildare and Dublin; extending thirty-six miles in its greatest length, and twenty-eight where broadest.

It is divided into six baronies, and sends ten members to parliament, two for the county, and two each for the towns of Wicklow, Baltinglass, Carysford, and Blessington. It is pretty mountainous, but the low lands are fruitful, and, among other advantages, contains a copper mine.

Wicklow, the county town, is seated twenty-four miles from Dublin, at the mouth of the river Leirtrim, and has what is called a castle; but it is only a rock, with a strong wall round it. It has no great trade; what it has is chiefly managed in small vessels, which carry provisions to Dublin: but the haven, which was in a manner choaked up by sands, has been deepened, and considerable works added to improve it. This place is famous for its excellent ale, and has barracks for three companies of foot.

Arklow is a pretty market-town near the sea, twelve miles from Wicklow. It has barracks for two companies of foot, and also sends boats loaded with provisions to Dublin.

The county of Catherlogh, or Caterlough, has Wexford on the south, part of Queen's-county and Kilkenny on the west, part of Kildare and Wicklow on the north, and part of Wicklow and Wexford on the east, lying for the most part between the rivers Barrow and Slaine. It extends twenty-eight miles from north to south, and eighteen from east to west; but is very unequal, it running with a narrow slip between Kilkenny and Wexford. It is woody, but pretty fruitful; is divided into five baronies, and sends only six members to parliament, namely, two for the county, and two each for the towns of Catherlogh and Old Leighlin.

Catherlogh, which is the county town, stands thirty-eight miles from Dublin. It is seated on the river Barrow, and hath a castle, with barracks for a troop of horse. It is well built, and is a pretty trading town, inhabited by the chief gentlemen of the county.

The county of Kilkenny is bounded on the east by Wexford and Catherlogh, on the south by Waterford, from which it is parted by the Suir; on the west by Tipperary; on the north-west by Upper Ossory; and on the north by the Queen's-county. Its greatest extent

from north to south is forty miles, and from east to west twenty. It comprehends ten districts and baronies, and sends sixteen members to parliament; namely, two for the county, two for the city of Kilkenny, and two for each of the following towns, St. Kennis, or Irish-town, Gowran, Thomastown, Enistoege, Cullen, Knocktopher.

This is a plentiful country, so populous as to be adorned with more towns and castles than any in the kingdom; and, though it is mountainous in the south part, is said to have fire without smoke, earth without bog, water without mud, and air without fog: thus having all the four elements in perfection, it is esteemed an healthful as well as pleasant country. It is remarkable for its coal mines, as well as for its quarries of marble. Near Ossory are the mountains called Sliewbloamy, or Bladin hills, out of which spring the Suir, the Neor, and Barrow. They descend in three several channels, but join in one before they fall into the sea. The Neor, or Nure, divides this county into two parts.

The principal places in this county are the following:

Kilkenny, which was once a bishop's see, is seated on the Neor, fifty-six miles from Dublin. It has two stone bridges over the river, and is a large, strong, populous, neat, and well-built city, which has as good a trade as any inland town of Ireland. It is divided into the English and Irish towns, of which the former is the principal, and the latter, as it were, the suburbs; but contains the cathedral, which is pleasantly seated on a hill of a gentle ascent, from which there is a delightful prospect of the city and the adjacent country. The English town is much newer, and is remarkable for its streets being paved with marble, and its being fortified with a castle by the Butlers, of the family of the earls of Ormond, who made it their principal seat, and built and liberally endowed a free-school, which is a fine structure, called the college. Here are barracks for a troop of horse and four companies of foot.

Thomastown is seated on the banks of the Neor, and is reckoned the second town in the county; but is a small place, with some fortifications.

The last county we shall mention in the province of Leinster, is that of Wexford, which is bounded on the north by Wicklow; on the east, south, and south-west, by St. George's Channel; and on the west by Catherlogh and Kilkenny, extending forty-seven miles in length, and twenty-seven in breadth. It is divided into eight baronies, and sends eighteen members to parliament; namely, two for the county, and the same number for each of the following boroughs, Wexford, New Ross, Enniscorthy, Feathard, Newborough, Banno, Clonmines, and Taghman. It is in some places fruitful in corn and pasture, but in others the soil is very indifferent.

The principal towns in this county are the following:

Ross, which is situated on the borders of Kilkenny, was once a large, trading, populous city, with a cathedral, and was the see of a bishop, afterwards annexed to that of Cork. It is now a town of trade, by means of its river, formed by the junction of the Neor and the Barrow, which brings up ships of very considerable burthen to its quay, and has barracks for a troop of horse.

Duncannon is a fort on the same river more to the south, which so commands it, that no ship can pass either to Ross or Waterford without its permission; and there are here barracks for three companies of foot. From hence to the north of the river, a narrow neck of land projects into the sea, on which stands Hook-tower, formerly built by the citizens of Ross, and now augmented with a light-house for the direction of sailors into the mouth of the river.

Wexford, the chief town of the county, stands at the mouth of the river Slaine, sixteen miles from Ross, and sixty-five to the south of Dublin. This is remarkable for being the first town in the whole island that surrendered to the English, who took possession of it in the year 1170, when it was reckoned the principal town in all Ireland. It has a very good harbour for vessels that do not draw above twelve or fifteen feet water; but it

has

has two or three sand-banks just before it, and several shallows within; so that all vessels which draw more water are obliged to lade and unlade in a creek three miles from the town, where there is water enough, but no shelter from the south-west wind. Here are barracks for two companies of foot. This town has a considerable trade in corn and butter, and is famous for its fine ale.

SECT. V.

Of the Province of Connaught; containing the Counties of Thomond or Clare, Gallway, Mayo, Roscommon, Sligo, and Leitrim; their Situation, Extent, Divisions, Rivers, Produce, and principal Towns.

THIS province is separated from that of Leinster by the Shannon, which also parts it on the south and south-east from Munster, and is bounded on the north and west by the Ocean. It is one hundred and thirty miles in length from Cape Lean, the most southerly point of Thomond, to the north parts of Leitrim; about eighty-four in breadth, from the east point of Leitrim to the Black Harbour in the west part of Mayo; and about five hundred in circumference.

In some places this province is extremely pleasant, but in others is gloomy and subject to great fogs, on account of its many bogs, woods, and lakes. The soil is very fruitful, and abounds with cattle, deer, hawks, and honey. It has many convenient bays and creeks for navigation, but few rivers of considerable note, except the Shannon. The chief are the Moy, in the county of Mayo, which, for a small distance, divides it from Sligo, and falls into the ocean by Mayo and Killala. The Suck divides Roscommon from Gallway, and falls into the Shannon near Clonfert. The Droos, a river in the county of Clare, which falls into the Shannon to the east of Clare; and the Gyll, a small river in Gallway, which runs into the bay of that name.

This province contains one archbishopric, five bishoprics, seven market-towns, eight places of trade and commerce, twelve boroughs that return members to parliament, and three hundred and sixty-six parishes; with six counties, which are subdivided into fifty-one baronies. These counties are Thomond or Clare, Gallway, Mayo, Roscommon, Sligo, and Leitrim.

Thomond, or the county of Clare, was formerly joined to Munster, but has been annexed to Connaught. On the east and south sides, it is parted by the Shannon from Tipperary, Limerick, and Kerry in Munster; on the north it is bounded by the county of Gallway; and on the west by the Atlantic ocean. It is about fifty-five miles in length, and thirty-eight in breadth; and is supposed to contain ten thousand houses. It is divided into nine baronies, in which are two market-towns, and but one borough, which is that of Ennis; it therefore sends but four members to parliament.

It is a hilly, irregular country, but is not deficient in good pastures, which produce the best horses in Ireland. The soil also bears corn and rape.

Ennis, the county town, is seated about one hundred miles from Dublin. It stands near a lake formed by the Shannon, has a market, and is by much the best town in the county.

Killalo, the other market town, stands on the Shannon, on the borders of Tipperary, eighteen miles from Ennis, and ten to the north east of Limerick. It is the see of a bishop, and was once a very considerable place; but is at present decayed. There is here a cataract in the Shannon, which stops vessels from going farther up.

The county of Gallway is bounded on the east and south-east by part of Roscommon, King's-county, and Tipperary, from which last it is parted by the Shannon; on the south-side by the county of Clare; on the west by the Atlantic ocean; and on the north and north-east by Mayo, Meath, and Roscommon. It is eighty-two miles in length, and forty-two in breadth; and is divided into seventeen baronies, containing one hundred and thirty-six parishes, about fifteen thousand four hundred

and twenty houses, and sends eight members to parliament; namely, two for the county, two for the town of Gallway, two for Athenry, and two for Tuam. The river Shannon here forms a lake several miles in length; and Lough Corrib, which runs into the bay of Gallway a little above the city, is twenty miles long, and in some places five broad. As this country abounds with a warm lime-stone soil, which rewards the industry of the husbandman and shepherd, it in general abounds with corn, pasture, and cattle; but the south and east parts are best inhabited. The west side runs out in the form of a peninsula. It is much indented with little bays, and bordered all along with a mixture of verdant islands and rugged rocks, among which are four islands called South Arran, which give title of Earl to the family of Gore.

Gallway, the county town, stands on an island, by the fall of the Lake Corbes, or Lough Corrib, into the bay of its own name, one hundred miles to the west of Dublin, and thirty-seven to the north of Limerick. It is a very strong, neat, and rich city, the capital of all the west part of Ireland. In beauty and compactness it is inferior to none but Dublin. It is extremely well situated for commerce, and has a large, safe, and excellent harbour, called the Bay of Gallway, which is sheltered at the mouth by the south isles of Arran, thro' which are three passages for ships, besides the north-passage at the mouth of the bay, and is capable of containing a vast fleet of ships. The buildings, especially the public structures, are generally of stone, very handsome and lofty, and inhabited by substantial merchants and shopkeepers. It is encompassed by a wall, and has barracks for ten companies of foot. This city was once the see of a bishop, but it is now included within the archbishopric of Tuam.

Tuam has been the see of an archbishop, ever since the beginning of the sixth century. It stands seven miles from the borders of Mayo, and was once a famous city, but is now greatly reduced; however, it has still some trade.

Mayo is bounded on the east and north-east by Roscommon and Sligo; on the south and south-east by Gallway; and on the west and north by the Atlantic ocean; extending sixty-two miles in length, and fifty-two in breadth. It is divided into nine baronies, in which there is but one borough town, and it sends only four members to parliament; two for the county, and two for Castlebar. It has seventy-three parishes, and is said to contain upwards of thirteen thousand houses. It is rough and mountainous on the side next the sea; but in other parts has pasture, and is well-stocked with cattle and deer; it is watered with many large lakes and rivers, and gives title of viscount to the family of Bourke.

Mayo, the chief town, was once a bishop's see, but is since annexed to Tuam. The town stands at the mouth of the river Moy, on the borders of Sligo, one hundred and fifteen miles from Dublin, and was once a flourishing place; but it is now much decayed.

Roscommon is bounded on the east by Longford and East-Meath; on the north by Sligo and Leitrim; on the south by Gallway and Mayo, and on the west by another part of Gallway and Mayo; extending fifty miles in length, and twenty-eight in breadth. It is subdivided into six baronies, in which are three boroughs, fifty-nine parishes, and about eight thousand seven hundred and eighty houses. It sends eight members to parliament; two for the county, and two each for Roscommon, Boyle, and Tullsk. It is, for the most part, a level and fruitful country, that with little cultivation yields plenty of corn and grass, which feeds large herds of cattle. On the north-side of the county, are the Curlew mountains, which were steep, and impassable, till with much difficulty a way was cut through them.

Roscommon, which gives name to the county, was formerly defended by a castle, which is now in ruins. It is a mean place, consisting chiefly of one street, with great part of the houses thatched; yet here is kept the sessions-house and jail, and it gives title of Earl to the family of Dillon.

Boyle is a good market town and corporation, by the lake Key, near the borders of Sligo. It is a place of some trade, and is remarkable for an old abbey, of which only

only the ruins now remain. It has also a fine seat which belonged to the late lord Kingsborough.

Sligo is bounded on the east by the county of Leitrim; on the south and south-west by Roscommon and Mayo; and on the north and north-west by the Atlantic ocean; extending thirty-five miles in length, and as much in breadth. Great part of this county is mountainous, and covered with bogs; but the lower grounds have a good soil, proper for grazing. It is subdivided into six baronies, and contains forty-one parishes, and about five thousand nine hundred and seventy houses. It has but one borough, and sends four members to parliament, two for the county, and two for Sligo, the capital town.

Sligo, the county town, is seated on a bay of the same name, a hundred and ten miles to the north-east of Dublin, and is the only town of note in the county. It has a very commodious harbour, and ships of two hundred tons burthen may come up to the quay. Here is also a good castle. The town is populous, but not large; nor is the trade considerable, though much better than in any other places beyond it.

A mile from Castle-connor, in this county, is a round hill, an entrance into which was discovered in 1646, leading to quadrangular chambers, arched over. The caves of the rock of Corin are equally remarkable, where, within a steep and almost inaccessible entrance, are many strange recesses. Before these caves is a path, about a hundred paces in length, also cut out of the rock. This work, which is called the Giants-house, is supposed to be formed either by the Irish or Danes.

The county of Leitrim is bounded by Sligo on the west and south-west; by Donegal bay on the north; by Longford, in Leinster, on the south-east; and by the counties of Fermanagh and Cavan on the east and north-east. It is forty-four miles in length, but only eighteen in breadth, and is a wild mountainous country, but abounds in grass, which feeds a prodigious number of cattle. It is divided into five baronies, and contains twenty-one parishes, about four thousand houses, two boroughs, and sends six members to parliament, two for the county, and two each for Jamestown and Doumrusk.

Leitrim, the county town, stands near the Shannon, which rises in this county; but the town is decayed, and of little consequence.

S E C T. VI.

Of the Province of Ulster; containing the Counties of Down, Armagh, Monaghan, Cavan, Fermanagh, Tyrone, Antrim, Londonderry, and Donegal; their Situation, Extent, Lakes, Rivers, Soil, Produce, Mountains, and principal Towns; with a particular Description of the Giant's Causeway.

THIS province is encompassed on three sides by the sea, it being bounded on the east by St. George's Channel, on the north by the Northern ocean, on the west by the Atlantic ocean, on the south-west by the province of Connaught, and on the south by that of Leinster; it being about a hundred and sixteen miles in length, and a hundred in breadth. It is subdivided into fifty-five baronies, and contains ten counties, twenty-nine boroughs, three hundred and sixty-five parishes, and about a hundred and fifteen thousand five hundred inhabitants, with one archbishopric, and six bishoprics.

The air is temperate and salubrious, being cooled by various winds in summer, and qualified by moderate rains in winter. It has many great lakes and rivers that abound with fish, many woods, plenty of corn and grass, and a great number of black cattle and some sheep.

The principal rivers and lakes are the following: the river Rann, which rises in the county of Down, receives the river Tanwagee, passes through Lough-neagh, and, after dividing the counties of Antrim and Londonderry, falls into the Northern ocean a little below Colerain.

Lough-foyle, which passes by St. John's-town and Londonderry, forms a bay of the same name at its entrance into the Northern ocean.

The Swilly, in the county of Donegal, also falls into the same ocean, with a kind of lake.

Lagan-water, in the county of Down, passes by Drogheda, Lisburn, and Belfast, into the bay of Carrickfergus.

Newry-water parts Down from Armagh, and falls into Carlingford bay.

With respect to the soil of this county, it ought farther to be observed, that it is apt to run into wood, unless constantly kept open, and the low grounds, where the drains are neglected, soon degenerate into bogs; but by the industry of the inhabitants it produces good crops of oats, and, where marl is found, barley. The staple commodity of this county is the linen manufacture, which has been of the greatest benefit to all ranks of people. Hence this province may be said to be in general populous, flourishing, and daily encreasing in the number and wealth of its inhabitants.

Its highest mountains are those of Mourne, the base of which terminates on the sea-shore. Among these that named Slive-Donagh is three miles in gradual ascent, and half a mile in perpendicular height. These are reckoned among the highest mountains in Ireland, and are useful land-marks for sailors. They afford variety of plants, and many springs: besides, a multitude of cattle graze on them in summer. In one of them are quarries of millstones, and in another are found crystals. These mountains are famous for the goats whey prescribed by physicians for scorbutic and nephritic ailments and disorders of the lungs; and in April, May, and June, are much frequented by the gentry of both sexes, many of whom have found relief; these shrubs and medicinal herbs affording the fittest nourishment to those animals. There has been a pearl-fishery on the river Bann, but it is not now much pursued.

This province is divided into the nine following counties, Down, Armagh, Monaghan, Cavan, Fermanagh, Tyrone, Antrim, Londonderry, and Donegal.

The county of Down is bounded on the east and south by St. George's Channel, on the west by the county of Armagh, and on the north by the county of Antrim. It lies opposite to the Isle of Man, Cumberland, and Westmoreland; and the north part of it fronts the Mull of Galloway, which is visible at about five leagues distance. It is about forty-four English miles in length, upwards of thirteen in breadth, and divided into seven baronies, which contain about nineteen thousand two hundred and seventy houses, seventy-two parishes, and sends fourteen members to parliament, namely, two for the county, and twelve for the six following boroughs, Newry, Downpatrick, Newtown, Killeleagh, Bangor, and Hillsborough.

Newry is a borough and market-town on the side of a steep hill, at the bottom of which runs the Newry-water, having over it two stone bridges, one on the road from Dublin, from which it is forty-nine miles distant, and another in the way to Armagh. The turnpike-road from Dublin to Belfast, Antrim, and Armagh, go through the town; and here is a lock of the new canal, lately formed by parliamentary encouragement; and over this canal is a third bridge. The town has suffered greatly by the rebellions that have happened in this province; and was burnt down by the duke of Berwick in 1689: but it is now so much improved in its trade and buildings, that it is the largest town in the county. At one end of it is a spacious church seated on a hill, and at the other a school-house near the river. It has the most trade of any town in the county, to which the increase of the linen manufacture has greatly contributed. It has also a manufacture of earthen-ware, and houses for baking of sugar. It is likely to receive farther business by means of the navigable canal just mentioned. In its neighbourhood is plenty of a hard gritty free-stone, which is easily cut into squares, and is used for building. There is also a castle built on an eminence, to command the head of the bridge, which was formerly a considerable pass, to secure the road through the bogs and mountains between Dundalk and this town. It is almost encompassed with mountains, except to the north, where it opens into a good country, through which the New Canal is carried.

Rostrevor is a small town, with a church, on the north side of Carlingford harbour, defended from the winds by the hills, which are clothed with wood; and an arm

of the sea forming a noble basin at the foot of these hills, affords an agreeable prospect. Here is a quay for ships, which safely ride at anchor within a few yards of the shore, a salt-house, and a pottery for white earthen-ware, made of the fine potters clay found near Carrickfergus.

Rathfryland, or Rathon-island, probably so called from Rath, a high fort on an island, it rising above all the neighbouring grounds. It stands on a hill where four great roads, laid out in almost straight lines, lead up to it, and meet in the center of the town, at one end of which is the church, built on a rock of free-stone, and at the highest point of the hill are the ruins of a castle, and on its side is a warren well stocked with excellent rabbits. This is one of the greatest marts for linen in this county. Two miles from it is a small pleasant lake, which hath on the verge of it a large plantation of young forest trees, called Ballyrony.

Killogh, or Port St. Ann, is a town with a commodious harbour on the north-east side of St. John's Point. A rock stands in the middle of the entrance of the harbour, which is covered at half flood; but there is a secure passage, either to the east or west of it. A mile within that rock, on the west side, is a quay and basin for ships, where they may lie defended from all winds. In this town is a neat chapel, barracks for two troops of dragoons, a Protestant charter working school for the linen manufacture, &c. and salt works: but its principal trade at present arises from the exportation of barley, and the importation of most sorts of commodities consumed in the adjacent country.

Downpatrick, which signifies Patrick's-Mount, stands five miles from Killogh, and is esteemed one of the most ancient places in the kingdom. It is a market-town and bishopric, erected in the fifth century by St. Patrick; but is now united to the see of Connor. Within two hundred paces of the town, on the ascent of a hill, are the ruins of an old cathedral, remarkable for a tomb, which contained the body of St. Patrick, St. Bridget, and St. Columb; and there were anciently four religious houses, besides the cathedral, in and near the town. It is situated on a branch of the lake of Strangford, and is adorned with several handsome public buildings; the parish-church is lately rebuilt, and it has a sessions-house, the diocese school, and an alms-house for old and decayed Protestants, with an English school for forty children, who are clothed and educated in the Protestant religion; the two last built and endowed by Edward Southwell, Esq; principal secretary of state for Ireland: an alms-house for three clergymen's widows, with good gardens, and twenty pounds per annum for each of them; a barrack for a troop of dragoons, and a large market-house. From this place the family of Dawny have the title of viscount.

Here is a variety of fine prospects from the south branch of Strangford lake. Among the hills and many islands are flights of swans and other water-fowl, and the lake abounds with good salmon, mullets, and other sea-fish. Over a branch of the lake, upon the road to Killeleagh and St. Field, is a handsome stone bridge of six arches. About a mile from the town is St. Patrick's well, to which, at certain seasons of the year, many thousand people resort, some in expectation of receiving benefit from the water blessed by that saint, others to perform a penance enjoined by the Popish priests.

Strangford is a small but ancient town, belonging to the earl of Kildare, seated on the river of Strangford, five miles from Down, and is so called from the great rapidity of the tides here, it being reckoned the strongest current in Europe. It gives title of viscount to the family of Smythe. The sea runs here both at flood and ebb like a sluice, at the rate of six knots, or miles, an hour. The lake is near four miles broad at a medium, and about seventeen long. It abounds with many kinds of excellent fish, as bass, mullet, whittings, large sea trouts, oysters, lobsters, shrimps, &c. and there are great quantities of kelp burnt on the islands in the lake, and on the stony flat coasts.

Bangor, a market town on Carrickfergus bay, six miles from Carrickfergus, is governed by a provost and twelve burgesses who elect the members of parliament. It is remarkable for a very old abbey, and the first church

built of stone in the province of Ulster, also for being the landing place of duke Schomberg, when sent against the rebels in 1689. The town contains about two hundred houses, has little trade, but spins considerable quantities of fine linen yarn. It has some noble ruins of an ancient abbey, and the walls of an old custom-house.

Belvoir, a pleasant seat of the honourable Arthur Hill, Esq; three miles from Belfast. The avenue to it is large and handsome; the gardens adorned with regular canals, cascades, slopes, and terraces: the kitchen garden is enclosed with espaliers; part of the garden lies over the Lagan river, and at a small distance is a neat church.

Killeleagh is seated on an arm of the lake of Strangford, ten miles from Newtown, and is agreeably built upon a rising ground, commanding a prospect of part of the lake. The castle stands at the head of the street; and at the lower end is a little safe bay, where ships lie sheltered from all winds. On one side is a small river running under a stone bridge into the sea. Adjoining to the castle are gardens and plantations. This borough is governed by a provost, who, with twelve burgesses, elect their representatives in parliament. Here the linen manufacture has spread to advantage, and it is remarkable for its fine white thread. Here is a barrack for a troop of dragoons, a handsome church, and a good parsonage house. This town gave birth to that eminent naturalist and physician Sir Hans Sloane, president of the royal society, and who may be justly termed the founder of the celebrated Museum in London.

Hillsborough, a market town, finely situated on a heathy gravelly soil, in view of the Maze course, and the town of Lisburn. The chief magistrate here is called sovereign, who with twelve burgesses elect representatives in parliament. Here are good gardens, and fine plantations, with the ruins of a noble house, destroyed by an accidental fire, belonging to the family of Hill, to which Hillsborough gives the title of Viscount. The parish church is a spacious and well contrived building, seated on a rising ground, near the ruins of an old mansion house.

Dromore takes its name from its situation, it signifying the back of a great hill. It stands twelve miles from Belfast, and is a market town, and the see of a bishop, the cathedral of which was founded by St. Coleman, who flourished in the sixth century. Here is a decent church with a steeple, but it has no revenue for the support of the cathedral service; the minister of the parish, who is treasurer of Dromore, discharging the duties of it. Here are two alms-houses for clergymen's widows of the diocese, erected by the contributions of the bishop and clergy. The diocese school is kept here, and near it is an English protestant school, where poor children are trained up in the protestant religion, and some of them set to work; twelve of them are clothed at the expence of the parish. The river Lagan divides the town, at the east end of which is a Danish mount, which is always green, and has its top encircled with a rampart, between eighty and ninety feet over, having a strong battlement, and a spacious parapet. The trenches are between ten and twelve feet wide, terminating on a precipice, with two arms embracing a square fort, about one hundred feet in diameter, whose rampart is forty feet high, with a large battlement; and from the Lagan water to the fortification, upon the easiest ascent at the precipice, is a covert way about two hundred and sixty feet long, seven wide, and nine deep. In and near the town are many linen weavers.

The county of Armagh, or Ardmagh, is separated in part from that of Down by the river Newry; it is bounded on the south by Lowth; on the west by Tyrone and Monaghan; and on the north by Lough-Neagh, extending thirty-two miles in length, and seventeen in breadth; and is divided into five baronies. It sends six members to parliament; two for the county; two for the city of Armagh; and two for the borough of Charlemont.

Armagh is seated near the river Kalin, thirty miles to the south of Londonderry. It gives name to the county of Armagh, and is the see of an archbishop, who has the

title of primate of all Ireland. It was a very ancient and considerable city, it being once the metropolis of the whole kingdom, yet is now a small place, but has some good houses, with a very spacious church seated on the top of a hill, and the ruins of a monastery, priory, and the archbishop's palace. The hill on which the church is seated, affords a view all round of a very delightful country.

The county of Monaghan is bounded on the north by Tyrone; on the south by Cavan; on the south-east by Lowth and part of East-Meath: on the east by Armagh; and on the west by Fermanagh. It is thirty-two miles in length from north-west to south-east; and thirty from east to west. It abounds with hills, woods, and marshes; is divided into five baronies; but sends only four members to parliament, two for the county, and two for the town of Monaghan.

Monaghan, the county town, is a small neat place, and has a sessions house in which the assizes are held. Here are sold considerable quantities of linen, and it has in other respects a pretty trade.

The county of Cavan is bounded on the north by Fermanagh; on the east by part of Monaghan, Meath, and Lowth; on the south by Longford and West-Meath; and on the west by Leitrim; extending forty-seven miles from the south-east to the north-west, and twenty-five from east to west in the broadest part. It is divided into seven baronies, and gives title of earl to the noble family of Lambert. It sends six members to parliament, two for the county, two for Cavan, and two for Belturbet. It contains thirty-seven parishes, and about eight thousand three hundred and twenty houses. It has several pleasant lakes, and much fenny pasture; but in other parts has a rich fertile soil, well planted and improved.

Belturbet is seated three miles from Lough-ern, and stands on the river of that name. It is a small place, but has a considerable fair for linen cloth.

Cavan, the county town, stands seven miles from Belturbet, is larger than that town, but is a place of no great trade.

The county of Fermanagh is bounded on the north and north-east by Tyrone; on the east by Monaghan: on the south by Cavan; on the south-west by Leitrim; and on the north-west by Donegal; extending thirty-eight miles in length, and twenty-four in breadth. It is divided into eight baronies, in which there is not one market town, and but one borough, which is named Enniskilling; so that it returns only four members to parliament.

This county is full of woods and bogs, a third part of it being filled with Lough-ern, the greatest lake in all this part of Ireland, of which we have already given an account in describing the lakes in general.

Enniskilling is seated in the middle of the lake, where the waters are contracted into the breadth of an ordinary river, and thus continue for six miles. At this town is a strong fort, it being a pass of the greatest importance, from the north part of Ireland to the south; and is famous for its obstinate defence against queen Elizabeth's army in 1595, and that of the protestants in 1689 against king James's forces.

The county of Tyrone, or Tir-Oen, is bounded on the north by Londonderry; on the east by part of Antrim, from which it is divided by Lough-neagh; on the south and south-west by part of Fermanagh, Monaghan, and Armagh; and on the west by the river Liffey, which divides it from Donegal and part of Fermanagh. It is forty-six miles in length, and thirty-seven in breadth. Though great part of it is rough and mountainous, yet in other parts it is not inferior to many counties in the kingdom for the richness of its soil, and the goodness of its pastures. It is divided into four baronies, which contain thirty parishes, about twelve thousand six hundred and eighty houses, and sends ten members to parliament, two for the county, and two each for Dungannon, Strabane, Clogher, and Augher.

Lough-neagh, in this county, is about thirty miles in extent, full of fish, and the banks variegated with shady groves, meadows always verdant, and rich corn-fields, adorned with gentle hills and pleasant brooks.

Clogher is a city and the see of a bishop, seated in Lower Tyrone, founded by St. Patrick, and well endowed; but the town is small, and much decayed.

Dungannon, which is reckoned the county town, is a place of some strength, situated upon a hill seventy-two miles from Dublin, and has a considerable trade in linen and linen yarn.

The county of Antrim, which is the most northern part of all Ireland, is bounded by St. George's Channel on the east; the county of Down on the south-east; part of Armagh on the south; Londonderry on the west, from which it is separated by the river Bann; and the Northern ocean on the north; extending forty-six miles in length, and twenty-seven in breadth. It gives title of earl and baron to the ancient family of Mac Donnell. It is subdivided into eight baronies, and contains fifty-six parishes, about eighteen thousand one hundred houses, and sends ten members to parliament, two for the county, two for Lisburn, two for Belfast, two for Antrim, and two for Randalstown.

The most remarkable curiosity in this county, and indeed, in all Ireland, is the Giants Causeway, a surprising structure of stones, extending a great way into the sea, where the same work seems to have been begun on the opposite shore of Scotland. This stupendous causeway was supposed to be the work of the giants, undertaken in order to form a communication between Ireland and Scotland. Nor is it at all wonderful that such a supposition should obtain credit among the vulgar; since though it is a work far above human strength, yet it has the greatest appearance of art. The sea cliffs are very high in the place where the causeway begins; and what is commonly called the causeway, is a low head extending from the foot of the cliffs, like a mole, into the sea. This head, when considered attentively, seems a stupendous production of art; and Dr. Pococke, late bishop of Ossory, and fellow of the Royal Society, informs us that he measured the most westerly point at high water, to the distance of three hundred and sixty feet from the cliff; but was told that at low water, it extended sixty feet farther upon a descent, till it was lost in the sea. Upon measuring the eastern point, he found it five hundred and forty feet from the cliff; and saw as much more of it as of the other, where it winds to the east, and is like that lost in the water.

The causeway is composed of pillars of all angular shapes, from three sides to eight. The eastern point, where it joins the rock, terminates in a perpendicular cliff, formed by the upright sides of pillars, some of which are thirty-three feet four inches high. Each pillar consists of several joints or stones, lying one upon another, from six inches to about a foot in thickness; and what is very surprising, some of these joints are so convex that their prominences are nearly quarters of spheres, round each of which is a ledge which holds them together with the greatest firmness, every stone being concave on the other side, and fitting in the exactest manner the convexity of the upper part of that beneath it. The pillars are from one to two feet in diameter, and generally consist of about forty joints, most of which separate very easily; and one may walk along upon the tops of the pillars, as far as the edge of the water.

But this is not the most singular part of this extraordinary curiosity, the cliffs themselves being still more surprising. From the bottom, which is of black stone, to the height of about sixty feet, they are divided at equal distances by stripes of a reddish stone, that resembles a cement about four inches in thickness; upon this there is another stratum of the same black stone, with a stratum five inches thick of the red. Over this is another stratum ten feet thick, divided in the same manner; then a stratum of the red stone twenty feet deep, and above that a stratum of upright pillars: above these pillars lies another stratum of black stone twenty feet high; and, above this again, another stratum of upright pillars, rising in some places to the tops of the cliffs, in others not so high, and in others again above it, where they are called the chimneys. The face of these cliffs extends about three English miles.

About a quarter of a mile to the south-east of the causeway, is seen what is called the Organs, composed of the same kind of pillars as those we have already described. Notwithstanding the great appearance of art, it is certain that all these are merely the work of nature, since if this causeway had been built by human beings, they must likewise have built not only these cliffs but also the rocks, which even at several miles distance from the sea are formed in the same manner of convex and concave stones, nicely fitted to each other.

The principal towns in this county are the following:

Antrim is a considerable thriving market-town and corporation, thirteen miles to the west of Carrickfergus, and is pleasantly seated on both sides of what is called the Six-mile Water, over which is a handsome bridge. Here is a harbour for boats, and a stately mansion-house which belonged to the late lord viscount Massareen, with a fine park.

Carrickfergus, or Knockfergus, is a rich and populous borough, ninety miles from Dublin, seated on a bay of its own name, where it has an excellent harbour, with a strong castle on a high rock, and had an ancient palace converted into a magazine for arms. It is a fortified place walled round, and has some modern outworks. The town and liberties have the privilege of being a distinct county, yet the assizes and quarter-sessions for the county of Antrim are kept there.

Belfast is seated at the bottom of the bay of Carrickfergus, three leagues from that town, and is the chief place of trade, as well as of beauty, in all this part of Ireland. It has a very long stone-bridge over the river, and ships come up the Cormoyle-road, which is a safe commodious harbour below the town, with good depth of water. There are here many rich merchants, and a very considerable trade from this part to Scotland, particularly to Glasgow; the town and most of the adjacent county being inhabited by the Scots, who have their regular presbyteries, kirk-sessions, and other judicatures here as in Scotland, tho' not with equal authority.

The county of Londonderry, or Colerain, is bounded on the north by a part of Donegal and the Northern ocean; on the east by Antrim, from which it is separated by the river Bann; on the south and south-west by the county of Tyrone; and on the west by Donegal; extending thirty-six miles in length, and thirty in breadth. It is subdivided into four baronies, which contain thirty-eight parishes, about thirteen thousand six hundred houses, and sends eight members to parliament, two for the county, and two for each of the towns of Londonderry, Colerain, and Newtown-Annagh.

It is a pretty champaign country, and very fruitful, its boggy and heathy ground being manured by shells brought from the sea-coast. Its chief river is the Bann, which is remarkable for its beauty and clearness: it rises out of the Mourne hills in the county of Down, and after losing both itself and name for about thirty miles in the lake called Lough-neagh, recovers its name again at Tome-castle, from whence, being shaded with woods on both sides, it passes to the sea. There is a smaller river of the same name, and therefore this is called the Great Bann; though it is not very large.

This county, which was formerly wild and uncultivated, has been greatly improved by the citizens of London, to whom king James I. by letters patent, granted this county, with the city of Londonderry, and the town of Colerain by the name of 'The society of the governor and assistants of London of the new plantation of Ulster, in the realm of Ireland, in consideration of their settling a colony there.'

Londonderry, the see of a bishop, and the capital of the county, is seated on the west side of the river Foyle, one hundred and four miles north-west of Dublin, and is the center of trade for this part of the country, though its river is not so large as that at Colerain; but it has a much better port; for ships of the greatest burthen go up without interruption; and though it is twenty miles up the river, very large ships sail up even to the quay, where it is from four to five fathoms deep. It is a modern place, built by a company of London-Adventurers, in the reign of James I. and has three or four castles on the north

bank of the river, besides a fort, which lies below the town: it is likewise encompassed by a strong wall; and besides the above forts, there are some out-works. This city is not very large, but is handsomely built: the streets are wide, well paved, and all the houses of stone. The church is very large and well built, and king William III. caused a town-house to be erected for the inhabitants, in consideration of their brave defence against his enemies. There are a great number of shipping belonging to the city; and the merchants not only carry on a great trade in the herring-fishery, but have a considerable share in many other branches of foreign trade; especially to the West-Indies, for which they are very advantageously situated; for, being open to the Northern and Western ocean, they are not exposed to the dangers and delays which frequently attend a passage through the Channel. The city of Londonderry is inhabited entirely by Protestants.

This city has rendered itself remarkable by the bravery of its inhabitants in three sieges, in each of which they were driven to the greatest extremity; but obliged the enemy to retire. The last gallant defence was made against the French and Irish troops of king James II. from the seventh of December, 1688, to the last day of July 1689, which was the more remarkable from its being besieged at a time when it was neither well fortified, nor had any garrison, or stores of provision or ammunition, and when relief was so long coming from England that many died for want, besides what were killed in defence of the town, in making sallies. But while the people were reduced to the utmost distress by famine, two ships with provisions bravely forced their way to the town, notwithstanding a boom being laid across the river and the fire of the enemy's cannon from several forts.

Colerain lies on the east side of the mouth of the Great Bann, three leagues from Londonderry, and is a neat, handsome, populous, and walled town; and a place of good trade, particularly in that kind of linen called Coleraine; but the river, though of a long course, and bringing with it the water of all the rivers that discharge themselves into the great Lough-neagh, being confined within a narrow channel, pours its waters out with such a furious current, that the tide is hardly strong enough to stem it, so as to promote its navigation: hence it is very difficult for vessels to make their way in; nor can any ships of great burthen go in at all. Besides the linen trade, it has a salmon-fishery, which is very beneficial. This town gives the title of baron to the family of Hanger.

The county of Donegal, or Tyrconnel, is bounded on the east by the counties of Londonderry, Tyrone, and part of Fermanagh; on the south by the bay of Donegal and Fermanagh; and on the west and north by the Atlantic and Northern oceans. It extends sixty-four miles from the south-east to the north-west, and is subdivided into five baronies, in which are contained forty parishes, with about ten thousand eight hundred houses, and it sends twelve members to parliament, two for the county, and two for each of the following towns; St. Johnstown, Donegal, Ballyshannon, Kilbeg, and Lifford.

Ballyshannon is seated on a river that runs out of Lough-Erne into Donegal Bay, where it has a harbour and a tolerable trade. It is pretty well inhabited, considering that this part of the country abounds with bogs and large lakes.

Donegal, from whence the county has its name, stands nine miles from Ballyshannon, at the bottom of a spacious bay which has many good roads and harbours, but no trade; nor is there any thing considerable in the town itself. The harbour is spacious, but the entrance has such dangerous shelves and rocks, that it is not safe to attempt entering without a pilot.

Lough-Swilly, into which runs a river of the same name near Letterkenny, a little market-town, is a salt-water lake that runs about twenty miles south into the country; it is about five miles broad at the mouth, has an island called Inch, and abounds with fish. A thousand sail of ships may ride safe here for twenty miles together. There are many villages and gentlemen's seats

on its banks, and yet it has no trade, there being only a few fishing-boats which resort there to catch herrings and salmon, of which there is a prodigious plenty.

Lough-Dirg is famous for an island, in which is a cell where the popish friars used formerly to make their votaries believe St. Patrick had his purgatory; and that he obtained it from God by his prayers, in order to convince unbelievers of the immortality of the soul and future torments. It was anciently much frequented by people of the Romish church, as well foreigners as natives, who came thither in pilgrimage, to do penance, and perform religious ceremonies, though it was invented some ages after St. Patrick's death. Certain friars resided on the island, who, after having made the pilgrims watch and fast till their minds were prepared to receive any impressions, amused them with stories of the strange

apparitions they should behold there, and shutting them up left them for some hours in the dark; and thus, when let out, their disordered imaginations made them tell strange stories of what they had seen and suffered. The cell was, however, demolished in the year 1497, by the authority of pope Alexander VI; but was afterwards restored, and again visited by pilgrims; but in the latter end of the reign of James I. some gentlemen being sent by the government to search into the affair, found that this pretended entrance into purgatory was only a little cell hewn out of a rock, so low that a tall man could but just stand upright in it, and of such small extent, that it could not contain more than six or eight persons; but when the door was shut, was quite dark: upon which the lords justices banished the friars, demolished their houses, and had the cell laid open.

C H A P. XXXII.

OF ICELAND and GREENLAND.

S E C T. I.

Its Situation, Extent, Climate, Face of the Country, Minerals, Volcanos, and remarkable hot Springs: its Vegetables and Animals.

ICELAND, which received its name from its excessive coldness, and the great flakes of ice seen near it, is a large island in the Northern ocean, about four hundred and eighty miles distant from the coast of Norway, and four hundred to the northward of Scotland, lying between the eleventh and twenty-seventh degree of west longitude, and between the sixty-third degree forty-five minutes and the sixty-seventh degree of north latitude. It extends four hundred miles in length, and a hundred and fifty in breadth.

This island is seated so far to the north, that, during two months of the summer, the sun never goes entirely below the horizon, one-half remaining above it from ten at night till two in the morning, when it rises entirely; and about the winter solstice, for two months, it never rises wholly above the horizon, one-half of it being only to be seen from ten in the morning till two in the afternoon.

They have always a short spring and autumn in Iceland before and after the summer season. The cold is severe in winter, and the heat very intense in summer, on account of the length of the days, and there being no night to cool the air: but neither of them is insupportable, at least to the inhabitants, or the Norwegians and Danes. The air is also salubrious, and agrees very well with foreigners as well as the natives.

Iceland properly consists of a prodigious range of mountains running from east to west, on the declivities of which, and in the vallies lying between them, the inhabitants live. Several of these high mountains are always covered with ice and snow: but on others, seated near the coast, are plains covered with verdure, several miles in extent, that produce fine grass. Though the country is so mountainous, there are roads passable for horses in every part of the island, and even carriages were formerly used, but they are now laid aside, on account of the trouble attending them; and every year some hundreds of pack horses come over the mountains from the north to the trading places in the south parts of the island, loaded with butter, woollen manufactures, &c. which are bartered for other commodities.

In the rocks of Iceland crystals are sometimes found, many of which represent an object viewed through them double; but these are properly only a species of talc. There are likewise evident signs that the mountains contain iron, copper, and even silver ore, near which are

found two kinds of agate, which will burn like a candle; a species of bitumen, black, shining, and pretty hard; with another sort of black earth, that is still harder, and breaks into thin diaphanous laminæ; this last is not inflammable, but vitrifies in the fire. In one part of the island sulphur is dug out of the ground, but the sulphur trade is now discontinued.

Though this island is seated so far to the north, earthquakes and volcanoes are more known than in many countries in much warmer climates: the former have several times laid the country desolate, particularly in the years 1734, 1752, and 1755, when fiery eruptions broke out of the earth, and produced very fatal consequences. Many of the snowy mountains have also gradually become volcanoes. Of these burning mountains Hecla is the best known, especially to foreigners. It is in the south-east part of the island, not far from the sea. This mountain has frequently sent forth flames and a torrent of burning matter. The inhabitants formerly imagined, that this is the place where the souls of the damned are tormented. Its eruptions have been very frequent, especially in 1693, when they were most dreadful, and occasioned terrible devastations, the ashes being thrown all round the island to the distance of a hundred and eighty English miles; but since that time it is said that Hecla has been free from eruptions. This mountain takes up four hours to ascend from its foot to the summit, and on the north-west side is a vast chasm, reaching from the top almost to the bottom; and it is remarkable, that while flames and ignited matter issued from this chasm, the huge masses of ice and snow, with which the other side was covered, were not melted, though the heat was so intense as to calcine large stones and other substances.

Notwithstanding the eruptions of Hecla have been stopped for a considerable time, others have since broke out. The huge mountain of Crabla in particular began on the seventeenth of May, 1724, to eject, in a terrible manner, smoke, fire, cinders, and stones, which were followed by a fiery stream like fused metal. The lava continued to move slowly on, for about eight or nine miles, as far as the lake of Mynat, into which it discharged itself; but did not cease till the end of September, 1729, when the eruptions of the mountain subsided. They were, however, soon followed by the eruption of three of the adjacent mountains; and it is a common observation among the inhabitants, that when the ice and snow are so accumulated on one of the mountains that formerly ejected fire, as to stop the clefts and chasms, which were the spiracles whence proceeded smoke and flame, a new eruption is not far distant. In 1756 a mountain, named Cotligiau, which had twice before cast forth fire and smoke, began again to flame.

It is also remarkable, that springs naturally warm, and even those that are hot, are frequently found in Iceland, with others that have a mineral taste. About mount Hecla are several small basins of warm water, which sometimes emit a copious steam, though at others this vapour is not so visible. These hot springs are of three sorts; some are a little more than tepid, so that a person may hold his hand in the water without any inconvenience: others are so hot as to rise in small bubbles, like water simmering over the fire; but in other the ebullition is so strong as to force the waters up to a considerable height. The last sort are observed to be either periodical or variable in their ebullitions; particularly in a district named Reyker-harbour, are three hot springs, about thirty fathoms distance from each other, which bubble up alternately; and this ebullition generally happens in each of them about three times in a quarter of an hour. Though these wells lie in a plain, they spring from a hard stony bottom, where two of them eject the water from the interstices between the stones, about an ell in height; but in the bottom of the third is a round aperture, through which, in its turn, it throws the water five or six ells high. After this it subsides about two ells, and one may go down, during that interval, and take a survey of this wonderful spring. Its ebullition has three gradations: during the first, the water rises half way up the cavity; afterwards it fills to the top; and the third time shoots up to the above-mentioned height. When the water is subsiding it absorbs any light substance, as a piece of wood; but at the return of the ebullition ejects even the heavy stones that are thrown into it.

Gyser, a spring in the valley of Hacadel, rises in a hollow rock at the foot of a mountain. Mr. Olave, who saw it in 1746, says the cavity is about twenty fathoms in circumference, and three in depth. There is a small aperture at the bottom, through which the water generally rises till it runs over the basin: then follows a terrible noise like the discharge of small arms, which shakes the very rock. After this noise has been repeated four or five times, the water, which is hot, emits a thick steam, like smoke, is violently agitated, and springs up to the height of sixty fathoms, in such quantities as to form several hot rivulets on every side of the rock. The rising and violent agitation of the water ceases in six or seven minutes, and the cavity, or basin, becomes empty. This astonishing phenomenon happens once a day, and is periodical, returning at a certain hour: but whether the agitations of this spring correspond with the tides in the neighbouring sea, has not been determined.

In several of these hot springs the inhabitants who live near them boil their victuals, only by hanging a pot, in which the flesh is put in cold water, in the water of the spring: they also bathe in the rivulets that run from them, which, by degrees, become luke-warm, or are cooled by their being mixed with rivulets of cold water. The cows that drink of these springs are said to yield an extraordinary quantity of milk; and it is likewise esteemed very wholesome when drank by the human species. The hot spring near Crysevig emits a very strong and fetid sulphureous vapour; and some of these springs are said to be so intensely hot, as to calcine bones.

Salt springs are not known here; however, salt has been found at the foot of the burning mountains; and that salt might be made here by art is unquestionable, from the success of former trials.

There are but few woods in the island, though here and there a small wood is to be seen; but great numbers of large and small trees are driven hither by the sea, especially on the north coast, where they generally lie and rot, the inhabitants having no ships to convey the wood for sale to their countrymen. There are here a great quantity of shrubs, on which grow all sorts of berries, as juniper, blackberries, &c. and these are burnt every year for charcoal, which is used by the natives in their forges. The common fuel of the country is turf, some of which has a very strong sulphureous smell, and in some parts of the island they even burn fish bones.

Very good grass grows not only in the vallies, which border on the lakes and rivers, but also in the hollows

between the mountains, and sometimes on their summits. The finest pastures are in the northern parts of the island, where the grass springs up very fast to a great height. The cattle are generally driven to graze among the mountains, where they find good pasture; but the grass that grows near the habitations of the Icelanders is reserved for winter fodder.

Here are also many salubrious and medicinal herbs, as scurvy-grass, samphire, angelica, which is much used by the inhabitants, and berg-grass, a kind of odoriferous moss that is very nourishing, great quantities of which are laid up by the inhabitants for occasional uses. Hitherto few esculent vegetables have been cultivated in Iceland; but as all kinds of culinary herbs thrive in the gardens at Bessetader, and those of the episcopal palaces, it is probable that, with proper culture, they would also grow in most parts of the island.

The inhabitants are entirely discouraged from pursuing agriculture, as they have not yet been able, in this soil, to bring any corn to maturity; yet some parts of the island are known, by several evident traces, to have been formerly cultivated.

Bread is but little known among the common people, for though a large quantity of meal and bread is annually imported into the harbours of Iceland, the lower class of people can purchase but little or none of it, on account of the price. They, however, make a kind of meal, and bread, of a sort of wild barley, which grows there; and in times of scarcity have recourse to a sea vegetable, called in Latin *alga marina saccharifera*, which is dried before the fire, and sold at half the price of dried fish. The cattle feed on this sea-weed at low water, and prefer it to any other marine vegetables.

Bears are frequently driven on this island with the large flakes of ice from Greenland; but the inhabitants are so vigilant and dexterous in destroying them, that the only species of wild beasts to be found in Iceland are foxes, some of which are brown and others white.

The horses here, as in all other northern countries, are small, but strong and full of mettle, and, except those broke for the saddle, lie in the open air all the year round. In winter they subsist only on what fodder they can scrape from under the ice and snow. Such horses as the owners have no immediate occasion for, are turned out among the mountains; and when wanted they go in quest of them, every one knowing his own horse by certain marks.

Great numbers of sheep are to be seen in Iceland, and where the inhabitants are chiefly employed in grazing, it is not uncommon for a man to be master of a flock of four or five hundred of them. In the winter season they drive their flocks to shelter at night, and in very severe weather also keep them under cover in the day-time. The grazing countries lie chiefly in the northern and eastern parts of the island; for the inhabitants of the southern, being mostly employed in fishing, leave their flocks abroad both in summer and winter. Nature, however, seems to have provided a shelter for them, there being large caves into which they are sure to retire in severe weather. In winter, when the snow is not very deep, and the weather is inclinable to be fair and mild, the sheep are turned out to pick what they can find under the snow: when if they happen to be surprized by its falling in a great quantity, they instantly form themselves into a close compact body, by laying their heads together in the center. In this posture they are quite covered with the snow, and are sometimes so benumbed with cold, as not to be able to help themselves till their owner happening to find them, clear their way out. This is often a work of some days, and frequently the weight of the incumbent snow is so great, that they are crushed down by it, and killed before their masters can come to their relief. When they pass some days under the snow, the sheep, in the extremity of hunger, have been known to eat one another's wool; but this is apt to disorder them very much; on which account, when the inhabitants have any apprehensions of bad weather, they take care to keep their flocks at home.

The wool of their sheep is very coarse; but a somewhat finer sort lies under the other. Those writers are mistaken who observe, that all the sheep in this island have

more

more than two horns: a few of them indeed have five, some have four horns, but they have generally only two. As for goats they have no great number of them. Some of the Iceland cows and oxen have no horns; and in the southern parts they are fed with fish bones, and the water in which fish has been boiled. Here are no hogs. As to domestic animals, there are a sufficient number of dogs, and but very few cats.

The keeping of poultry and all other tame fowl is so expensive, that very few of them are to be seen here: but they have plenty of swans, wild geese, and ducks, among which may be reckoned the eider, the eggs and feathers of which are much valued. There are likewise snipes, woodcocks, and other wild-fowl. At certain times an incredible number of eggs of sea-fowl, of which the inhabitants are very fond, are found along the sea-coast.

The birds of prey are the eagle, hawk, raven, and falcon: some of the last are entirely white; others are partly of that colour, and others brown. In every district are certain falconers, who are alone empowered to catch falcons: these carry them to the king of Denmark's falconry at Bessetader, where the king's falconer, who annually visits that place, picks out the best. The governor of Iceland pays the falconers fifteen rix-dollars for every white falcon, ten for one that is partly white, and seven for every brown falcon that is chosen; besides which the falconers receive a gratuity of five or six rix-dollars when they first bring them in.

The rivers, lakes, and bays, with the other parts of the sea, supply the Icelanders with prodigious quantities of various kinds of fish.

S E C T. II.

Of the Persons, Food, Dress, Employments, Language, Religion, Government, and Trade of the Icelanders; the Divisions of the Country, and Number of Inhabitants.

THE Icelanders are naturally of a robust and vigorous constitution; but are often worn out by the continual fatigues and hardships they undergo at sea in their fisheries; and when about fifty years of age become afflicted with various diseases, especially those of the breast and lungs; whence few of them arrive at an advanced age. In case of sickness they entirely resign themselves to nature and Providence, for there is not one physician or surgeon in the whole island. Indeed a few persons keep medicines by them, with which they are supplied from Denmark; but they are not very well acquainted with their virtues, or the method of administering them.

The usual food of the inhabitants is fresh and dried fish, milk, oat-meal, and flesh; but they chiefly live on dried fish with butter. They eat all their provisions without salt. Their common drink is milk, which, when sweet, they drink by itself; but when it turns sour, mix it with water. They are very fond of beer and spirituous liquors, and the most wealthy among them sometimes purchase red and white French wines.

The Icelanders are wisely contented with what apparel their own country furnishes. The cloth which they wear is called wadmal; besides which they also use a garment of close linen. However, some of the gentry are fond of appearing in cloths and stuffs made in Denmark, though a stuff manufactory has lately been set up at Bessetader. Their fishing-dress is made of untanned leather, which is kept pliable by being rubbed with the liver of fishes.

As they are obliged to buy their timber of the Danish company established here, they build their houses as cheap as possible; so that they are neither very commodious nor handsome.

The Icelanders are chiefly employed in fishing and grazing, and when they are not engaged in either of these, especially in winter, both the men, women, and children knit woollen waistcoats, stockings, gloves, and the like; and also employ themselves in weaving Iceland cloth. Their looms indeed are but very indifferent;

but those made in Denmark now begin to be introduced among them.

The Iceland language is the same with the old Norwegian, though it is not at present quite pure and uncorrupted. They are not wanting in mental endowments, which is evident from the learned men and ingenious artists this island has produced. Several of their authors have written very accurate and elegant dissertations relating to the northern history. They even began to cultivate the study of letters so early as the year 1130.

The only religion tolerated in Iceland is the Lutheran. The churches of the east, south, and west quarters are under the jurisdiction of the bishop of Skaalholt, and those of the north quarter are subject to the bishop of Hoolum. The bishops of Iceland cultivate the estates annexed to their respective sees, and their annual produce is about two thousand rix-dollars; but out of these revenues a stated sum is appropriated to the rectors and assistants of the school, and the ministers of the cathedral: besides this, a certain number of scholars must be lodged and clothed, and also the bishop's palace, &c. must be kept in good repair out of the same revenues; and after these deductions the remainder is the bishop's income. Some of the preachers are liberally provided for; others but indifferently; and many of them very scantily: among the latter not a few of them are obliged to be satisfied with the poor pittance of four rix-dollars, which amounts to about eighteen shillings a year.

The secular government of this island under the king of Denmark, is lodged in the general governor of Iceland and Faroe, who usually resides at Copenhagen, and deposes under him a prefect, who lives in the king's palace at Bessetader. Here is also a collector, who levies all the king's revenues in the island, and passes his accounts at the treasury.

The revenues of Iceland arise, First, from the farms of the ports or harbours, which annually amount to above sixteen thousand rix-dollars. Secondly, from the taxes and tithes, which according to the custom of the country are accounted for in fishes, and farmed to private persons. Thirdly, from the farmers of the sequestered convents and crown lands. Fourthly, from the king's boats; and, fifthly, from the hundred and thirty-eight ells and a half, and ninety-two pair of stockings, delivered in annually by every district, called a fyller, and likewise one hundred and seventy-two pounds of fish payable by some fyllers. There are eighteen of these fyllers or districts in Iceland.

With respect to the distribution of justice, here are two superior judges, one of whom presides over the south and east quarters, and the other over the north and west; each of these has usually under him a deputy or inferior judge. There are also twenty-one fyller-men, who are a kind of inferior officers, who, besides levying the king's revenue farmed in their respective fyllers, hold several courts of judicature to which belong certain districts; but an appeal lies from these to a provincial court. Every superior judge determines the causes belonging to his district, and has eight assistants. The supreme court on the island is under the prefect, assisted by twelve superior judges. But if the cause amount to a certain sum, an appeal lies from this court to the supreme court at Copenhagen.

For the regulation of ecclesiastical affairs, here is a provost court consisting of the provost and two assistants. The next is a consistory, which, as well as the others, is held at Oxera, for the diocese of Skaalholt, to which belongs one hundred and sixty-three parishes. In this consistory the prefect, as the representative of the governor, sits as president; the provost and ministers, and even the bishop himself, being only assistants. In the diocese of Hoolum, which contains one hundred and forty parishes, a consistory is held in autumn at a seat called Flige Myre, where the prefect deposes another to represent him as president. From the consistories an appeal lies to the supreme court at Copenhagen.

The capital punishments inflicted on male criminals in Iceland is beheading with an ax, and hanging to a wooden beam fixed in the cliff of a rock; but females who have forfeited their life are put in a sack and then drowned.

With respect to the commerce of Iceland it must be observed, that the company that farms it was established in 1733 by a royal charter, and stiled The Iceland Company of Copenhagen. This company sends twenty-three ships every year, with their factors and sub-factors, who visit all the ports on the island. These ports and harbours are divided into flesh and fish ports; the former are but eight in number, and lie on the north and east coasts of the island; but the latter are fourteen, and these lie on the south-west side. There are also some ports from which both flesh and fish are exported. The natives either barter their commodities for those of Denmark, or receive ready money from them in Danish crowns and dollars, in proportion to the land tax or rate settled by the king's ordinance. The cattle are delivered to the factors at the flesh ports about the end of August, and in the fish ports they purchase all the sound dried cod, ling, and train oil, according to a fixed rate.

Accounts are kept here, and all calculations made by fishes; a fish, which is properly two pounds of fish, being equal to a lub-schelling, and consequently forty-eight fishes are equal to a specie dollar worth about four shillings and sixpence sterling. Danish marks at eight lub-schellings are sometimes current here, and also, though seldom, some lub-schelling pieces. A quarter of a specie dollar, equal to twelve fishes, is the smallest piece of money current in Iceland; so that any balance under this not being payable in money, is made up in fish and tobacco.

The exports from Iceland chiefly consist in dried fish, salted mutton, a good deal of beef, butter, and train oil; a great quantity of tallow, coarse and fine jackets of Iceland woollen cloth, woollen stockings and gloves, red wool, sheep-skins and lamb-skins, fox tails of several colours, feathers, and quills. In 1751 the late king Frederick V. in order to enable the Icelanders to improve their manufactures, and to promote trade and commerce, bestowed on them a bounty of ten thousand rix-dollars, and lent them five thousand more. The imports to Iceland are chiefly iron horse-shoes, timber, meal, bread, wine, brandy, tobacco, coarse linen, a few silk stuffs, and domestic utensils.

Iceland, according to the general division, consists of four quarters, which derive their names from the four cardinal points towards which they lie: this division is caused by so many branches of mountains that separate the quarters from each other. Hence the middle of the island is not inhabited, the people living only in these valleys, which are between twenty and thirty miles broad, and are properly the fyslles, just mentioned, to which other small valleys among the mountains, where good pasture are found, likewise belong. From these mountains several brooks and rivers, some of which are very considerable, run into the valleys, and afford excellent fish.

The number of the inhabitants of Iceland, according to an authentic computation, amounts to about fifty thousand. Yet there are no towns of any consequence, though there are a number of trading places at each harbour. The villages are composed of thirty, or forty, and sometimes fifty small dwellings, placed at a distance from each other.

SECT. III.

Of GROENLAND, or GREENLAND.

Its Situation, Climate, Vegetables, Animals; particularly of the Whale, Fin-fish, Sea-Unicorn, Sword fish, the Morse, and Seal.

IT is not yet determined to which part of the earth Greenland properly belongs; yet as it extends as far to the east as the last mentioned island, and is even supposed to join Spitzberg, which is seated in thirty degrees east longitude, it can no where be more properly placed than here. Its full extent and dimensions are entirely unknown. The most southerly part lies in the fifty-ninth degree fifty minutes north latitude, from whence the coast stretches to the north west beyond the seventy-

eight degree of north latitude, while the eastern coast reaches, according to the Danish writers, to the eighty-second. The west coast was first discovered in 1585 by Mr. John Davis, an Englishman, from whom the streights that run between the continent of North America and Greenland are called by his name.

On the eastern and southern coast vast flakes of ice, which may properly be called islands, are seen, and these are driven from Spitzberg towards the south by a very strong current.

The east side of Greenland, which is opposite to Iceland, is at present inaccessible, on account of the mountains of ice, which rise to an astonishing height, with which the sea is covered: this part is therefore unknown; but sailing between these and Iceland, several adventurers have safely arrived there; and this course the Dutch, in particular, have actually steered.

The west side of Greenland towards Davis's Streights is, however, better known. On that side the coast is defended by rocks and several large and small islands. It has also wide and deep bays, which run a great way into the land, some of which are the mouths of large rivers, and others form good roads and harbours. The main-land consists of little more than confused heaps of rocks, the summits of which are always covered with ice and snow; as are also some of the valleys.

The climate as far as the Danish colonies have penetrated is not insupportable; but the weather is very changeable and unsettled. During the summer season, which lasts from the end of May to the middle of September, the sun shines bright and very warm, and on the main-land, above which no cloud can be seen, the weather is very pleasant and always clear: but a cold damp fog that intercepts the sun-beams continually hovers over the islands, except in the month of August, which is the only time in the whole year when the vapours are dissolved. The rains that fall here are neither frequent nor heavy. In this climate it seldom thunders, and storms, which are very rare, are of no long continuance; but the most violent gusts of wind come from the south. The winters, as far as the sixty-fourth degree of latitude, are generally reckoned by the Danes and Norwegians pretty temperate, to which the calm and clear weather may greatly contribute. But when a north-east wind blows, which comes from mountains covered with ice and snow, it is extremely severe; the air being thick and filled with clouds of icy particles, which cause a most piercing frost. The snow falls in less quantities in that part of Greenland known to the Danes, than it does in Norway; for in the former, especially near the rivers in the inland parts, the snow does not exceed half an ell in depth.

This account of the weather is true only of the southern parts of this country subject to the Danes; for to the northward of the sixty-eighth degree of latitude, the cold is in winter so excessive, that the most spirituous liquors, as French brandy, will freeze near the fire-side. As the weather is in this climate very calm, the ice in the bays between the islands is not disturbed till the end of August; and even in the creeks it does not begin to thaw till the close of May, when it is gradually wathed away by the agitation of the waves. From June to August the sun is continually above the horizon, and consequently during that term they have no night; but in winter the sun is invisible to the Greenlanders, and their day is nothing more than the morning and evening twilight, which do not last above two hours.

In the valleys and plains the soil consists of moor and turf-land, and in some few spots, particularly in the south parts, in about sixty-one degrees of latitude, grow fine grass, with yellow flowers, the roots of which smell in the spring like roses, angelica, scurvy-grass, wild rosemary, and some good esculent herbs. Indeed that part of the county which lies between the sixtieth and sixty-fourth degree of latitude has the best soil; so that in some places cabbages and turneps thrive very well, and the latter are remarkably sweet. There is not a tree of any kind to be seen in the country, except on the sides of a bay, sixty Norway miles to the south of Hope-colony, where a little coppice of birch trees grow: but their

trunks

trunks are no thicker than a man's leg. Some shrubs are dispersed here and there; as small juniper, gooseberry and bilberry bushes, brambles, &c.

No trial has yet been made of what minerals are contained in the Greenland mountains. There are, however, rocks of asbestos, from which considerable quantities have been hewn. Some mountains also consist of an imperfect kind of variegated marble, of which the inhabitants make kettles and other utensils.

On the main land are found some hares; but these, which are very small, are grey in summer, and perfectly white in winter. Here is also a species of rein-deer; but they are very different from those of Lapland. The foxes are white, brown, and grey; but are small. White bears are sometimes found here, and towards the north are very numerous; these differ from the bears of other countries, their heads being long like that of a wolf, which they much resemble in form; but the Greenlanders are very daring and active in destroying them.

The only domestic animals found here are dogs that never bark, but snarl and howl: they are timorous and unfit for the chase; yet if not tamed when young, become wild and very mischievous. The Greenlanders kill and eat these dogs, and also often use them to draw their sledges, yoking four, six, and sometimes eight or ten to a sledge, loaden with five or six of the largest seals, with the master sitting upon them, who drives as fast with them as we can do with good horses, for they often travel sixty miles in a winter day upon the ice. Neither snakes nor any other venomous creatures can live in this climate; nor are they plagued with beetles, rats, mice, or the like.

The land-fowl in this country are the ryper, a sort of large parrot, which is grey in summer and white in winter; but builds his nest very high in the cliffs of the rocks; with eagles, falcons, large speckled owls, ravens, different sorts of sparrows, and, in short, all the kinds of land and sea-fowl known in Norway are seen here in amazing numbers. Among the insects the mosquitoes, or gnats, swarm in this country, and are extremely troublesome; but they have neither ants nor bees.

The fresh water in Greenland has been highly recommended for its salubrity and palatableness. The rivers afford plenty of trout, cray-fish, and salmon; and the sea yields an inexhaustible variety of all kinds of fish, except oysters; but it abounds with excellent muscles, and very large shrimps, or prawns. The smaller species of fish are dried here for winter store, especially the lodden, a sort of small herring. Here are also great plenty of cod, haddock, thornbacks, and the holybutt, by some called the turbot of the North, which is so big that it will fill a large cask.

The Greenland sea, and other parts of the Northern ocean that lie under the north pole, contain a very great number of the largest species of fishes, which there swim in vast shoals. In these regions the great Creator has dealt out their food with a liberal hand, and of all climates this is the best adapted to their hot constitutions and enormous bodies, which are, as it were, enclosed in fat. This species of fish differ from all other kinds in many particulars; for in their internal parts they resemble land animals. They breathe with lungs, and consequently cannot remain long under water. They also copulate like quadrupedes, bring forth their young alive, and suckle them with their milk. The fins of other fish consist of bones, or cartilages, fastened together by thin membranes running between them; but the whale has articular bones, like the fingers of a human hand, with their proper ligaments covered with a thick skin like that of the other parts of its body. By means of this mechanism the whale can move and turn about with greater ease than he could with fins of the common form, and secure himself from falling precipitately upon the rocks when he dives to the bottom of the sea; for which end he lays his thick tail horizontally on the surface of the water, which is of great service to him in this motion.

The whales are of several kinds, and may be divided into such as have apertures in the head, and such as have nostrils for respiration. Some of the former have two

holes or apertures; as the whale properly so called, the fin-fish, &c. others have only one, as the cachellotte, or spermaceti whale: but those that respire through the nostrils are seldom to be met with. This species may also be divided into those that have plain, and those that have prominent backs.

The Greenland whale with a flat back is thick and unwieldy, its head taking up one-third part of its bulk. These are from sixty to seventy feet in length, the fins on their sides from five to eight feet, and the tail, which is in a horizontal position, or bent a little upwards on both sides, is from three to four fathoms broad. When the whale is in danger, he turns upon his side and brandishes his tail, which it is dangerous to approach: the tail also serves him for an oar, with which he rows himself forward with surprising swiftness. The skin of the back is black and smooth, but in some places variegated or marbled. Next to the skin, which is not thicker than strong writing-paper, or thin parchment, is the rind, which is near an inch thick; and between this and the flesh lies the fat, to the thickness of nine, and sometimes twelve inches. Under the fat is the flesh, which is dry and very red. In its upper jaw on both sides are the spicula, or whale-bone, which serves him for teeth; and the largest of these, which are placed in the middle, are seven or eight feet in length, and sometimes more. On each side are generally two hundred and fifty of these spicula; so that they amount in all to five hundred. The tongue is very fat, and so large that it fills several casks. The eyes of the whale, which are no bigger than those of an ox, are in the hind part of the head, where it is broadest, and are defended by eye-lids and eye-brows. This fish is very quick of hearing, though it has no external ears, and has only a black spot under the upper skin behind the eye, and under that spot a narrow duct, which seems to convey the sound to the tympanum, or drum. They generally bring forth only one at a birth, though they have sometimes two, and their milk is like that of a cow. Their usual food is a small, black, round insect, of about the size of a horse-bean, which abound in these seas, and of which the whale sucks in prodigious swarms with his vast mouth, and afterwards grinds them with his spicula. The nord-caper, so called from the vast number of them seen about the North Cape in Norway, is much slenderer and smaller.

The fin-fish equals the whale in length, but not in thickness, and has a fin on his back, from whence he receives his name. He throws water higher than a whale of his size; has brown lips, which are twisted like a rope; and his body in colour much resembles a tench. He is extremely nimble, as well as strong.

The narval, or sea-unicorn, is chiefly remarkable for its long horn, which resembles ivory, but is generally more solid and ponderous. This fish is smooth like an eel, its colour white, sprinkled with black spots, and its eyes small. It has two fleshy fins, and a semi-circular hole on the top of its head, from whence it spouts water, like a whale. The horn, from which it receives its name, grows straight forwards from the middle of its upper jaw, is curiously wreathed, and terminates in a point. With this it attacks the largest whale, and can strike with such violence as to pierce the side of a ship. The horn of this fish has a place in the cabinets of the curious, where it has been shewn for that of the unicorn.

The sword-fish, so called from their sharp pointed upper jaw, which resembles a sword, pursues the whale and fin-fish with great eagerness. They are of a slender form, of various sizes, from three to twenty feet in length, and their eyes stand far out of their head. A few of them will dispatch a large whale, and when they have killed him they feed chiefly on his tongue.

Among the amphibious animals are the morse and the seal. The morse is as large as an ox, with four feet, a thick round head, and a short neck, in which lies his principal strength. He has red eyes, small ears, and large nostrils, from whence he spouts water. His skin is very thick, and covered with hair, and from his upper jaw proceed two long teeth, as white as snow, and more esteemed than ivory, as they keep their colour better.

This

This creature is very bold, making towards the boat as soon as attacked, and endeavouring to overset it.

The seals are of the size of a large dog, and are mostly black, but some grey, with very fine smooth hairy skins. The old ones make a noise like the howling of dogs, and the young ones like the bleating of lambs. Their head and body are shaped much like those of a dog, whence they are by some called sea-dogs. These are the most serviceable of all animals to the Greenlanders, for their flesh serves them for food, and the skin for clothing and for making their boats: of its entrails and membranes they also make sails and windows; its ligaments serve them for thread and cords; and of the bones they make all kinds of domestic utensils and implements of hunting.

SECT. IV.

Of the Persons, Language, Dress, Houses, Furniture, and Boats of the Greenlanders; their Method of catching Whales, Seals, and Salmon; their Manners, Customs, Religion and Trade.

THE Greenlanders of both sexes are generally short, but fat, plump, and well proportioned. Their faces are something flat, their hair black and lank, and their complexion of a brownish red. They are strangers to the small-pox, and are seldom afflicted with epidemical diseases; but the scurvy is the reigning distemper, and on this occasion their common remedy is scurvy-grass and other simples. They have neither surgeon nor physician among them; but readily rely on certain impostors who pretend to foretel future events, and to be skilled in physic. They have some instances among them of longevity, and these perhaps would be more frequent did not their manner of life expose them to numberless dangers.

Their language has something very singular in it, and is difficult to be learned, yet it is said to have many elegant phrases. Mr. Egede has published a dictionary of it, and for the instruction of the Greenlanders, the four Gospels, with several small tracts, have been translated into the Greenland tongue, and printed at Copenhagen. The Greenland dialect is mostly the same throughout the whole country known to the Danes, except some little difference in the pronunciation. The women have also a particular manner of pronouncing their words, which generally terminate in an *n*.

Their clothing is made of the skins of their deer, the dog-fish, and of certain birds, sewed together with the small guts of the dog-fish. There is very little difference between the dress of the two sexes.

The men's dress consists of a coat or jacket, with a cap or hood sewed to it, that covers the head and shoulders. This coat reaches down to the knees. Their breeches are very small, and fit close; they wear no linen, and the hair of the skins the coat is made of, is turned inward, to keep them warm. Over this coat they put a large frock made of seal-skins, dressed and tanned without the hair, in such a manner as to keep out the water. Between the leathern frock and the under coat they wear a linen shirt, or for want of linen, one made of seals guts, which also helps to keep out the water from the under coat. Those seated near the ports frequented by the Danes and Dutch, have shirts of striped linen, with coats and breeches made of red and blue stuffs, which they buy of the Danish or Dutch merchants, but after their own fashion, and these they wear upon extraordinary occasions. They formerly wore stockings made of rein-deer or seal-skins; but now they have worsted stockings of different colours, as white, blue, and red, which they buy of the Danes: their shoes and boots are made of seal-skins well dressed or tanned.

The women's coats are higher on the shoulders, and wider than the men's, with higher and larger hoods. The married women who have children have much larger coats than the rest, on account of their carrying their children in them upon their backs, for these are their only swaddling cloaths and cradle. They wear drawers, which reach to the middle of their thigh, and over them

breeches. The drawers they keep on day and night; but the breeches, which come down to the knee, they only wear when they go abroad in winter, and as soon as they come home pull them off. Next to their body they wear a waistcoat made of a young fawn's skin, with the hairy side inward. The coat, or upper garment, is sometimes made of fine coloured swan-skins trimmed and edged with white, neatly wrought in the seams and about the edges, which look very well. Their shoes and boots, with little difference, are like those of the men.

Their hair, which is very long and thick, is braided, and tied up in a knot, which becomes them; they commonly go bare-headed, both without and within doors; and in these southern parts seldom wear their hoods except it rains or snows. Their chief finery consists in wearing glass beads of several colours, corals about their neck and arms, and pendants in their ears; some of them also wear bracelets of black skin set with pearls, with which they adorn their cloaths and even their shoes. The Greenland women have likewise another more extraordinary kind of embellishment: they make black streaks between their eyes, on their forehead, upon the chin, arms and hands, by passing under the skin a needle and thread made black. Hideous as this renders them in the eyes of strangers, they think it extremely ornamental, and say, that those who do not thus adorn their faces, will have their heads turned into train oil tubs, that shall be placed under the lamps that burn in the land of souls.

They have two sorts of habitations, one of which serves for the winter, and the other for the summer season. The winter dwellings are the largest. These are dug deep in the earth, and raised a little above the surface of the ground with stone and turf. In this hut the windows are on one side made of seals-guts dressed and sewed together, or the maws of holy-butts, which are white and transparent. On the other side the beds are placed, which consist of benches made with boards, raised half a yard from the ground. Their bedding consists of the skins of seals and rein-deer. On the hearth is a great lamp in the form of a half moon, and over it are hung their kettles formed of a kind of marble, or, where they have the advantages of trade, of brass or copper, in which they boil their provisions. The entrance is dug narrow and winding under ground, and the door so very low, that they must creep on their hands and feet to get in, which is so contrived in order to keep out the cold. The inside is lined with seal-skins. Some of these houses are so large as to afford lodging for seven or eight families. Upon the benches where their beds are placed, is the seat of the women, who employ their time in sewing and making up cloaths, while the men belonging to the family, or strangers, sit on the opposite side under the windows, upon benches placed there for that purpose. It is observable, that though in one of these houses there are ten or twenty lamps of train oil kept constantly burning, their smoke is not perceived to fill the room; which is probably owing to the care they take to prevent it. Dry moss rubbed very small is laid on one side of the lamp, which being lighted, burns softly, and if not laid on too thick does not cause any smoke. This fire gives such a heat that it not only serves to boil their victuals, but also heats their rooms to that degree, that they are as hot as a bagnio; however, to those who are not used to this method, the smell of the house is very disagreeable, as well from the number of burning lamps, all supplied with train oil, as from various sorts of raw meat, fish, and fat, heaped up in these habitations; but especially their urine tubs smell insufferably.

They betake themselves to these winter retreats in October, and continue in them till the beginning of May. All the warm part of the year they lodge in tents, which are their summer habitations. These are made of poles set in a circular form, bending to a point at the top, in the form of a sugar-loaf, fenced by a double cover, the innermost of which is of the skins of seals or rein-deer, with the hairy side inward; and the outermost of the same skins, but without hair, and dressed with fat, that they may not be penetrated by the rain. In these tents they have their beds, lamps to dress meat, and a curtain
made

made of the guts of seals sewed together, through which they receive the day-light, instead of windows. Every master of a family has one of these tents.

They usually eat when they are hungry, but their chief meal is at night: their common food is the flesh of rein-deer and hares; all kinds of land and water fowl; seals; several sorts of fresh water and sea-fish; and even some parts of the whale. Their manner of dressing and eating of their victuals is indeed extremely disgusting. They are said to prefer the blood of the seal to any other drink; but they usually quench their thirst with water, yet can drink a great deal of brandy, without being intoxicated.

In their marriages the chief qualifications required in the bride are skill in domestic affairs, and especially in cutting out and sewing their garments. On the other hand, nothing recommends a suitor more than boldness, activity, and success, in fishing and hunting. But at the marriage festivities the bride puts on a shew of gravity, and a melancholy air. Here relations never intermarry, even to the third or fourth degree of consanguinity. They have a respectful idea of marriage, and in general every Greenlander has but one wife. They are fond of their children, even to a culpable excess; and, instead of moderate correction, or checking them for their faults, let them do whatever they please.

The men are chiefly employed in hunting and fishing, for which they have very curious tackle. The boats in which the men row out to sea are about six yards long, and only three quarters of an ell broad in the middle, ending in a very sharp point at both extremities. They are made of very thin narrow boards fastened together with whale-bone, and covered with seal-skins. Only one man goes out in these boats, the top of which is covered with skin, with only an opening in the middle, which, when the man has entered, is fastened close round his waist; so that no water can enter the boat; and thus equipped he will row sixty or seventy miles a day, though he has but one oar, which is six or seven feet long, and flat at both ends. These boats are easily upset, which they look upon as no great damage if the owner escapes with his life. The larger sorts of boats are used chiefly by women. They have also a kind of open barges, which are likewise pointed at both ends; but are not very deep: these are covered with seal-skins, and are high at the extremities. They make use of them in conveying their effects in their emigrations, or when they embark for the whale-fishery, and in coasting from one part to another.

The Greenlanders are more frequently employed at sea than on shore. When they go to catch whales they put on their best apparel, fancying that if they were not neatly dressed, the whale would shun them. Upon these occasions about fifty persons, men and women, set out together in one of the large boats. When they have found the whale they strike him with their harpoons, to which are fastened lines or straps two or three fathoms long, made of seal-skins; at the end of which they tie a bag of a whole seal-skin filled with air like a bladder, that the whale, when he finds himself wounded and flies away with the harpoon sticking in his body, may be the sooner tired and easily found, the air-bag hindering him from keeping long under water. When he loses strength they attack him with spears and lances till he is killed, and then put on their coats made of dressed seal-skin, with boots, gloves, and caps, laced so tight together that no water can penetrate them. In this garb they leap into the sea, and begin to slice off the fat all round the body, and are sometimes so daring as to get upon the whale's back, while he is yet alive, in order to make the quicker dispatch in killing him, and cutting away the fat.

They use much the same method in killing the seals, only the harpoon is less, to which is fastened a line of seal-skin, six or seven fathoms long, and at the end of it a bag of seal-skin filled with air, to keep the seal when wounded from escaping by diving: but in the northern parts, where the sea is frozen, they use other methods in catching of seals. They first look out for the holes, which the seals themselves make with their claws, of about the bigness of a halfpenny, that they may fetch

their breath. On their finding one of these holes, they seat themselves near it; and as soon as they perceive the seal put his snout to it for air, immediately strike him with a small harpoon, which they have ready in their hand; to which is fastened a strap of a fathom long, which they hold in the other hand. After he is struck and cannot escape, they cut the hole large enough to get him up through it; and as soon as they have got his head above the ice, kill him, and then lift him out.

They have also another way of catching seals: they make a great hole in the ice; or, in spring, find holes made by the seals themselves, through which they get upon the ice, in order to lie and bask themselves in the sun. Near these holes they place a low bench, upon which they lie down on their belly, having first made a small hole near the large one, through which they softly let down a pole headed with a harpoon, a strap being fastened to it, which one holds in his hand, while another, lying upon the bench with his face downwards, watches the coming of the seal; which when he perceives, he cries *Ke*, upon which he who holds the pole strikes the seal.

They have another method in the spring when the seals lie upon the ice, near holes which themselves make to get up and down; the Greenlanders, disguised in seal-skins, with a long pole in their hands, move their heads forwards and backwards, and snort like a seal, till they come so near him, that they reach him with a pole and strike him.

As their fishing is the principal concern of these people, we are from thence enabled to judge of their characters and capacities. This is of the utmost importance to them, since on their ability in hunting and fishing depends their whole subsistence. In fishing they make use of hooks of iron or bones, their lines are made of whale-bone cut very small and thin, and with this tackle they catch abundance of fish. Their way of fishing for small salmon, or sea-trout, is as follows: at low water they build small enclosures of stone, near a river's mouth, or any other place where the salmon comes: when the tide comes in, the salmon, which enter the river, passes at high water over the enclosure, and remains in the river till the water falls again, when they endeavour to return to the sea; but the fishermen waylay them at the enclosure, and stop their passage till the time of low ebb, when the salmon are left on dry land, and may be caught with the hand: if they are left in holes, they take them with a pole headed with two sharp hooked bones, or iron hooks.

The Greenlanders are strangers to trades, arts, and sciences. They have no traffic one among another, and their commerce with foreigners is very inconsiderable. They neither use nor have any knowledge of money; but fix a certain value on iron.

When the Greenlanders meet together they express their mirth by drumming, singing, and dancing. They are accustomed from their very childhood to an unbounded liberty, all of them being on a level. They have indeed little regard to the forms of ceremony and decorum which in other places obtain the name of politeness; yet are free, open, and cheerful in conversation, nothing pleasing them better than merry jests and raillery. They live very sociably, and repose great confidence in each other. Amorous intrigues of an unlawful kind are seldom or never heard of among them; and as they abstain from theft, rapine, and violence, among themselves, they are never known upon any pretence to make war on their neighbours. They think themselves greatly superior to the Danes, and make no scruple to pilfer any thing from them, when it can be done with safety; but it is probable they have little idea of property; and as they behave with such integrity to each other, it is natural to suppose that they have learned this pilfering of the Dutch and Danish seamen. They exercise great hospitality, and indeed have most things in common; so that if there be any among them who cannot work, or get his livelihood, they do not let him starve, but admit him freely to their table. They are remarkable for their good-nature and inoffensive behaviour: hatred and envy, strife and rage, are rarely heard of among them. They have as great an abhor-

rence

rence of stealing from each other, as any nation upon earth, and therefore keep nothing under lock and key; but leave all so free that every body may come at it without any fear of losing it.

They are, however, charged with having no idea of a God, and some authors have said that their language has not any expression to denote a Supreme Being; though they themselves acknowledge, that they are convinced of the immortality of the soul, and believe that as soon as a person dies he goes to the land of spirits, and there enjoys the felicity of hunting from age to age; while the body remains behind and moulders in the dust.

They maintain that there is a spirit which they call *Torngarfuk*, to whom they ascribe a supernatural power, though not the creation of the world. The *Angakuts*, or prophets, form very whimsical ideas of this being, some representing him as without form or shape, others giving him that of a bear, and others pretending that he has a large body and but one arm. They assign him his abode in the lower regions of the earth, where they tell you is constantly fine sun-shine weather, good water, deer, and fowls in abundance. They likewise maintain that a spirit resides in the air, whom they name the *Moderator*, or *Restraint*; for these *Angakuts* pretend, by his order, to command the people to abstain from certain things, as preservatives from evil and danger. They also believe that there are spirits who govern the elements.

Their notions of the heavenly bodies are also very whimsical; they say the moon was once a young man, and the sun a young woman his sister, with whom he was familiar in the dark; but that she being desirous to find out her lover, rubbed her hands with foot, with which she marked his white bear-skin coat, and hence they say came the spots in the moon. The sun flying from his embraces, ascended the air, whither the moon followed her, and still continues to pursue, without being able to overtake her; but this is probably only a fiction of their poets, like those of Ovid in his *Metamorphoses*, who also represents the loves of *Diana* and *Endymion*.

They do not compute or measure their time by weeks or years, but only by months, beginning their computation from the sun's first rising above their horizon in the winter, from whence they tell the moons, in order to know exactly the season in which every sort of fish, sea-animals, or birds, seek the land, that by this knowledge

they may regulate their different employments. According to their astronomical system, the heavens turn around the point of a huge rock.

What seems most extraordinary in these people, thus seated in frozen regions, which might be supposed to damp the genius and extinguish the fire of imagination, is their talent for poetry, in which they take extreme delight. The poems they compose are a kind of lyric odes, the harmony of which depends both upon rhyme and quantity, there being a visible regularity in the number of syllables of which their verses are composed, and a plain regard to cadence even in their manner of reading them. They use this sort of poetry, which, all things considered, is as far from being rude, as it is from being exact, to express all their passions, such as love, joy, grief, but more especially anger; for when two people quarrel in this country, it is said they challenge each other, not to fight, for that they never do but in jest, or by way of diversion, but to contend in verse; and he who first wants words to express himself in this poetical duel, is held to be conquered, and so the controversy ends without either blood or law-suit.

Mr. Egede, who was sent to Greenland by the Danish Society for propagating the Gospel, lived among this people fifteen years, which he spent with the most indefatigable zeal and laborious application, by which means he made a great number of converts. He returned to Copenhagen in 1736, and by his solicitation a seminary was founded in that city for educating able missionaries and catechists to be sent to Greenland. The Mission-college also sends young lads to Greenland to learn the language, and to be instructed by the missionaries there, in order to qualify them for that station.

The Greenland trade is at present carried on by the Copenhagen company, who send thither three or four ships every year, and the Dutch are prohibited from coming within several miles of their colonies. The commodities Greenland affords for commerce are whale-blubber, whale-bone, sea-unicorns horns, the skins of rein-deer, bears, seals, and fox-skins, which they barter for the following merchandizes; shirts made of white, blue, red, and striped linen, coarse woollen cloth; knives, saws, needles, large fishing-hooks, and other hard-ware; looking-glasses, rafts, poles, deal boards, chests, kettles of copper, brass, and tin, with other articles.

BOOK IV.

Of AMERICA in general.

WE are now entering upon a country of amazing extent, unknown to the ancients : a country discovered so lately as the year 1491, by the judgment, the vigilance, the perseverance, and maritime skill of the great Columbus, a Genoese ; who, by this discovery, extended geographical knowledge, perfected navigation, opened new sources of commerce, and gave a new face even to the affairs of Europe.

America, the fourth grand division of the earth, received its name from Americus Vespucius, a Florentine, who was far from deserving that honour, to which he had no other claim than a few inconsiderable discoveries, after Columbus had led the way, and his drawing a map of the country ; and therefore if it was proper for it to receive the name of any European, it might with more justice have been called Columbia, from the great man who made it known to the Europeans.

This New World, as it is emphatically called, extends from the frozen regions of the North, where its limits are secured from the observation of the curious by the shortness of the summers and barriers of ice, through an extent of country in which successively pass all the climates to be found in the other regions of the earth ; till you come on the south to the snowy rocks of Terra del Fuego. Thus the continent of America extends from about the eightieth degree north to the fifty-sixth degree south latitude, and, where its breadth is known, from the thirty-fifth to the hundred and twenty-fifth degree of west longitude from London, without including the islands ; stretching between eight and nine thousand miles in length : but in its greatest breadth, where certainly known, three thousand six hundred and ninety ; though in the middle it is not above sixty or seventy miles over.

It is bounded on the north by the seas about the north pole ; on the east by Davis's Straights, which separates it from Greenland, and by the great Atlantic ocean, which divides it from Europe and Africa ; on the south by the vast Southern ocean ; and on the west by the Pacific ocean, which divides it from New Guinea, probably another very extensive continent, and from China, Japan, and the east part of Siberia.

It is very remarkable that the climates of North America are many degrees colder than any of the countries in the same latitude in Europe : thus New Britain, which is nearly in the same latitude with Great Britain, is insufferably cold to an European : the greatest part of the frozen country of Newfoundland, the bay of St. Laurence, and Cape Breton, lie opposite the coast of France :

Nova Scotia and New England are in the same latitude as the Bay of Biscay : New York and Pennsylvania lie opposite to Spain and Portugal. Hence the coldest winds of North America blow from the north and the west, as they do here from the north and the east.

This vast continent is divided almost in two by an isthmus about fifteen hundred miles in length, and in one place so narrow as to be, as hath been already intimated, only about sixty miles over ; but being mountainous, it would be impossible perhaps to open a communication there with the Pacific ocean, which lies on the other side of it. All the continent to the north of this isthmus, together with the isthmus itself, is stiled North America ; and all to the south of it, including that even on this side the equator, is stiled South America.

North America is far from being mountainous, and chiefly consists of gentle ascents and level plains ; the principal hills in this extensive tract are called the Appalachian or Aligany mountains, which extend on the back of our southern colonies. But in South America is the immensely long and lofty chain called the Cordillera of the Andes, which in height and length exceed any chain of mountains in the other three parts of the earth ; for beginning near the isthmus of Darien, they extend to the straits of Magellan, cutting the whole southern part of America into two, and running a length of four thousand three hundred miles.

America is also extremely well watered by rivers, not only for the support of animal life, and all the advantages of fertility, but for the convenience of trade, and the intercourse of the distant inhabitants by water. In North America the great river Mississippi, rising from unknown sources, runs above two thousand miles chiefly from north to south, receiving in its course the Ohio, the Ouabache, and other large rivers, scarcely inferior to the Rhine or the Danube, navigable almost to their sources, and laying open the inmost recesses of this continent. Near the heads of these are extensive lakes of fresh water, which have a communication with each other, and with the great river St. Laurence, which is navigable for ships above four hundred miles from its mouth, where it is said to be ninety miles broad. On the eastern side of North America are the fine rivers Hudson, Delaware, Potowmack, Susquehanna, and several others of great length and depth.

But in South America are the two largest rivers in the known world, the river of Amazons, and the Rio de la Plata : the first rises in Peru, and, after a course of above

three thousand six hundred miles, in which it receives a prodigious number of navigable rivers, falls into the ocean between Brasil and Guiana. The Rio de la Plata, or Plate-river, rises in the heart of the country, and becomes so large by the accession of other considerable rivers, that it pours such an immense flood into the sea, that it makes it taste fresh for several leagues from the shore. Besides these there is the Oronoko, and several other very considerable rivers.

A country of such vast extent on each side the equator, must necessarily have a variety of soils as well as climates; but if we except the most northern and southern parts, which here, as every where else, are naturally cold and barren; the rest is an immense treasury of nature, producing most of the metals, minerals, plants, fruits, trees, and woods, to be met with in the other parts of the world, and many of them in greater quantities and higher perfection. The gold and silver of America has supplied Europe with such immense quantities of those valuable metals, that they are become vastly more common; so that the gold and silver of Europe now bears little proportion to the high price set upon them before the discovery of America.

This country also produces an immense quantity of diamonds, pearls, emeralds, amethysts, and other valuable stones, which are brought from thence into Europe, in such quantities, as have also greatly lowered their value. To these may be added a great number of other commodities, which, though of less price, are of much greater use. Of this sort are the constant and plentiful supplies of cochineal, indigo, anatto, logwood, brasil, fustick, pimento, lignum-vitæ, rice, ginger, cacao, or the chocolate-nut, sugar, tobacco, banillas, cotton, red-wood, the balsams of Tolu, Peru, and China, Jesuits-bark, mechoacan, sassafras, sarsaparilla, cassia, tamarinds, hides, furs, ambergris, and a great variety of woods, roots, and plants, to which, before the discovery of America, we were either entire strangers, or forced to buy at an extravagant rate from Asia and Africa.

America has also a variety of most excellent fruits, which here grow wild to great perfection; as pine-apples, pomegranates, citrons, lemons, oranges, malicats, cherries, pears, apples, figs, grapes, vast numbers of culinary, medicinal, and other herbs, roots, and plants. Add to this the surprizing fertility with which the soil is blessed, by which many exotic productions are nourished in as great perfection as in their native ground.

With all this plenty and variety, the vast continent of America formerly laboured under the want of many necessary and useful commodities: for upon the first landing of the Europeans, they found neither corn, wine, nor oil; the inhabitants in many places knew not the use of corn, but made their bread of pulse or roots: their drink was the water of the clear spring; and, with regard to money, they were ignorant of the use of it. Our kind of sheep, goats, cows, asses, and horses, were not to be found there, though the land abounded with pastures; and at first the sight of a man on horseback would throw a whole troop of these innocent and simple inhabitants into a dreadful panic. But all these animals have been brought hither in such plenty, and have increased so fast in those fertile pastures, that the country has no want of them, as appears from the innumerable hides, particularly of oxen, continually exported from thence. However, in the room of these domestic animals they had others no less valuable, and to which we in Europe were utter strangers; these we shall describe in the countries where they are bred.

The same may be said of the vast variety of birds to be seen there, some of which greatly surpass all that are

to be found in any other parts of the world, for their surprizing beauty, fine shape, bright and glowing colours. The seas, lakes, and rivers, are no less fraught with the greatest plenty and variety of fish.

Before the arrival of the Europeans they had arts of their own; they had some notion of painting, and also formed pictures by the beautiful arrangement of feathers of all colours, and in some parts built palaces and temples. Though the use of iron was unknown, they polished precious stones, cut down trees, and made not only small canoes, but boats of considerable extent. Their hatchets were headed with a sharp flint, and of flints they made knives. Thus, at the arrival of the Europeans, they afforded a lively picture of the primitive state of mankind in the infancy of the world. At that period the arts, the sciences, and all the learning that had long flourished in these more enlightened parts of the earth, were entirely unknown. These, which had before travelled west from Egypt to Greece, and from thence to Rome, have proceeded in the same course, and are daily gaining ground where ignorance reigned triumphant; and the time may arrive when America may become the seat of mighty empires, and be distinguished by cities extensive as Babylon, and beautiful as Athens and Palmyra.

North America is divided

I. Into the dominions of Great Britain: containing Labrador, or New Britain, with the countries about Hudson's-bay, Canada, Nova Scotia, New England, New York, the Jerseys, Pennsylvania, Maryland, Virginia, Carolina, Georgia, East and West Florida.

With many rich and fertile islands, the principal of which are Newfoundland, Cape Breton, Providence, Jamaica, St. Christophers, Antego, Nevis, Dominica, Barbuda, Anguilla, Montserrat, Tobago, St. Vincent, Barbadoes, the Granades, and Granada. To which may be added the Bermudas, or Summer Islands.

II. The dominions of Spain: containing Louisiana, Old Mexico, New Mexico, and California, in North America. With the extensive countries of Terra Firma, Peru, and La Plata, or Paraguay, in South America.

With the valuable islands of Cuba, half of Hispaniola, or St. Domingo, Porto Rico, Trinidad, and Margareta, in North America. Chiloe, the Kings or Pearl Islands, Juan Fernandes, and the Gallipagos Islands, in the Pacific ocean.

III. The dominions of France, by the late peace confined to the farther side of the river Mississippi, are now said to be exchanged with Spain.

The French have, however, the following islands: St. Martin's, St. Bartholomew's, Deseada, Guadalupe, Marigalante, Martinico, St. Croix, and part of Hispaniola.

IV. The dominions of Portugal consist of the rich and extensive country of Brasil, in South America.

V. The dominions of the Dutch consist of Surinam, on the continent of South America; with the islands of Curassao, Bonaire, and Aruba, near the coast of Terra Firma; with Eustatia and Saba, two of the Caribbee Islands.

VI. Those of the Danes consist only of one of the Caribbee Islands, named St. Thomas.

VII. The parts still possessed by the native Indians, which are the countries north-west of Mexico; the greatest part of Guiana, and all the most southern part of the continent, as Patagonia, and the island Terra del Fuego.

We shall begin with the dominions of Great Britain, which are bounded on the north by the ocean and lands near the north pole, on the east by the Atlantic ocean, on the south by the Gulph of Mexico, and on the west by unknown lands inhabited by the native Indians.

C H A P. I.

Of the Northern Part of the BRITISH AMERICAN Dominions, particularly of the Countries bordering on HUDSON'S-BAY; with the Islands of NEW-FOUNDLAND, CAPE BRETON, and St. JOHN.

S E C T. I.

Of the Countries bordering on Hudson's-bay; a particular Account of the Climate, Soil, Vegetables, and Minerals; with a Description of the Beaver.

THE most northern part of America subject to the English, particularly the countries bordering on Hudson's-bay, which are situated between the fiftieth and seventieth degree of north latitude, and extend between the fifty-first and one hundredth degree of west longitude, including Hudson's-bay; are bounded on the north by unknown lands and seas about the pole, on the east by the Atlantic ocean, on the south by the Gulph of St. Lawrence and Canada, and on the west by unknown lands. Were we to extend the country claimed by Great Britain as far as our mariners have discovered to the north, we might stretch it to eighty-one degrees thirty minutes north latitude; for so far captain Hudson and captain Baffin have sailed, and gave their names to the bays so called; but we are not solicitous to extend the bounds of the countries subject to Britain to regions where no Briton has ever settled, and which we have neither purchased nor conquered.

The knowledge we have obtained of these countries is owing to the repeated attempts that have been made to discover a north-west passage to the East Indies. But though these countries, which extend sixteen hundred miles in length, are claimed by Great Britain, and distinguished by English names, as the east coast by that of New Britain, and the west by that of New North Wales and New South Wales; yet very little advantage has been made of them, except by the Hudson's-bay company, who have several settlements on the coast of Hudson's-bay, and therefore an accurate and distinct account of them cannot be expected. With respect to the climate we shall give some account of it from Mr. Ellis, who sailed thither in 1746, and wintered in the country on the west side of the Bay.

This gentleman wintered in a creek about five miles above York Fort, in the fifty-seventh degree thirty minutes latitude, a situation so far to the south, that the weather might be supposed to be tolerable; but fearing that they might be froze to death in their ships, they built a house of thick pieces of timber, with the spaces between stuffed with moss, and plastered over with clay: the door was low and small, the fire-place was in the middle, and over it a chimney to let out the smoke. It was placed on an eminence surrounded with trees; about a hundred and fifty yards from the front was a handsome basin of water, called the Beaver-creek; and they were protected from the north and north-east winds by thick and tall woods. On the second of November the cold was so intense, that all the bottled beer was froze solid, though packed up in tow near a good fire; and on the sixth the cold became insupportable abroad. About this time they put on their winter-dress, which consisted of a robe of beaver-skins that reached to their heels, two waistcoats under it, a cap and mittins of the same lined with flannel, a pair of Indian stockings over their yarn ones, with shoes of soft tanned moose or elk-skin, under which they wore two or three pair of blanket or thick duffel socks; and a pair of snow-shoes about five feet long and eighteen inches wide, to prevent their sinking in the snow, completed their dress. This, with some alterations, is the garb of the Indians, who have taught it the English. They usually put at least an horse-load of wood at a time into their stove, which was built of bricks six feet long, two wide, and three high. When the wood was near

burnt they beat off the embers, threw out the brands, and then stopped up the top of the chimney. This caused a sulphureous suffocating smell, and so great a heat, that, notwithstanding the severity of the weather, they often sweat; yet if a door or window was but opened, the cold air rushed in with great fury, turning the inclosed vapours into small snow; nor could all the heat they could raise keep the windows, the sides, and ceiling, free from ice: those whose bed-cloaths touched the wall were generally froze fast to it in the morning, and their breath settled in a white hoar frost upon the blankets. This happened soon after the fire went out. As the house cooled, the sap that had been thawed in the timbers with the heat froze, splitting the wood in cracks, with a noise resembling the report of a musket.

No liquid can here withstand the cold; brandy, and even spirits of wine, froze; but the latter only to a consistence like oil. All liquors under the proof of common spirits became perfectly solid, and burst the vessels that contained them, whether they were of wood, tin, or even copper. The ice in the river was above eight feet thick, and they could keep their provisions sweet as long as they pleased, without the assistance of salt; for their game froze the instant it was killed. The hairs, rabbits, and partridges, which in summer are brown and grey, change in winter to white. Every animal is here furnished by nature with extraordinary furs, to resist the cold, which fall off as the warm weather returns; and even this is the case with the dogs and cats brought hither from Europe. If the men touched iron, or any other solid surface, their fingers were froze fast to it; or if in drinking a dram of brandy out of a glass, they touched it with their tongue or lips, in pulling it away the skin was left upon it. They buried their beer twelve feet deep in the ground, on a bed of willow and grass, both under and over it; and then covered it twelve feet deep with a soapy earth; yet some of the casks of small beer next to the sides were frozen, and the strong iron-bound casks burst, though the spirituous part remained fluid in the heart of the ice, and was strong; but the ice, on being melted, tasted quite vapid; other casks were not burst.

From this account of the severity of the winter one would imagine, that it must be extremely uncomfortable, and its inhabitants very unhappy; but this is far from being the case, for though the weather is cold, they have abundance of furs to shelter them from its violence, and many other conveniences that in some measure put them on a level with those who live in a milder climate; and however extraordinary it may appear, there are Englishmen who have lived in the company's settlements for some years, who prefer that country to any other.

There are here frequently seen parhelia or mock suns, and halos about the sun and moon, which are very luminous, and beautifully tinged with all the colours of the rainbow. Our author observes, that he has seen six of these parhelia at a time. The true sun also rises and sets with a large cone of yellow light perpendicular to it; and no sooner does it disappear than the aurora borealis spreads a thousand different lights and colours over the whole concave of the sky, with such resplendent beauty, that even the full moon does not efface their lustre, though they are more apparent when she does not shine; for then one may distinctly read by them, and the shadows of objects are seen upon the snow tending to the south-east. The stars seem to burn with a fiery red, especially those near the horizon.

In the southern parts of this country the soil is fertile, the surface being a loose dark mould, under which are layers

layers of different coloured clay. Near the shore the land is low and marshy, covered with trees of various sorts: and within land are large plains, with little herbage except moss, interspersed with tufts of trees, and some lakes. In the country are a great variety of shrubs and plants, with many of those known in Europe, as the gooseberry, currant, and cranberry, strawberries, angelica, wild auriculas, savine, many of the Lapland plants, and others that are unknown to us. There are great quantities of wild rice by the sides of the lakes and rivers; there is also long grass and good meadow ground, and at the factories are tolerable gardens, especially at York Fort, Albany, and Moose-river, where most kinds of English garden-stuff grow very well, as beans, peas, cabbages, turnips, and many kinds of fallads. Farther within land the country is much more fruitful, the summers warmer, the winters shorter, and less severe.

There are many sorts of minerals here: lead-ore is said to be found in plenty on the surface of the earth near Churchill-Fort: iron-ore is likewise to be met with, and the natives who live to the northward frequently bring pieces of copper to that factory. There are likewise a great variety of talcs, spars, and rock-crystals of different colours, as red and white, the former resembling rubies, and the latter, which are very transparent, shooting into pentangular prisms. In the northern parts is found a kind of coal; the asbestos, or stone-flax, is common here; and also a stone of a black, smooth, and shining surface, that easily separates into thin transparent leaves, which the natives use as looking-glasses. The country likewise abounds in various kinds of marble, some speckled with green, blue, and red; and others perfectly white.

Among the animals are deer, rabbits, beavers, and other beasts; with a great variety of birds, as swans, wild-geese, plover, ducks, and many others that fly to the northward in the spring to breed, and return to the southward in autumn. There are likewise eagles, hawks, partridges, pheasants, crows, and owls.

As the inhabitants of this country are clothed in the skins of beavers, and as the principal trade consists in those skins, with which they have supplied us by means of the Hudson's-bay company, it will be proper to give here a description of that curious animal. A large beaver is about twenty-eight inches in length, from the hind part of the head to the root of the tail, and weighs sixty or seventy pounds, but their colour is different; in some places they are black, in others white, and in others almost of the colour of the deer. The beaver lives to a great age; the females generally bring forth four young ones at a time. Their jaws are furnished with two cutters and eight grinders; the upper cutter is two inches and a half in length, and the lower something longer. The upper jaw projects over the lower one; the head is shaped like that of a rat, and is small in proportion to its body; its snout is long, its eyes small, and its ears sharp and round; its legs are but about five inches in length, with paws formed like a man's hand; but the hind-feet are webbed like the toes of a goose. The tail is shaped like the blade of a paddle, and is four inches broad where it joins to the body, five or six in the middle, and three at the extremity: it is about fourteen inches in length, and about an inch in thickness. It is covered with a scaly skin, the scales being near a quarter of an inch long, and fold over each other, like those of a fish.

The ancient writers of natural history are mistaken in asserting, that the beavers bite off their testicles when pursued by the hunters; for what the physicians call castoreum, is the inguinal glands of this animal.

The industry, foresight, and good management of these animals is extremely surprizing, and scarce credible to those who never saw them. When they want to form a settlement, three or four, or more of them, assemble together, and first pitch upon a place where they may have provisions, such as the bark of trees, particularly roots, or grass, with every thing necessary for erecting their edifices, which must be surrounded with water; and if there be neither a convenient lake nor pond they make one, by stopping the course of some brook, or river, with a dam. For this purpose they cut down trees, above the place where they are resolved to build, and take

their measures so well, as always to make the tree fall towards the water, that they may have the less distance to roll it, when they have cut off the branches. This done they float it to the place appointed, and these pieces they cut bigger or less to suit their convenience. Sometimes they use the trunks of large trees, which they lay flat in the water; at others they fasten stakes in the bottom of the channel, and then interweaving small branches, fill up the vacancies with clay, mud, and moss, in such a manner, as renders the dam very tight and secure. In these works their tails serve them for carts and trowels, and their teeth for axes; their paws supply the place of hands, and their feet serve instead of oars.

The construction of their houses is no less admirable; they are generally built upon piles, at some distance from the shore, but sometimes close to the banks of the rivers; the first make holes at the bottom of the water for planting six posts, upon which each of their edifices is built in a most curious manner; their form is round, with a flat roof; the walls are two feet thick, and sometimes more; they are formed of the same materials as the dams just mentioned, and every part is so well finished, that no air can possibly enter; about two-thirds of the edifice is raised above the water; in this they lodge, and are careful to keep it clean. They have generally three or four different avenues to each house, which they enter under water. To provide provisions against the winter, they draw the sticks they cut from the trees, and thrusting one end into the mud, let them lie under the water to preserve the bark green and tender for their winter provisions. There are sometimes found eight or ten beavers in one house; at others not more than three or four; and let them be as numerous as they will, they all lodge upon one floor.

When the snows melt and raise the stream, they leave their dwelling, and separate till the season returns for repairing them, or for building new ones, which is in the month of July. The Indians lay traps for the beavers in the paths they frequent, and bait them with fresh-cut poplar boughs, which they are very fond of. Sometimes the Indians open the ice near the beaver-houses, at which opening one stands, while another disturbs the house; when the beaver hastening to make his escape at the opening, seldom fails of having his brains beat out the moment he raises his head above the water.

The beavers are excellent food, but the tongue and tail are the most delicious parts. The Indians sometimes roast these animals in the same manner as we do pigs, first burning off their fur.

The coasts are frequented by seals, and the rivers and lakes have very large sturgeon, pike, and trout; with two very delicious kinds of fish; the one called titymag, the other resembling an eel, spotted with yellow and white, and called by the natives muthoy: these are reckoned fattest in winter, when they are caught by making holes in the ice, and letting down a baited hook, at which the fish greedily bites. At the mouths of the rivers, especially those more to the north, are plenty of fine salmon, trout, and a fish called a sucker, which resembles a carp. There comes in with the flood tide a great number of white whales, which might easily be taken.

SECT. II.

The Persons, Dress, Manners, Customs, and Religion of the Indians on the western Coast of Hudson's bay; with a Description of York Factory.

THE natives are of the middle size, and of a copper colour: they have black eyes, and long, lank, black hair; but their features vary as in Europe. They are of a chearful disposition, good-natured, affable, friendly, and honest in their dealings.

In summer the men are clothed in a close coat made of blanket, which they buy of the English settled in their neighbourhood. They have a pair of leather stockings, which reach so high as to serve also for breeches, and they make their shoes of the same materials.

The

The cloaths of the women differ from those of the men only in their generally wearing a petticoat, that in winter comes a little lower than their knees. Their ordinary apparel is made of the skins of deer, otters, or beaver, with the hair or fur on them. The sleeves of their upper habit are generally tied on with strings at the shoulders, so that their arm-pits, even in the depth of winter, are exposed to the cold, which they imagine contributes to their health: their diseases indeed are but few, and those chiefly arise from colds caught after drinking spirituous liquors, which they buy of the English; and it is a melancholy truth, that those who live near the settlements of the Hudson's-bay Company, are, by drunkenness, become meagre, small, indolent, and hardly able to encounter the hardships of the country; while those who live at a distance are hardy, vigorous, and active.

They dwell in tents covered with moose and deer-skins sewed together. These are of a circular form, probably on account of its being most capacious and convenient for their sitting round the fire, which is in the middle. They are formed of poles, which are extended at the bottom, and at the top lean to the center, where an opening is left to admit the light and let out the smoke. They strew the bottom with the top of pine-trees, and lie with their feet to the fire, and their heads to the sides of the tent. The entrance is generally on the south-west side, and they go in by lifting up one of the skins, to which is fastened a piece of stick, to make it flap close.

They have no dependance for subsistence on the fruits of the earth, but live entirely on the animals they take in hunting or catch in traps. They every season make a prodigious slaughter among the deer, from the absurd opinion that the more they destroy, the greater plenty will succeed; hence they sometimes leave three or four hundred dead on the plains, taking out only their tongues, and leaving their carcasses either to rot or to be devoured by the wild beasts. At other times they attack them in the water, and bring great numbers on floats to the factories. They also live upon birds, and even feed on eagles, hawks, crows, and owls, as well as on partridges, wild-geese, and ducks. They generally boil their flesh, and eat it by itself, drinking the water it is boiled in, which they esteem very wholesome; and in the same manner they dress their fish.

These ignorant people have many amiable qualities: they are influenced in their behaviour by a natural love of rectitude, that restrains them from all acts of violence and injustice, as effectually as the most rigorous laws. The chiefs of every family, or tribe, who are generally chosen from among the most ancient of the people, usually for their skill in hunting, their experience in trade, and their valour in the wars, in which they frequently engage, direct those who reside with them in their different employments; but their advice is rather followed through deference and respect than any compulsive obligation.

They have, however, some customs which must appear very whimsical, and others that are extremely cruel. It is esteemed a great offence for a woman to stride over the legs of a man when he sits on the ground, and they even think it beneath them to drink out of the same vessel with their wives. They have another custom that must appear shocking to every humane mind, and in which they are in some measure imitated by the Hottentots. The latter, as hath been mentioned in treating of California, expose their parents, when labouring under the infirmities of old age, to perish with hunger, or to be devoured by wild beasts, and these wretches strangle theirs; for when their parents grow so old as to be unable to support themselves by their own labour, they require their children to strangle them, and their performing it is esteemed an act of duty. This is done in the following manner: the old person's grave being dug, he goes into it, and after having conversed and smoked a pipe, or perhaps drank a dram or two with his children, he informs them that he is ready; upon which two of them put a thong about his neck, then one standing on one side, and the other opposite to him, pull violently till he has expired;

they then cover him with earth, and over that erect a kind of rough monument of stones. Such old people as have no children, require this office of their friends; but in this case it is not always complied with.

They have also a very strange maxim of policy, which is obliging their women to procure frequent abortions, by the use of a certain herb, common in that country, in order to ease themselves of the heavy burthen of an helpless family. Savage as this custom is, it is less barbarous than that anciently practised by the polite and civilized Greeks and Romans, as it is still by the Chinese and Hottentots, of exposing their children, and leaving them to perish with hunger or be devoured by wild beasts.

They acknowledge a Being of infinite goodness, whom they stile Uckewma, or the Great Chief, whom they consider as the author of all the blessings they enjoy, and sing a kind of hymns to his praise; in a grave and solemn tone, that is not altogether disagreeable; but their religious sentiments are very inconsistent and confused. They likewise acknowledge another being, whom they call Witticca, and represent as the author of all evil; of him they are much afraid; but it is not said that they use any methods to appease him.

Though these people spend the best part of their lives in procuring necessaries, and might easily lay up a store of provisions to secure them against want; yet they take little care of futurity. From their natural generosity they are very free of their provisions when they have plenty, and, except drying a little venison and fish, take no care to have a supply against winter. The Indians who come in the summer to trade at the factories, sometimes not obtaining the succours they expected, have been obliged to singe off the fur from thousands of beaver-skins, in order to feed upon the leather: but when they are thus reduced to the greatest extremity, they behave with a patience that is easier to admire than to imitate. They frequently travel two or three hundred miles, even in the depth of winter, through a wide open country, without meeting with any house to receive them, or carrying any tent for their protection. At the approach of night they raise a kind of fence with brushwood, by the side of which they kindle a fire, and having cleared away the snow, they lie down upon the ground, and sleep between the fire and the fence: but when they happen to be benighted where no wood can be obtained, they are obliged to lie down under the snow, as is practised in Siberia and some other countries; and by this means they are in a great measure sheltered from the sharpness of the piercing air.

As York-fort is situated on the west coast of Hudson's-bay, in the country, the manners of whose inhabitants we have just described, and is considered as the most valuable of the Hudson's-bay Company's settlement, we shall here give a description of it. It is seated on the southern branch of Port Nelson-river, called Hays's-river, within five miles of its fall into the sea, in the latitude of fifty-seven degrees twenty minutes, and in the ninety-third degree fifty-eight minutes west longitude. This fort and factory is in a clear space, surrounded on three sides by the woods, with an open front to the water. The fort is a square building, flanked with four small bastions, all of them covered, and at present converted either into lodging or store-rooms. There are three small pateraroes placed on each of the curtains; the whole is palisadoed: a battery of pretty large guns commands the river, and a small breast-work of turf is thrown up by way of defence of the battery; but even in time of war the number of people who reside there amount to no more than between thirty and forty. On the south-east of the fort is a dock for rebuilding or repairing sloops or boats, between which and the battery is a piece of land called The Plantation, where the Indians who come to the factory pitch their tents; and there are generally one or two tents of old infirm Indians, both men and women, who are maintained by the factory, from which this place is separated by two rows of high palisadoes: between these are store-houses, the kitchen, and some work-shops low built; and within the inner palisadoes are small spots sowed with turnips, colworts, fallads, and other garden-stuff. But however

formidable this fort may appear to the natives, it is incapable of defence, should it happen to be attacked by an European army.

S E C T. III.

Of the Persons, Dress, Manners, and Customs of the different Tribes of Eskimeaux, or Eskimows, chiefly seated on the East Side of Hudson's-bay.

IT would not be difficult, in treating of the countries which border on Hudson's-bay, to give the names and situation of the number of little islands, harbours, and creeks, but it is impossible to give a good account of any of them, that will either answer the purposes of instruction or entertainment; we shall therefore confine ourselves to the different inhabitants.

The principal inhabitants situated to the north of those just described are the Eskimeaux, which name is derived from an Indian word that signifies eaters of raw flesh; for after thoroughly drying the flesh of the beasts they kill, they eat it without any other preparation; and it is evident that to this Indian term is added a French termination; but to adapt it to the English pronunciation, it should rather have been written by our authors Eskimows.

These people are of several tribes, and we shall begin with those who live on the borders of the straits which enter into Hudson's-bay. They are of a middle size, robust, and inclinable to be fat. Their heads are large, and their faces round and swarthy; their eyes are black, small, and sparkling; their noses flat, their lips thick, and their hair lank and black: they have broad shoulders, and their limbs are proportionable; but their feet are extraordinary small.

The behaviour of the Eskimows is chearful and sprightly; but some nations of them are said to be subtle, cunning, and deceitful, great flatterers, and much addicted to pilfer from strangers; easily rendered bold by encouragement, but as easily frightened; and so attached to their own country, that some, who have been taken prisoners by the Southern Indians when they were boys, and brought to the factories, have for several years regretted their absence from their native country, and the enjoyment of what they loved when they were there: thus one of them, after having been fed on English diet, being present when an Englishman was cutting up a seal, from which the train-oil ran very plentifully, scooped up what he could save with his hands, and swallowing it, cried, "Ah! commend me to my own dear country, where I could get my belly-full of this."

The men's cloaths are made of seals-skins, and sometimes of the skins of land and sea-fowl sewed together; their coats have a hood like a capuchin, are close from the breast before, and reach no lower than the middle of the thigh: the breeches are close before and behind, gathered like a purse, with a string, and tied about their waists: they have several pair of boots and socks, which they wear one over another, to keep them warm and dry. The difference between the dress of the men and that of the women is, that the latter have a narrow flap behind to their jacket, that reaches to their heels. Their hoods are likewise larger and wider at the shoulders, for the sake of carrying their children in them at their backs; and their boots, which are a great deal wider, are commonly stuck out with whalebone, because when they want to put a child out of their arms, they slip it into one of their boots till they can take it up again. A few of them wear shifts of seals bladders sewed together. Their cloaths are in general sewed very neatly: this is performed with an ivory needle, and the sinews of a deer split fine, and used for thread. They discover a good deal of taste in adorning them with stripes of different coloured skins sewed in the manner of borders, cuffs, and robings for their cloths, which altogether appear handsome as well as convenient.

One singular part of their dress is their snow eyes, as they properly call them. These are bits of wood, or ivory, formed to cover the organs of sight, and tied at the back of the head: in each piece are two slits of the

same length with the eyes, but narrower, through which they see very distinctly. This invention prevents snow blindness, a very painful disorder, occasioned by the brightness of the light reflected from the snow, especially in spring. Their use strengthens the sight, and becomes so habitual to them, that when they would observe an object at a great distance, they commonly look through them, as we do through a perspective-glass.

The same spirit of invention is observable in their instruments for fishing and fowling, which, in several respects, resemble those of the Greenlanders. Their darts and harpoons are well made, as are also their bows and arrows. Their boats, which are easy of carriage, and quick in motion, resemble those of the Greenlanders, have their frames made of wood or whalebone, covered all over with seal-skin parchment, except a hole in the middle, which has a ring of wood or whalebone round it, to prevent the water running in from the deck, affording only room for one man to sit in, his feet being stretched forward; and sometimes the skin is laced about his waist at the above-mentioned rim, which effectually shuts out the water. They rub the seams with a kind of tize made of seals blubber. In these boats they carry their little conveniences, and their instruments for killing whales, sea-horses, sea-unicorns, seals, and the like. They also carry in their canoes slings and stones, with which they can do execution at a great distance. Their harpoons are headed and pointed with the teeth of the morse, one end of it serving for a spear, and the other for introducing into the body of the fish a barb tipped with iron, which remains there, while the other part of the harpoon readily disengages itself and comes out. To this barb is fastened a thong of the hide of the morse, at the end of which is a seal-skin blown up, which serves as a buoy, to shew them where the whale is when he goes down, and prodigiously fatigues him in swimming. As soon as he expires, they, with their canoes, tow him ashore, and strip him of his fat, which not only serves them for food, but to burn in their lamps during winter.

As the persons who traversed Hudson's-bay, in order to discover a north-west passage, had no leisure to examine the countries by which they passed, and had sometimes opportunities of observing the natives, they were enabled to describe the latter, without having it in their power to give much account of the former. In Mr. Ellis's voyage, which was attempted in order to find out that passage, the ship named the Resolution was driven upon a ridge of stones, when six boats of Eskimows came off with whalebone, which, notwithstanding their danger, they bought of them. These people, so far from taking advantage of their distress, behaved with the utmost civility, and endeavoured to relieve them: for when the tide had floated them off, an old man, who seemed better acquainted with the place than the rest, had the humanity to paddle before them, to point out the shoals, and direct their course, by keeping in deep water: thus, by his assistance, the Resolution escaped being lost, which is a sufficient proof that these people do not deserve to be termed artful and thievish, since they could not avoid being sensible that they would have reaped great advantage by the loss of the ship. Our author therefore justly observes, that whatever others may say to their prejudice, it is but justice to own, that they behaved not only with humanity, but with great kindness and friendship. Nothing can be more admirable than the ingenuity and industry of these people, who, for want of iron, are frequently obliged to make not only the barbs of their harpoons, but also their hatchets and knives, of stones, sea-horse teeth, and sea-unicorns horns; and it is difficult to conceive the dexterous use they make of materials that seem so very improper for the purposes to which they employ them. These seem to be originally one people with those just described; but are more affable and friendly, and likewise more skilful artists. The borders of their habits are generally fringed with cut leather, and are sometimes hung with the teeth of fawns. The women do not, like those of the other Eskimows, stick out the sides of their boots with whalebone: they also differ from them in wearing a cap made of the skin of a buffalo's tail, which,

which, though it has a frightful appearance, is of great use in keeping off the musketoos, which are here excessively troublesome. Indeed the hair hanging over their faces somewhat obstructs their sight, but it is easily removed with their hands; and, was it not for this defence, these insects would be insupportable. Hence their children wear them, while hanging at their mother's backs; and as, thus dressed, they make a most dismal figure, it is apt to raise a shocking idea of the barbarity of these harmless and inoffensive people. Their manner of kindling a fire appears very extraordinary, but is nearly the same in all countries where they have not the advantage of flints and steel: they prepare two pieces of dry wood, and making a small hole in each, fit to them a little cylindrical piece of wood, round which a thong is put; then by pulling the ends of the thong, they whirl the cylindrical piece about with such velocity, that the motion sets the wood on fire; when lighting a little dry moss, which serves for tinder, they make as large a fire as they please: but as the little timber they have towards the north of Hudson's bay, is only what is driven on shore, this fails them in winter, and they are obliged, like the Greenlanders, to make use of their lamps, for the supply of their family occasions.

These simple people were so far from being jealous of their wives, that they offered them to the English sailors, from an opinion that the children they had by them would be in every respect as much superior to those of their nation, as they took the English to be; for they imagine, says our author, that in the most literal sense every man begets his like, and that the son of a captain must infallibly be a captain.

On their going to sea, in order to catch fish, they usually take in their boats a bladder filled with train-oil, as our people do a dram-bottle, and seem to drink the contents with the same relish; and when their stock is out, they have been seen to draw the bladder through their teeth with much seeming satisfaction. They are probably convinced by experience of the salutary effects of this coarse kind of oil in this rigorous climate, which renders them so fond of it. They also use it for their lamps, which are made of stone, hollowed out with as much art as can well be expected, considering their tools.

We shall now leave Hudson's-bay, which, considering its great extent, may as well be called a sea as the Baltic, and several others that bear that name; and shall only observe, that in sailing to the northward from York-fort every thing dwindles, the men become lower in stature, and in the latitude of sixty-one degrees the very trees shrink into brushwood.

S E C T. IV.

Of NEWFOUNDLAND.

Its Situation, Extent, Climate, Soil, and Produce; with a particular Account of the Manner of preparing the Cod in that Island.

NEWFOUNDLAND received its name from Cabot, who discovered it in 1497. It is of a triangular form, and situated to the east of the gulph of St. Lawrence, between the forty-sixth degree forty minutes and the forty-second degree seven minutes north latitude, and between the forty-first degree fifty-two minutes and the fifty-seventh degree forty minutes west longitude; it being bounded to the eastward and southward by the Atlantic ocean, on the north by the streights of Belleisle, and on the west by the gulph of St. Lawrence.

The coasts are extremely subject to fogs, occasioned by the vapours exhaled from the lakes, swamps, and bogs, with which the island abounds; yet the air is salubrious, and agreeable to most constitutions. The winters are severe, attended with almost continual storms of snow and sleet, the sky being usually overcast.

The soil is generally supposed to be barren, except only the banks of the rivers, which are tolerably fertile. There are however woods of different kinds throughout

almost all the country for several miles from the coast, which contain abundance of timber fit for ship and boat building, as well as for erecting stages for curing and drying fish; and beyond these woods, where the lands are cleared, are in many places good pasturage. The inland parts of the country rise into high hills, and sink into bogs and swamps; where such parts as are not covered with water, afford only shrubs, spruce, and white moss. It however contains many fine rivers, lakes, and rivulets, which abound with beaver, otters, and the like, and afford great plenty of salmon and other fish. The forests are stored with deer, moose, bears, wolves, and foxes in great plenty; but here are few cattle, sheep, or horses; instead of the latter, the inhabitants make use of dogs for drawing of wood and other necessities. These they manage with great dexterity, fixing them in leather collars, and yoking together what number they please. There are here great plenty of wild fowl, but the staple commodity of the island is cod-fish, which are here larger and in greater abundance than in any part of the world yet discovered; and a considerable part of Europe is at present chiefly supplied with this article from hence.

Great Britain and North America, at the lowest computation, annually employ upwards of three thousand sail in this fishery; on board of which, and on shore, to cure and pack the fish, are not less than ten thousand hands; so that it is at the same time, not only a very profitable branch of trade to the merchant, but a source of livelihood to so many thousands of poor people, and a most excellent nursery to the royal navy, which is hence supplied with a great number of able seamen: it might still be greatly enlarged; for notwithstanding the great trade carried on by the English here, the French are said to have by far the best part.

On these coasts are also taken a great number of whales, seals, porpuses, &c. whence above five thousand barrels of oil, besides a great quantity of whale-bone, seal-skins, &c. are annually exported from hence to different parts of the world; all which sufficiently shew the importance of the island, notwithstanding the severity of the climate, and the roughness and barrenness of the soil.

The number of English inhabitants on the island, is uncertain and fluctuating. They are indeed very inconsiderable, if compared with its extent, but there are not half the number in winter that there are in summer. The capital of the island, which is seated on the southern point, contains no more than between three and four-score houses.

As fishing is the staple commodity of Newfoundland and the adjacent islands, it will not, perhaps, be disagreeable to our readers, if we here give a concise account of the method of curing the cod, and preparing it for the market.

The vessels employed in this business are small shallops, which come to shore every day, where the fishermen throw the cod they have taken upon a stage prepared for that purpose. One of them, who is called the cut-throat, opens the fish with a two-edged knife, and cuts off his head; a second hands the fish to the carver, who stands opposite to him at a table erected upon the stage, who with a single-edged knife, six or eight inches long, and very thick on the back, to encrease its weight, splits the fish open; when it is conveyed to the salter, who places it with the skin undermost in a barrel, and then very slightly covers it with salt, laying the fish regularly one upon another.

After leaving the cod in salt three or four days, and sometimes twice as long, according to the season, they put it into a tub, wash it well, make it up in piles, and, in fair weather, spread it out with the skin undermost, on a kind of stage raised with wattles about two feet from the ground; before night they turn the skin uppermost, which they also do whenever it rains. When the fish becomes a little dry, it is raised into larger piles, where it rests a day or two; after which it is again exposed to the air, and turned according as there is occasion, before they again raise it into larger piles, where, after this is done, it sometimes remains fifteen days with-

out being moved; after which it is once more exposed to the air, and when almost dry, gathered together again, in order to sweat, which takes up twenty-four hours or more, according to the season: it is then opened and exposed to the air for the last time, and when thoroughly dried, housed.

Fish cured in this manner are not only more fair to the eye, but more grateful to the taste, than those which are partly prepared at sea; and that cured in the spring before the great heats, is generally the best.

S E C T. V.

Of CAPE BRETON, called by the French L'ISLE ROYAL.

Its Situation, Extent, Face of the Country, Climate, Soil, and Produce, with the advantages France received from it.

THE island of Cape Breton, which is seated fifteen leagues to the south-west of Newfoundland, is in the forty-sixth degree north latitude, and in the fifty-eighth degree thirty minutes west longitude, it being separated from the continent by a narrow passage on the west. This island is about one hundred and ten miles from the north-east to the south-west. Round it are several harbours and bays, which, from its situation in the gulph of St. Lawrence, have made it considered as the key of Canada, it being a safe retreat for ships bound either to or from Canada.

It is of a very irregular figure, and so cut through by lakes and rivers, that its two principal parts are held together only by an isthmus of about eight hundred paces in breadth; this neck of land separates the bottom of Port Toulouse from several lakes, which are called Labrador. These lakes discharge themselves into the sea to the east by two channels, formed by the islands of Verderronne and la Boularderie.

All its ports open to the east, turning a little to the south, and are within the space of fifty-five leagues, beginning at Port Dauphin, and continuing to Port Toulouse, which is almost at the entrance of the passage of Fronfac. In all other parts it is difficult to find anchorage. The northern coasts are very high, and almost inaccessible; and it is not easy to land on the western coast, till you come to the passage of Fronfac, near which, as we have already observed, is Port Toulouse, which is between a kind of gulph called Little St. Peter's and the island of St. Peter: from hence proceeding towards the south-east is the bay of Gaborie, at twenty leagues distance; this bay is a league broad, between islands and rocks, and two leagues in depth; but it is not safe to come near the islands. The harbour of Louisburgh, formerly called the English Harbour, is not above a league from the last-mentioned bay, and perhaps one of the finest in America, it being near four leagues in circumference, and having every where six or seven fathoms water. The town of Louisburgh is situated on the south-west side, in latitude forty-five degrees fifty minutes, and in fifty-eight degrees thirty-five minutes west longitude. It was pretty strongly fortified, with as much regularity as the situation would admit. It had a good rampart, with irregular bastions, a dry ditch, a covert-way, with an excellent glacis, and before two of the curtains a ravelin, with a bridge to the sallee-ports; but the chief strength of the place by land consisted in the thickness of the walls, and the impassable morasses, that extend from the foot of the glacis to a considerable distance. There was indeed one part without any walls for about a hundred yards, this being there absolutely unnecessary, the sea flowing close to the town, and therefore a palisade was thought a sufficient defence: nor can even small barks approach it for want of sufficient depth of water; and ships must keep at a very considerable distance, on account of the rocks and shoals. Besides, there were two collateral bastions, which flanked this part to very great advantage. In the center of one of the chief bastions was a strong building, with a moat on the side towards the town; and this was called the citadel, though it had neither artillery, nor was a structure proper for receiving any: indeed the entrance to it was over a draw-bridge, on one side of which was

a corps de garde, and advanced centinels on the other. Within this building were the apartments for the governor, the barracks for the garrison, the arsenal, and under the platform of the redoubt a magazine always well furnished with military stores. The parish-church, or rather chapel, was also within the citadel, and without it was another belonging to the hospital of St. Jean de Dieu, an elegant and spacious structure, built with stones. On an island at the entrance of the harbour was a strong fort, and on the opposite side a very high tower, serving as a light-house. Here was a large fortification called the royal battery, and beyond it was another fort built on a point farther within the harbour. When the town of Louisburgh was last taken from the French, it consisted of only several narrow lanes, and had few tolerable houses in it, they being of wood, with a foundation of stone carried about six feet above the ground.

There are several other excellent ports; which are the more necessary, as the sea round the island is subject to violent storms of wind, with snow and sleet, and such fogs that it is frequently impossible to see the length of a ship: but what is still more extraordinary, these fogs will, in the space of one frosty night, case over the rigging of ships with such thick ice, as to render them impossible to be worked till it is beaten off: the quantity beat off from only one of the ships employed in the conquest of the island in 1758, was computed to amount to six or eight tons weight; yet this amazing quantity was all congealed on the night of the fifth of May, when warmer weather might have been expected. These circumstances shew the advantages of an island filled with such a number of excellent ports, seated in such a tremendous sea.

The soil and climate nearly resemble those of Newfoundland, and consequently its produce is not very different. A considerable part of the land is barren; it, however, produces oaks of a prodigious size, pines for masts, and all sorts of timber fit for building. The most common sorts are cedar, oak, ash, beech, maple, aspen, wild-cherry, and plane-trees. It likewise produces some sorts of fruit, particularly apples, with herbs and roots, some kinds of grain, with hemp and flax.

It is observable, that the mountains may be cultivated up to the tops, and that the good soil always inclines towards the south. There are here great numbers of fowl, particularly very large partridges, which in their feathers resemble pheasants. There are here likewise animals brought from Europe, as horned cattle, hogs, sheep, goats, and poultry. The lakes, rivers, and bays, abound with beavers, otters, and excellent fish in the greatest plenty; and what is got by hunting, shooting, and fishing, is sufficient to maintain the inhabitants a good part of the year.

This induced the French, on their being excluded from Acadia and Newfoundland, to begin a settlement here in 1714, which they continued to encrease, and fortified it in 1720. They were, however, dispossessed in 1745 by the bravery of the inhabitants of New England, with little assistance from Great Britain; but it was again, by the treaty of Aix la Chapelle, ceded to the French, who spared no expence to fortify and strengthen it. However, it was again reduced in 1758 by the British troops under general Amherst and admiral Boscawen, who found in that place two hundred and twenty-one pieces of cannon and eighteen mortars, together with a very large quantity of stores and ammunition; and was yielded for ever to the crown of Great Britain by the last peace, since which the fortifications have been blown up, and the town of Louisburgh dismantled.

The importance of this island to the French may be estimated from the advantages they reaped from it when in their possession. Though but a small number of ships fished near the harbour of Louisburgh, in comparison of those employed in the French fisheries on the banks of Newfoundland, the gulph of St. Lawrence, and the neighbouring shores, bays, and harbours; yet it is so situated, that all their fishing-vessels could repair to it on any danger, or emergency, especially those which fished in the gulph on the main, or at the north-west end of Newfoundland, none of which are above one or two days sail at

at most from thence ; as might also those vessels which loaded with mud-fish on the banks ; whence this island was the center and protection of their whole fishery.

According to a computation made by persons intimately acquainted with every branch of it, the quantity of fish they caught in the year before the last war was one million one hundred and forty-nine thousand quintals of dry fish, and three million nine hundred thousand mud-fish ; the value of both which, including three thousand one hundred and sixteen one quarter tons of train-oil, drawn from the blubber, amounts to nine hundred and twenty-six thousand five hundred and seventy-seven pounds ten shillings, according to the prime cost of the fish at Newfoundland ; and with the addition of its freight to the several markets where it is sold, makes nine hundred and forty-nine thousand one hundred and ninety-two pounds ten shillings sterling ; and if to this be added the consumption which is made of their coarse woollens by the men employed in the fishery, reckoning for each a blanket, watch-coat, rug, pea-jacket, &c. in the whole thirty shillings per man, with the brandy they consume ; and also the canvas, cordage, nets, hooks, grapplings, anchors, &c. that the ships and shallops of this fishery must expend at sea and on shore, the value of it will amount, at least, to one million sterling per annum, at which it is generally computed.

But in order to form a just estimate of the value of this branch of trade to the French, we should also take in its beneficial consequences, which principally consist in the following articles : First, the train-oil produced by it is necessary to the French in their woollen manufactory, in which they have already rivalled us with too much success ; and their sugar colonies abroad, which cannot do without it, are supplied with it from France out of this fishery.

Secondly, the trade it opens for them in the Mediterranean, and all the Roman Catholic states, where they carry their fish to market ; and by this means force a vent for the French manufactures ; which has been found so beneficial to their commercial interest, that they have been indefatigable in the cultivation of it, sparing no pains nor cost, and using every art to monopolize it.

Thirdly, the great increase of their navigation and seamen arising from this fishery, in which five hundred and sixty-four ships, besides shallops, and twenty-seven thousand five hundred seamen, were employed ; circumstances, especially the latter, which, considered with regard to their maritime force, were of themselves as valuable to France, as the revenue of the fishery itself : hence Charlevoix, in his History of New France, justly observes, “ That this fishery was a more valuable source of wealth and power to France, than even the mines of Peru or Mexico would be.”

This great branch of trade may be said to have depended upon the possession of the Island of Cape Breton, on account of its affording them a convenient harbour to supply and protect it ; but this they have since found means to carry on in a very profitable manner to themselves without it. However, there are other great advantages which the French received from their possession of this island. France has not one sea-port for the relief and shelter of her trading ships, either to or from the West Indies, open to them any where in North America to the northward of the river Mississippi ; and consequently the

whole trade must for the future be exposed to the English privateers from the northern colonies in time of war, without any place of strength to which they can retreat ; but Louisburgh served them as an harbour for their ships employed in this trade to resort to for wood and water, to clean or repair, for convoy from thence to Old France, and on account of any distress. To all this must be added, that the possession of this island put it into their power to annoy the trade of the British northern colonies in time of war, with their privateers from this harbour, to such a degree, that it has ever been called by the English the Dunkirk of North America.

S E C T. VI.

Of the Island of St. John.

Its Situation, Extent, and Produce.

THOUGH the island of St. John is seated in the neighbourhood of Cape Breton, and lies partly between it and the continent, and consequently has nearly the same climate, yet it greatly exceeds the islands just mentioned, with respect to its pleasantness and the fertility of its soil. It is computed to be about sixty miles in length, and has not only a commodious harbour for carrying on the fishery, but abounds with a variety of useful timber and most kinds of game common to the neighbouring country. This island is so fertile, and was so well improved while possessed by the French, that it was justly stiled the granary of Canada, which it furnished with great plenty of most sorts of corn, as well as great quantities of beef and pork ; and, when last taken, had upwards of ten thousand head of black cattle, and some of the farmers raised twelve hundred bushels of corn annually. It has several rivers, which abound with salmon, trout, eels, &c. and the surrounding sea affords plenty of sturgeon, plaice, and most kinds of shell-fish. An island of this advantage was at once carefully cultivated, and its importance concealed from the English, lest it should induce them to make themselves masters of it, and by that means cut off the principal supplies from Quebec. In this island are yet considerable quantities of land uncultivated, which, by a proper improvement, would render it still more valuable.

When this island was surrendered to colonel Rollo, it had four thousand inhabitants ; and, to the disgrace of the governor, there were found in his house several English scalps, which were brought there to market by the savages of Nova Scotia ; this being the place where they were encouraged to carry on this barbarous and inhuman trade.

The important conquest of the islands of Cape Breton and St. John filled the whole kingdom with exultation ; and eleven pair of colours, taken at Louisburgh, were, by his majesty's order, carried in a pompous parade, escorted by a detachment of foot-guards, from Kensington-palace to the cathedral of St. Paul, where they were deposited as trophies, under a discharge of cannon, and other expressions of triumph and exultation.

Both this island and that of Cape Breton are at present under the governor of Nova Scotia, as are also several small adjacent islands.

C H A P. II.

OF NOVA SCOTIA, CANADA, NEW ENGLAND, NEW YORK,
the JERSEYS, PENNSYLVANIA, and MARYLAND.

S E C T. I.

*Of ACADIA, or NOVA SCOTIA.**Its Situation, Extent, Produce, Harbours, and History.*

ACADIA, or Nova Scotia, is the most eastern part of the continent of America. It is bounded by the gulph of St. Lawrence and the streights of Canso, which separates it from Cape Breton, on the east; on the south by the Atlantic ocean; on the west by the bay of Fundy and the province of Main, belonging to Massachusetts-bay; and on the north by the river of St. Lawrence, which divides it from Canada; extending from the forty-third degree thirty-seven minutes to the forty-ninth degree thirty minutes north latitude, and from the sixtieth degree fifteen minutes to the sixty-ninth degree west longitude. It is so indented by what is called the bay of Fundy, that the south-east part, towards the ocean, forms a triangular peninsula, only joined by a small isthmus to the other part.

It is in general a fine country, the climate being tolerably temperate, though pretty severe in winter, when the cold is sharp and the snow lies deep on the ground; but the air is there generally clear, with a bright sunshine, and azure sky: the summer is, however, hotter than in England.

The soil of this province is various, in some places barren, and in others exceeding pleasant and fertile; particularly round the bay of Fundy, and on the rivers which fall into it, where are large tracts of ground on both sides these rivers, for fifty or sixty miles into the country, and several miles from the bay, which were once marshy, but, by being dyked, are improved to great advantage. The eminences in this province are also very pleasant and fruitful, producing wheat, rye, Indian-corn, peas, beans, hemp, flax, and some kinds of fruit in great perfection, as gooseberries, raspberries, strawberries, which grow in the woods. Several parts yield fine timber, and particularly excellent oak fit for building of ships; with fir, spruce, birch, &c. It abounds with all the necessaries of life, particularly a great number of deer and other game, with plenty of wild-fowl, as teal, herons, wood-cocks, pigeons, bustards, partridges, wild-ducks, and great numbers of beavers and otters. The rivers abound with salmon and other kinds of river-fish. There are also several fisheries erected in the different harbours, which are carried on with great success.

The coast has the advantage of many bays, harbours, and creeks; and the land is enriched by many rivers, some of which are navigated for a long course by the native Indians. The harbour of Chebucto, upon which is seated the metropolis, may be justly esteemed one of the finest in the world, both for safety and convenience, it having good anchoring-ground, and water sufficient for the largest men of war. This is therefore made the place of rendezvous for the royal navy in America, it having a royal dock, and conveniences for the largest ships to heave down and careen. The entrance into it is from the south, with a large island of an irregular form, lying on the north-east side, named Cornwallis Island, from the first governor of Halifax. This island, as well as a smaller one that lies higher up the harbour, named George Island, is very commodiously situated for a fishery, and has conveniences of all sorts proper for drying and curing the fish.

On the west side of this harbour is seated the town of Halifax, which, though founded so lately as the year 1747, is now a considerable place, consisting of above

one thousand houses, laid out in handsome straight streets, and is the capital of the whole province.

There are also several other towns laid out round the bay, and partly inhabited; but the most considerable settlements are upon the bay of Fundy, and the rivers that fall into it.

About two miles up the harbour of Chebucto is a river on the south-west side, with a small harbour at its entrance. This river, which was called by the first settlers of Halifax Sandwich river, is at the mouth about as wide and deep as the Thames at London-bridge, and is salt-water for about four or five miles up, when it terminates, where a small fresh water rivulet falls into it from the north. From the mouth of Sandwich river to the opposite side of the harbour, is about two miles, with good anchoring-ground for the largest ships in any part of it, and a fine watering-place on the north-east side: the land on both sides is exceeding high, but covered with wood.

Four or five miles to the north of the above river, is a narrow entrance of half a mile, into Bedford-bay, which is about twelve miles in circumference, and has several creeks at the bottom of it, abounding with the finest salmon in the greatest plenty: there are also several islands in it, and on the western side of it, grow a great number of pines fit for masts. This bay, with the harbour, and Sandwich river, divide the peninsula from the main-land.

Upon the opposite shore are several large rivers, among which that of St. John is the most considerable. It is ten leagues distant from the gut of Annapolis, and has a very long course; but has two prodigious cataracts near its mouth, one of them no less than thirty fathoms deep, which is supposed to be chiefly occasioned by the great head of water above, and the channel being pent up between two steep mountains.

The inhabitants may be computed at about twenty thousand, who export to other parts chiefly lumber, as planks, staves, hoops, joists, and fish. The latter is, indeed, the staple commodity, and employs a considerable number of hands.

The king of Great Britain, who is sovereign of the soil, appoints the governor, the lieutenant-governor, and council, who form the upper-house; and the lower-house is formed of the representatives of the people, who are chosen by the freeholders.

This country was discovered by Sebastian Cabot in 1497, but lay long neglected before any considerable settlement was made in it. The French, however, had landed and built houses; but in 1614, captain Argal, by order of the governor of Virginia, sailed thither, and obliged them to depart.

In 1621, king James gave a grant of this province to Sir William Alexander, afterwards earl of Stirling, and secretary of state for Scotland, by whom it was called Nova-Scotia. The next year, Sir William sent a number of people, and all kinds of necessaries for beginning a settlement; but in 1632, Quebec and Cape-Breton, which had been taken from the French, were, together with this province, ceded to them by a treaty concluded between Charles I. and Lewis XIII. when a number of English removed out of it, and the French kept it in their possession till the year 1654, when Oliver Cromwell sent major Sedgewick, who took Port-Royal, and obliged the French to quit the country.

Nova-Scotia continued in our possession till the reign of Charles II. when it was again ceded to the French by the treaty of Breda. They kept it without molestation

tion till the year 1690, when the people of New England, finding the inconvenience of having the French so near them, prepared a fleet, with a proper number of land forces, and gave the command to Sir William Phipps, a native of that province; who sailing from New England, on the twenty-eighth of April 1690, arrived before Port-Royal, now Annapolis, in May following; and soon reducing that town, obliged the inhabitants there, and on St. John's river, amounting to about six thousand, either to consent to submit to the English government, or to be transported to Canada: when most of them, for the sake of keeping their estates and habitations, consented to become British subjects; but soon shewed that they were still bad neighbours to the people of New England. In 1710 queen Anne listening to their repeated complaints, sent a squadron and some land forces under colonel Nicholson, who took Port-Royal, which, in honour of the queen, he called Annapolis; after which Nova Scotia was yielded to Great Britain, by an express article in the treaty of Utrecht. Those of the inhabitants who chose to remain, were to become British subjects, and freely to enjoy their religion. However, in order to secure their obedience, and keep possession of the country, a garrison was kept at Annapolis, and a small one at Canso: but as no government was yet established, nor any proper encouragement given to the British subjects to settle there, the inhabitants, notwithstanding their oaths of allegiance, assisted a party of French, in 1744, in the reduction of the fort at Canso, and made an attempt upon Annapolis, but without success; that garrison being seasonably relieved from New England. They, however, still continued to commit secret hostilities, and to supply and encourage the Indians in their neighbourhood to perpetrate the most horrid acts of cruelty and barbarity on the English, upon the frontiers of New England, whose scalps, says major Rogers, were carried to market to Louisburgh, Quebec, &c. not only in time of war, but in peace, and there exchanged for powder, ball, or whatever they wanted. By these means there were at the conclusion of the peace, in the beginning of the year 1749, no other English in Nova-Scotia besides the garrison of Annapolis, and the inhabitants who lived within a few miles round that place.

The peace was, however, no sooner concluded, than the earl of Halifax projected the complete settlement of Nova-Scotia by the English, and used his utmost endeavours to carry it, in the most effectual manner, into execution. He, with the other lords commissioners of trade and plantations, having gained his majesty's approbation, they in March 1749, published proposals, offering proper encouragement to such of the officers and private men as, after the conclusion of the peace, had been dismissed his majesty's land and sea service, and were willing to accept of grants, in order to settle in Nova-Scotia. Fifty acres of land in fee-simple were offered to every private soldier or sea-man, free from the payment of quit-rent or taxes for the term of ten years, and at the expiration of that time, they were to pay only one shilling a year for every fifty acres. But this was not all, every private soldier or seaman who had a family, was to have ten acres for every person of which his family consisted, including women and children; and farther grants were to be made to them on the like conditions, in proportion as their families encreased, or to their abilities for cultivating the land.

The next care of the governor was to pitch upon a proper spot for the first settlement, and as the peninsula appeared preferable, both on account of its commodious situation, and the fertility of the soil, the able-bodied men on board each ship were employed in clearing ground in order to build a town at the south point, at the entrance of Sandwich river; but many objections being soon found against that place, another spot was chosen by the governor, at about the distance of a mile and a half from it, on the side of Chebucto harbour, and on the declivity of a rising ground that commands the whole peninsula, and would shelter the town from the north-west winds. The beach they found was a fine gravel, convenient for small boats, the anchorage was every

where good for large ships, within gun shot of the town, and small but navigable rivers of fresh and wholesome water flowed round it.

Here then they made a second, and more successful attempt; and, indeed, it would not have been easy to have chosen a more happy situation; they therefore cleared the ground in as expeditious a manner as possible, and having erected a large wooden house for the governor, with proper store houses, the ground was laid out, so as to form a number of straight and beautiful streets, crossing each other at equal distances, upon a most excellent plan, said to have been formed by the earl of Halifax. The work went on briskly; the people of New England brought several ships laden with planks, door-cases, doors, window-frames, and other parts of houses; and the people being employed in ships companies, this created an emulation, that rendered their labours remarkably successful; so that in about three years time, this town, which was named Halifax, from that nobleman to whom the settlement owed its beginning, was finished, and every family had a good house of their own, of which the master was landlord. Within the same space of time were also erected a church, and wharfs, the town was pallisadoed, and other fortifications erected: some land was also cleared for agriculture, and already planted, notwithstanding the opposition they met with from the French, and their tools the Indians.

To explain this last circumstance, it is necessary to observe, that in the beginning of the settlement, and soon after the landing of the English, a hundred black cattle and some sheep were brought them by land from a French settlement at Minas, a town about thirty miles from the bottom of Bedford-bay; and French deputies also coming to make their submission, it was proposed to cut a road thither, those deputies promising to contribute fifty men towards carrying on that work. The English also received the promise of friendship and assistance from the Indians, their chiefs waiting upon the governor for that purpose. But these submissions, and these promises, were soon broken by the perfidy of the French court, which disapproved of these proceedings, and resolved to harass the English before their town was built, and their fortifications erected. Instructions were therefore communicated to the descendants of the French in Nova-Scotia, and the scene was instantly changed; they engaged the Indians to use their utmost endeavours to prevent the new colony from proceeding; and the year in which peace was proclaimed, and Cape Breton restored, was not expired, when the town began to be frequently attacked in the night, and the English could not stir into the adjoining woods, without the danger of being shot, scalped, or taken prisoners. They however prosecuted the settlement with indefatigable industry, and the town was soon finished, notwithstanding all the endeavours of the French to oppose it.

It was however impossible to clear woods and plough lands, without separating into small parties; and this work was attended with great danger; for though the French and Indians did not dare to attack any considerable body of the English, yet they frequently fell upon small parties; and though they had been often repulsed, they always returned whenever they had an opportunity of doing it to advantage. Complaint of this open war, in a time of peace, was now made to the court of France, when his Most Christian Majesty proposed that commissaries should be appointed to settle the bounds of Nova-Scotia. This was done; but those of the French endeavoured by all the arts of sophistry to prove, that the Nova-Scotia ceded to the English by the treaty of Utrecht, was no more than the peninsula of that country. The British commissaries justified our claim to the whole by memorials filled with the strongest and most evident proofs; and the most trifling answers being returned to these, admiral Boscawen was sent to seize the French ships in North America; and France evidently appearing to have concerted the means of conquering all the British dominions on that continent, the late war was entered into to prevent it. During all this time, the French of Nova-Scotia continued their cruel and infamous practices, till at the beginning of that war, when
I the

the government being convinced that these French rebels, called neutrals, from their having sworn allegiance to the crown of Great Britain, were more inveterate and dangerous enemies than those who were under no such obligation; and finding that all methods to render them good subjects were ineffectual, they were forcibly deprived of their estates, and with their families were obliged to leave the province.

SECT. II.

Of CANADA, or NEW FRANCE.

Its Situation and Extent; a concise Account of its Rivers, Mountains, Vegetables, and Animals.

CANADA, the largest province upon the continent, is now bounded on the north-east by the gulph of St. Lawrence and St. John's river; on the south-west by lands inhabited by the Indians; on the southward by the province of New York, New England, and Nova Scotia; and on the north-westward by lands claimed by the Indians. Quebec, which is its capital, is seated near the centre, in lat. forty-six degrees forty-five min. and in sixty-nine deg. forty-eight min. west longitude; and the country extends, according to Major Rogers, about five hundred miles in length, from the north-east to the south-west, and upwards of two hundred miles in breadth.

The French comprehended under the name of Canada, a much larger territory, taking into their claim great part of the New England provinces, and of the provinces of New York and Nova Scotia; northerly to Hudson's-Bay; to the west as far as the Pacific Ocean; and to the southward extending it to the gulph of Mexico. They even endeavoured to support their claim, by erecting a chain of forts from the mouth of the river St. Lawrence to their settlements in Louisiana.

They began the settlement of this province in 1605 at Quebec, which is seated on the north shore of the river St. Lawrence, about three hundred miles from its mouth; and about the same time began to form settlements upon the island of Orleans, which is seated in that river, a little below Quebec; likewise on each side of the river, to its mouth, and on several smaller rivers that fall into it. They soon after began a settlement called Jecorty, about twenty miles up the river from Quebec, and erected a fort at Chamblee on the river Sorreil, near its influx into the lake Champlain. Soon after this the foundations of Montreal were laid on the island of the same name, in the river St. Lawrence, two hundred miles above Quebec. Another settlement was made at Trois Rivières, or the Three Rivers, so called from a river discharging itself by three mouths into that of St. Lawrence; and is seated about half way between Quebec and Montreal, in a very delightful spot, that affords the most agreeable prospect of any in the whole country. There are many other settlements on the banks of the river St. Lawrence, and of those which flow into it, as well as on the islands formed in it.

While the above settlements were forming Sir David Kirk, in 1629, with the English under his command, took Canada, which was then considered as within the limits of the British dominions, attacked Quebec, and made themselves masters of all the French settlements. But they were restored by the treaty of 1632, and continued in their possession till September 13, 1759, when Quebec was surrendered to the generals Monckton and Townsend, commanding the British troops that had been destined for the expedition against it the preceding spring, under the command of general Wolfe; and on the eighth of September, 1760, all Canada was delivered up to the English in the capitulation of Montreal; but we shall give a particular account of the taking of Quebec, after having described that city.

The climate here is cold, the winters long and tedious, especially in the north-easterly parts of the province; notwithstanding which the soil is in general very good, and in many parts both pleasant and fertile, producing most kinds of English grain and vegetables in great abundance,

especially the island of Orleans, and the islands and lands near it, which are remarkable for the richness of their soil.

The summers of Canada are exceeding pleasant, and are said to have so happy an effect upon the soil, that the farmer expects to reap his crop in sixteen weeks from the time of sowing his seed. The meadow grounds, which are well watered, yield excellent grass, and breed vast quantities of large and small cattle; and where the land is well cultivated, it produces rich crops. The mountains abound with coal-mines. This province has in some parts very excellent timber, such as white pines, oak of different kinds, and spruce in great abundance.

The rivers branching through this extensive country are very numerous, and many of them navigable a considerable way; but they are all swallowed up by the river St. Lawrence. This river is eighty miles wide at its entrance into the sea at Cape Rosier's, and in its course forms a variety of bays, harbours, and islands; the most pleasant and fruitful of which is the island of Orleans, just mentioned, a little below Quebec, the soil of which is excellent, and being well improved, produces in abundance all the kinds of grain and vegetables common to the climate, it extending twenty-one miles in length, and three or four in breadth. The French, while in possession of this province, industriously represented the navigation of the river St. Lawrence to be difficult and dangerous; but the contrary has been since found to be the case, ships of the line meeting with no difficulty in sailing to Quebec.

The land in general on both sides of the river is low and level; but opposite to Quebec are two considerable mountains, called the Lady Mountains, which run from thence south-west through the continent to the country of the Creek Indians, on the north part of the Two Floridas, in one continued ridge; and wherever rivers pass through them they rise very steep on each side to their common height. This ridge of mountains is called the Apalachian hills.

The country affords plenty of stags, elks, bears, foxes, martins, ferrets, weazles, squirrels, hares, rabbits, and other animals.

The elk is near as large as a horse, but resembles the deer, and, like it, annually renews its horns. The Indians have a great veneration for this animal, and imagine that to dream of it portends good fortune and long life. The elk delights in cold countries, feeding upon grass in summer, and moss-buds, &c. in winter, when they herd together. It is dangerous to approach very near him when he is hunted, as he sometimes turns furiously on his pursuers, and tramples them to pieces. To prevent this, the hunter throws his cloaths to him, and while the deluded animal spends his fury on these, he takes proper measures to dispatch him.

The wild-cats are great enemies to the elk; and, notwithstanding their being vastly inferior in size, often make a prey of him: for he has no other way to disengage himself from them, but by plunging into the water.

The Indians scarce undertake any thing with greater solemnity than hunting the bear; and an alliance with a noted bear-hunter, who has killed several in one day, is more eagerly sought after than that of one who has rendered himself famous in war; this chase supplying them both with food and raiment. The bears lodge during the winter either in hollow trees or caves; and, as they lay up no provisions, have no food during that season.

The bear is not naturally fierce, except when wounded or pinched with hunger. They run themselves very poor in the month of July; and it is somewhat dangerous to meet them till their hunger is satisfied, and they recover their flesh, which they do very suddenly. They are very fond of grapes, and most kinds of fruit. When provisions are scarce in the woods, they venture out among the settlements, and make great havock of the Indian-corn; and sometimes kill the swine. Their chief weapons are their fore-paws, with which they will hug any animal they seize immediately to death.

The skunk, or pole-cat, is very common, and called by the Indians the stinking beast, on account of its emitting a disagreeable smell to a considerable distance, when pursued

purfued or difturbed. It is about the fize of a fmall cat, has fhining hair of a grey colour, with two white lines that form an oval on its back. The fur of this animal, with that of the ermin, otter, and martin, make up what is called the fmall peltry.

The ermin is about the fize of the fquirrel, its fur is extremely white, its tail long, and the tip of it as black as jet.

The martin, or fable, lives principally among the mountains; is as long as a common cat, but very fletcher: their fur is very fine and valuable.

The mufk-rat refembles the beaver in every part, except its tail, which is round like that of a rat. One of thefe animals weighs about five or fix pounds. During the fummer feafon the male and female keep together, but feparate at the approach of winter; and each feeks a fhelter in fome hollow tree, without laying up any provisions.

The foxes here are of various colours, as black; grey, red, and white; who, by their craft and cunning, make great havock among the water-fowl in the lakes and rivers.

The country abounds with a vaft variety of fowls, and the rivers and lakes are well ftored with falmon, eels, and a multitude of various kinds of other fifh.

S E C T. III.

A Description of Quebec and Montreal; with a particular Account of the Conqueft of thofe Cities, by which all Canada became fubject to the Crown of Great Britain.

QUEBEC, the capital of Canada, feated about three hundred miles north-weft of Bofton, in New England, is a handsome and large city, ftrongly fortified. The harbour is flanked with two baftions, which at high tides are almoft level with the water. A little above one of them is a demi-baftion, which is partly taken out of the rock; and above it, on the fide of the gallery of the fort, is a battery of twenty-five pieces of cannon: above this is a fquare fort called the citadel, and the ways from one fortification to another are difficult to pafs. To the left of the harbour, on the fide of the road, are large batteries of cannon, and fome mortars. It is encompassed with walls, and has a caftle on the brow of a hill, about forty fathoms above the town; but it is irregularly built, and fortified with only two baftions, and no ditch towards the town. It has alfo another fort at Cape Diamond of folid rock, four hundred fathoms high: but it owes its greateft ftrength to nature. The firft place taken notice of upon landing here is a fquare of an irregular figure, with well-built houfes on one fide; on the back of which is a rock; on the left it is bounded by a fmall church; and on the right has two rows of houfes parallel to each other. There is another between the church and the harbour; as alfo another long row on the fide of the bay. This is called the Lower Town, which is moftly inhabited by merchants; but it is too much crowded. Between this and the Upper Town is a very fteep afcent, in which are fteps for the foot paffengers to go up. This has noble edifices, and between two large fquares is a fort, in which the governor refides. Oppofite the fort the Recollects have handsome houfes, and on the right is the cathedral, which is built in a mean ftile, but has a large, high, and well-built tower, that may be feen at a great diftance. Over-againft this is the Jefuits college, which is a fine building; and between them are well-built-houfes. The houfe of the Knights Hospitallers is a ftately ftructure, with two fine pavilions. In the fecond fquare are two defcents to the river of St. Charles, an hospital called Hotel-Dieu is in the midway, and from thence are fmall houfes, which reach to that of the intendant. On the other fide of the Jefuits college is a pretty long ftreet, in which is a nunnery. Almoft all the houfes are built of ftone, and there are above feven thoufand inhabitants. Befides the Lower and Higher Towns, there is another beyond the latter, on the banks of the river St. Charles, along which are feveral noble country feats.

In 1711 the Englifh fitted out a fleet, with a defign to conquer Canada: but the expedition failed, from the rafhnefs of the admiral, who, contrary to the advice of his pilot, failed too near the Seven Ifles, and thus loft his largeft fhips, with three thoufand of his beft failors. But it has fince been attacked with much better fuccefs.

It will not be improper to give here a particular account of the taking of this city, one of the moft difficult enterprizes that was ever effected by the united efforts of prudence and valour. The fituation of the place, and the fortifications with which it is fecured; the natural ftrength of the country; the great number of veffels and floating batteries the French had provided for the defence of the river; the fkill, labour, fuperior force, and uncommon vigilance of the enemy; their numerous bodies of Indians, who continually hovered about the pofts of the Englifh to furprize parties and harrafs detachments; thefe, and many other obftacles, formed fuch a combination of difficulties, as was fufficient to difcourage and perplex the braveft and moft intelligent general.

But the fpirit of Wolfe was not to be intimidated by danger; embarking the troops on board the transports, he paffed with them up the river; while admiral Holmes made a motion with his fhips to amufe the enemy, now pofted along the north fhore. But the transports being extremely crowded, and the weather very bad, the general thought proper to canton half his troops on the fouth fhore, where they were refrefhed. As no probability appeared of annoying the enemy above the town, it was agreed to convey the troops farther down in boats, and land them during the night within a league of Cape Diamond, in hopes of afcending the heights of Abraham, which rife abruptly with a fteep afcent from the banks of the river, that they might take poffeffion of the ground on the back of the city, where the fortifications were but indifferent: but the dangers and difficulties attending this undertaking were exceeding great. The fream was rapid; the fhore fhelving; the bank of the river lined with centinels; the landing-place fo narrow as to be eafily miffed in the dark; and the ground fo difficult as hardly to be furmounted in the day-time, had no oppofition been expected. Had the enemy received the leaft intimation from a fpy or deferter, or even fufpected the defign; had the embarkation been difcovered in confequence of the rapidity of the river, or the fteepnefs of the north fhore, near which they were obliged to row; had only one centinel been alarmed, or the landing-place much miffed; the height of Abraham muft have been infantly fecured by fuch a force as would have rendered the undertaking abortive; confufion would have neceffarily enfued in the dark; and this confufion would naturally have produced a panic, which might have proved fatal to the greater part of the detachment. Thefe objections did not efcape the penetration of the intrepid Wolfe, though he readily adopted the plan, and even executed it in perfon, though at that time afflicted with a fevere difentery and fever.

Having prepared for this dangerous enterprize, admiral Holmes moved with his fquadron farther up the river, about three leagues above the intended landing-place, in order to deceive the enemy, and amufe M. de Bougainville, whom Montcalm had detached with fifteen hundred men to watch the motions of that fquadron; but the Englifh admiral was directed to fall down in the night, and protect the landing of the forces; this he punctually performed. On the twelfth of September, at one in the morning, the firft embarkation, confifting of four complete regiments, the light infantry, commanded by colonel Howe, a detachment of Highlanders, and the American grenadiers, was made in flat-bottomed boats, under the immediate command of the brigadiers Monckton and Murray, though general Wolfe accompanied them in perfon, and was one of the firft who landed: and they began to fall down with the tide to the intended place of difembarkation, rowing clofe along the north fhore, in order to find it the more eafily. The boats glided gently along without any diforder; but by the rapidity of the tide, and the darknefs of the night, they overfhot the mark, and the troops landed a little below the place intended.

This remarkable success in landing without the least knowledge of the enemy, was in some measure owing to the following accident: two French deserters had been carried the evening before the embarkation on board the English fleet, and from them the general learned that the garrison of Quebec expected that night to receive a convoy of provisions, sent down the river in boats, from the detachment above, commanded by M. de Bougainville. The knowledge of this particular was of the utmost consequence, and tended to deceive the centinels posted along shore to challenge boats and vessels, and give the alarm. The first boat that contained the English troops being questioned accordingly, a captain of Fraser's regiment, who had served in Holland, and was perfectly acquainted with the French language and customs, answered without hesitation to *Qui vit*, which is their challenging word, *De la France*: nor was he at a loss to answer the second question, which was much more particular and difficult. When the centinel demanded *A quel regiment?* to what regiment? the captain replied, *De la reine*, which he knew by accident to be one of those that composed the body commanded by Bougainville. The soldier took it for granted that this was the expected convoy, and saying *Passe*, allowed all the boats to proceed without farther question.

The troops were no sooner landed, than the boats were sent back for a second embarkation, which was under the direction of brigadier Townshend. In the mean time colonel Howe, with the light infantry and Highlanders, ascended the woody precipice with admirable courage and activity; for the narrow path that slanted up the hill from the landing place had been broken up, and rendered impassable by cross-ditches: and in every other part the hill was so steep and dangerous, that the soldiers were obliged to pull themselves up by the roots and boughs of trees, growing on each side of the path. In their passage they dislodged a captain's guard, which defended a passage, by which alone the rest of the troops could reach the summit. After this the whole army mounted without molestation, and the general drew up the troops as fast as they arrived.

M. de Montcalm no sooner understood that the English had gained the heights of Abraham, than he determined to hazard a battle; and collecting his whole force without delay, marched towards the English.

Mean while the brave general Wolfe, perceiving that the French were crossing the river St. Charles, formed his own line; the right commanded by brigadier Monckton, and the left by brigadier Murray, while colonel Howe, who had just returned with his light infantry from taking a four-gun battery, was posted in the rear of the left. M. de Montcalm advancing in such a manner as shewed his intention was to flank the left of the English, brigadier Townshend was sent with the regiment of Amherst, which he formed, presenting a double front to the enemy, and was afterwards reinforced by two battalions. The reserve consisted of one regiment, drawn up in eight sub-divisions, with large intervals. The enemy's right was composed of half the colony troops, and a body of Canadians and Indians: their center consisted of a column of two other regular battalions; and on the left were posted one battalion, and the remainder of the colony troops: the bushes and corn-fields in their front were lined with fifteen hundred of their best marksmen, who kept up an irregular galling fire, which proved fatal to several brave officers, who were singled out for destruction. This fire was indeed choaked by the advanced posts of the British line, who piqueered with the enemy some hours before the battle began. Both armies were almost entirely destitute of artillery; the French having only two pieces, and the English no more than one, which the seamen had with great difficulty drawn up from the landing-place; but this single piece, being well served, galled their columns severely.

The enemy advanced to the charge with great order and vivacity, about nine in the evening, though their fire was both irregular and ineffectual. The British forces, on the contrary, reserved their shot till the French approached within forty yards of their line, when they poured in a terrible discharge, and continued their fire

with such spirit and deliberation, as could not fail of producing a very remarkable effect. The general himself stood in the warmest part of the attack, at the head of Brag's regiment and the Louisburgh grenadiers, conspicuous in the very front of the line, where he was aimed at by the enemy's marksmen, and at last received a shot in his wrist, which, however, did not oblige him to quit the field: wrapping a handkerchief about the wound, he continued to give his orders, without the least emotion; and boldly advanced at the head of the grenadiers, with their bayonets fixed, when another ball unfortunately pierced the breast of the young hero, who fell at the moment when victory was crowning all his labours with success; for at that instant every regiment of the British army seemed to exert itself for the honour of its own peculiar character. While the right pushed on with their bayonets, brigadier Murray advanced briskly with the troops under his command, and soon broke the enemy's center; when the Highlanders, supported by Anstruther's regiment, drawing their broad swords, fell in among them with irresistible impetuosity, driving them with great slaughter into the city, and the works they had raised at the bridge over the river St. Charles. The action was less violent on the left and the rear of the English. Colonel Howe having taken post with two companies, behind a small copse, frequently sallied out on the flanks of the enemy during the attack, and often drove them into heaps, while brigadier Townshend advanced platoons against their front: so that the right wing of the French was prevented from executing their first intention. The brigadier himself continued at the head of Amherst's regiment to support this disposition, and overcome a body of Indians posted opposite to the light infantry, waiting for an opportunity of falling upon the rear of the British army.

General Wolfe being slain, and Mr. Monckton dangerously wounded at the head of Lascelles's regiment, where he distinguished himself with remarkable gallantry, the command devolved on brigadier Townshend, who hastened to the center; and finding the troops disordered in the pursuit, formed them again with all possible expedition. He had hardly performed this necessary part of his duty, when M. de Bougainville, at the head of two thousand fresh men, appeared in the rear of the English. He had begun his march from Cape Rouge as soon as he received intelligence that the British troops had gained the heights of Abraham; but did not reach the field of battle soon enough to have any share in the action; for this body no sooner approached the British rear, than Mr. Townshend ordered two battalions, with two pieces of artillery, to advance; but the French prevented an attack by retiring among woods and swamps, whither general Townshend, who had already obtained a complete victory, wisely declined pursuing them; he having a great number of French officers prisoners, and being in possession of a very advantageous situation. M. de Montcalm, the French general, was mortally wounded in the battle, and conveyed into Quebec; but before he died wrote a letter to general Townshend, recommending the prisoners to that generous humanity which distinguishes the British nation. His second in command was left wounded on the field, and being conveyed on board an English ship, expired the next day. About a thousand of the enemy were made prisoners, including a great number of officers; and about eight hundred were slain on the field of battle. Among the English army, it is said that no more than fifty men were killed in gaining this important victory, and about five hundred wounded; but the death of general Wolfe was a national loss universally lamented.

This victory was no sooner obtained than admiral Saunders, who had all along heartily assisted the land-forces, for the advantage of the service, sent up all the boats of the fleet with artillery and ammunition; and on the seventeenth sailed up with all the ships of war, in a disposition to attack the Lower Town, while the Upper should be assaulted by general Townshend. That gentleman had employed his whole time since the action in securing the camp with redoubts; in forming a military-road for the cannon; in drawing up the artillery; preparing

A View of QUEBEC from the Basin.

Robert Smith.

paring batteries; and cutting off the enemy's communication with the country. But on the seventeenth, before any battery could be finished, a flag of truce was sent from the city, with proposals for a capitulation; which were accepted and signed at eight o'clock next morning. By these articles it was agreed, that the garrison should march out with all the honours of war, and be sent to France: that the inhabitants, on their laying down their arms, should be maintained in the possession of their houses and effects: that the effects belonging to the absent officers should not be touched: that the exercise of the Roman religion should be fully permitted: that the artillery and warlike stores should be delivered up; and the sick and wounded taken care of.

Thus was the city of Quebec taken by a handful of troops, and at the signing of the peace was confirmed to Great Britain.

The most considerable place, next to Quebec, is Montreal, which is seated on an island of the same name in the river St. Lawrence, upwards of two hundred miles above Quebec, and is nearly as large and populous as that city. The island of Montreal is exceeding fertile, and well improved, producing great plenty of greens, and some fruit. It is about twenty-eight miles in length, and ten in breadth. The town is pretty well fortified, and is much more pleasantly situated than Quebec. The streets are regular, and the houses well built, commodious, and agreeable. It stands by the side of the river, on a gradual easy ascent to what is called the Upper Town, whence you may see every house at one view from the harbour, or from the south side of the river. The public buildings exceed those of Quebec for beauty, and are equal to them in number. The Hotel-Dieu, the magazines, and the place of arms, are in the Lower Town, which is also the residence of the merchants. The seminary, the parish-church, the house of the Resolutes, the Jesuits-college, and nunneries, are in the Upper. There is also a general hospital, and a church belonging to the Jesuits, which is large and well built. The principal trade of the inhabitants has long consisted in the skins and furs they purchase of the Indians.

This island and city were taken on the eighth of September, 1760, by the generals Amherst and Murray, without firing a gun, which completed the conquest of Canada; for by the terms of the capitulation, all the French forces in that country were to be sent to France. Montreal has lately suffered by a most terrible fire, which consumed great part of the city, the houses of many of the merchants, and a number of stately buildings. This dreadful loss instantly awakened the humanity of the inhabitants of this kingdom, and great sums have been raised in the city of London, to remove the distresses of these new subjects to the British crown.

S E C T. IV.

Of the interior Country of North America beyond the present Government of Canada; with a concise Account of the Rivers and Lakes, their Cataracts, and a Description of the Countries and Indian Nations on their Banks.

THE river of St. Lawrence is represented as running through a considerable number of lakes, which some represent in Canada, and others on its southern and western borders; but surely nothing can be more improper, than to trace the course of a river through a number of lakes of a prodigious extent, merely because those lakes have in some part or other of them a communication by a streight.

As these lakes are generally described in treating of Canada, it will be proper here to give some account of them, and of the Indians who dwell upon their banks. The farthest of these lakes, from which the river St. Lawrence is injudiciously supposed to arise, is named Nippissong, which in the English language signifies a large body of water. It is seated to the north-west of Lake Superior, in the fifty-second degree of latitude. The northern bank of this lake is a bog, or morass, near four hundred miles in length, from the north-east to the south-west,

and about a hundred and fifty miles broad. To the north of this bog is a ridge of mountains, extending from the north-east to the south-west, the whole length of the marshy country, and beyond it to the westward: these are very high and steep, and are supposed to be the most lofty mountains in North America, whence they are called the Head of the country. To the south-east of these rises a stream, which is supposed to be the head of the river St. Lawrence; on the north-east rises the river Christino, which runs to the north-eastward, till it falls into Hudson's-bay; and from the south and south-west of these mountains rises the Mississippi, which runs to the southward, and at length discharges itself into the gulph of Mexico; so that by these rivers the country is divided into so many departments as it were from a center, which may be placed at the above mountains.

The Indians who inhabit the country round this lake are called the Lake Indians, and have about five or six thousand men. They chiefly live upon the west, south, and south-east sides of the lake, and on the islands it contains. Their country is of considerable extent, but of very difficult access; on which account they have had little or no connection with the English or French; and as they have no fire-arms, they hunt with bows and arrows. They seldom concern themselves with any other tribe of Indians, and live almost as independent as if they had the world to themselves. They never pretend to plant or improve the land by labour, but live on such food as the lake and the country affords them. From this lake a stream runs through a rough, broken, uninhabited country to Lake Superior, having in its course several cataracts, the most remarkable of which is about fifteen miles from the lake, where the water falls perpendicularly from a great height. The river here is a quarter of a mile wide, and a rock extending across the stream, it falls from thence with a noise that may be heard at the distance of several miles. Below these falls is great plenty of fish, especially of trout, which are very large and good.

At the entrance of this river into the lake is a town of Indians, called the Attawawas, or Souties, which dwell all along by the mouths of the rivers that fall into Lake Superior. They can raise about twelve thousand fighting men, and by carrying on a considerable commerce with the French, are more improved than the Nippissongs. They live in huts built in the form of cones; the base is generally from sixteen to twenty feet wide, and the top is left open for about two feet for a chimney and a window, their fire being kindled in the center. To render these huts a defence against the cold, they cover them with mats of rushes, which they weave very neatly, and place in such a manner as to render these dwellings, which commonly contain ten or twelve persons, very warm and comfortable.

When these people remove from one place to another for the sake of hunting, fishing, or any other convenience, they carry their external covering with them; by which means they are able, in a short time, to erect new towns, which have all the convenience of the old ones. They generally change their habitations in spring and autumn; spending the summer season upon the banks of the rivers and lakes, where they fish and raise corn; and living during the winter among the mountains, sometimes two or three hundred miles distant, for the sake of meeting with a great quantity of game in hunting. They as yet make but little use of spirituous liquors; nor do they make any kind of drink, except of the juice of the maple-tree: when in health they live upon the simple gifts of nature, and when sick the woods and lakes furnish them with all the drugs they use; in the application of which some are allowed to have a superior skill, but ask no fee or reward for their trouble. They have private property, which they transfer to one another, by way of bargain and exchange; which, if taken from them unfairly, brings contempt on the aggressor; but there can here be little temptation to fraud or robbery, as no individual or family is allowed to suffer by poverty, sickness, or any other misfortune, while their neighbours can supply their wants.

On the north of Lake Superior is another tribe of the Indians called the Bulls. These dwell round what is called the

the North Bay, and differ little from the Souties in their manners, they being originally of the same nation, as appears by there being such an affinity between the two languages, that they can perfectly understand one another. They can raise about four thousand fighting men, and their chief trade is to Hudson's-bay, where they carry fur and ermines in great abundance, and exchange them for blankets, arms, and ammunition.

Lake Superior is described by major Rogers as two thousand miles in circumference, and is very deep, except near the west end, where are several islands; and near the place where it is joined by the river is a large island, separated from the main by a strait five or six miles wide. The soil of this island is very good, and on it are several Indian towns. The banks to the north, south, and east, are very high and steep, they rising in some places above two hundred feet from the surface of the water, and almost perpendicular; so that it is very difficult landing, except where the rivers of this island fall into the lake. There are also some good islands in the north bay of the lake, forty or fifty miles in length, but not near so much in breadth.

The Indians in this territory enjoy the greatest plenty of the necessaries, and even of the luxuries of life. Here are beasts, fowl, and fish, of every size and kind common to the climate, in the greatest abundance; and it may become a rich and valuable country, should it ever be inhabited by a civilized people. It has not only rivers, but what may be termed a sea of its own, which, by its communication with the river of St. Lawrence, makes great amends for its inland situation, by affording all the advantages of trade and commerce, from one part of the country to the other, by a cheap and easy conveyance; nor do the Indians entirely neglect this advantage, but make great use of canoes on the rivers and lakes. These they form of the bark of birch, spruce, and elm; but those made of the former are said to be much the largest and best, as they are well suited to the country; since they will carry from four or five hundred to two thousand weight, and are so light that a single Indian, on his coming to a cataract, will carry it upon his back, till he thinks proper to take the water again.

Lake Superior has a communication with Lake Huron by a strait upwards of a hundred and fifty miles in length. The stream is here generally very rapid, and has one considerable cataract, round which the Indians are obliged to carry their canoes when they pass this way. The land near the strait between the two lakes is hilly and broken, but a great deal of it is capable of being improved to good advantage. The timber is thick and lofty; iron ore is here found in the greatest plenty; this is said to be the best in America: and there are streams sufficient for any kind of water-works.

Lake Huron, which is nine hundred miles in circumference, is of a triangular form; one of the extremities points to the north-west at the straits of Michlimacana; another to the south, where a strait runs into the lake of Erie; and a third to the north-east, where a considerable stream flows into it, called the Souties river, from which there is but a short carrying-place to the river of the Attawawas, which joins the river of St. Lawrence near Montreal.

The country about Lake Huron is to the north and north-west rocky and mountainous; but on the south-east the land is low, and covered with lofty trees, as oaks, white-pine, walnut, ash, and maple. On the south-west the land is level and plain, having few trees upon it of any kind, but the soil is pretty good and covered with tall grass; among which are great plenty of deer, elk, bears, and racoons. It also abounds in a great variety of land and water-fowl, and every thing necessary to supply the natural wants of mankind. There are about three thousand inhabitants who dwell round this lake, six hundred of whom are capable of bearing arms.

On the west side of the above plain is Lake Michigan, which is nearly of the same form as Lake Huron; but is larger, and extends farther to the south. Between these lakes a communication is formed by the strait of Michlimacana, which is fifteen miles wide, and forty

in length. At the point adjoining to Lake Michigan stands our fort of Michlimacana, which is a good stockade near twenty feet high. There are in this place some French inhabitants, who come here for the sake of trading with the Indians, and for the trout-fishery, which is here very valuable: the trout in these straits being in great plenty; and of an extraordinary size, some having been taken that weighed upwards of eighty pounds. The Indians annually resort hither from all the adjacent countries for the sake of these fish, and yet their numbers seem to be not at all diminished. On the south-east side of Lake Michigan are some towns of the Souties; and on the south and west sides live the Pottawatamies. In short, the Indians around this lake amount to about four thousand fighting men.

On the north-west side of Lake Michigan is a strait about forty miles wide, and a hundred long, in which are many islands, some of which are inhabited by the Attawawas, and others by the Pottawatamies. This strait leads into what is called the Green-bay, a lake of considerable extent, into which flows a large river that lies between Lake Superior and the Mississippi, and is called the river of Foxes. On the banks of this river live a nation called the Fox Indians, who have no less than four or five thousand men.

The extended country upon this river, and on the strait from the lake of Michigan to the Green-bay, is uniformly fertile and pleasant, and wants nothing but the cultivation of an industrious people to render it perfectly delightful. The timber is tall, but not so thick as to prevent the growth of grass, which is here so luxuriant as to rise five or six feet in height. This invites a multitude of buffaloes, wild cows, elk, deer, bears, beavers, and other animals, which, with plenty of wild game and fish, render this a most desirable region, for the air is no less agreeable than the soil. The winters are never severe, and, during great part of the year, the country wears a delightful verdure. Here also grow spontaneously a great variety of grapes, which are agreeable to the taste, and might be improved to considerable advantage. The Indians have learned that their juice will revive the spirits, and therefore make from them a kind of rough claret; but not knowing how to manage it properly, it is greatly inferior to what it might be made under the management of skilful persons; and this liquor they put in their empty rum-kegs. This country likewise produces a kind of wild oats, or rice, which grows in the greatest plenty in shallow water, above which it rises two or three feet. The ear resembles that of oats, but the kernel is more like rice; and there is so much of it, that canoes may be loaded in a short time. The Indians in this country raise Indian-corn, and have many horses. Their cabins resemble those described near Lake Superior.

From the south point of Lake Huron a strait, as hath been already observed, runs easterly about eighty miles into Lake Erie, passing in its way through Lake St. Clair. The country on both sides is level and good, abounding with tall oaks, maple, &c. The strait on its entering Lake St. Clair, or, as it is sometimes called, Lake Sinclair, is divided into several branches, which form five or six islands of various dimensions. Lake St. Clair is nearly circular, and about eighteen miles over. On the east side are large marshes, and at the lower end of that side a strait of a considerable size enters it, from which, by a short carrying-place, is an easy conveyance to Lake Ontario, used by the inhabitants who dwell on its banks.

The strait at the entrance of Lake Erie forms a bay, below which is the fort of Detroit, and the French are settled on both sides of the strait for about eight miles. The English fort is built of stockades: it is about twenty-five feet high, and twelve hundred yards in circumference. It is in a pleasant situation, the land is very good, and the inhabitants not only raise a great deal of wheat and other grain, but have plenty of cattle. They, however, chiefly enrich themselves by their trade with the Indians, which is here very lucrative.

Lake Erie extends three hundred miles in length from the south-west to the north-east; it is eighty or ninety miles

miles wide at the westerly end, and about forty at the lower end, where it tapers off to seven or eight miles, near the streight which joins it to Lake Ontario. At the west end of the lake the river Miamée flows into it, which has an easy communication with the Ohio by the river Walbach, there being no more than twelve miles land-carriage between the two rivers. At the south-west corner of Lake Erie the Lake Sandusky has a communication with it by a streight half a mile broad. This last lake is thirty miles in length, and eight or ten wide. Into it flows the river Sandusky, or Huron, upon the banks of which, and round the Sandusky, the Huron Indians have several towns in a very pleasant fertile country; they can raise about six or seven hundred fighting men, and differ in their manners from any of the Indians yet mentioned. They build regular houses, which they cover with bark, and are esteemed the richest Indians upon the whole continent, they having not only many horses, but some black cattle and swine. They likewise raise great quantities of corn, not only for their own use, but in order to supply other tribes, who purchase it of them. Their country extends a hundred and fifty miles to the westward of the lake, and is a hundred miles broad. The soil is not exceeded by any in this part of the world; the timber is tall and beautiful; the woods abound with game; here is the greatest plenty of water-fowl, and both the rivers and lakes contain a variety of fish. In short, if it was properly improved, the land would equal that in any of the British colonies on the sea-coasts.

The country on the south side is claimed by the Indians of the Five Nations, who do not inhabit it, but keep it for the sake of hunting. The country is level and very fine for several miles, having many streams flowing through it into the lake. Our fort at Presque Isle is on the south side about a hundred miles from the east end; and from this fort is a carrying-place of about twelve or fourteen miles, to a branch of the Ohio. From the east end of Lake Erie a streight runs north easterly about fifty miles, and nearly opposite to the place where it leaves the lake is Fort Erie, which has been lately built. The current from thence is rapid, on account of the rocks and falls of the water for about a mile; yet vessels are worked up by the help of windlasses. Lower down are several small islands, and at about six or seven miles distance the streight is divided into two branches, which form the Great Island, which extends almost to Little Niagara fort, and contains forty thousand acres of good land.

Near Little Niagara fort, which is nothing more than a stockade, is a remarkable cataract in the streight which runs into Lake Ontario, and is generally called the river of St. Lawrence. Its course is here south-south-east, and it is about half a mile wide, where the rock crosses it in the form of a half moon. Above the fall is an island, about half a mile in length, the lower end of which extends to the edge of the fall. The current of the streight above the island is quite slow, but on its approaching it, and being divided, it runs more swiftly, and, before it comes to the fall, with great violence, especially on the west side of the island, where the whole stream appears in a foam, for even here the descent is equal to the side of a pretty steep hill: but when it comes to the perpendicular fall, which is an hundred and fifty feet, no words can express the consternation of the traveller, on his first seeing so great a body of water falling, or rather violently thrown from such a height upon the rocks below, from which it again rebounds, appearing white as snow, it being all converted into foam, through these repeated violent agitations. The noise of this fall is frequently heard at the distance of fifteen miles, and sometimes much farther. The vapour that rises from it resembles a cloud, or pillar of smoke, and in it may be seen the appearance of a rainbow, whenever the sun and the position of the traveller favours it. Many beasts and fowls here lose their lives, by attempting to swim across the rapid stream above, and are found dashed in pieces below.

Farther down the stream are smaller falls for several miles, which render the streight unnavigable. Its bank on the east side is three hundred feet high, till you come to another English fort nine miles distant from Little Niagara; and this length goods are obliged to be carried by

land, on account of the cataract and the many lesser falls of the streight. Perhaps no place in the world is frequented by such a number of eagles as this, they being invited hither by the deer, elks, and bears, which are dashed to pieces.

The streight enters Lake Ontario at the south-west corner, at which place is Niagara fort, an handsome well-built fortification of considerable strength. This lake is of an oval form, two hundred and sixty miles in length, and a hundred and fifty wide in the middle. At its south-eastern extremity the river Oswego falls into it, where we have another fort, and a garrison kept up of considerable force. This is about two hundred miles from Niagara. The river Oswego rises from Lake Oneida, which is about thirty miles in length, and has at the east end a royal block-house, which is garrisoned to keep up a communication with the lakes: at the west end is Fort Brewerton, another post built for the same purpose; and about half way between this and Oswego is a block-house to command the ferry over the Seneca river.

The country between Oswego and the river St. Lawrence is level and good for several miles, and belongs to the Five Nations; several rivers flow through it, the most considerable of which is the Sable, which joins the Lake Ontario eighty or ninety miles east of Niagara, and rises near a branch of the Ohio. In it are several cataracts, and one higher than that of Niagara. About a hundred and fifty miles up this river are remarkable springs greatly esteemed by the Indians, as a remedy for many diseases: they are called the oil-springs on account of an oleous substance that issues forth with the water, and rises upon its surface. The water of these springs is drank by the Indians as a remedy for consumptions, asthmas, and various internal disorders; and they bathe in it with great success for rheumatic pains and strains. In the rivers round Lake Ontario are great plenty of salmon during the summer season; and at the entrance of the river St. Lawrence are in the winter abundance of what are called white fish, of which there are said to be none else in America, except a few at Long Point. In summer they disappear, and are supposed, during that season, to lie in deep water, out of soundings. They are about the size of a shad, very agreeable to the palate, and it does not appear that there are any of them in Europe. The country round the lake is, to appearance, fertile, capable of valuable improvements, and abounds with water-fowl and variety of game.

The Five Nations have their towns at some distance from the lake, chiefly upon the rivers that flow into it; but of these people we shall hereafter give a particular description.

The river St. Lawrence, on its taking leave of the lake, is ten or twelve miles wide, and has several islands; on the most northerly of which is a small fortress erected by the French, and now kept by us. A little to the south of this island it is joined by a considerable stream, that rises near Hudson's-bay, far to the north; it is called Oswegotchy, and has frequent falls, after ascending it forty or fifty miles. The above island is about twenty miles below the lake, and here the river grows narrower.

From Lake Ontario to the Cedars, the present western boundary of the province of Quebec, is about eighty miles; and from thence to Lake St. Francis is near the same distance, and is considered as the next stage of St. Lawrence.

We shall conclude this subject with a concise account of the river Christino, which runs far to the north, and shall leave the Mississippi and Ohio till we come to the more southern provinces subject to Great Britain.

The river Christino is so called from the Indians, who have the name of Christineux, or Christinos, who possess the country adjoining it. Its highest source is on the north-east of the Central mountains, called by the Indians the Head of the Country, where it rises in several streams, all which bend their course towards Hudson's-bay, and at different places unite, till in the course of about a hundred and fifty miles from their source they all join, and by their confluence form a large bay, round which live a tribe of Christians. Farther down the river are a few small lakes, and several small streams on each

side flow into the river; by which means its waters are encreased, till it discharges itself into Hudson's-bay, near two hundred miles to the north of York fort, and about five hundred from the Central mountains.

The country near this river is greatly inferior to that on the lakes and the river St. Lawrence, it extending from the fifty-fifth to the sixtieth degree of north latitude. The winters are long and severe, the snow continues long on the ground, and the soil, which is cold and barren, is scarce capable of any valuable improvements. The timber here is beech and maple, and for a considerable way up the river the land is high; and so thickly covered with spruce, hemlock, &c. that it is difficult to travel through it, without being entangled; but nearer the mountains the soil is better. In the river are many kinds of fish; and beaver are taken here in great abundance, with some ermines, elks, moose, bears, &c. There is likewise an animal which resembles the moose, but is much smaller, and seems peculiar to this country.

The inhabitants subsist entirely on their fish and game, for they raise no kind of grain, nor keep any animals, except dogs. The number of warriors in this country is supposed to amount to about two thousand. They generally cover their houses or huts with the skins of wild beasts; and not only make them warm and secure, but, according to their taste, both neat and elegant. These Indians have nearly the same language with those on the lakes; and, according to their own history, they all came round from the north into this country. Indeed, the only history they have is a verbal one, transmitted from father to son; yet they pretend to give an exact account for many generations back; for however negligent they are in the education of their children in almost every other respect, they are very careful in acquainting them with the story of their ancestors.

S E C T. V.

The most remarkable Beasts and Birds in the interior Part of North America.

THE beasts and birds we shall here describe are those principally found in the northern part of the extensive country of which we have been treating, and particularly those near the river Christino. The most remarkable of these are the porcupine, and the wolverene, or quick-hatch; the pelican, the white-tailed eagle, the brown and spotted heath-cock, and the white partridge.

The porcupine of this northern part resembles in shape and size the beaver; but the head has some resemblance to that of a rabbit: it has a flat nose, entirely covered with hair: its mouth is armed with two teeth above and two below, that are yellow and remarkably strong: its ears, which are short and small, scarcely appear through its fur: its legs too are remarkably short; but its claws, of which it has four on its fore-feet, and five on those behind, are very long, hollow within like scoops, and very sharp-pointed. This animal is covered all over with a pretty soft fur about four inches long; but beneath the hair on the head, body, and tail, it is thick set with sharp stiff quills, which are white with black points, bearded, and not easily drawn out when they have entered the skin. The porcupine usually makes his nest under the roots of large trees, and sleeps much. He chiefly feeds upon the bark of trees, eats snow in the winter to quench his thirst, and in summer drinks water; but carefully avoids going into it. The Indians eat these animals, and esteem their flesh a wholesome and pleasant food.

The wolverene, or quick-hatch, is another very extraordinary animal, and is of the size of a large wolf: the snout, with the upper and under jaw, as far as the eyes, is black; the upper part of the head whitish; the eyes dark; the throat and upper part of the neck white spotted with black; the ears small and round; the whole body of a reddish brown, darker at the shoulders and rump, and lighter upon the back and sides. The fur of the whole body is pretty long, but not very close: the feet as far as the first joint, are covered with short black hair; but the legs are brown, and the claws of a light colour:

most of the tail is brown, but towards the tip bushy and black. This creature in walking carries his head very low, so that his back rises archwise. He defends himself when attacked with great force and obstinacy, and it is said will tear traps and gins to pieces in a very surprising manner.

The pelican is somewhat bigger than a large tame goose; the upper mandible of the bill is narrower in the middle than at either end, and is received into the lower, except towards the point, which widens and receives the lower into it; the point is red, but the upper and under part towards the head are yellow: the pouch when dry resembles an ox's bladder blown, and is prodigiously large while the creature is living. The head and neck are covered with white feathers; the body is of a dirty ash-colour; the quills of the wings are black, and all the under part is of a dark ash-colour. The legs are short, with four toes webbed together; the middle toe is longer than the leg; the claws are dark, and both the legs and feet are of a dirty yellow mixed with green. These birds live chiefly on fish; they are found in many other countries, and in some places are much larger.

The white-tailed eagle is about the bigness of a turkey-cock, flat-crowned, short-necked, and full breasted, with brawny thighs. Its wings are very long, and broad in proportion to its body; but darker on the back, and lighter on the sides. The quills of the wings are black, and the breast spotted with white: the tail when closed is white both above and below, except the very tip of the feathers, which is black or brown: the thighs are covered with dark brown feathers, through which in some places a white down appears: the legs, to the very feet, are covered with soft feathers of a reddish brown. It has four toes on each foot, which are very thick and strong, standing three forward and one backward, covered with yellow scales, and armed with very strong and sharp claws of a shining black. There are also several kinds of falcons, hawks, and other birds of prey.

The great horned-owl is a very singular bird, with a head very little inferior in size to that of a cat; what are called the horns, are composed of feathers rising just above the bill, intermixed at the bottom with white, becoming of a red brown by degrees, and tipped with black. The great white owl of a bright shining colour, so as scarce to be distinguished from the snow, is also common in the northern part of this country, and continues there throughout the whole year, where it is frequently seen flying by day, and preys upon white partridges.

The white partridge is common in some other countries, but is no where in such plenty as in the northern part of this near Hudson's-bay. It is of a middle size, between that of our common partridge and the pheasant, shaped very much like the former, except its tail being somewhat longer. These birds are mostly brown in summer, but in the winter become perfectly white, except the outward feathers of the tail, which are black tipped with white. In that severe season they repose in the snow all night, and in the morning fly directly up to shake it off their feathers. They stay in these parts all the year, feed only in the mornings and evenings, and sun themselves in the middle of the day.

The brown and spotted heath-cock, which also continues in the north all the year, is somewhat bigger than an English partridge; it is likewise longer-bodied, and has a longer tail in proportion. The bill is black, covered with brown feathers; the skin above the eye red; the top of the head, the upper part of the neck, and down the back covered with feathers of a dark brown, mixed with a dull orange and ash-colour: the tail is of a dark brown, the throat under the bill of a yellowish white; the neck and breast of a dull orange, with spots in the form of half moons. The legs from the knee joint down to the feet are covered with a kind of hairy feathers of a brown colour, intermixed with black: the feet are of a reddish brown; and three toes forward have pretty long and black claws; these toes are jagged; but the hinder toes are smooth on the sides.

S E C T. VI.

A particular Description of the Persons, Dress, Customs, Manners, Religion, and Government of the Five Nations and other Indians: their Method of going to War, the Manner in which it is carried on, and Peace concluded, &c.

WE shall now more particularly describe the customs and manners of the Indians who inhabit the interior part of America. They formerly inhabited the sea-coasts, where they were very numerous; but have retired into the westerly parts of the country, so that few of them are to be found within less than two or three hundred miles of the sea: for though many of them have been instructed in the knowledge of Christianity, and parcels of land have been allotted them in several of the British colonies, where they have been formed into societies; yet it has been found that in proportion as they lay by their ancient customs, and conform to our manner of life, they dwindle away, either because the change is prejudicial to their constitutions, or because when settled among the English they have greater opportunities of procuring spirituous liquors, of which both sexes are generally inordinately fond; very little care being ever taken to prevent those who are inclined to take advantage of them in trade, from basely intoxicating them for that infamous purpose: this has a worse effect on their constitutions than on ours, and soon proves fatal, producing diseases to which they were formerly strangers. Thus where a few years ago there were considerable settlements of them, their name is almost forgotten; and those who still remain, have, for the most part, joined themselves to other nations in the interior part of the country, on the banks of the lakes and rivers.

The Indians of America are tall and straight beyond the proportion of most other nations: their bodies are strong; but it has been observed, that this is a strength rather suited to endure much hardship, and the exercises of the chase, than much hard labour, by which they are soon consumed; hence it has been said to be rather the strength of a beast of prey, than that of a beast of burden; an odious comparison when speaking of the human species: however, they have generally straight supple limbs, and the least degree of deformity is very rarely seen amongst them. Their features are regular, their complexion somewhat of a copper colour, or a reddish brown; their hair, which is long, black, and lank, is as strong as that of a horse; and what is very singular, is their not having any beards, nor hair on any part of their body but the head.

They generally wear only a blanket wrapped about them, or a shirt, both which they purchase of us: but when the Europeans first came amongst them they found some nations entirely naked, and others with a coarse cotton cloth, wove by themselves, round their waist: but in the northern parts their whole bodies were in winter covered with skins.

Among the various nations and tribes within the vast extent of country of which we have just given a description, the Five Nations deserve particular notice; these being dreaded and revered by all the others for their superior understanding, activity, and valour in war; in which constant practice has rendered them expert, they being generally at war with one nation or other, and sometimes with several at a time. Their manners, customs, and modes of dress, are, as near as possible, adopted by several of the other nations; and those are esteemed the politest and best bred, who the nearest resemble these. Their most northern settlement is a town called Chockonawago, on the south of the river St. Lawrence, opposite to Montreal; but their largest settlements are at the head of the rivers Mohocktanese, Oneida, and Oneneaga, between Lake Ontario and the provinces of New York and Pennsylvania. They claim the whole country that lies to the south of the river St. Lawrence, as far as the Ohio, and down that river to the Wabach, from the mouth of the Wabach to the bounds of Virginia: on the westward they extended to the lakes of Ontario and Erie, and to the river Miami: their eastern boundaries are Lake Champlain and the British

colonies. When the English first settled in America, they were able to raise fifteen thousand fighting men; but at present, including the Delawares and Shawanees, they do not amount to more than between three and four thousand. Thus have they been reduced by the perpetual wars they have carried on against the other Indians and the French in Canada.

The Mohocks, once the most numerous tribe among them, are now the smallest; yet still maintain a superiority over the rest, and are consulted and appealed to by the others in all great emergencies. About a hundred years ago they destroyed the greatest part of the Hurons, who dwell on the south side of the lake of Ontario; and the remainder fled for protection to the French in Canada; but most of them have since returned to their own country, and, by permission of the Five Nations, dwell on the lands at the west end of Lake Erie. The Mohocks also made prisoners of the whole nation of the Shawanees, who lived upon the Wabach, and afterwards, by the mediation of Mr. Penn, at the first settlement of Pennsylvania, gave them liberty to settle in the westerly parts of that province, giving them the appellation of cousins, and allowing them to claim kindred with the Five Nations, as their uncles. They about the same time conquered the Delawares, whom they brought into a like subjection; and also the Mickanders, or Mohegons, who dwelt on the banks of Hudson's river. The two last nations they suffered to live in any uninhabited part of their southern territories; but the latter upon condition of paying them an annual tribute. They also conquered several nations upon the frontiers of New England.

Some nations to this day are not allowed to appear painted at any general meeting, or congress, where the Five Nations attend; that being an express article in the capitulations. They have been the inveterate enemies of the French ever since their first settlement in Canada; and are almost the only Indians within many hundred miles that have been proof against their solicitations to turn against us; the greatest part of them having maintained their integrity, and been our faithful friends and allies. They once burnt great part of the city of Montreal, and put the French into great consternation. They have conquered most of the Abnaques, or eastern Indians; and now maintain a constant war with the Cherokees, Chickesaws, and Creeks, against whom many of their young men are annually sent; while others of them go against the Misauri; and, indeed, they sometimes carry their hostilities as far south as the isthmus of Darien; but have long lived in peace with the Indians on the lakes and the Tweeghtwees.

The Indians are far from being deficient in good sense and ingenuity, many of them shewing a great capacity for some art or science. They have strong imaginations, and their memories are so retentive, that when they have been once at a place, let it be ever so distant or obscure, they will readily find it again. Thus the Indians about Nova Scotia, and the gulph of St. Lawrence, have frequently passed over to Labrador, which is thirty or forty leagues, without a compass, and have landed on the very spot they intended: even in dark cloudy weather they will direct their course by land with great exactness, merely by observing the bark and boughs of trees; the north side in this country being always mossy, and the boughs on the south side the largest.

Poligamy is practised by some nations, but it is not general. In most they are contented with one wife; but a divorce is admitted for the same causes that it was allowed among the Greeks and Romans: but no nation of the American Indians is without a regular marriage, in which are many ceremonies, the principal of which is said to be the bride's presenting the bridegroom a plate of corn.

Though the women are incontinent before wedlock, their chastity after marriage is remarkable. The punishment of the adulterer, as well as the adulteress, is in the hands of the husband himself, and is often severe, as being inflicted by one who is both the injured party and the judge. Their marriages are not remarkably fruitful, they seldom producing above three or four children; and these are brought forth with much less pain than our women suffer upon the like occasions, and

are immediately followed but with little diminution of their usual strength. The mothers are so fond of their children, that they seldom wean them till they are upward of two years old, and carry them on their backs till the burden becomes quite insupportable. They can no sooner walk, than they are at liberty to go when and where they please; but their parents carefully instruct them very early in the use of arms, and frequently relate to them the exploits and great achievements of their ancestors; in order to lead them on to brave and heroic actions. They introduce them very young into their public councils, and make them acquainted with the most important affairs and transactions: this accustoms them to secrecy, gives them a composed and manly air, inspires them with emulation, and makes them bold and enterprising. They seldom chastise their children; for when they are young, they observe that they are not sufficiently endowed with reason; for if they were, they would not do wrong: when they are more advanced in life, they say that they do not then chastise them, because, being capable of judging, they ought to be masters of their own actions, and not be accountable to any one. In the same manner they excuse any ill treatment they receive from a person in liquor: "Should we blame" or punish him, say they, when he has not his reason, "and does not know what he does?" Yet when a mother sees her daughter act amiss, she generally bursts into tears, and upon the other enquiring the cause, she tells her the reason, and this admonition seldom fails of the desired effect.

The Indians do not always enter into a formal obligation of marriage; but take a wife for a longer or shorter time, as they please; but their children, on these occasions, suffer no disgrace, and enjoy all the privileges of those begotten in marriage.

The men are remarkable for their indolence, on which they even seem to value themselves, saying that labour would degrade them, and belongs solely to the women, while they are formed only for war, hunting, and fishing: it is, however, their business to make arms for hunting and lines for fishing; to form their canoes, and to build and repair their houses; but they frequently make the women assist them in these, besides attending all domestic affairs, and cultivating the land.

The Indians are generally possessed with an astonishing patience and equanimity of mind, with the command of every passion except revenge. They bear the most sudden and unexpected misfortune with calmness and composure, without uttering a word, or the least change of countenance. Even a prisoner, who knows not whether he may not in a few hours be put to a most cruel death, seems entirely unconcerned, and eats and drinks with as much cheerfulness as those into whose hands he has fallen. Their resolution and courage under sickness and pain, is really astonishing. Nothing is more common than to see persons of all ages, and both sexes, supporting themselves with the utmost constancy under the greatest pains and calamities; even when under the shocking torture to which prisoners are frequently exposed, they will not only make themselves cheerful, but provoke and irritate their tormenters by the most severe reproaches.

They treat those in alliance with them with an high degree of complaisance and good nature.

They are grave in their deportment upon serious occasions, observant of those in company, respectful to the old; of a temper cool and deliberate, by which they are never in haste to speak before they have well thought of the matter, and sure the person who spoke before them has finished all he had to say. In their public councils, every man is heard in his turn, according as his years, his wisdom, or his services to his country, have ranked him. Not a whisper, nor a murmur is heard from the rest, while he speaks; no indecent commendations; no ill-timed applause. The young attend for their instruction; for here they learn the history of their nation, are animated by those who celebrate the warlike actions of their ancestors; are taught what is the interest of their country, and how to pursue it.

The laws of hospitality are executed among them with the utmost generosity and good-will. Their houses,

their provisions, even their young women, are presented to a guest. To those of their own nation, they are likewise very humane and beneficent. If any one of them succeed ill in his hunting, if his harvest fails, or his house is burnt, he feels no other effect of his misfortune, than its giving him an opportunity to experience the benevolence and regard of his countrymen, who, for that purpose, have almost every thing in common. But to the enemies of his country, or to those who have privately offended him, the American is implacable. He never indeed makes use of oaths, or indecent expressions, but cruelly conceals his sentiments, till by treachery or surprize, he can gratify his revenge. No length of time is sufficient to allay his resentment; no distance of place is great enough to protect the object; he crosses the steepest mountains, pierces the most impassable forests, and traverses the most hideous deserts; bearing the inclemency of the seasons, the fatigue of the expedition, the extremes of hunger and thirst, with patience and cheerfulness, in hopes of surprizing his enemy, and exercising upon him the most shocking barbarities; and when this cannot be accomplished, the revenge is left as a legacy, transferred from generation to generation, from father to son, till an opportunity offers of taking what they think ample satisfaction. To such extremes do the Indians push their friendship, or their enmity; and such indeed is, in general, the character of all uncivilized nations. They, however, esteem nothing so unworthy of a man of sense, as a peevish temper, and a proneness to a sudden and rash anger; and this has such an effect, that quarrels rarely happen among them, when they are not intoxicated with liquor.

On the other hand, they are highly sensible of the utility and pleasures of friendship; for each of them, at a certain age, makes choice of some one nearly of the same standing in life to be their most intimate and bosom friend; these two enter into mutual engagements, by which they oblige themselves to brave any danger and run any risque, to assist and support each other. This attachment is even carried so far as to overcome the fear of death, which they consider only as a temporary separation, being persuaded that they shall meet and be united in friendship in the other world, never to be separated more; and that there they shall need one another's assistance as well as here.

It does not appear that there is any Indian nation that has not some sense of a Deity, and a kind of religion; but this is so various, so perplexed, and confused, that it is difficult to give a minute description of it. Their ideas of the nature and attributes of the Deity are very obscure, and some of them absurd; but they all acknowledge him to be the Creator and Master of the world; yet how the world was created they know not, and have various conjectures about it, some imagining that men were first rained down from the clouds, and that brute animals descended with them. They seem to have some idea that there are spirits of a higher and more excellent nature than man; and supposing them to be every-where present, frequently invoke them, and endeavour to act agreeable to their desires. They likewise imagine that there is an evil spirit, who, they say, is always inclined to mischief, and bears great sway in the creation; this, indeed, is the principal object of their devotions; they generally address him most heartily, beseeching him to do them no harm: but supposing the others to be propitious, and ever inclined to do them good, they intreat them to bestow blessings upon them, and prevent the evil spirit from hurting them. To procure the protection of the good spirit, they imagine it necessary to distinguish themselves, and that in the first place they must become good warriors, expert hunters, and steady marksmen.

The Indians have great dependance on their dreams, and really believe that from the dreams of youth, may be collected the whole history of their future life. On this account, when they arrive at a certain age, dreaming is made a kind of religious ceremony, which is thus performed: they besmear their face all over with black paint, and fast for several days, in which time they expect that the propitious spirit will appear to them in some shape or other while they sleep. The effect this long fast

fast must naturally have on the brain of a young person, is doubtless considerable, and the parents and other old people take care, during the operation, that the dreams they have in the night be faithfully reported the next morning. In favour to some constitutions they sometimes limit the fast to a shorter term than is generally judged necessary; however, the propitious spirit being constantly the subject of the person's waking thoughts, becomes also the subject of his dreams; at least every phantom of their sleep is regarded as a figure of him, whether it be bird, beast, fish, tree, or, indeed, any thing animate or inanimate, and is particularly respected by them all their lives after.

Their priests often persuade the people that they have revelations of future events, and are authorised to command them to pursue such and such measures. They also undertake to unfold the mysteries of religion, and to solve and interpret all their dreams. They represent the other world as a place abounding with an inexhaustible plenty of every thing desirable, where they shall enjoy the most full and exquisite gratification of all their senses. This is, doubtless, the motive that induces the Indians to meet death with such indifference and composure; none of them being in the least dismayed at the news that he has but a few hours or minutes to live, but with the greatest intrepidity sees himself upon the brink of being separated from all terrestrial things, and with great serenity talks to all around him: thus a father leaves his dying advice to his children, and takes a formal leave of all his friends.

They generally bury their dead with great decency, and deposit in the grave such things as the deceased had made the greatest use of, and been most attached to; as his bow and arrows, pipes, tobacco, &c. that he may not be in want of any thing when he comes to the other country. The mothers mourn for their children a long time, and the neighbours make presents to the father; and he in return gives them a feast.

The feasts of an Indian, whether at a funeral, a triumph, or a visit, are very simple. Instead of endeavouring to make a splendid appearance, he makes his friends heartily welcome, and values not spending the fruits of a whole season's toil, to convince them that he is so. The guest is sure to be treated kindly, and that he shall not be the subject of ridicule while present, nor of cruel remarks when departed. On these occasions a servile regard is never paid to the distinctions of high and low, rich and poor, so as to lessen the spirit and pleasure of conversation, when the company happens to be made up a mixture of these.

Their physicians generally treat them, in whatever disorder, the same way: they first inclose them in a narrow cabin, in the midst of which is a stone red hot, on which they throw water till the patient is covered with warm vapour, and is in a profuse sweat, when they hurry him from thence and plunge him into the next river. This is repeated as often as they think necessary; and by this method extraordinary cures are sometimes performed: but it also frequently happens that persons die in the very operation; especially where they are afflicted with the new disorders brought to them from Europe; and it is partly owing to this manner of proceeding, that the small-pox has proved so much more fatal to them than to us. It must, however, be acknowledged that they have the use of some specifics of wonderful efficacy, the power of which they however attribute to the ceremonies with which they are administered.

Liberty, in its fullest extent, is their darling privilege; for it is the great and fundamental principle of their policy, that every man is equally free and independent; and that nothing can be a compensation for the loss of liberty. Avarice is unknown to them, and they are neither prompted by ambition, nor actuated by a love of gold; for the distinctions of rich and poor, high and low, noble and ignoble, do not so far take place among them as to create the least uneasiness, or excite the resentment of any individual; hence the brave and deserving, let their circumstances be what they will, are sure to be esteemed.

The generalissimo, who may be considered as their

king, among all the nations who speak the Roundock dialect, is elective, and his election is attended with singing and dancing: when chosen he makes a panegyric upon the person to whom he succeeds. He is rather revered as a father than feared as a monarch. He has no guards, no prisons, no officers of justice.

The other forms, which may be considered as a kind of aristocracies, have not more power among the Iroquois or Five Nations; there is no other qualification absolutely necessary for their chiefs but age, with experience and ability in their affairs. However, there are generally in every tribe some particular stocks, which they respect, and who are considered in some sort as their chiefs, unless they shew themselves unworthy of that rank; and indeed there are some of the tribes themselves who, on account of their number or bravery, have a pre-eminence over the rest, which, as it is not exacted with pride, so it is never disputed where due.

This great council is composed of the heads of tribes and families, with such whose capacity has raised them to the same degree of consideration. They meet in a house, built in each of their towns for that purpose, and also receive ambassadors, to deliver them an answer, to sing their traditionary war songs, or to commemorate their dead. In these councils they propose all such matters as concern the state, and which have been already digested in the secret councils, at which none but the head men assist. The chiefs seldom speak much themselves at these general meetings, but intrust their sentiments with a person who is called their speaker, or orator, there being one of this profession in every tribe and town; and their manner of speaking is natural and easy, their words strong and expressive, their style bold, figurative and truly laconic, nothing being said but what is necessary either to inform the judgment, or raise such passions as the subject naturally excites.

When any business of consequence is transacted, they appoint a feast upon the occasion, of which almost the whole nation partakes. Upon matters of less general concern, are lesser feasts, to which none are invited but they who are engaged in that particular business. Before the entertainment is ready, the principal person begins a song on the remarkable events of their history, and whatever may tend to their honour or instruction. The others sing in their turn. They also have dances, chiefly of a martial kind; and no solemnity or public business is carried on without songs and dances. These ceremonies serve to preserve order, and contribute to fix all transactions in their memory.

It ought not to be omitted, that the same council of elders, which regulates whatever regards the external policy of the states, has likewise the charge of its internal peace and order. Their suits are few, and soon decided; they having neither property nor art sufficient to render them perplexed and tedious. Criminal matters, when so flagrant as to become a national concern, are brought before the same jurisdiction: but in ordinary cases, the crime is either revenged or compromised by the parties concerned. If a murder is committed, the family that has lost a relation prepares to kill the murderer; and when this is done, the kindred of the last person slain think themselves as much injured, and as justifiable in taking revenge, as if the violence had not begun among themselves. But, in general, things are determined in a more amicable manner: the offender absents himself; and his friends send a compliment of condolence to those of the party murdered; they offer them presents, which are rarely refused; and the head of the family appearing, delivers them in a formal speech, one by one, sometimes to the number of sixty articles; saying, "By this I remove the hatchet from the wound.—By this I dry up the flowing blood." And thus, in a figurative manner, take away, one by one, all the circumstances and consequences of the murder. If the murder be committed by one of the same cabin, that cabin has the full right of judgment within itself, without appeal, either to punish the guilty with death, to pardon him, or to force him to give some recompence to the wife or children of the slain. Mean while the supreme authority of the nation looks on unconcerned.

As the Indians are of a vindictive disposition, unrestrained by the influence of religion, the most trifling provocations frequently rouse them to arms, and prove the occasions of bloodshed and murder. Their petty private quarrels are often decided this way, and expeditions undertaken without the knowledge or consent of a general council. These private expeditions are winked at, and excused, as a means of keeping their young men in action, and inuring them to the exercises of war.

But when war becomes a national affair, it is entered upon with great deliberation. They first call an assembly of the sachems and chief warriors, to deliberate upon the affair, and every thing relating to it. In this general congress among the Northern Indians and the Five Nations, the women have a voice as well as the men. When they are assembled, the chief sachem or president, proposes the affair they have met to consult upon, and taking up the tomahawk, which lies by him, says, "Who among you will go and fight against such a nation? Who among you will bring captives from thence to replace our deceased friends, that our wrongs may be revenged; and our name and honour maintained, as long as the rivers flow, grass grows, or the sun and moon shall endure?" Then one of the principal warriors rising, harrangues the whole assembly, and afterwards addressing himself to the young men, enquires who among them will go along with him; and fight their enemies? When they generally rise, one after another, and fall in behind him, while he walks round the circle, till he is joined by a sufficient number.

On such occasions they have usually a deer, or some other beast roasted whole, and each of them, as they consent to go to war, cuts off a piece and eats, saying, "Thus will I devour our enemies," mentioning the nation they are going to attack. This ceremony being performed, the dance begins, and they sing the war-song, which has relation to their intended expedition and conquest, or to their own skill, courage, and dexterity in fighting, and the manner in which they will vanquish their enemies. Their expressions are strong and pathetic, uttered with a tone that inspires terror.

Such is the influence of their women in these consultations, that the issue depends much upon them. If any one of them, in conjunction with the chiefs, has a mind to excite one, who does not immediately depend upon them, to take part in the war, she presents, by the hands of some trusty young warrior, a string of wampum, to the person whose help she solicits, which seldom fails of producing the effect. But when they solicit an offensive or defensive alliance with a whole nation, they send an embassy, with a large belt of wampum and a bloody hatchet, inviting them to come and drink the blood of their enemies.

The wampum used upon these and other occasions, before their acquaintance with Europeans, was only small shells, which they picked up by the sea-coasts, and on the banks of the lakes. It now consists of a kind of cylindrical beads, made of white and black shells, which are esteemed among them as silver and gold are among us. The black they think the most valuable; both of them are their greatest riches and ornaments, answering all the ends of money among us. They have the art of stringing, twisting, and interweaving them into their belts, collars, blankets, &c. in ten thousand different sizes, forms, and figures, so as not only to be ornaments for every part of dress, but expressive of all their important transactions. They dye the wampum of various colours and shades; and as they are made significant of almost any thing they please, by these their records are kept, and their thoughts communicated to one another, as ours are by writing. Thus the belts that pass from one nation to another, in all important transactions, are carefully preserved in the cabins of their chiefs, and serve both as a kind of record or history, and as a public treasure; hence they are ever used on trifling occasions.

The calumet, or pipe of peace, is of no less importance, nor is it less revered among them. The bowl of this pipe is made of a kind of soft, red stone, easily wrought and hollowed out; the stem is of cane, or a kind of light wood, painted with different colours, and adorn-

ed with the heads, tails, and feathers of the most beautiful birds, &c. The use of the calumet, is to smoke either tobacco, or some other herb used instead of it, when they enter into an alliance or any solemn engagement; this being esteemed the most sacred oath that can be taken, the violation of which is thought to be most infamous, and deserving severe punishment in the other life. When they treat of war, the whole pipe, and all its ornaments, are red; sometimes it is red only on one side, and by the disposition of the feathers, &c. a person acquainted with their customs, knows at first sight the intentions or desires of the nation who presents it. Smoking the calumet is also, upon some occasions, and in all treaties, considered as a sacred oath, as a seal of their decrees, and a pledge of their performance of them. The size and decorations of their calumets are commonly proportioned to the importance of the occasion, to the quality of the persons to whom they are presented, and to the esteem and regard they have for them.

Another instrument of great importance among them, is the tomahawk. This is an ancient weapon, used by them in war, before they were taught the use of iron and steel; since which hatchets have been substituted in the room of them: but it still retains its use and importance in public transactions, and, like the pipe, is frequently very significant. This instrument is formed, in some respects, like an hatchet, having a long handle; the head, which is a round knob of solid wood, calculated to knock a man down, has on the other side a point, bending a little towards the handle; and near the centre, where the handle pierces the head, another point projects forward, of a considerable length, which serves to thrust with like a spear. The tomahawk is also ornamented with painting and feathers, disposed and variegated in many significant forms, according to the occasion and end for which it is used; and on it is kept a kind of journal of their marches and most important occurrences, in a sort of hieroglyphics. When the council is called to deliberate on war, the tomahawk is coloured red; and when the council sits, it is laid down by the chief; and if war be concluded upon, the captain of the young warriors takes it up, and holding it in his hand, dances and sings the war-song. When the council is over, this, or some other of the same kind, is sent by the hands of the same warrior, to every tribe concerned, who, with it, presents a belt of wampum, and delivers his message, throwing the tomahawk on the ground, which is taken up by one of the most expert warriors, if they choose to join; if not, it is returned with a belt of their wampum, suited to the occasion.

Each nation or tribe has its distinct ensigns, or coats of arms, generally consisting of some beast, bird, or fish. Thus the Five Nations have the bear, otter, wolf, tortoise, and eagle: by these names the tribes are generally distinguished, and the shapes of these animals are pricked and painted on several parts of their bodies. Generally, when they march thro' the woods, they, at every encampment, cut the figure of their arms on trees, especially when they have had a successful campaign, that travellers may know they have been there; recording also, in their way, the number of prisoners and scalps they have taken.

Their military appearance is very odd and terrible. They cut off all their hair, except a spot on the crown of the head, and pluck off the eyebrows. The lock left upon the head is divided into several parcels, each of which is stiffened, and intermixed with beads and feathers of various shapes and colours; the whole twisted and connected together till it takes a form much resembling the modern pompadour upon the top of the head; which is painted red, down to the eyebrows, and sprinkled over with white down. The gristles of their ears are slit almost quite round, and hung with ornaments that have generally the figure of some bird or beast drawn upon them. Their noses are likewise bored and hung with beads, and their faces painted with various colours. On their breasts are a gorget or medal of brass, copper, or some other metal; and by a string which goes round their necks, is suspended that horrid weapon the scalping-knife.

Thus equipped, they march forth, singing their war-song,

A Sachem exhorting the Indians to War.

song, till they lose sight of their village; and are generally followed by their women, who assist them in carrying their baggage, whether by land or water, but commonly return before they proceed to action.

They have generally one commander for every ten men; and if the number amounts to one hundred, a general is appointed over the others, not properly to command, but to give his opinion. They have no stated rules of discipline, or fixed methods of carrying on a war; but make their attacks in as many different ways as there are occasions, but generally in flying parties, equipped for that purpose, with a thin light dress, usually consisting of nothing more than a shirt, and sometimes they are almost naked.

The weapons used by those who trade with the English and French, are commonly a firelock, hatchet, and scalping-knife; but the others use bows, tomahawks, and pikes. As the commander in chief governs only by advice, and can neither reward nor punish, every private man may return home when he pleases, without assigning any reason for it, or any number may leave the main body, and carry on a private expedition in whatever manner they please, without being called to an account for it.

Every morning the commander harrangues his detachment, and gives his advice for the conduct of affairs during the day. If he wants to detach a party on any occasion, he proposes the affair, and gives his opinion how, and by what number, it should be performed; and it seldom happens that he is opposed in any of his measures. For so greatly are the Indians influenced by a sense of honour and love of their country, that upon these occasions they are in no need of penal laws to restrain them: but then it must be observed, that the qualifications necessary to recommend a person to the chief command, are his being fortunate, brave, and disinterested; and they cheerfully obey a person in whom they believe that all those qualifications are united.

When the Indians return from a successful campaign, they manage their march so as not to approach their village till towards the evening. They then send two or three forwards to acquaint their chief, and the whole village, with the most material circumstances of the campaign. At day-light next morning they give their prisoners new cloaths, adorn their heads with feathers, paint their faces with various colours, and put into their hands a white staff, tasseled round with the tails of deer. This being done, the war-captain sets up a cry, and gives as many yells as he has taken prisoners and scalps; and the whole village assemble at the water-side. As soon as the warriors appear, four or five of their young men, well clothed, get into a canoe, if they come by water, or otherwise march by land: the two first, carrying each a calumet, goes singing to search the prisoners, whom they lead in triumph to the cabin, where they are to receive their doom. The owner of this cabin has the power of determining their fate, though it is often left to some woman who has lost her husband, brother, or son, in the war; and when this is the case, she generally adopts him into the place of the deceased. The prisoner has victuals immediately given him, and while he is at this repast, a consultation is held; and if it be resolved to save his life, two young men untie him, and taking him by the hands, lead him to the cabin of the person into whose family he is to be adopted, and there he is received with all imaginable marks of kindness. He is treated as a friend, as a brother, or as a husband; and they soon love him with the same tenderness as if he stood in the one of those relations to them.

But if the sentence be death, how different their conduct! these people, who behave with such disinterested affection to each other, with such tenderness to those whom they adopt, here shew that they are truly savages; the dreadful sentence is no sooner passed, than the whole village set up the death-cry; and, as if there were no medium between the most generous friendship and the most inhuman cruelty, the execution of him whom they had hesitated whether he should not have a tender relation to them, is no longer deferred than they can make the necessary preparations for rioting in the most diabolical cruelty. They first strip him, and fixing two posts in

the ground, fasten to them two pieces from one to the other; one about two feet from the ground, the other about five or six feet higher: then obliging the unhappy victim to mount upon the lower cross piece, they tie his legs to it, a little asunder: his hands are extended and tied to the angles formed by the upper piece. In this posture they burn him all over the body, sometimes first daubing him with pitch. The whole village, men, women, and children, assemble round him, every one torturing him in what manner they please, each striving to exceed the other in cruelty, as long as he has life. But if none of the bye-standers are inclined to lengthen out his torments, he is either shot to death, or inclosed with dry bark, to which they set fire: they then leave him on the frame, and in the evening run from cabin to cabin, superstitiously striking with small twigs the furniture, walls, and roofs, to prevent his spirit from remaining there to take vengeance for the evils committed on his body. The remainder of the day and the night following is spent in rejoicing.

This is the most usual method of murdering their prisoners, but sometimes they fasten them to a single stake, and build a fire round them; at other times they cruelly mangle their limbs, cut off their fingers and toes, joint by joint, and at others scald them to death.

What is most extraordinary, if the sufferer be an Indian, there seems, during the whole time of his execution, a contest which shall exceed, they in inflicting the most horrid pains, or he in enduring them: not a groan, not a sigh, not a distortion of countenance escapes him, in the midst of his torments. It is even said, that he recounts his own exploits, informs them what cruelties he has inflicted upon their countrymen, and threatens them with the revenge that will attend his death: that he even reproaches them for their ignorance of the art of tormenting; points out methods of more exquisite torture, and more sensible parts of the body to be afflicted. But perhaps these instances of intrepidity are somewhat exaggerated. However, they frequently kill their prisoners on the spot where they have taken them; or in their way home, when they find it inconvenient to carry them farther, or have any fear of their escape.

These instances shew the inconsistencies to which human nature is subject, and the benefit these people would receive from a divine revelation, breathing an uniform humanity, and the forgiveness of their enemies; for had they these dispositions, and were they taught to treat their enemies in the manner our holy religion inspires, how consistent, how amiable, would be their character!

S E C T. VII.

Of NEW ENGLAND.

Its Situation, Extent, Climate, Vegetables, Beasts, Birds, Fishes, and Rivers; with a particular Description of Maize, or Indian Corn; and, among the Animals, of the Moose.

NEW ENGLAND, the most powerful colony in North America, is situated between the forty-first and forty-third degree fifty minutes north latitude, and between the sixty fourth degree forty minutes and the seventy-third degree west longitude; it being bounded on the north east and east by Nova Scotia and the bay of Fundy, on the north-west by Canada, on the west by the province of New York, on the south by the Sound, and on the south-east by the Atlantic ocean. Its extent from Kennebec river to the south-east boundary of New York, according to the late Rev. Mr. Neale, three hundred and thirty miles, from the south-west to the east-north-east is four hundred and eighty miles, and it is a hundred and ninety miles broad from Cape Cod to the north-east bounds of New York.

The summer-season is here warmer than ours, and generally accompanied for two months together with a clear sky, which renders the country extremely wholesome; so that none of our plantations are more agreeable to the constitutions of the English; yet the winters of New England are much severer than ours; and, though it lies considerably farther to the south, the frosts continue longer,

longer, and are much sharper than with us. The sun rises at Boston on the longest day at twenty-six minutes after four in the morning, and sets at thirty-four minutes after seven in the evening; and on their shortest day it rises at thirty-five minutes after seven in the morning, and sets at twenty-seven minutes after four in the afternoon: thus their longest day is about fifteen hours, and the shortest about nine.

The land next the sea is generally low, and in some parts marshy, but farther up it rises into hills, and on the north-east is rocky and mountainous.

The country abounds with mines of excellent iron, and some of copper; in the woods and swamps is plenty of good timber: oak, elm, ash, cypress, pine, chestnut, walnut, cedar, beach, aspen, and sassafras, are common here; as are also spruce and fir trees, which are of an extraordinary growth, producing pitch, tar, rosin, and turpentine, with masts, yards, and planks, as the oak does other ship-timber; so that more ships are said to have been built in this province than in all the other parts of America. The dwarf oak grows wild here. It likewise abounds with fruit-trees; so that it is easy for a planter to make a hundred hogheads of cyder in a season. They have besides as good hemp and flax as any in the Baltic; great plenty of roots, as turnips, parsnips, carrots, radishes, much larger and richer than ours, though their seeds came originally from hence; with a great quantity of onions, cucumbers, squashes, pompions, and water-melons.

When the English arrived here they found a variety of fruits that grew wild, particularly grapes, currants, raspberries, strawberries, &c. and Mr. Dudley, one of the council in New England, observes, that the peaches here are very large, all standards, and the fruit better than ours; and that they commonly bear in three years from the stone. They have likewise a great variety of plants different from those of England.

Nothing is so much planted here as Indian corn, which in some parts of America is called maize; it has an ear a span long, containing eight rows of grain, or more, according to the goodness of the soil, and about thirty grains in a row. It is of almost all colours, sometimes in the same field, and even in the same ear; but the white and yellow are the most common. The stalks grow six or seven feet high, are jointed like a cane, with long flags at every joint, yielding a juice like the sugar-cane, from whence a sweet syrup has been often extracted. Mr. Dudley says this corn generally produces twelve hundred, and often two thousand grains for one; that six quarts of grain will plant an acre; and that an acre of good soil commonly produces fifty bushels.

New England produces great plenty of beasts, both tame and wild: among the former are cows, sheep, goats, hogs, and horses, all originally brought from hence; but their horses are generally smaller than ours, though larger than the Welsh, and are extremely serviceable. Among the wild beasts are deer, elks, racoons, bears, wolves, which are only a kind of wild dogs, and if taken when young may be made tame; with ounces, foxes, hares, rabbits, squirrels, opossums, fables, beavers, otters, minks, and martens. One of the most singular animals of this and the neighbouring countries is the moose, of which there are two sorts; the common light-grey moose, which resembles the ordinary deer; these herd sometimes thirty together: and the large black moose, whose hair is ten or twelve inches long on the ridge of his back. Of this sort there are seldom more than four or five together. This is made much like a deer, as it parts the hoof, chews the cud, has no gall, and his ears are large and erect. A stag-moose is bigger than a large horse. The horns, when full grown, are about four or five feet from the head to the tip, and have shoots or branches to each horn, which generally spread about six feet. When the horns come out of the head they are round like those of an ox, but at about the distance of a foot begin to grow a palm broad, and farther up are still wider; and of these the Indians make good ladles that will hold a pint.

When this animal goes through a thicket, or under the boughs of a tree, he lays his horns back on his neck,

not only to place them out of his way, but to secure himself from being scratched in the woods; and these prodigious horns are shed every year. This animal does not spring or rise in going, like a deer; but a large one in his common walk has been seen to step over a gate five feet high. When a moose is unharboured he will run a course of twenty or thirty miles before he turns about or comes to a bay; but when chased he generally takes to the water. He is, however, not so swift as the common deer, though he runs much farther. As the moose is tall, and has a short neck, he does not graze like other cattle; for when he eats grass, it is only the top of that which grows very high, or on steep rising-grounds. These animals are fond of water-plants, for which they will wade far and deep. In summer they also feed upon other plants, herbs, and young shrubs; and in winter live upon the tops of bushes and young trees. The flesh of the moose is very good food; it is more substantial than common venison, and will bear salting. The nose is admired as a great dainty.

There is hardly any where greater plenty of fowls, as turkeys, geese, partridges, ducks, widgeons, dappers, swans, heath-cocks, herons, storks, black-birds, all sorts of barn-door fowl, vast flights of pigeons, which come and go at certain seasons of the year, cormorants, ravens, crows, bats, &c.

With respect to the disagreeable reptiles, there are rattle-snakes, frogs, and toads, which swarm in the uncleared part of the country, where, with the owls, they make a most hideous noise in the summer evenings. But wherever the country is planted by the English, it is pretty well freed from all noxious animals.

The sea and rivers afford a vast abundance of excellent fish, as sturgeon, salmon, cod, thornback, mackarel, herrings, lampreys, whales, grampuses, porpoises, seals, sharks, and other fish great and small. The best months for fishing are March, April, May, and June.

There are few countries better watered with springs, rivers, and lakes, though the latter are much smaller than those to the north and west. Of its rivers seven are navigable, these are the Thames, which rises from a lake to the north of Massachusetts's country, and running directly south falls into the sea below New London.

The river Patuxet, which rising in the north-west, runs south-east through Providence plantation, and falls into a noble bay of the sea, near Swansey. The river Piscataway, which runs from west to east, and falls into the sea near Portsmouth, in Hampshire, with a mouth that resembles an arm of the sea, and is capable of receiving the largest ships; the Casco river, which runs parallel with the former, and falls into a bay of its own name; Connecticut river; the great river Merrimac; and the river Saco, of which we shall give an account in treating of the rivers which flow from the White Mountains in the province of New Hampshire. To the east of these are many other considerable rivers, which rising far to the north, run almost due south, and fall into the sea to the north-east of Casco-bay.

It is owing to the conveniency of so many fine rivers that this country is so full of large and populous towns; and in the country between the rivers is such plenty of springs, that there is scarce any place where water may not be had by sinking a well to the depth of ten feet.

S E C T. VIII.

Of the Divisions of New England, and a particular Account of the Manner in which its first Settlements were formed.

THIS territory is divided into four distinct governments; the most northerly, which was formerly called the province of Main, and now the county of York, is under the jurisdiction of Massachusetts's-bay; next to this county, and between it and Massachusetts's-bay, is the province of New Hampshire; next to the bay government is the colony of Rhode Island; to the south and west of these is the colony of Connecticut. These several districts took their rise from the first settlement made by the English in this country, which was the

the colony of Plymouth, seated near Cape Cod, which now, as well as the province of Main, is incorporated into that of Massachusetts-bay.

It will not, therefore, be here improper to give some account of the settlement of this colony. In 1614 the North Virginia company employing captain John Smith and captain Thomas Hunt to fish on this coast, the former went on shore, took a particular view of the country of the Massachusetts, and had some skirmishes with the natives; after which he ordered Hunt to dispose of his fish, and then return to England; but Hunt treacherously enticing twenty-seven of the Indians on board his ship, set sail with them to Malaga, and had the villainy to sell them to the Spaniards for slaves, keeping only an Indian called Squanto. This outrage was so resented by the Indians, that all commerce between them became impracticable, and no thoughts were entertained of making any settlement there till a congregation of Brownists, or Independents, who had been persecuted in England, were obliged to fly to Holland, where they formed the design of seeking an establishment in the New World; and having, by means of interest, obtained the consent of king James I. contracted with some merchants for a settlement on the banks of Hudson's river.

This congregation sold their estates in order to make a common bank to carry on the undertaking; then hired a ship of one hundred and eighty tons, which they freighted with proper goods and merchandize, and the whole company, consisting of one hundred and twenty persons, with Mr. Robinson their minister, first returned to England, embarked on board their vessel on the sixth of September 1621, and fell in with Cape Cod in November following; and finding a safe harbour, fixed upon the place for their present settlement, called Plymouth from the place of their embarkation, which name it still retains; and as this was out of the limits for which they had obtained a grant, they associated themselves into a body politic, by a formal instrument; in which, having declared themselves the subjects of the crown of England, they solemnly engaged submission to the laws that should from time to time be made for the good of the country.

The planters who agreed to stay in this place were about one hundred, including women and children, and of these there were only nineteen families; but such were the fatigues endured by this infant colony during the first winter, that fifty persons out of the hundred died within the space of two months; and had the Indians attacked them, they had probably all perished.

The adventurers, however, saw none of the natives till the middle of March, when one of their chiefs came to them in a friendly manner, made them understand that they were welcome, and that his people would be glad to trade with them. The next day coming again with other Indians, he made them understand that Massassoiet, their sachem, had his residence three days march to the northward, and intended them a visit. He accordingly arrived a few days after, attended by sixty people; and being received by captain Standish, was conducted to a kind of throne prepared for him. His face was painted red, and smeared with oil; he had a deer-skin mantle; his breeches and stockings, which were of a piece, were of the same materials, and his arms were covered with wild-cats skins. His attendants were dressed in the same manner, and there appeared little distinction between him and his followers. This chief had not been long seated when Mr. John Carver, whom they had chosen governor, came in with a guard of musketeers; upon which Massassoiet rose up and kissed him, and then both sitting down, an entertainment was provided, of which no part appeared more acceptable to the sachem than the brandy, of which he drank very plentifully.

In the retinue of this chief was Squanto, who had been carried to England by Hunt, where he had been treated kindly; and, after living here several years, had been brought back to his country. He had entertained an affection for the English, and from his favourable representation the sachem had made them this visit, in which, by his means, was concluded an offensive and defensive alliance; which being founded upon the mutual interests of the contracting parties, was inviolably maintained for many years.

This infant colony was annually reinforced by fresh adventurers from the mother country, driven thither by the spirit of persecution; so that by the year 1628 their number and improvements were considerable; and that year they obtained a grant from the North Virginia company of this colony, and another of all the lands within three miles north of Merrimac river to three miles south of Charles river, where it falls into the sea at the bottom of Massachusetts-bay: and the next year six ships with three hundred and fifty passengers arrived at Salem, with a large stock of cattle of all sorts; and other necessaries.

This new colony, which settled the town called Salem, was supported with the same spirit and vigour as the former, and soon after obtained a patent from king Charles I. whereby they were incorporated by the name of the governor and company of Massachusetts-bay, and were empowered to make laws for the good of the plantation not repugnant to those of England; and liberty of conscience being granted to all who would settle there, great numbers of those who could not obtain that privilege in England went over, and in a little time new settlements were made, particularly one styled Charles Town, on the south side of Charles river, and that of Dorchester, at the bottom of Massachusetts-bay. Soon after part of the inhabitants of Charles Town, passing over to the opposite shore, erected Boston, the present capital of New England.

In the mean while those who had strenuously contended for liberty of conscience in favour of themselves, became actuated with that spirit of persecution which had driven them from their native country, and Mr. Roger Williams, a minister of Salem, advancing some religious sentiments contrary to those which had been generally received, and refusing to recant, these people were so void of charity as to expel the minister and his followers from Massachusetts colony: upon which they built a new town, which they called Providence, upon Newport river, near Rhode Island.

Hitherto they had not been in the least molested by the Indians, but now a nation called the Pequots, who lived on Connecticut river, committed some murders; on which it was considered, that a town and fort on Connecticut river would make a good frontier on that side. Agents were therefore sent to view the country, who made such an advantageous report of the fertility of the soil, and the largeness of the river, as induced many of the planters in several of the towns, where they were streightened for room, to remove thither. Mr. Hooper put himself at the head of about a hundred of these new adventurers, who set out in the month of July, and travelling on foot with their children and baggage, they arrived at the banks of the river, where they began a town which they called Hartford. After these came another draught, who built a little town which they called Windsor; a third detachment built Weathersfield; and a fourth Springfield.

In 1635 no less than twenty sail loaded with goods and passengers arrived at Boston, with whom came Mr. Henry Vane, afterwards Sir Henry Vane, intending with these people to begin another settlement on Connecticut river; but being chosen governor the year ensuing for the Massachusetts, he laid aside the design of beginning a new colony for the present; but the next year he being inclined to favour the Baptists, they left him out, and chose their old governor Mr. Winthrop. Upon which it was thought expedient for both parties to make a settlement upon Connecticut river, and towns were accordingly built on both sides of it; but this being out of the limits of the other colonies, they formed themselves into a separate government, and for that purpose obtained a charter from king Charles II. authorizing them to elect their own governor, council, and magistrates; and to enact such laws as should be most advantageous to the colony, provided they were not opposite to those of England.

The persecution of the Protestant dissenters in England still continuing, great numbers of people removed to New England; and the old colonies being over-stocked, there was an absolute necessity of forming new plantations; and therefore, in 1637, Theophilus Eaton, Esq; and the Rev. Mr. Davenport, finding there was not room

at Massachusset's-bay, purchased from the Indians the lands lying on the sea-coast between Connecticut river and Hudson's river, where they built a town, and named it New Haven, from whence the colony derived the name of the New Haven colony.

While the south-west parts of New England were thus filling with inhabitants, others, induced by the profits arising from the fur-trade, settled to the north-east between the rivers Merrimac and Kennebec, forming two distinct colonies, one named New Hampshire, and the other, still farther to the eastward, was called the province of Main.

Thus in the space of about twenty years New England had above forty towns, and the English had taken possession of this country from the river Kennebec on the north-east almost to Hudson's river on the south-west, an extent of upwards of four hundred miles on the sea-coast. Such was the first rise and origin of the New England colonies, which, from these small beginnings, are now become rich and of great importance.

SECT. IX.

Of the Province of Massachusset's-Bay ; its Situation, Extent, Soil, Produce, and Government ; with a Description of the Towns of Boston and Cambridge.

THE province of Massachusset's-bay contains what were formerly the colonies of Plymouth, Massachusset's-bay, and the county of York ; the latter of which is separated from the others by New Hampshire, which runs in between them, and is about thirty miles wide upon the sea. That part of this province called the province of Main, or county of York, is bounded on the westward by New Hampshire ; on the northward by Canada ; on the north-eastward by Nova Scotia ; on the south-eastward and southward by the sea for near two hundred miles. The other part of this province is bounded on the north by New Hampshire ; on the east and south by the sea ; on the south and west by the colonies of Rhode Island, Connecticut, and the province of New York.

That part of the province called the county of York has a very cold soil, great part of it towards Canada being mountainous, and entirely unfit for agriculture ; and that towards the sea-coast is low, covered with spruce, white and yellow pines, and some oaks, except near the banks of the many rivers which fall from the mountains, on which a great number of saw-mills are erected ; and on their banks is plenty of oak, ash, and maple. There are several safe and convenient harbours along the sea-coast, the principal of which is Casco-bay. This part of the province is well stored with wild game, and from it are exported considerable quantities of furs and skins.

The other part of the province has a variety of soil, it being in some places very barren, and in others extremely fertile, producing great quantities of Indian corn, rye, oats, barley, peas, flax, and on the western parts wheat. The surface is generally rocky and uneven, except near the rivers, where are some pleasant fields. Several fisheries are carried on to great advantage from the sea-coasts of this province to the banks of Newfoundland, the isle of Sable, &c. especially from the town of Marblehead, where is the most considerable fishery in New England.

His Britannic majesty appoints the governor, lieutenant-governor, secretary, and officers of the admiralty in this province ; and the freeholders elect a house of representatives, who choose a speaker and council, or upper house. However, the governor can put a negative on their choice ; yet both he and all the officers in the province, except the comptroller of his majesty's customs, receive their salaries by a vote of the two houses, who have never yet been persuaded to settle a salary even upon the governor, who has it generally in his instructions from the king to insist upon their doing it. They, however, commonly grant him one thousand pounds sterling per annum.

The established religion is that of the Independents ; but there are a number of churches of the episcopal per-

suasion. Great care is taken of the education of children, free-schools being established and supported by law in most of their towns, which are generally supplied with able masters ; and at Cambridge, about six miles from Boston, is an university, or public seminary.

This colony is divided into several counties : thus in the division stiled New Plymouth are the county of Bristol, the county of Plymouth, and the Barnstable county. In Massachusset Proper are the counties of Suffolk, Middlesex, and Essex ; to which must be added the county of York, already mentioned, and in each of these counties are several considerable towns.

Boston, the capital of this province, is seated in the county of Suffolk, in the province of Massachusset's-Proper, in the forty-second degree twenty-one minutes north latitude, and in the seventy-first degree west longitude, at the bottom of a fine bay in a peninsula about four miles in circumference. At the entrance of this bay are several rocks, which appear above water, and upwards of a dozen small islands, some of which are inhabited. There is but one safe channel to approach the harbour, and that so narrow that two ships can scarce sail through a-breast ; but within the harbour there is room for five hundred sail to lie at anchor. The entrance is defended by the castle of Fort William, one of the finest pieces of military architecture in British America, it being surrounded by a covert-way, and joined by two lines of communication from the main guard to a redoubt. The castle is defended by a hundred guns, twenty of which lie on a platform level with the water ; so that it is scarce possible for an enemy to pass the castle. To prevent surprize, they have a guard placed on one of the rocks at about two leagues distance, from whence they make signals to the castle, when any ships come near it. There is also a battery of great guns at each end of the town, to the fire of which an enemy would be exposed, if he should be so fortunate as to pass the castle. At the bottom of the bay is a pier near two thousand feet in length, with ware-houses for the merchants on the north side ; and to this pier ships of the greatest burthen may come and unload, without the help of boats. The greatest part of the town lies round the harbour in the form of a crescent ; the country beyond it rising gradually, and affording a delightful prospect from the sea. The town has several streets little inferior to the best in London, the chief of which runs from the pier up to the town-house, a handsome building, with walks for the merchants, as in the Royal Exchange in London ; and in this edifice are not only the courts of justice, but the council-chamber and the house of representatives. The town contains between four and five thousand houses, which are in general well built ; and several of the public structures are very spacious and elegant. It has seventeen churches, or places appropriated to Divine worship. The episcopal church is handsomely built and adorned, and the congregation is said to amount to about a thousand. The church-furniture, and some pieces of plate, were given by king William and queen Mary ; it has an organ, and there is a magnificent seat for the governor, when he happens to be of the church of England. The governor has also a very fine house. Among the other buildings is Fanniuel-hall, thus named from Mr. Fanniuel, who was its founder. The shipping of this port was some years ago computed at between six and seven hundred. The inhabitants of the town amount to about twenty-five thousand, and there is said to be two hundred thousand in the province.

Cambridge, the principal town of the county of Middlesex, in this province, is seated on the north branch of Charles river, six miles to the north-west of Boston, and has several fine houses and good streets. It was originally called New Town, but on founding the university changed its name to Cambridge, and contains two spacious colleges, called by the names of Haverford-college and Stoughton-hall, with a public library, said to be the best furnished with books of any in that part of the world. It consists of a president, five fellows, and a treasurer. The governor of the province, deputy-governor, and all the magistrates of the Massachusset's colony, with the ministers of six neighbouring towns for the time being, are visitors. This university never conferred any degree

above that of master of arts, till it obtained a new charter from king William and queen Mary, by which it had the power of creating doctors of divinity; but has seldom made use of it.

S E C T. X.

Of the Province of New Hampshire; its Situation, Extent, Soil, and a particular Description of the White Mountains, and the Rivers that flow from them: its Produce, Government, and a Description of the Town of Portsmouth.

THE province of New Hampshire is bounded on the south by Massachusetts-bay, on the west by the province of New York, on the north by Canada, and on the north-east by the county of York, having only thirty miles of sea-coast.

The soil is various, and the northerly parts of it are mountainous and barren. The most considerable mountains in this province, and indeed of all the British dominions near the coast, are called the White Mountains, from their appearing like snow, they being generally supposed to consist of a white flint, from which the reflection of the sun is very brilliant and dazzling. From their prodigious height they are to be seen at a very great distance, and it is not certain that any person was ever on the top of them. Major Rogers says, that he has often been told by the Indians that they have frequently attempted them in vain, on account of the change of air they met with; which, he says, he is inclined to believe, he having ascended them himself till the alteration of air was very perceptible, though he had not advanced half way up, and yet the valleys below were concealed from his view by the clouds. The basis of these mountains is a tract about fifty-five miles square, from which they rise in craggy heads one above another, in an irregular manner all the way to the top. For the first four or five miles as you ascend them you find beech, hemlock, and some white pines; higher up the growth is chiefly black spruce for six or seven miles, then the sides are cloathed with a white moss; and if you advance still farther, you find scarce any thing growing, which alone would render the ascent very difficult, the mountain being extremely steep.

Many streams of water gush out of the sides of these mountains, which run down with great rapidity. Indeed the largest and best rivers in New England rise from some part of them. Saco river rises from the south in several small rivulets, which join in the course of a few miles, and run through the county of York, falling into the sea between Cape Porpoise and Cape Elizabeth. On the banks of this river are some fine meadows and fields, which are annually overflowed when the snows melt, and thereby greatly enriched. The rivulets that break out from the south-west of the mountains, after various windings, fall into a lake called Winnipisiokee, out of which issues the river Merrimac, which, from the waters that join it, soon becomes a considerable stream. Upon it are several vales, overflowed and enriched like the former. This river runs through the province of New Hampshire, and part of the Massachusetts, discharging itself into the sea between Salisbury and Newbery. From the north and west parts of these mountains rises Connecticut river, which runs to the southward across the provinces of New Hampshire, the Massachusetts, and Connecticut, till, after running a course of at least two hundred miles, it empties itself into the sea, or sound, between Connecticut and Long Island. This river, like the others, annually overflows its banks, and enriches the adjacent fields, which in some places are very extensive, particularly through a tract called the Cohas, in New Hampshire, twenty miles in length, and six in breadth, which for its fertility and beauty may be stiled the garden of New England. The river Kennebec, which is a considerable stream, likewise rises on the east side of these mountains, running through the county of York, and is endowed with the same properties as the former. Another river rising from the north of them runs into the province of Quebec, and falls into the river St. Lawrence. A part of the river Shedoir also rises at these

mountains, and joins the river St. Lawrence twelve miles above Quebec.

In the province of New Hampshire are raised great quantities of Indian corn, rye, oats, and peas, it being too cold for wheat. It likewise produces some hemp and flax. It has great plenty and variety of timber, and its forests abound with all kinds of game common to the climate. There are here likewise bred black cattle, horses, sheep, &c. but in no great abundance. Its rivers abound in salmon, shad, trout, eels, &c. Some fisheries are carried on in the sea-ports; but its scanty limits on the sea prevents the inhabitants engaging so considerably in the fishery as their neighbours.

The governor, lieutenant-governor, council, and secretary, with the officers of the admiralty in this province, are appointed by his majesty, who is absolute sovereign of the soil. The several towns and districts choose their representatives; but all the inferior officers of the executive power are appointed by the governor, with the advice of the council.

The religion of this province is the same as in Massachusetts-bay, and there is only one episcopal church erected, which is at Portsmouth.

The town of Portsmouth, the metropolis of the province, contains about seven hundred dwelling-houses, and is pleasantly seated on Piscataqua-bay, having a safe and convenient harbour, where the largest ships may ride securely, and five places of religious worship. Here the courts of justice are held; but as this is the only place where causes are tried in this province, and it is seated on one of its extremities, the inhabitants are sometimes obliged to travel a hundred and fifty or two hundred miles on any trifling occasion. From this port annually sail about two hundred vessels, loaded chiefly with timber, pipe-staves, fish, &c. for the West Indies; which having disposed of, they load there, and proceed from thence to Europe, where they sell both their vessels and cargoes, and the mariners return passengers.

The other principal towns for trade in this province are Hampton, Cochecha, Exeter, and Londonderry, an inland town about thirty-five miles from Portsmouth, which is chiefly peopled with the natives of Ireland, and has a considerable manufacture of linen. The number of inhabitants in this province amounts to about seventy thousand; these have been greatly increased since the entire reduction of Canada, settlements being annually begun and new towns formed where formerly they did not dare to attempt it, for fear of the Indians.

S E C T. XI.

Of the Colony of Connecticut; its Situation, Extent, Produce, Trade, and Government.

THE colony of Connecticut contains not only the original colony of the same name, but that of New Haven, they being incorporated into one in 1692, and still retains, by the charter then granted them, all the privileges of their ancient charters; but ever since their union they have kept up two seats of government, namely, at Hartford and New Haven, at which places their general court, or assembly, sits alternately for transacting the affairs of the colony. It is bounded on the north by the Massachusetts, on the east by Rhode Island and a part of Massachusetts-bay, on the south by the Sound, and on the west by New York, extending in length from Stoniton to Rye, in the borders of New York, about a hundred miles, and in breadth from Saybrook to the borders of New Hampshire about seventy.

The soil of this colony is various, a great deal of it being uneven, rocky, cold, and barren; but in other parts it is fertile and exceeding pleasant, particularly on Connecticut river, where the fields produce all kinds of grain and fruit common to the climate in great abundance, seldom disappointing, and frequently exceeding the hopes of the husbandman. In this colony are bred great numbers of black cattle, horses, and swine; and the inhabitants raise a considerable quantity of flax and hemp. A town called Weathersfield, seated on the river Connecticut, is remarkable for the production of onions,

onions, with which it annually loads several vessels to the neighbouring provinces.

The inhabitants of this colony carry on a very considerable trade to foreign parts, they being chiefly supplied with foreign commodities from Boston and New York; in exchange for which they send beef, pork, flaxseed, onions, &c. In this colony are some iron works, which are carried on to great advantage; and they ship some horses and lumber to the West Indies, with considerable quantities of saffrafras to England and Holland.

The inhabitants of this province have the privilege of annually choosing their own governor, lieutenant-governor, assistants, and representatives, by whom all executive officers are appointed and authorized. They generally allow their governor a very handsome salary, and have good funds for other public exigencies.

The religious persuasions here are the same as in the other New England governments, but there are more people of the church of England than in all the others. Particular care is here taken in the education of their children; the several towns being provided with schools, supplied with able masters.

This colony has many fine towns, agreeably seated on the river Connecticut and along the Sound, the principal of which for trade and commerce are New London, Hartford, and New Haven: the latter is seated on New Haven-bay, and is elegantly laid out in regular streets, having a beautiful parade in the center. It contains about two hundred dwelling-houses, besides public buildings, among which is a college that makes a very handsome appearance.

The number of inhabitants in this colony is supposed to amount to no less than two hundred and ten thousand.

SECT. XII.

Of the Colony of Rhode Island; its Situation, Soil, Produce, Government, and Trade.

THIS colony contains only Rhode Island and Providence, which were united by charter about the same time as the colony of Connecticut, and like that the inhabitants retain the rights and privileges at first granted them in their separate state, having also two seats of government at Newport and Providence, where their general court is alternately held. This colony has but a small territory, it lying somewhat in the form of a heart, and is bounded on the north and east by Massachusetts-bay, to the southward by the ocean, and to the westward by Connecticut.

The climate of Rhode Island is much more favourable than that of Boston, though it only lies about sixty-five miles to the south of that city: it being much warmer in the winter, and being surrounded by the sea, is less affected in the summer with hot land breezes than the places on the opposite continent.

The soil is generally low, rocky, and stony; yet, when properly improved, produces Indian corn, rye, oats, peas, hemp, flax, and some wheat; with most kinds of fruit common to the climate in great perfection, especially on Rhode Island, which for its beauty and fertility is much admired, it being exceeded perhaps by no spot in New England. They raise cattle, sheep, and horses in abundance, and the latter is esteemed the best on the continent. They likewise make considerable quantities of butter and cheese.

The form of government is in every respect the same as in the colony of Connecticut; and the number of the inhabitants are computed to amount to seventy thousand.

Liberty of conscience is here granted in the fullest extent, but the greatest number of people here are Quakers. Here is so little bigotry, that every man is left to think and act for himself; and, while he observes a good moral conduct, no body give themselves any trouble about his religious principles, for which he is only accountable to God. There are here also a pretty many Jews. The education of children is, however, said to be not much attended to, there being not one free-school in the whole colony.

The principal towns are Newport, which is pleasantly seated on Rhode Island, and has a safe and good harbour for ships of a moderate burthen, with its entrance defended by a fort, on which are planted three hundred guns; and Providence, which is also delightfully seated on a river of the same name, and is a thriving town, with a considerable trade.

The chief commodities exported from hence are horses, sheep, cheese, and the produce they procure from the neighbouring provinces, as lumber and fish from the Massachusetts and New Hampshire; beef, pork, and flour from Connecticut, New York, and Philadelphia, which they commonly pay for in rum, sugar, and molasses imported from the West Indies. They are charged with carrying on an illicit trade with our enemies in time of war, by carrying beef, pork, and flour to the French islands; but this is no more than has been performed by the merchants of Great Britain.

We shall conclude this account of New England with giving a cursory view of the commerce of that province in general, which extends over a great part of America and Europe. From thence our sugar-colonies are furnished with fish, cattle, dried beef, bacon, boards, hoops, pipe-staves, bark, skins, butter, cheese, oil, tobacco, corn, apples, turpentine, &c. and that in such vast abundance, that it is computed the island of Barbadoes alone takes off to the value of two hundred thousand pounds every year. They deal with the other sugar-colonies; sometimes with the French; largely with the Spaniards, and ship off prodigious quantities of fish to Italy, Spain, and Portugal. They take from us all kind of mercery goods, linen and woollen cloths, stuffs, stockings, shoes, sail-cloth, cordage, haberdashery-ware, vessels of tin and copper, hardware, and a vast quantity of other things: in return, they build a prodigious number of ships for our merchants, and export to England a great deal of iron, and a vast quantity of masts, planks, and yards for the royal navy; and also pitch, tar, turpentine, skins, furs, oil, whale fins, logwood, saffrafras, and other commodities.

SECT. XIII.

Of NEW YORK.

Its Situation, Climate, Soil, Produce, and Rivers. A Description of Long Island, and several other Islands within this Province; with a concise Account of the City of New York, its Trade, Government, and History.

NEW York is situated between the fortieth and forty-fourth degree of north latitude, and between the seventieth and seventy-sixth degree of west longitude, it being bounded on the east by New England, on the north by Canada, on the north-west and west by part of Pennsylvania and the lands of the Five Nations, and on the south and south-west by the province of New Jersey and the Atlantic ocean; extending two hundred miles in length from north to south, but not above twenty-five in breadth, particularly between Connecticut colony and Jersey.

As this country lies to the south of New England, the climate is more temperate; the soil is generally pleasant and fertile, producing in great abundance all sorts of grain and fruit common to the climate, particularly wheat, one bushel of which is said to have produced here an hundred. The many fine, large plains on the banks of its extended rivers are remarkably fruitful.

The principal river of New York is Hudson's river, which rises within twenty or thirty miles of Lake Champlain, and runs south for about fifty or sixty miles, crossing in its way some lakes, the most considerable of which is at Scanderoon; then bends more easterly to the Carrying-place, where is Fort Edward, and then southward till it discharges itself into the sea at New York, or Sandy-hook. This river is navigable for vessels of one hundred tons as high as Albany, and shallops may go up eight or ten miles higher.

The next considerable river of this province is the Mohawk river, which rises in the Mohawk country, and

is navigable, except where there are some falls, for large boats, upwards of an hundred miles: it runs easterly, and has on its banks many fine plains, particularly that called the German-flats, from its being settled by the Germans, and extends along the river fifty miles in length, and about two in breadth. This tract is exceeded by none in America, it being easily cultivated, and producing, in the greatest abundance, wheat, barley, peas, hemp, and flax. This river discharges itself by several mouths, called the Spouts, into Hudson's river, about eight miles above Albany; and about two miles above its confluence with that river it has a cataract, where the whole stream falls perpendicularly about seventy feet. This part of the province abounds with saw-mills, it having plenty of timber.

These rivers abound in great plenty of fish; and in this part of the province are several excellent iron works, some of which are said to manufacture the best iron in America.

There are very fine lands upon the East river, or Sound, though it is very rocky, as indeed are most of the high lands of this province on the continent; these being mountainous, and at present hard to cultivate; but afterwards they richly reward the labour of the husbandman. There are likewise several pleasant and fruitful islands belonging to this province, among which Long Island is the most worthy of notice.

Long Island is about a hundred and fifty miles in length, and in some places twenty, but generally about twelve miles broad; the middle of it is indeed somewhat barren, but both ends have most excellent soil, which perhaps is improved to as great advantage as any lands in America; producing corn and fruit to great perfection, and abounding in horses, cows, sheep, and swine, more than any other part of the province. It is even said that the produce of some single acres at the west end, which is conveniently situated for the market of New York, annually amounts to near a hundred pounds sterling. In the midst of the island is a celebrated plain sixteen miles long, and four broad, to which they have given the name of Salisbury-plain, from its having as fine turf as that of Salisbury-plain in England. As there is an excellent breed of horses in the island, they have races here every season, to which the gentlemen of New England and New York resort, as people do here to Newmarket.

There are indeed several other islands belonging to the province not at all inferior to this in pleasantness and fertility of soil, though they are of much less extent, as Staten, or Streighten Island, which is opposite to the west end of Long Island, and forms the narrows or streights through which ships pass that are bound to or from the sea to New York: Fisher's Island lies in the Sound between Long Island and the colony of Connecticut; and Manahattan, upon which the city of New York is built: there are several others both in the bay and Sound, one of which, called Barn Island, about twenty-five miles from New York, has lately obtained a charter for erecting a city.

This province is divided into ten counties, which, proceeding from north to south down Hudson's river, lie in the following order; Albany, Ulster, Dutchess, Orange, King's-county, Chester, New York, Queen's-county, Suffolk, and Richmond counties, which abound in farms, but have not many great towns: the principal are the city of New York, Schenectada; Albany, and West Chester.

New York is extremely well situated for trade, it having a safe and commodious harbour, accessible three different ways for ships of common burthen, namely, by way of the Sound, by the streights between Long Island and Staten Island, which is the most usual and easy entrance, and between Staten Island and the shore of Jersey. There are also easy conveyances to it by water from the rivers and lakes, except a few carrying-places, both to Montreal and Quebec on the northward, and to the lakes Erie and Ontario on the westward, for six hundred miles; and upon the sea it has not only the advantage of its coasts, but also of Connecticut and the Jerseys, their trade in a great measure centering here, where they exchange their several commodities for foreign goods.

This city is seated in the fortieth degree forty minute north latitude, and the forty-seventh degree four minutes west longitude, at the south end of York county, in an island at the mouth of Hudson's river, about fourteen miles long, and three broad. It stands upon an eminence, and contains between two and three thousand houses, generally pretty well built with brick and stone; but the streets are very irregular, defended by a wall and fort, which are formed so as to answer the purposes both of ornament and defence. It has several spacious public buildings, among which the college; the court-house, and the governor's house within the fort, are the most considerable. Hence there is scarce any town in North America that makes a better appearance. Public worship is every Sunday performed in different churches in the English, the German, the Dutch, and French languages. There are two handsome churches belonging to those of the church of England, with others belonging to the Swedes of the Lutheran persuasion, to the Dutch Calvinists, to the French refugees, and the English dissenters; the Jews have also a synagogue.

The city is governed by a mayor and aldermen, and abounds with wealthy merchants, who trade very largely to foreign parts, and are observed to deal very much upon honour. The trade from New York to the sugar islands is very considerable, and consists in corn, flour, beef, pork, bacon, smoked beef, peas, apples, onions, staves, plank; and to England flax-seed, pig and bar iron, with some copper. Of late great encouragement is given to several manufactories, especially that of hemp, the raising of which is encouraged by a bounty given by the province; and in the city of New York a society is formed to consult methods for promoting the various branches of trade and husbandry, and the manufacturing of iron, wool, linen, &c. considerable premiums being allowed to such as excel in these branches, which has doubtless a tendency to preserve the credit of this province, to enrich the inhabitants by increasing their exports, and to render them less dependent on other countries.

The next considerable place in this province is Albany, which is seated on the west side of Hudson's river, a hundred and fifty miles to the north of New York city, and has a fort erected for its defence. It contains near four hundred houses, and here the chiefs of the Five Nations used to meet the governors of the northern colonies.

The number of inhabitants in the whole province amounts to about a hundred and fifty thousand.

His majesty is absolute sovereign of the soil of this province, and appoints the governor, lieutenant-governor, secretary, and council; but the freeholders of the several counties elect their own representatives, in order to form a legislative body with the others. The cities of New York and Albany have likewise by their charters the privilege of making bye-laws for themselves, provided they are neither inconsistent with the laws of the province, nor of those of England. These bye-laws are enacted by the mayor, aldermen, and common-council of the respective cities; annually elected by the freemen of each; these also form a court of judicature, called the mayor's court.

The religious persuasions in this province are pretty numerous, there being Episcopalians, Lutherans, Baptists, Presbyterians, Moravians, Quakers, and Jews, who perform religious worship here in different languages. Learning has lately been much encouraged in this province, in which is established a college under the government of a president, professors, and tutors. It has also a good library, and both the city and country in general are well furnished with schools.

The English have a double right to this province by discovery and conquest. The coast was first viewed by Sebastian Cabot, and in the reign of queen Elizabeth it was considered as a part of the province of Virginia. Afterwards, in 1608, that famous navigator Hudson discovered the river that bears his name, with the adjacent country, which he afterwards, without any legal authority, sold to the Dutch, who found some Swedes settled here; and being reinforced from Holland, soon became the strongest party, and obliged the Swedes to acknowledge them as the sole proprietors of the country, paying

no regard to the claim of the English, who had not only discovered, but traded to it before. They were, however, soon after dispossessed by captain Argall, who was sent for that purpose with a proper force by the Virginia company. Upon this the Dutch West India company begged permission of king James I. for some of their people to settle in the country, pretending it's being convenient for their ships to call at for refreshment in their passage to and from the Brasils, which then belonged to them.

The king granted their request, upon condition that the people who settled there should acknowledge themselves subjects of the king of England. This they did for some years; but taking advantage of the troubles that arose in the reign of king Charles I. the states of Holland gave their West India company a formal grant of the country, and under this grant they appointed governors, erected forts, and called it Nova Belgia, or the New Netherlands, and afterwards refused to pay to king Charles II. the sum they had paid to his father and grandfather for leave to fish on the coast of Great Britain. This did not occasion an immediate rupture; but soon after king Charles II. made a grant of what is now the province of New York, New Jersey, and Pennsylvania, to his brother James, duke of York, who, in 1664, sent a fleet under the command of Sir Robert Carr, with a sufficient number of land-forces, to take possession of the country, who soon reduced the forts the Dutch had erected there, and obliged them either to become British subjects, or to leave the country. The people gladly accepted of the former, and hence many of the best families in New York appear by their names to be of Dutch extraction. Hence New Amsterdam, which was made the metropolis, had its name changed to that of New York, in honour of the proprietor's title; and from the name of the city the whole province received the same appellation. Orange-fort also received the name of Albany from the duke's other title.

Sir Robert having thus subdued the country, took with him the greatest part of the land-forces, leaving colonel Nichols governor; and as the States General seemed to give up all pretences to it, many people removed thither from England; whence it soon became a very flourishing colony, Mr. Nichols making it one of his first studies to enter into a treaty of peace with the Five Nations of the Indians, who have ever since continued faithful allies, and been of great service to this province.

In the year 1673, when a war broke out between England and the States General, the Dutch sending a fleet, reduced this colony to their obedience; but they kept possession of it only a short time, for it was ceded to the crown of Great Britain by the treaty concluded the next year. Ever since that time it has been under the English government, and the people have shewed themselves peaceable and obedient subjects, ready upon all occasions to exert themselves in defence of the rights of Great Britain, particularly in opposing and repelling the encroachments of the French settled in Canada, with whom they have had various engagements, in which they were always assisted by the Mohawks, with three hundred of whom, and the same number of English, colonel Schyler, in the reign of William III. obtained a complete victory, near the river St. Lawrence, over seven hundred French regulars, and an equal number of Huron Indians, commanded by the governor of Quebec. The same brave officer repulsed them again in 1716, and destroyed a fort they had erected near the lake of Onondago, in order to cut off their communication with Lake Ontario. Soon after our fort at Oswego was erected, where has since been carried on the greatest Indian trade of any in America.

SECT. XIV.

Of NEW JERSEY.

Its Situation, Extent, Produce, and Exports; its Sub-divisions; a particular Description of Perth Amboy, and Burlington; and a concise History of the Province.

THE entire province containing the two Jerseys, is seated between New York and Pennsylvania, in a

triangular form; it being bounded on the north by Hudson's river, which separates it from the province of New York; on the east by the Atlantic ocean, which washes its coast, from the mouth of Hudson's river to the mouth of Delaware river; and on the southward and westward by Pennsylvania. It lies between the thirty-ninth and fortieth degree north latitude, extending in length, on the sea-coast and also along Hudson's river, above an hundred and twenty miles, and sixty in breadth from east to west.

The soil of this province is very uniform, and produces wheat and all other kinds of English corn: it likewise abounds in all sorts of fruit proper to the climate, and is said to produce the best cyder of any place on the continent. The timber is tall, and the oaks are esteemed for ship-building. It abounds in streams of water, which afford great convenience for mills, furnaces, and any other kind of water-works; and as it affords great quantities of iron, it has several furnaces and iron-works, besides one flitting-mill. This province is also supposed to be rich in silver and copper ore, some of both kinds having been found in several parts; and one copper-mine in particular is worked to great advantage, several fine estates having been obtained from it.

The lands in this province are chiefly taken up and improved; so that they have but little wild game of any kind.

There are no remarkable rivers that extend far into the province; that named Passaic, which discharges itself into the sea to the northward of it, has a remarkable cataract about twenty miles from its mouth, where the river falls, like the cataract on Hudson's river, from a perpendicular rock about seventy or eighty feet.

This province has a considerable disadvantage, which prevents the inhabitants thriving so much as might be expected from the goodness and fertility of its soil, and their making those improvements of which the country is capable. This is the great uncertainty of their titles, and the continual disputes and law-suits which on this account arise among the inhabitants; hence it is said, that no people here grow rich so fast as the gentlemen of the law. Besides, the inhabitants suffer the same fate from Philadelphia and New York, that those of the colony of Connecticut do from New York and Boston; for as they have no considerable foreign trade of their own, they exchange their commodities at those two places for foreign goods, and consequently give them the profit which they might enjoy among themselves.

The principal exports of the Jerseys are wheat, flour, timber, copper ore, pig and bar iron, and black cattle, which they drive in great numbers to Philadelphia, on whose rich pastures they are generally grazed for some time, before they are sent to market and killed.

This province has the same form of government as that of New York, and the religious persuasions are no less numerous. Here is likewise a college founded at Prince-town, about thirty miles from the city of Philadelphia, much resorted to by the young gentlemen of this and the neighbouring provinces.

This province contains East and West Jersey; the former of which is the largest and best inhabited, and is divided into Bergen-county, Essex, and Middlesex, on the south side of the river Raritan, and Monmouth-county on the south. West Jersey contains the same number of counties, which are Burlington, Gloucester, Salem, and Cape Mary. These were originally two provinces, and in the hands of different proprietors; but, on the twenty-second of April, 1702, the proprietors made an assignment of their rights to the crown.

The chief towns in the Jerseys are,

Perth Amboy, the capital of the county of Middlesex, in East Jersey, which is pleasantly seated at the mouth of the river Raritan, and is so commodiously situated for trade, that ships of three hundred tons may come up in one tide and lie before the merchants doors.

Burlington, the capital of the county of the same name, and of all West Jersey, is seated on an island in the middle of the river Delaware, to the northward of Philadelphia, in Pennsylvania. The houses are handsomely built with brick, and laid out into spacious streets, with

with commodious quays and wharfs, to which ships of two or three hundred tons may come up. It has likewise a handsome market-place, a town-house where the courts of justice were formerly held, and two good bridges over the river, one called London-bridge, and the other York-bridge. It has likewise an easy communication both with Philadelphia and the ocean, by means of the river Salem, which falls into Delaware-bay; but though these places have the privileges of a city, they are neither remarkable for the number of their inhabitants nor the greatness of their trade.

This province, like that of New York, was first settled by the Swedes, who had three towns here, named Christina, Elsinburg, and Gottenburg: they, however, made but little progress in their plantations; while the Dutch, who had settled in the northern part, had greatly the advantage, for this country they included under the name of Nova Belgia. It was also contained in the grant made by king Charles to his brother James in 1663, who the following year made a grant of that part now called New Jersey to lord Berkley and Sir George Carteret. These two proprietors sent Philip Carteret, Esq; as governor; and the lands being granted to the settlers for six or seven years free of quit-rents, induced many of the Dissenters of England to settle in the country: thus the inhabitants being a mixture of Swedes, Dutch, and English, were far from agreeing about the form of government, but continued to behave within some bounds, while they were excused paying quit-rents; but when that indulgence was no longer allowed them, and they became considerably in arrears, the proprietors no sooner insisted on their payment than they broke into open rebellion, deposed the governor, and set up a kind of government of their own, under which they continued till the year 1673, when they were attacked and conquered by the Dutch; but the country being again restored to the crown of England by the treaty concluded the following year, Mr. Carteret returned to his government; and the proprietors making some concessions, the inhabitants continued pretty quiet for some time. Lord Berkley soon after assigned over his right to Mr. William Penn, and three other assignees, with whom Sir George Carteret agreed to divide the country into two equal parts, by running a line from the south-east point of Little Egg-harbour almost due north. The easternmost part of this division was allotted to Sir George, whose family was of the isle of Jersey, and from this circumstance was called East New Jersey; while the other part, which was allotted to Mr. Penn and the other proprietors, was then distinguished and still retains the name of West New Jersey: and thus they became for some time two separate and distinct governments. After Sir George's death his trustees sold his right to Mr. Penn and eleven other purchasers, and they not long after sold a part of theirs to the earl of Perth and eleven others. These divisions and sub-divisions caused the land to be branched out into so many shares, that the respective owners thought them so inconsiderable that they took little or no concern about them; and no proper care being taken to settle and fix the boundaries of their estates, it became difficult, if not impossible, to ascertain their respective rights; which caused great uncertainty of property, the people rose in frequent mobs, till the proprietors being quite wearied out, surrendered the entire government of both the Jerseys to the crown, only reserving to themselves their other rights and privileges, and stipulating for some privileges in favour of the people, which were to be given in charge to the governors appointed by the crown as part of their instructions.

Upon this surrender the crown annexed the government of the two Jerseys to that of New York, in which state they continued till the year 1736, when they became one government, and Lewis Morris, Esq; was appointed their first governor; but they still retain a seat of government in each division, at which their assembly and supreme court of judicature sit alternately, namely, at Burlington in West Jersey, and at Perth Amboy in East Jersey.

S E C T. XV.

Of P E N S Y L V A N I A.

Its Situation, Extent, Climate, Vegetables, Animals, and Rivers. The Divisions of the Country; with a Description of Philadelphia, the other Towns in this Province, and a concise Account of its Commerce.

PENNSYLVANIA was also esteemed by the Dutch a part of Nova Belgia, and as such was supposed to be included in king Charles the Second's grant to his brother James, duke of York, in the year 1663. It is seated between the thirty-ninth and forty-second degree north latitude, and between the seventy-second and seventy-eighth degree west longitude; it being bounded on the north-east by the Jerseys, on the south by Maryland, on the west by the Apalachian mountains, and on the north by the lands of the Five Nations; extending in length about three hundred and thirty miles, and two hundred in breadth.

The air is here sweet, serene, and clear. Autumn begins about the twentieth of October, and lasts till the beginning of December; after which frosty weather is very common, and sometimes the river Delaware, notwithstanding its breadth, is frozen over; but in such seasons the air is dry, clear, and agreeable. The spring lasts from March till June, during which the weather is more inconstant. In the summer months, July, August, and September, the heats are very great, but are alleviated by cool breezes that render them very tolerable. During this season the wind is south-west; but in spring, autumn, and winter, it is generally north-west. The earth is extremely fertile, and easy to be cleared, as the roots of the trees lie near the surface of the earth.

Pennsylvania produces almost all sorts of trees, which are in some respect different from the European, though they are called oaks, beech, walnut, red, white, and black ash, Spanish chesnut, cypress, and red and white cedar; but the most durable are gum-wood, hickory, sassafras, and poplar. They have also apples, pears, pines, cherries, grapes, cranberries, musk-melons, and several other fruits; with all sorts of corn, as wheat, barley, oats, rye, peas, beans, Indian corn, and likewise hemp and flax, with snake-root, sarsaparilla, and many other medicinal woods and roots. There are here also a great variety of garden plants, and of those proper for the kitchen.

Among the animals they have such plenty of horses, cows, and sheep, that it is common for farmers to have four or five hundred of the latter in a flock; they have moose deer, rabbits, racoons, beavers, and a great number of other wild beasts. Among the reptiles are snakes of several kinds; and among the fowl they have fine bustards of forty or fifty pounds weight, pheasants, heath-cocks, partridges, swans, geese, teal, snipe, braindes, pigeons, dunghill fowls, ducks, and a great variety of small birds distinguished by their beautiful plumage. The fish are sturgeons, herrings, perch, eels, smelts, &c. with oysters, cockles, muscles, and other shell-fish. In short, no province on the continent is less dependent on its neighbours for either the necessaries, conveniences, or luxuries of life.

The largest river in this province is the Delaware, which rises in the country of the Five Nations, and flows into the sea at Delaware-bay. It is navigable for near a hundred and fifty miles up, after which it has some falls; the settlements upon this river extend a hundred and fifty miles from the city of Philadelphia. The lands on its banks are excellent, and generally reward the labour of the husbandman with great profusion. Its course is nearly south-east, and it affords great plenty of all such fish as are common to the climate, especially sturgeon, which are here cured and sent abroad in greater abundance than in any other part of America.

The Susquahanah rises in the same country, at the distance of about ninety miles from the Apalachian mountains, and runs nearly parallel to the Delaware, till it discharges itself into Chesapeak-bay in Maryland. This
river

river is likewise navigable a great way up the interior country, and, if possible, exceeds the other in the pleasantness and fertility of the soil on its banks, which produces in great abundance all sorts of corn, especially wheat. This extraordinary plenty is not confined to the plains near the banks of the rivers, for the intermediate lands are generally fruitful and extremely well improved; they being divided among the farmers in such proportions as they are able to manage to advantage, for which they pay an annual quit-rent to the proprietor.

But we ought not to omit to mention the river Schoolkill, or Schuylkill, which has also its source in the same country, running almost parallel to the two other rivers, till at length it falls into the Delaware, near the city of Philadelphia, above which it is navigable for boats at least a hundred miles higher up the country.

These rivers, with the numerous bays and creeks in Delaware-bay, capable of containing the largest fleets, render this province admirably suited to carry on a foreign trade. The country also abounds in streams fit for mills, and all other kinds of works invented to ease the labour of man; hence there is here manufactured the greatest quantity of iron of any province on the continent.

This famous settlement is divided into three upper and three lower counties. The three upper are those of Buckingham, Philadelphia, and Chester; and the lower counties are Newcastle, Kent, and Suffex. The three first are those Mr. Penn obtained by a grant from king Charles II. and the three last by a grant from James duke of York.

Philadelphia, the capital of this province, is seated in the county of the same name, in the fortieth degree fifty minutes north latitude, and in the seventy-fourth degree west longitude. It is built upon one of the finest plans that ever was formed, it being laid out by Mr. Penn himself, and far excels any other city belonging to Great Britain in North America. It is seated between two navigable rivers, the Delaware on the north, and the Schoolkill on the south, which join each other a few miles below, and is near a hundred miles above the bay, into which the river discharges itself. It is an oblong of near two miles in length, extending nearly to each of those rivers, where the front facing each is a mile in length. The streets are wide and spacious, with a dry defended walk on each side, and are exactly straight and parallel to each other: the houses are in general well built, and make a handsome appearance, especially several of the public buildings, which are not exceeded by any in the country. The High-street, which runs the whole length of the city, is a hundred feet wide, parallel to which run eight streets that are crossed by twenty more at right angles, all of them thirty feet wide. Every owner of a thousand acres has his house in one of the two fronts facing the rivers, or in the High-street, running from the middle of one front to the middle of the other. In the center of the city is a square of ten acres, encompassed by the town-house and other public buildings, and in each quarter of the city is a square of eight acres. Several canals are let into the town from each river, which add to the beauty and convenience of the place. It has noble barracks for the reception of the king's troops, and the finest market of any on the continent, it being of a prodigious extent, well built, and as well regulated and supplied. Its quay is two hundred feet square, to which ships of four or five hundred tons may come up, and lay their broad-sides close to it; with wet and dry docks for building and repairing of ships, besides magazines, warehouses, and all other conveniences for exporting and importing of merchandize. The proprietor's seat, which is the usual place of the governor's residence, and is about a mile above the town, exceeds any private building in British America, both in its magnificence and the pleasantness of its situation. In short, scarce any thing can appear more beautiful than the city and the adjacent country, which for some miles may be compared to a fine and flourishing garden. The city contains about four thousand houses, and about twenty thousand inhabitants, among whom are many very wealthy merchants, who carry on a considerable trade with the English, French,

Spanish, and Dutch colonies in America; with the Azores, the Canaries, and the Madeira islands; also with Great Britain and Ireland, Spain, Portugal, and Holland.

The other principal towns in the county of Philadelphia are German-Town and Oxford; the former a thriving and populous place, chiefly inhabited by the Germans, who there speak and transact their business in their own language. In the same county is likewise the city of Radnor on the south-side of School-kill river, which is the capital of a large district planted by the Welsh. To the south of the county of Philadelphia, lies that of Chester, the capital of which is the town of Chester, seated on the river Delaware; and to the southward of Chester lies the town of Chichester. At either of these two last towns are ports sufficient to receive and secure the largest fleets from storms. The county of Newcastle lies south of that of Chester; its capital of the same name is remarkable for the briskness of its trade, and has also an iron-mine in its neighbourhood. The town of Aquoquinemink is seated on the river Delaware, south of Newcastle, and has a good trade. Kent lies south of the last-mentioned county, and Dover, its chief town, has a very commodious port. The most southern county is that of Suffex, the capital of which is Lewes; this town has a secure harbour, and also carries on a considerable trade. On the other side of the province, Lancaster, which is about sixty or seventy miles from Philadelphia, on the road to Pittsburg, may justly be reckoned the second town in Pennsylvania, it being near as large as the city of New-York.

The number of inhabitants in the whole province of Pennsylvania amounts to upwards of three hundred and fifty thousand.

The trade of this province is extensive, large, and valuable, no less than three hundred sail annually clearing out from Philadelphia alone to Europe, the West-Indies, &c. Their trade into the interior country with the Indians is likewise very extensive and lucrative; of them they take the skins and furs of wild beasts; while the Indians in return receive shirts, blankets, arms, ammunition, rum, and other spirits. Their commerce to Europe and the West-Indies chiefly consists in their exporting all sorts of grain, as wheat, rye, Indian corn, barley, oats, pease, and beans; beef, pork, salted and barrelled fish, horses, furs and skins, with pig and bar-iron, hogsheds, pipe-staves, hoops, and flax-seed. In return for which they import from the islands and other places, silver and gold, sugar, rum, molasses, salt, wine, &c. and from Great Britain cloathing of all kinds, hard-ware, tools, toys, furniture, &c.

S E C T. XVI.

A History of the first Settlement of Pennsylvania, and its Government.

WE shall now give a concise account of the settlement of this province, which was the best projected, and is the most flourishing of all our colonies. But it is necessary just to observe, that the Dutch were the first planters here as well as at New York, and living near the bay in the neighbourhood of that province, applied themselves chiefly to trade. Afterwards some of the inhabitants of Finland settled near the Freshes of Delaware, the country being so called above and below the falls of that river for a considerable length; there they applied themselves to husbandry, and had a governor appointed them by the king of Sweden, their own sovereign. Between these two neighbouring settlements there happened frequent disputes, till the Dutch becoming too powerful for the Swedes, the latter submitted to their stronger neighbours, and the Swedish governor made a formal surrender of the country to the governor, for the States General; after which this province continued subject to that republic till the English drove the Dutch out of New York.

Admiral Penn, who, in conjunction with colonel Venables, conquered the island of Jamaica, and was afterwards knighted, being in high credit with king Charles

II. and the duke of York had the promise of a grant of this country from that king as a reward for his past services; and some years after his death, his son strenuously solicited the promised grant; which, as the king owed considerable sums to his father, he obtained in the year 1679, and the original patent was dated the fourth of March, 1680. Mr. Penn afterwards, as hath been already intimated, obtained part of Nova Belgia, or New York, which was added to the country he had acquired by the first grant, and both together, from his own name, he called Pennsylvania, or Penn's country.

Mr. Penn, who had turned Quaker during the lifetime of his father, had the more earnestly solicited the above grant on account of the persecution of the Dissenters; and particularly of his friends the Quakers, who were harrassed all over England by the spiritual courts, he himself being many times thrown into prison both for preaching, and for being only present at their assemblies. There were at this time a few English in Pennsylvania, over whom he placed as governor, colonel William Markham, his nephew, to whom both the Dutch and Swedes submitted. Mr. Penn, being continually under the hand of persecution, resolved now to put himself at the head of as many as would go with him, and remove to this country; but first sent over a body of settlers from London, Liverpool, and Bristol, who purchased considerable quantities of land at the rate of twenty pounds for one thousand acres, and paying a small quit-rent. The male and female servants were to have fifty acres when their time was out; and the owners of land fifty acres per head for as many servants as they carried over. In order to secure the new planters from being molested by the Indians, he appointed commissioners to confer with them about the land, and to confirm a league of peace: by these first adventurers, he also sent a very affectionate and friendly letter to the native Indians, and the same year went to Pennsylvania himself, taking with him a great number of people, who, with those he had sent before, and that immediately followed him, amounted to two thousand persons.

As soon as he arrived, he took the government into his own hands; entered into a treaty of peace with the Indian chiefs; and, instead of immediately taking advantage of his patent, purchased of them the lands he had obtained by his grant, judging that the original property and eldest right was vested in them; and at the same time engaged the several nations of Indians, inhabiting or claiming this territory, to promise that they would not sell or dispose of any of their lands but to him, or such as should be authorized by him to purchase them; giving orders to his agents not to take possession, or suffer any person to take possession of any lands, till they had first made a fair purchase of them from the Indians. This generous behaviour not only recommended him strongly to the natives, who conceived a very high opinion of his honour and integrity, but laid a foundation for a lasting peace with them, and effectually prevented many of those tragical calamities which several of the American provinces suffered in their infant state.

He then settled the constitution and laws of the country by the consent of the inhabitants, who unanimously agreed to the fundamental constitution of Pennsylvania, which he himself had drawn up and published in England, That none who believe in the existence of a God, and live peaceably, shall be molested on account of their religious sentiments, or be compelled to frequent or support any religious worship contrary to their declared opinion; and that all persons who profess to believe in Jesus Christ, shall not be incapable of serving the government in any capacity, on account of any particularities in their religious opinions, they solemnly promising, when required, allegiance to the crown of Great Britain, and fidelity to the proprietor and governor of the province.

He likewise determined that no laws should be made there, nor money raised but by the consent of the inhabitants, who were empowered to enact what laws they pleased for the prosperity and security of the province. He established courts of justice in every county, with proper officers to prevent law-suits and contentions, and that three peace-makers should be chosen by every coun-

ty-court in the nature of common arbitrators, to hear and put an end to all the differences that arose between man and man: he also ordained, that every spring and autumn an orphan's court should be held in each county, to inspect and regulate the affairs of the widows and orphans.

Mr. William Penn staid there two years till he had settled every thing to his own and the people's satisfaction, during which he behaved in such a manner to the Indians, that he inspired them with the most extraordinary love and esteem both for him and his people. Their descendants received from them the same sentiments of this benevolent man, and still speak of him with the greatest gratitude and affection; and whenever they would express an extraordinary regard for any Englishman, they say, "We esteem and love you as if you were that good man William Penn himself."

"What crowned all," says an ingenious author, on speaking of the inhabitants who formed this settlement, "was the noble charter of privileges by which he made them as free as any people in the world, and which has since drawn such vast numbers of so many different persuasions, and such various countries, to put themselves under the protection of his laws. He made the most perfect freedom, both religious and civil, the basis of this establishment; and this has done more towards the settling of the province, and towards settling it in a strong and permanent manner, than the wisest regulations could have done upon any other plan."

The unbounded latitude given to liberty of conscience in this country, has occasioned its being inhabited by people of almost every religious sentiment in Europe. Here you see Quakers, people of the church of England, Lutherans, Catholics, Presbyterians, Independents, Baptists, Moravians, and the Dimplers, a sort of German sect, who live in common, forming a kind of religious society, wearing long beards, and a habit resembling that of friars; but marry and live in a peaceable manner by cultivating the earth: in short, the diversity of the people, religions, nations, and languages, is here prodigious, and the harmony in which they live together no less edifying. When there is far from being an union of sentiment, nothing can be more amiable than an union of affection: it affords a beautiful prospect to see men take and give an equal liberty; to see them live, if not as belonging to the same church, yet to the same Christian religion; and if not to the same religion, yet to the same fraternity of mankind.

We have already mentioned the terms upon which Mr. Penn settled this plantation; namely, twenty pounds for a thousand acres, reserving only a shilling quit-rent for every hundred acres, and this in some of the best situated parts of the province; but it is necessary to add, before we conclude this article, that now at a great distance from navigation, land is granted at twelve pounds the hundred acres, with a quit-rent of four shillings reserved; and the cleared lands near Philadelphia rent for twenty shillings an acre. In many places, even at the distance of several miles from that city, land that has been cultivated sells for twenty years purchase.

Of M A R Y L A N D.

Its Situation, Extent, Climate, Face of the Country, Soil, Produce, and Rivers. Of the Trade of this Province, with an Account of its Trade and Settlement.

THIS province is bounded on the north by Pennsylvania and Delaware bay; on the east by the Atlantic ocean; on the south by Virginia; and on the west by the Apalachian mountains. It is situated between the thirty-eighth and fortieth deg. north lat. and between the forty-fourth and forty-eighth deg. west long. extending in length from north to south about one hundred and forty miles; but its breadth is not so considerable. This country is divided into the eastern and western divisions by the great bay of Chesapeak.

Though the air in summer is excessive hot, and in

winter very cold, when the north wind blows, yet their heats are seldom very troublesome, and only in a perfect calm, which seldom happens above two or three days in the year, and then but a few hours at a time; when this inconvenience is rendered very tolerable, by their cool shades, their open and airy rooms, harbours, and grottoes. In spring and autumn the weather is as pleasant as can be wished; even the winters do not last above three or four months, and in these they have seldom one month's bad weather. During all the rest they have a clear air and a bright sun, and are scarce ever troubled with fogs. They have indeed sometimes hard frosts, but they last no longer than while the wind blows from the north and north-west points, which is seldom more than three or four days; and at other times they have no frost at all. Their rains, except in the depth of winter, are pleasant and refreshing, and in summer continue but a few hours. However, these summer showers are very heavy for the time they last. That part of the country which lies on the bays of the sea, and the mouths of the rivers, is certainly hot and moist, but higher up in the country the air is more agreeable, especially since their lands have been cleared of wood. In the heat of summer they have however dreadful thunder, but as it cools and refreshes the air, the people rather wish for it than fear it.

The face of the country may be divided into the low lands next the sea, the hilly country towards the heads of the rivers, and the Apalachian or Allegany mountains, which are exceedingly high, and extend from the north-east to the south-west, parallel to the Atlantic ocean.

The low lands formerly consisted of swamps covered with woods, and were in a manner a continued forest, till the English cleared part of it, either to make room for their plantations, in building of ships and houses, or the making of tobacco-casks and pipe-staves for exportation. All these have, at length, made such havock among the woods, that the people begin to want timber; especially near their forts and rivers, towards the heads of which is a mixture of hills and valleys covered with a variety of timber and fruit-trees; and where these are wanting are large savannahs, or meadows, where the grass grows to a surprising height.

The soil is here as fruitful as in any other country, the principal part being a large plain interspersed with hills of so easy an ascent, and of such a moderate height, that they rather seem an artificial than a natural ornament. An abundance of rivers and brooks diffuses fertility throughout the country, and there is no tree, plant, or grain that grows in Virginia but thrives as well here; and as the animals and every thing else are the same in both countries, we shall avoid repetition, and refer our readers for these particulars to the description of Virginia.

This country is watered by innumerable springs, and many fine rivers; the principal of these are Potowmac, which, rising in the mountains on the north-west, runs to the south-east, separating Maryland from Virginia, and then falls into the middle of Chesapeak-bay. Potowmac, which issues near the ocean, runs directly south, till turning to the west, it falls into Chesapeak-bay, near Watkins's point. The river Patuxent rises in Arundel county, and running to the south-east, falls into Chesapeak-bay, about twenty miles to the northward of the river Potowmac. The Severn rises on the north-west, and running south-east falls into the upper part of the same bay. Sassafras-river rises in the north-east, and running almost due west, discharges itself into the north of the same bay. Wicomico-river rises on the eastern shore, runs to the south-west, and falls into the same bay, almost opposite the mouth of Potowmac river.

There are many other rivers capable of receiving large ships, which with the numerous bays and creeks where-with the land is on every side indented, affords the advantage of bringing vessels to the very doors of the planters.

Maryland is divided into ten counties, of which the four following are on the east side of the bay, Somerset, Dorchester, Talbot, and Cecil county. Those on the west side of the bay are St. Mary's county, Charles-county,

Prince George-county, Anne Arundel-county, and Baltimore-county.

The capital of the province is Annapolis, which is situated on the Severn; but though the governor resides there, and the courts of justice, with the general assemblies, are held in the town, it does not much exceed a hundred houses; for, throughout the whole colony of Maryland, the English live in their several plantations, which are almost all situated upon some navigable creek or river with which the province abounds, by which means the planters have the convenience of shipping their own produce to England and other parts, and of being supplied from thence with foreign commodities. Hence all the towns are extremely small; indeed, every plantation is a little town of itself provided with provisions and necessaries, a considerable planter's warehouse being a kind of shop, where he not only supplies his own family, but inferior planters, servants, and labourers, and has commodities to barter for tobacco and other goods, there being but little money in the province, and but little occasion for it, tobacco answering all the uses of gold and silver; and indeed there are but few shopkeepers who live entirely by buying and selling. The tobacco of this province called Oronoko, is sold to great advantage, and the planters of Maryland find so good vent for it in foreign markets, that several hundred sail of ships are annually employed in the commerce between Great Britain and this country. The number of inhabitants amount to about eighty-five thousand whites, and twenty-five thousand negro slaves.

Maryland was esteemed a part of Virginia till the year 1632, when king Charles I. made a grant of all the country not then planted on the north of Potowmac river to lord Baltimore, a Roman-catholic nobleman, and his heirs; and the country was called Maryland in honour to queen Mary, consort to king Charles. His lordship sent Leonard Calvert, Esq; with some popish gentlemen and other adventurers, to the number of two hundred, to take possession of the country; who, sailing from England in November 1633, arrived at the mouth of Potowmac river in March following, and having fixed on a proper place for beginning a settlement, purchased the land of the natives. The place they chose was near a small bay at the mouth of the above river, and was a town belonging to the Yoamaco Indians, who, having been defeated by the Susquahana Indians, had resolved to leave the town and retire farther into the country. The English arriving at this happy juncture, and fulfilling their agreement, were immediately put into possession of one half of the town.

The English having thus by purchase become masters of a spot of cleared ground, they not only began to build a town, which they called St. Mary's, but to plant corn; they also purchased all the corn they could of the Indians, by which means they had very soon a plentiful supply; and as they prudently took care to cultivate a friendship with the Indians, they avoided the distresses to which the neighbouring colony of Virginia had often been reduced. While they were cultivating the ground, and raising large quantities of Indian corn, the natives went every day into the woods to hunt for game, bringing venison and turkies to the English colony in great plenty, for which they received knives, tools, and toys.

Thus both nations lived in the greatest friendship, doing mutual good offices for each other, till some of the English in Virginia envying the happiness of this thriving colony, had the baseness to suggest to the Indians, that these strangers were not really English, as they pretended, but Spaniards, and would enslave them, as they had done many of their countrymen. Having thus sowed the seeds of suspicion and enmity in the minds of these inoffensive people, who now made preparations to attack them, the new planters prepared to defend themselves, built a good fort with all expedition, and took every other necessary precaution for their defence; but continued to treat the Indians with such kindness, that partly by the effect this had upon them, and partly by the awe of their arms, the ill designs of their enemies were defeated.

Being thus happy in the enjoyment of peace and plenty, they soon received reinforcements from England, many popish families of rank and fortune retiring thither to avoid the penal laws which were at that time made against them in England. After the king's death, Cromwell deprived the proprietor of his rights, and Maryland remained under the governors appointed by the parliament and Cromwell, till the Restoration, when lord Baltimore was reinstated in his former possessions, which he cultivated with his usual wisdom, care, and moderation. No people could live in greater ease and security; and his lordship, willing that as many as possible should enjoy the benefits of his mild and equitable administration, gave his consent to an act of assembly, which he had before promoted in this province, for allowing a free and unlimited toleration for all who professed the Christian religion, of whatever denomination. This liberty, which was never violated, encouraged a great number, not only of the church of England, but of all kinds of dissenters, to settle in Maryland, which before that time was almost wholly in the hands of Roman catholics.

Though this nobleman was guilty of no mal-administration in his government, though he was a zealous Roman catholic, and firmly attached to the cause of king James II. this could not prevent his charter being ques-

tioned in that arbitrary reign, and a suit being commenced to deprive him of the property and jurisdiction of a province granted by the royal favour, and peopled by himself at a vast expence: but it was the error of that weak reign neither to know its friends nor its enemies. Upon the Revolution the lord Baltimore had no reason to expect any favour, yet he met with more than king James himself had intended him: he was indeed deprived of his jurisdiction, but was allowed the profits of his province, which were far from being inconsiderable; and when his descendants conformed to the church of England, they were restored to all their rights. At present but a small part of the province is vested in lord Baltimore, he having conveyed to others the greatest part of it.

This colony and Pennsylvania were for a long time free from being harrassed by the calamity of any war, offensive or defensive, with their Indian neighbours, with whom they always lived in the most exemplary harmony. Indeed in a war which the Indians made upon the colony of Virginia, they by mistake made an incursion into the bounds of Maryland; but they were soon sensible of their error, and atoned for it. The late war, however, changed every thing; for the Indians were then taught by the French to laugh at all their ancient alliances.

C H A P. III.

Of the Southern Part of the British Colonies on the Continent of AMERICA, particularly of VIRGINIA, CAROLINA, GEORGIA, and FLORIDA.

S E C T. I.

Of VIRGINIA.

Its Situation, Extent, Climate, and Face of the Country. Of Chesapeak-bay, with the Rivers and Soil of Virginia. Of the Vegetables, containing a Description of the Tobacco Plant and its Preparation; of the Flowers; the Myrtle-berry, and the Candles made of the Wax extracted from them; the wild Fruits, their Kitchen-Gardens, and a general View of the Beauties of the Country.

VIRGINIA contains a very extensive territory, it being seated between the thirty-sixth and thirty-ninth degree north latitude, and between the seventy-fourth and eightieth of west longitude; it extending about two hundred and forty miles in length from north to south, and about a hundred and twenty miles in breadth from east to west. It is bounded on the north by the river Potowmac, on the east by the bay of Chesapeak, on the south by Carolina, and on the west by the Alleghany mountains.

With respect to the climate, the heat and cold both here and in Maryland are governed by the winds; the north and north-west winds are commonly cold and clear; but the south-east moist, hazy, and very hot. In winter the air is dry and clear; and though the snow falls in great quantities, it seldom lies above a day or two: the frosts are quick and sharp, freezing the river over, though three miles across; but do not continue long. Their spring is somewhat earlier than ours; in April they have frequent rains: May and June are very pleasant months, the heat being greatly tempered by cooling breezes; but July and August are generally very sultry, the air sometimes growing in a manner stagnant, which produces dreadful thunder and lightning; but even then the heat is rendered tolerable by the refreshing sea-breezes; and in September and October the rains fall, when the inhabitants become liable to agues and intermitting fevers. The weather is changeable, and the changes sudden and violent. Their winter frosts come on without the least warning: thus, after a warm

day, towards the setting in of winter, so intense a cold often succeeds, as to freeze the rivers in one night; but these frosts, as well as their rains, are rather violent than of long continuance.

The whole face of the country is so extremely low towards the sea, that when you come within fifteen fathom soundings, you can hardly distinguish land from the mast-head. All this coast of America has one useful particularity, that you know your distance exactly by the soundings, which uniformly and gradually diminish as you approach the land. The trees appear first as if they arose out of the water, and afford the stranger a very uncommon and not disagreeable view. In sailing to Virginia, or Maryland, you pass a streight between two points of land called the Capes of Virginia, which opens a passage into the bay of Chesapeak, one of the largest and safest bays perhaps in the world; for it enters the country near three hundred miles from the south to the north, having the eastern side of Maryland, and a small part of Virginia on the same peninsula, to cover it from the Atlantic ocean. This bay is almost eighteen miles broad for a considerable way, and seven where it is narrowest, the water in most places being nine fathoms deep. Through its whole extent it receives both on the eastern and western side a vast number of fine navigable rivers; for, besides those of Maryland from the side of Virginia, it receives James-river, York-river, the Rappahannoc, and the Potowmac.

These, in the order they are here mentioned, discharge themselves, with several smaller ones, into the bay of Chesapeak; and are not only navigable themselves for very large vessels a prodigious way into the country, but have so many creeks, and receive such a number of smaller navigable rivers, as renders the communication of all parts of this country infinitely more easy than that of any other country. The Potowmac is navigable for near two hundred miles; it is nine miles broad at its mouth, and for a vast way not less than seven. The other three are navigable upwards of eighty; and in the windings of their several courses approach one another so nearly, that the distance between them is in some parts not more than ten,

ten, and sometimes not above five miles; while in others there is fifty miles between each of these rivers. The planters, as in Maryland, load and unload vessels of great burthen each at his own door; which, as their commodities are of small value in proportion to their bulk, is a very fortunate circumstance.

The soil in the low grounds of Virginia is a dark fat mould, which for many years, without any manure, yields plentifully whatever is committed to it. The soil as you leave the rivers becomes light and sandy, but, though sooner exhausted than the low country, yields corn and tobacco extremely well. The land higher up the rivers, throughout the whole country, is generally a level ground, with shallow valleys, which abound with springs and streams of clear water, there being interspersed some small hills and extensive vales. The lands next the rivers are stored with large oaks, walnut-trees, hickories, ash, beech, poplar, and many other sorts of timber of a surprising size. Towards the mouth of the rivers the land has a moist and fat mould, for the most part well stored with oaks, poplars, pines, cedars, cypresses, and sweet gums; the trunks are often thirty, forty, and some sixty or seventy feet high, without a branch or limb. It likewise produces great variety of evergreens, as the holly, sweet myrtle, and many others. The heads of the rivers afford a mixture of hills, valleys, and plains, adorned with fruit and timber trees.

There are also found great variety of earths, as antimony, talc, yellow and red ochre, fuller's earth, and tobacco-pipe clay. In these upper parts are likewise coal, slate, flat paving-stones in vast quantities, and likewise pebbles, though some travellers have said there is not a stone in the country; besides, near the falls of the rivers are vast quantities of stone fit for all uses.

There is no better wheat than what is produced in this province and in Maryland; it also produces other sorts of English grain, as barley, oats, rye, peas, &c. but the cultivation of tobacco employs all their attention, and almost all their hands; so that they scarcely raise corn enough for their own consumption.

As the great produce of this country is tobacco, and as Virginia is celebrated for producing the best, it will be proper here to give a particular account of the management of this plant so well known in England. This plant at its full height is as tall as a common sized man; the stalk is straight, hairy, and clammy; the leaves alternately of a faded yellowish green, and towards the lower part of the plant of a great size. The tobacco seeds are first sown in beds, where having remained a month, the young sprouts are in the first rainy weather transplanted, and the earth raised about them: within the space of another month they grow near a foot high; after which the people top them and prune off the bottom leaves, leaving only seven or eight on the stalk, that they may be the better fed; after which these leaves in six weeks time come to their full growth. The planters prune off the suckers, and clear them of the hornworm twice a week, which is called worming and suckering. This last work lasts three weeks or a month, by which time the leaf, from being green, begins to turn brownish, and to spot and thicken, which is the sign of its ripening. They cut the plants down as fast as they ripen, heap them up, and let them lie a night to sweat. The next day they carry them to the tobacco-house, where every plant is hung up at a convenient distance from each other, for about a month or six weeks: they take them down in moist weather, else they will crumble to dust. After this they are laid upon sticks, and covered up close in the tobacco-house for a week or a fortnight to sweat; and then opening the bulk in a wet day, they are stripped and sorted, the top leaves being the best, and the bottom the worst tobacco. The last work is to pack it in hogheads, or to bundle it up, which is also done in a wet season; for in the curing of tobacco, wet seasons are as necessary as dry to render the leaf pliant.

There is no commodity of such advantage to the revenue as this, for while it produces a vast sum, it seems to lay but a very inconsiderable burthen upon the people in England, all the weight in reality falling upon the planter. Near three hundred thousand pounds sterling per annum is received by the government for the duty on

this article only; and the exported tobacco, the far greater part of the profits of which come to the British merchant, brings almost as great a sum annually to the kingdom.

The country is all over interspersed with a surprising variety of curious plants and flowers. They have a sort of briar growing somewhat like the sarfaparilla; the berry of which is as big as a pea, and of a bright crimson colour, very hard and finely polished. The flowers grow spontaneously in a surprising variety: among these is a most beautiful crown imperial; the cardinal flower, which is of a beautiful scarlet; the moccasin flower, and a thousand others; for almost all the year round the levels and vales are beautified with flowers of one colour or another, which render the woods as fragrant as a garden. From these materials the wild bees make vast quantities of honey; but their magazines are often rifled by bears, racoons, and the like. There is also found the fine tulip-bearing laurel-tree, which has the pleasantest smell in the world, and keeps blossoming and seeding several months together: it delights much in the gravelly banks of the brooks, and perfumes the very woods with its odour; as does also the large tulip-tree; the locust, which resembles the jessamine; and the perfuming crab-tree, during this season. With one sort or other of these, and by many other sweet flowering-trees not mentioned, the woods are almost every where adorned.

At the mouth of the rivers, and all along upon the banks of the sea and bay, and likewise near many of the creeks and swamps, grows the myrtle, which bears a berry of which the inhabitants make a hard brittle wax of a beautiful green colour, which by refining becomes almost transparent. Of this they make candles, which are never greasy to the touch, nor melt with lying in the hottest weather; nor does the snuff ever offend the smell, like that of a tallow candle; but instead of being disagreeable, if a candle be put out it yields a pleasant fragrance, which is diffused all over the room; so that nice people frequently put them out on purpose to smell the incense of the expiring snuff.

The melting of these berries is said to have first been discovered by a surgeon, who performed wonderful things with a salve made of them. The method of managing these berries is by boiling them in water, by which all of them dissolve, except the stone or seed in the middle, which amounts to about half the bulk of the berry, the biggest of which is something less than a pepper-corn. Cedar berries have been found to yield the same sort of wax; but their berries are as much larger than pepper, as those of the myrtle are less.

The fruits natural to the country are in great abundance, the several species of which are produced according to the difference of the soil, and the various situation of the country.

Peaches, nectarines, and apricots, that grow upon standard trees thrive here extremely; and of the two first there are finer sorts than in England. The best sort of these cling to the stone, and will not come off clear; are they call plum-nectarines and plum-peaches. Some of these are twelve or thirteen inches in compass. These sorts of fruits are raised so easily there, that some good husbands who live at a distance from the woods, plant large orchards of them purposely for their hogs; and others make a drink of them, which they call mobby, and either drink it like cyder, or make brandy of it by distillation, it making the best spirit next to grapes.

Of the cherries which grow wild in the woods there are at least three sorts, two of which grow upon trees as large as the common English oak; the fruit of one of them grows in bunches like grapes. Both these sorts are black without, and but one of them red within: this last is more palatable than the English black cherry, it not having its bitterness. The other, which hangs on the branches like grapes, is water-coloured within, of a faintish sweet, and is greedily devoured by the small birds. The third sort, which is called the Indian cherry, grows higher up the country, and is commonly found by the sides of rivers growing on small slender trees that are scarce able to support them; but this is the most delicious cherry in the world: it is of a dark purple when ripe, and grows upon a single stalk like the English cherry;

cherry; but is very small. They are, however, so greedily devoured by the small birds, that they seldom remain long enough on the tree to ripen.

The plums which grow wild are of two sorts, the black and the murrey-plum, both which are small, and have much the same relish with the damson.

The persimmon is a kind of Indian plum of several sizes, between the bigness of a damson and a Burgamot pear; but, till they are fully ripe, the taste of them are so very rough as not to be endured: however, they are pleasant fruit when fully ripe. These, like most other fruits, grow as thick upon the trees as ropes of onions; so that the branches are often broke down by them.

An incredible variety and plenty of grapes grow wild, some of which are very sweet and pleasant to the taste, and others very harsh and rough. There are two sorts of them as large as the Dutch gooseberry, which are very fine eating: one species of them is white, the other purple, but both of them are much alike in flavour.

We ought not here to omit the honey and sugar-trees, which grow near the heads of the rivers. The honey-tree bears a thick swelling pod full of honey, appearing at a distance like the bending pod of a bean or pea. The sugar-tree yields a kind of sap, or juice, which by boiling is made into sugar. The juice is drawn off by making an incision in the trunk of the tree, and placing a receiver under it. The Indians make one pound of sugar out of eight pounds of the liquor. This sugar has a large full grain, and its sweetness resembles that of good muscovado.

They have musk-melons, water-melons, pompions, cushaws, macoas, and gourds. The musk-melons here resemble the large Indian kind, and generally fill four or five quarts. The water-melons are much larger, and of several kinds, distinguished by the colour of their meat and seed; some of them are exceeding pleasant to the taste, and very beautiful. One sort has the rind of a lively green, streaked and watered, the meat of a carnation colour, and the seed black and shining. Their pompions are much larger and finer than those in England. Their cushaws are a kind of pompion of a bluish green, streaked with white when fit for use, and larger than the pompion. The macoas are a smaller sort of pompion, of which there are many sorts, all of which are here called by the Indians by this name; but by the more northern Indians they are called the squash. These being boiled whole when young and the shell tender, and melted butter or cream poured over them, are very good with all sorts of butcher's meat.

There are here great variety of berries, all very good in their kind. They have three sorts of mulberries, two black and one white, of which the long black sort are the best; these being about the size of a boy's thumb. The other two kinds are of the shape of the English mulberry, but are of a faintish sweet, without any tartness.

There grow naturally two sorts of currants, one red and the other black; but these are far more pleasant than those of the same colours in England.

The wild strawberries are as delicious as any in the world, and grow almost every where in the woods and fields, where they are so plentiful, that few persons take care to transplant them. Here are also wild raspberries, cranberries, and hurts, with various kinds of nuts. Besides these they have all the other fruits common in England.

A kitchen-garden thrives no where better or faster; they have all the culinary plants that grow in England, in far greater perfection, with many others that will not grow there. Besides these they have many medicinal plants, roots, and wood fit for medicine and dying. The snake-root here is a great antidote in all pestilential distempers; the rattle-snake-root is the most admirable remedy ever discovered for curing the bite of that reptile, which has sometimes been mortal in two minutes. If this medicine be early applied it presently removes the infection, and in two or three hours restores the patient to as perfect health as if he had never been hurt.

An author born in Virginia, after shewing that the unhealthiness of the climate attributed to this country is solely owing to the folly and indiscretion of those who on their first arrival from Europe over-heat themselves, and

then take a surfeit with greedily eating their delicious fruits, by drinking cold water or new cyder, adds, "Here the people enjoy all the benefits of a warm sun, and by the shady groves are protected from its inconvenience. Here all their senses are entertained with an endless succession of native pleasures. Their eyes are ravished with the beauties of nature: their ears are serenaded with the perpetual murmur of brooks, and the through-bass which the wind plays when it wanders through the trees; the merry birds too join their pleasing notes to this rural concert, especially the mock-birds; who love society so well, that whenever they see mankind they will perch upon a twig very near them, and sing the sweetest wild airs in the world: but what is most remarkable in these melodious animals, they will frequently fly at small distances before a traveller, warbling out their notes several miles an end, and by their music make a man forget the fatigues of his journey. Their taste is regaled with the most delicious fruits, which, without art, they have in great variety and perfection. And then their smell is refreshed with an eternal fragrantcy of flowers and sweets, with which nature perfumes and adorns the woods almost the whole year round.

"Have you pleasure in a garden? all things thrive in it most surprisingly; you cannot walk by a bed of flowers, but, besides the entertainment of their beauty, your eyes will be saluted with the charming colours of the humming-bird, which revels among the flowers, and sucks off the dew and honey from their tender leaves, on which it only feeds. Its size is not half so large as an English wren, and its colour is a glorious shining mixture of scarlet, green, and gold. Colonel Bird, in his garden, which is the finest in that country, has a summer-house set round with Indian honeysuckles, which all the summer is continually full of sweet flowers, in which these birds delight exceedingly. Upon these flowers I have seen ten or a dozen of these beautiful creatures together, sport about me so familiarly, that with their little wings they often fanned my face."

S E C T. II.

Of the Quadrupeds of Virginia, particularly the Panther, the Bear, the Elk, the Raccoon, the Opossum, and the Flying-Squirrel. Of the Birds, with a particular Description of the Humming-Bird and the Fishing-Hawk. Of the Reptiles and Insects, with a very particular Account of the Rattle-Snake. Of the Fishes of Virginia.

IT has been already observed, that there were neither horses, cows, sheep, nor hogs in America before they were carried thither by the Europeans; but now they are multiplied so extremely, that many of them here run wild. The hogs in particular are very numerous, and in general find their own support in the woods, without any care of their owner, and it is well if the proprietor can find and catch the pigs, or any part of a farrow, when they are young, in order to mark them; for if there be any marked in the herd, they determine the property of the rest, because they seldom miss their gangs; for as they are bred in company, so they continue to the end.

There are also many horses foaled in the woods of the uplands, and are as shy as any wild creature. The young men take great delight in hunting these wild horses, which they pursue sometimes with dogs, and sometimes without; for as they have no mark upon them, they belong to the first who take them; but they are so swift, that it is very difficult to come up with them.

Among the animals originally found in Virginia are panthers, bears, wolves, elks, red and fallow deer, racoons, wild-cats, the opossum, &c.

The panther of North America is of the cat kind, near as large as the tyger, and much of the same shape. It is of a pale reddish colour, finely mottled with small round black spots, and the hair is short. The eyes of these animals are large and of a greyish colour, very fierce and sparkling. Their tails are exceeding long; and they are very strong limbed. They pur like a cat, and will climb trees

trees with the greatest agility imaginable; but are so wild, that they cannot be tamed even when taken young. They devour swine, deer, or any other creature they can master, but seldom attack mankind, except they are enraged by being wounded: it is even said that a small dog will make them take to a tree, where they generally remain till they are shot by the huntsmen. The flesh looks as well as any shambles meat, and is much admired.

The bears are not very large, but, though they seem so clumsy, they climb trees very nimbly, and in coming down always go with the tail foremost. They are also very dexterous and expert in fishing. It is remarkable that the female never appears abroad when with young. Bear-hunting is a common diversion both with the Christians and Indians, the former having a breed of dogs fit for that sport, who bark and snap at him till he mounts a tree; when, by the noise of the dogs, the huntsmen repair to the place, and generally shoot one after another till they kill him; for though the bears are not naturally fierce, they will fight most desperately when wounded. Their flesh is good, nourishing, and not inferior in taste to the finest pork; the paws are accounted the best eating. The young cubs are a most delicious dish; the planters prefer the flesh to that of any other meat; it looks as well as it eats, their fat being as white as snow, and the sweetest of any creature in the world.

The elk is a strong and swift beast, bigger than a horse, and exactly like a deer. They have two large horns, which weigh twelve or fourteen pounds. Their neck is short and thick; but the ears and back are very long. In colour they resemble a hart; but their flesh is not near so sweet as that of the fallow deer.

The racoon is of a dark grey colour, and in shape and size partly resembles a fox; but has large black eyes, with great whiskers like a cat; the nose resembles that of a pig, and the feet are formed like those of a monkey. The tail is round, and encircled with annular stripes like that of a cat. It makes use of its fore-feet in the manner of hands, and will run up a tree to the very end of the boughs. This animal is very fond of crabs, and it is said that when he wants to catch them, he will stand by the side of the water and let his tail hang in, which the crab taking for a bait fastens his claws in it; upon which the racoon springs forward a considerable way upon the land, dragging the crab along with him, which no sooner finds itself out of its element than it lets go its hold, and the racoon seizing it crosswise in his mouth, devours it.

The opossum is a very extraordinary animal of the size of a cat, it being almost eighteen inches in length; the head resembles that of a fox; the eyes are little, round, clear, and lively; and the ears long, broad, smooth, thin, transparent, and placed erect. The fore-legs are short, and no more than three inches long; but those behind are more than four, and the feet resemble hands. Its back is covered with long hair; but on the head, neck, under the belly, and legs, it is pretty short. The tail is round, and a foot long, with which it lays hold of the branches of trees, and thus suspends itself. It is hairy from the root to the length of four inches; but the other part is naked, and scaled like a snake, which it nearly resembles. The whole back, the sides, and the upper part of the tail, are chiefly black; but under the neck, belly, and tail, it is of a yellowish colour. This animal has one peculiar property which distinguishes it from all others in the world, the female having a false belly, or bag, hanging below under the other belly, with a pretty large aperture at the end, towards the hinder-legs. Within this bag, on the usual parts of the common belly, are eight teats, and, what is very extraordinary, upon these when the female conceives the young are formed, and there hang like fruit upon the stalk, with all their members complete, till they grow in bulk and weight to their appointed size; and then dropping off, are received in the false belly, from which they go out at pleasure, and in which they take refuge when any danger threatens. The false belly is hairy within, and the aperture, which is big enough to admit a large orange, shuts up pretty close, and cannot be well opened without violence. Improbable as this method of propagation may appear, yet this account is confirmed by a considerable number of authors, and particularly by that

great naturalist Mr. Ray, who dissected one of these animals himself, and informs us, that this false belly is the only uterus the animal has, no other being to be found. These animals are so hard to kill, that when their skulls are mashed and broken to pieces, and they seem to be quite dead, yet in a few hours they will recover and creep about again.

There are here two sorts of squirrels, one grey and commonly larger than a rabbit, but small like a fox; yet are good to eat. It is commonly of a grey colour, yet some are pyed, and some white, red, and black.

The flying-squirrel is of a grey or light dun colour, and is less than the English. It has a fine thin skin on each side, covered with hair like the rest of the body, and extending from the fore-feet to the hinder-feet, which buoys them up as they spring from one tree to another, and enables them to take a much more extensive leap than any other squirrel; this is termed flying.

They have all our sorts of wild and tame fowl in equal perfection with us, and some which we have not, with a vast number of birds of various kinds valuable for their beauty or their note. The white-owl of Virginia is much larger than those of England, and is all over of a bright silver-coloured plumage, except one black spot upon his breast. The Virginian nightingale is a beautiful bird, whose colours are crimson and blue. The mocking-bird is supposed to excel all others in the fineness of its note, and is remarkable for imitating the notes of all others. The rock-bird is very sociable, and his society very agreeable by the sweetness of his music.

The humming-bird is the least of all the birds yet known, and has this remarkable peculiarity, that though it is feathered like a bird, it gets its living like the bee by sucking honey from the flowers. These birds are of different colours; but the cocks are more beautiful than the hens, and are finely tinged with red, green, and gold, as hath been already observed, which being exposed to the sun-beams shine with wonderful lustre. They have long bills and tails, considering their size, and in some of the larger flowers they often bury themselves, and are quite covered while sucking to the bottom of them, by which means they are often caught by children. They fly very nimbly, but more like insects than birds, from flower to flower, making a humming noise somewhat like that of a bee. They breed during the heat of summer; but what becomes of them in the winter is not known. Their nests are a great curiosity, and may be said to be one of the finest pieces of workmanship the whole species of winged animals can shew; for it commonly hangs on a single briar, and is most artificially woven like a round ball, with a small hole to go in and out. Within it the hen lays and hatches her eggs, which are oval, and no bigger than a small pea.

There are here several sorts of eagles and hawks. The fishing-hawks are very eager in catching of fish at their first coming in the spring; and the bald eagle no sooner perceives a hawk that has taken his prey, but he immediately pursues and strives to get above him in the air; which if he can once attain, the hawk, for fear of being torn by him, lets the fish drop, and thus compounds for his own safety; for the fish is no sooner loose from the hawk's talons, than the eagle shoots with such inconceivable swiftness, that he catches it in the air. It is said that the fishing-hawks in more plentiful seasons will catch a fish and loiter about with it in the air, in order to have a chase with an eagle; and when he does not appear soon enough, will make a noise as insolently defying him. This is said to have been frequently seen.

The troublesome reptiles and vermin of this country are frogs, snakes, musketos, chinchies, seed-ticks, or red-worms. The marshes, fens, and watery grounds are full of frogs, which make a disagreeable croaking noise. In the swamps and running streams are frogs of an incredible size, which are called bull-frogs, from their bellowing noise. These are said to be frequently six times as large as those in Europe; but there are no toads in the country.

The rattle-snake usually fills strangers with terror, who are under great apprehensions of being bit by this formidable reptile; but it is here very rarely seen, and then

then never does the least mischief, unless you offer to disturb it, and by that means provoke it to bite in its own defence; and even then it never fails to give fair warning, by making a noise with its rattle, which may be heard at a considerable distance.

The rattle-snake is so called from the rattles at the ends of their tails, which is a connection of joints within a thin covering of a horny nature. The number of joints, or rattles, are uncertain, being more or less according to the age of the snake; some authors asserting, that every year there is the addition of a new rattle, and that these do not begin to grow till they are three years old. Mr. Brickell informs us, that he has seen one with thirty rattles. M. Derham and others have observed, that Providence has wisely given these rattles to this poisonous serpent, that the noise might be a warning to man and beast to avoid the approaching danger. Some of these reptiles grow to the length of six or seven feet, and they are about the thickness of the small of a man's leg. Their skins are all over covered with thin scales, with a ridge through the middle of them, of an orange tawny; the rest of their back are generally of a blackish colour beautifully mottled, and the belly of an ash colour, inclining to lead. The top of the head is flat as in the viper, and by the protuberance of the jaws somewhat resembles a bearded arrow; it has two nostrils, and its eyes are round and very bright and shining. The mouth is very large; its tongue in all respects like that of a viper, which it darts out and retracts again with great agility. The male is easily distinguished from the female by a spot on the head resembling a patch of black velvet, and his head is smaller and longer. They seldom or never bite except they are provoked, and this they cannot do till they gather themselves into a coil, and then will spring at a good distance to bite whatever provokes or injures them; otherwise they are most peaceable creatures, and never attack or molest any one. They have several small teeth in each jaw, which serve them for catching and retaining their food, which they always swallow whole; and besides these are the poisonous fangs, which are placed without the upper jaw, towards the fore part of the mouth. These fangs usually lie under a strong membrane, or sheath; but are erected upon occasion, and there are only two on each side of their upper jaw. These are hooked, but in all of them is a hole, so small that you can but just get in the point of a small needle; towards the point is a plain slit, and close to the jaw a bag filled with venom, which issues out of the hole when this serpent bites. The venom, which is of a water-colour tinged with yellow, is not always of the same force, it being most poisonous in the hottest weather. Those who have been bit say, that it seems as if a flash of fire ran through their whole bodies: but the Indians have happily a remedy, by which they easily cure themselves if bitten by accident, which is by chewing a bit of the rattle-snake root, swallowing some part of the juice, and applying the rest to the wound, which perfectly cures those who are bit in a few minutes.

Dr. Brickell observes, that the Indians frequently pull out these poisonous fangs, which is easily done by tying a bit of red woollen cloth to the upper end of a long hollow cane, provoking the rattle-snake to bite, and then suddenly snatching it away, by which means the teeth are found sticking fast in the cloth.

Their common food is frogs, ground-mice, crickets, grasshoppers, and other insects; and the rattle-snakes themselves serve for food to bears, and even hogs will eat them without harm. They are viviparous, and generally bring forth about twelve young ones.

We shall now consider the effects of the rattle-snake's poison, of which we have some extraordinary instances given us by captain Hall, who being in South Carolina, where perhaps the venom may be somewhat more violent than in this province, and where they are at least more numerous, procured a fine healthful rattle snake, and, with one Mr. Kidwell, a surgeon, and three or four other gentlemen, made several experiments. They got three cur-dogs, the largest no bigger than a common harrier; and the snake being tied and pinned down to a grass-plat, they took the largest of the dogs, and having tied a cord round his neck, so as not to strangle him, the captain held one end, and another person the other; when pul-

ling the dog over the snake, the latter raised himself near two feet, and bit the dog as he was jumping. The dog yelped, by which the captain perceived he was bitten, and pulling the dog to him as fast as he could, he found his eyes fixed, his tongue between his teeth, and, in short, he was quite dead in a quarter of a minute: but as they could neither perceive the bite, nor any blood, they ordered some hot water, and scalding off the hair, discovered only one puncture, with a bluish green colour appearing a little round it, between his fore legs and breast.

Half an hour after they took a second dog, that was somewhat smaller, and brought him in like manner over the snake, which bit his ear, so that all the company saw it. The dog yelped much, reeled and staggered about for some time, then fell down and struggled as if convulsed, and two or three times got up, and wagging his tail, though slowly, endeavoured to follow a negro boy, who used to make much of him. They put him into a closet, and ordered the boy to look after him, who two hours after brought word that the dog was dead.

About an hour after the second dog was bitten, they took the third in like manner, which the snake bit on the right side of the belly, so that he drew blood. The dog for about a minute did not seem to be hurt; but was dead the next morning.

Four days after they got two dogs as big as common bull-dogs; and the first which the snake bit, on the inside of his left thigh, died exactly in half a minute, according to the watches of two gentlemen present, though no blood was drawn. The second was bit about an hour after, on the outside of the thigh, where they perceived blood at two places, and he died in four minutes. As they imagined the venom was not quite spent, they got a cat, which he bit an hour after; she was very sick, and was found dead the next morning.

The last experiment the captain made with this snake was to try if his poison would not prove mortal to the reptile himself. In order to this, he hanged him in such a manner that he was not above half his length on the ground, and then so irritated him by pricking and scratching him with two needles fastened to the end of a stick, that he soon bit himself, after having several times attempted to bite the stick. He then let him down, and he was quite dead in eight or ten minutes. The snake was then cut into five pieces, and given to a hog, the head-part first, in the sight of several people. The hog eat up all the snake, and ten or twelve days afterwards the captain saw the hog alive and healthful.

But besides the effect of the poison, there are others attributed to the eyes of this serpent, that appear much more surprizing; and we have many accounts that seem to prove that the rattle-snake, by fixing its eyes on any small animal, as a bird or squirrel, though sitting on the branch of a tree, can so disorder their animal spirits, that they have not the power to fly but fall down, and are swallowed by that dreadful reptile. The following instance given by colonel Beverly cannot fail of being highly agreeable to the reader.

The above gentleman, with two other persons in company, stopping at an orchard by the side of a road, one of the company searching for the best cherries espied a hare, better than half grown, sitting; and though he went close by her she did not move, till he, not suspecting the occasion of her tameness, gave her a lash with his whip; upon which she ran three or four yards, and sat down again. The gentleman not finding the fruit ripe, immediately returned the same way; and near the place where he struck the hare observed a rattle-snake. Not suspecting the charm, he went back about twenty yards to a hedge to get a stick to kill the snake, and at his return found it removed and coiled in the same place from whence he had removed the hare. This made him look about for her, and he soon espied her about ten feet distant from the snake in the place to which she had started when he whipped her. She was now lying down, but would sometimes raise herself on her fore-feet, struggling as it were for life to get away; but could never raise her hinder parts from the ground; and then she would fall flat on her side again, panting vehemently. The hare and snake were in this condition when our author was called, who says, that though all three went within five yards of the

snake to have a full view of the whole, the snake did not so much as give a glance towards them. There they stood at least half an hour, the snake not altering one jot; but the hare often struggled to get up, and fell again on its side; till at last she lay still as if dead. The snake then moved out of his coil, and slid gently and smoothly towards the hare, his colours at that instant shining ten times more bright than at other times. As the snake moved along the hare happened to make another struggle, upon which the snake made a stop, lying at his length till she was quiet, and then advanced till he came up to the hare's hinder parts, which in all this process had been towards the snake. There he surveyed the hare all over, raising part of his body above it; then turning off, he went to the nose, and after that to the ears, which he took into his mouth one after another, working them as a man does a wafer to moisten it. He then returned to the nose, and took the face into his mouth, straining and gathering his lips sometimes on one side sometimes on the other. At the shoulders he was a long time puzzled, often pulling and stretching the hare out at length, till at last he got the whole body into his throat. The spectators then advanced, and our author taking the twist-band off his hat made a noose, and threw it about the snake's neck. This made him very furious; but having secured him, they put him into one end of a wallet, and carried him on horseback five miles to the house where they lodged that night, and killing him the next morning, took the hare out of his belly. The head began to be digested, and the hair to fall off, having laid in the snake's belly about eighteen hours.

Sir Hans Sloane endeavours to solve the mystery, by supposing that when such animals as are the prey of these snakes, as small quadrupeds, birds, &c. are surprized by them, they give them a bite, and the poison allows them time to run a little way, or a bird to fly into the next tree; where the snakes watch them with great earnestness till they fall down, and then licking them over with their spawl swallow them; but this does not seem fully to explain the difficulty, since among the squirrels, birds, and other animals frequently found in their bellies, it does not appear that any of them were wounded: nor could they have an opportunity of ever biting them, if it be true that they never bite with their poisonous fangs without first giving warning by rattling their tails.

They have several other snakes which are more frequently seen, some of which have very little or no hurt in them, as the black-snake, the water-snake, and the corn-snake. However, the black-viper-snake and the copper-bellied-snake are said to be extremely venomous. These three poisonous snakes bring forth their young alive, while the other three lay eggs, which are hatched afterwards. There is here also the horn-snake, which is so called from a sharp horn in its tail, with which it assaults any thing that offends it with such force, that it will strike its tail into the butt-end of a musket so far as to be unable to disengage it.

The musketos are less dangerous, but more troublesome, on account of their being more frequent. They are a kind of long-tailed gnat, and are only found in the low grounds and marshes.

The chinch is a kind of flat bug, that lurks in the beds and bedding, and is very troublesome in the night; but every neat house-wife contrives to keep the beds clear of these vermin, by searching for them early in the spring. Seed ticks and red-worms are small insects that are very troublesome by day, as musketos and chinchies are by night. The seed-ticks are no where to be found but in the track of cattle, upon which the great ticks fasten, and fill their skins so full of blood that they drop off; and wherever they happen to fall, produce a kind of egg, which lies about a fortnight before the seedlings are hatched. They then run in swarms up the next blade of grass, and the first thing that brushes the grass gathers off most of these vermin, which stick like burs upon any thing that touches them. Red-worms lie only in old dead trees and rotten logs, and without sitting down upon them in the midst of summer, no person ever meets with them; but a little warm water immediately brings off both the seed-ticks and red-worms, though they be

ever so thick upon any part of the body, and are so small that they can scarcely be perceived; but if nothing be done to remove them, the itching they occasion goes away in two days time.

No place abounds with sea and river-fish more than Virginia. In February, March, April, and May, shoals of herrings come up into the very brooks, some of the size of ours; but most of them are much larger. There are also plenty of cod, and stingrays, a fish peculiar to this country, so called from its having a sting in its tail; it is, however, esteemed good food. In the rivers are sturgeon, old-wife, the sheep's-head, an excellent fish; trouts, and green-fish in great plenty; also plaice, flounders, whittings, carp, pike, mullets, and perch; and for shell-fish they have crabs, oysters, cockles, and shrimps. Of those that are not eaten, here they have in the seas whale and dog-fish. Here is also a fish called the toad-fish, from its swelling monstrously when taken out of the water; and likewise the rock-fish, some species of which are poisonous; though others, which are not easily distinguished from them, are very wholesome food.

Annually in the month of June there are here vast numbers of worms, which enter the bottoms of ships, floops, and boats, wherever they find the coat of pitch, tar, and lime worn off the timber, and by degrees eat the planks into cells like those of a honeycomb. These worms continue upon the surface of the water from their rise in June till the first great rains, after the middle of July; but after that do no great damage till the next summer season, and never penetrate farther than the plank upon which they first fix. The damage occasioned by these worms may be prevented several ways, as by keeping the coat of pitch, lime, and tallow whole upon the bottom of the ship, or vessel; by anchoring the large vessels in the strength of the tide, during the worm season, and hauling the smaller on shore: by running up into the freshes with the ship or vessel; for they never do any damage in fresh water: and by burning and cleaning immediately after the worm-season is over; for then they have but just stuck into the plank, and have not buried themselves in it.

SECT. III.

Of the Divisions, Number of Inhabitants, and Towns of Virginia: A Character of the People: The Form of Government, and Trade.

VIRGINIA is divided into twenty-five counties, namely, James county, which is seated on both sides the river James, Prince George county, Henrico county, Charles County, Surrey, Isle of Wight, Nansemond, Norfolk, Princess Anne, York, Warwick, Elizabeth, New Kent, King William, and Queen, Gloucester, Middlesex, Essex, Richmond, Stafford, Westmoreland, Lancaster, Northumberland, Northampton, and Acomat counties.

The number of inhabitants in this province is about two hundred thousand whites, and it is supposed there are half that number of slaves; yet there are only two towns in the whole country built by the English; these are Jamestown and Williamsburg.

Jamestown, which before the building of Williamsburg was esteemed the capital, is seated on a peninsula formed by James river, about forty miles from its mouth, in the seventy-sixth degree west longitude, and the thirty-seventh degree thirty minutes north latitude, and contains only about eighty or a hundred houses, the greatest part of which are taverns or public-houses for the entertainment of mariners. Its situation is naturally strong, but the fortifications are neglected, the inhabitants thinking themselves perfectly secure from enemies so far up the river.

Williamsburg, now the capital of Virginia, is seated seven miles from the above town, between James river and York river, in the thirty-seventh degree twenty minutes north latitude, and the seventy-sixth degree thirty minutes west longitude; but though it is the seat of the government, where the general assembly or parliament meet,

meet, it scarce contains sixty houses. It has a town-house, and a handsome college erected for the education of the Indians, and also some works raised for its defence. The above college consists of a president, six professors, and one hundred students; and for endowing it king William not only gave two thousand pounds, but granted twenty thousand acres of land, and one penny per pound on all tobacco exported. It has likewise received several other valuable donations, and is upon the whole one of the richest colleges in America.

The inhabitants of Virginia are a chearful hospitable people, and many of them genteel, vain, and ostentatious; they live luxuriously, and generally leave all kinds of labour to their slaves. But though there are not many rich planters in this province, there is scarce a man so poor as to be reduced to a state of beggary; but if any one happens to be disabled by age or sickness from working, he is quartered upon some substantial planter, where he is plentifully provided for at the public expence.

The constitution of the Virginian government resembles that of Great Britain. The governor represents the king, by whom he is chosen; the council answers to the house of peers; and the representatives of the people, elected by the freemen of every county, are their house of commons.

There are only three public officers besides the governor, who have their commission immediately from his majesty, namely, the auditor of the revenue, the receiver-general, and the secretary, in whose office is kept the public records, and all deeds and other writings are there proved. The treasurer of the province is chosen by the general assembly, and receives the money raised by the acts of that assembly.

No other forces are kept in Virginia but militia, of which the governor is by his commission lieutenant-general, and appoints in each county a colonel, lieutenant-colonel, and all other commissioned officers. All freemen between the ages of sixteen and sixty, not otherwise excused, are obliged to bear arms and attend a general muster once a year in the county where they dwell, and four times a year in smaller parties or single companies.

The public revenues are a rent reserved by the crown of all lands granted by patent: a duty of two shillings a hogshead on all tobacco exported: a duty of six-pence a head for every passenger brought into the country: fines and forfeitures: duties on slaves and servants imported, and on foreign liquors: money raised by acts passed in the assembly, and the heavy duties laid on tobacco when exported to Great Britain.

Their county courts have the power of censuring and punishing all masters that do not provide their servants good and wholesome diet, cloathing, and lodging; and these courts have power to redress any grievance servants may have reason to complain of.

The established religion is that of the church of England: every parish has its minister, who has a house and glebe, with about the value of eighty pounds per annum paid him in tobacco, which the church-wardens collect for him. The ecclesiastical affairs are under the inspection of a commissary authorized by the bishop of London, who presides over all the colonies in religious matters. But though full liberty of conscience is allowed to people of all persuasions, there are few dissenters from the established church.

The chief exports from this province are iron, beef, pork, pipe-staves, and other lumber: but, as hath been already observed, all the other commodities of this country are swallowed up in tobacco. It is computed that generally one year with another two hundred large ships are freighted with that commodity, and that a hundred thousand hogsheads are annually exported, each weighing four hundred weight, out of which it is supposed that forty thousand hogsheads are consumed at home, and the other sixty thousand exported from Great Britain to foreign markets, after most of it is manufactured at home.

S E C T. IV.

A concise History of the Settlement of Virginia.

VIRGINIA, which was discovered by Cabot, is the most ancient of our colonies; though the first attempts to settle a colony were not, strictly speaking, made

in Virginia, but in that part of North Carolina which immediately borders upon it. The great Sir Walter Raleigh, when this country was first made known to the English, saw how advantageous it might be made to this kingdom. He was the first man in England who had a right conception of the advantages of settlements abroad, the only person who had a thorough insight into trade, and who saw clearly the proper methods of promoting it. He applied to court, and formed a company, composed of several persons of distinction and some eminent merchants, who agreed to settle a colony in that part of the world, which, in honour of queen Elizabeth, he named Virginia. The ill success that attended the first attempts seemed to give little hopes of their ever being completed: near half of the first colony was destroyed by the Indians, and the rest, consumed and worn out by fatigue and famine, returned home to their native country: the second colony was cut off to a man in a manner unknown; but was supposed to be destroyed by the Indians: the third had the same unhappy fate; and the fourth quarrelling among themselves, neglected agriculture to hunt for gold, and exasperating the Indians by their insolent behaviour, lost several of their people, and the poor remains of them were returning in a famishing condition to England, when just in the mouth of Chesapeake-bay they met the lord Delaware with a squadron loaded with provisions, and with every thing necessary for their relief and defence, who persuaded them to return.

This nobleman endeavoured with the utmost zeal and assiduity to cherish and support the froward infancy of this unpromising colony. After he had prevailed on the people to return, he comforted them under their misfortunes, pointed out their causes, and uniting the tenderness of a father with the steady severity of a magistrate, healed their divisions, and reconciled them to authority and government, by making them feel by his conduct what a blessing it could be made. Having settled the colony within itself, his next care was to put them upon a proper footing with regard to the Indians, who had been too often treated ill, and whom he now found very haughty and assuming on account of the miserable state to which the English had been reduced; but by some well-timed and vigorous, though cruel, steps, awed them into very peaceable dispositions; and having settled his colony in a very thriving condition, retired home for the benefit of his health, which, by his constant attention to business, and the air of an uncultivated country, had been impaired; but left his son, who had his father's spirit, as his deputy, and Sir Thomas Gates, Sir George Summers, the honourable George Piercy, Sir Ferdinand Wenman, and Mr. Newport, for his council.

Lord Delaware on his return to England did not forget the colony. For eight years together he was indefatigable in doing every thing that could tend to the peopling, the support, and the good government of this settlement; and died in the pursuit of the same object in his voyage to Virginia, with a large supply of people, cloathing, and goods.

The colony of Virginia took such vast root under the care of lord Delaware, that it was enabled to stand two terrible storms, in which the injured Indians had nearly cut off that colony, and to subdue them so as to put it entirely out of their power to give the English the least disturbance for many years. After the death of Charles I. Sir William Berkley held out for the crown, till the province was reduced by the parliament.

Soon after the Restoration a rebellion arose in the province, from mismanagement in the government, the decay of trade, and exorbitant grants, which included the settled property of many people; these grievances raised a general discontent among the planters, which was made to blaze out into an actual war, by a young gentleman named Bacon: he had a graceful presence and winning behaviour: he had been bred to the law, had a lively and fluent expression fit to set off a popular cause, and to influence men who were ready to hear all that could be said to colour, in a proper manner, whatever was already strongly drawn by their own feelings. By a specious, or perhaps a real, regard for the public good, finding the governor slow in his preparations against the Indians, who

were then ravaging the frontiers of the province, he took up arms without any commission to act against the enemy. When he had sufficient force for this purpose, he found himself in a condition not only to make head against the Indians, but to give law to the governor, and to force him to give a sanction by his authority to those proceedings, with which he intended to destroy it.

Bacon at length, armed with the commission of a general, marched against the Indians, followed by the whole force of the colony; when Sir William Berkley, the governor, being freed from the immediate terror of his forces, proclaimed him a traitor, and issued a reward for apprehending him. Upon this the people were universally inflamed, and adhered to Bacon, while the governor, who was unwilling to temporize, or yield to the storm, retired over the river Potowmac, proclaimed all Bacon's adherents traitors, put himself at the head of a small body of troops, which he raised in Maryland, and of such Virginians as were faithful to him, and wrote to England for supplies.

Meanwhile Bacon marching to the capital, called an assembly, and for six months together disposed of every thing according to his own pleasure. Things were now brought to a crisis, and hastening to a civil war; when suddenly the public tranquility was restored by Bacon's dying a natural death; for the people being unable to act without a head, proposed terms of accommodation, and peace was restored not so much by the removal of the grievances complained of, as by the arrival of a regiment from England, which remained a long time in the country: and it must be observed, in honour of the moderation of the government, that no person suffered in his life or estate for this rebellion, which was the more extraordinary, as many people were then very earnestly soliciting grants of land in this country.

S E C T. V.

Of NORTH and SOUTH CAROLINA.

Their Situation, Extent, Climate, Soil, and Face of the Country. The many Species of Corn, Plants, and Trees.

THE provinces of North and South Carolina, lying between the thirty-first and thirty-sixth degrees of latitude, are upwards of four hundred miles in length, and in breadth to the Indian nations near three hundred. North Carolina is bounded on the east by the Atlantic ocean, on the south by South Carolina, on the west by the Apalachian mountains, and on the north by Virginia. The coasts are extremely broken by bays, creeks, and rivers, in the openings of which are many bars and shoals, which render the navigation difficult to strangers: there are, however, several safe and good harbours.

The climate and soil of both Carolinas are not very different from those in Virginia; but where they differ it is much to the advantage of Carolina, which, upon the whole, may be considered as one of the finest climates in the world. Indeed the heat in summer is very great, but it exceeds little that in Virginia, and has the advantage of having the winters milder and shorter. However, the weather, though in general serene, and the air healthy; yet, like all American weather, makes such quick changes as obliges the inhabitants to observe more caution in their dress and diet than we are obliged to use in Europe. Thunder and lightning is very frequent, and these, with the southern colonies, are the only ones we have on the continent that are subject to hurricanes; but they are here very rare, and not near so violent as those of the West Indies. Part of the month of March, all April and May, and the greatest part of June, are here inexpressibly temperate and agreeable; but in July, August, and for almost the whole of September, the heat is very intense; and though the winters are sharp, especially when the north-west wind prevails, yet the cold is seldom severe enough to freeze any considerable body of water. It is chiefly felt in the mornings and evenings; for the frost has never sufficient strength to resist the noon-day's sun; so that many tender plants, which do not stand the winter of Virginia, flourish in Carolina.

The whole country, where it is not cleared by our planters, is in a manner one forest. The trees are almost the same in every respect with those produced in Virginia; and by the different species of these the quality of the soil is easily known: thus the ground which bears the oak, the walnut, and the hickory, are extremely fertile; it is of a dark sand, intermixed with loam; and as all the land abounds with nitre, it is long before it is exhausted; for here they never use manure. What is called the pine-barren is the worst, it consisting of a white sand, yet naturally bears the pine-tree and other useful plants; those trees yield good profit in pitch, tar, and turpentine: when this land is cleared, it produces for two or three years together tolerable crops of Indian corn and peas; and when it lies low, and is flooded, answers well for rice; but what is of greatest advantage to this province is, that the worst species of its land is favourable to a species of one of the kinds of indigo, the most valuable of all its products. There is another sort of ground which lies low and wet on the banks of some of the rivers, and is in some places useless; but in others is far the richest of all their grounds, it consisting of a black fat earth that bears their great staple rice, which requires a rich moist soil.

The country near the sea, and at the mouths of the navigable rivers is much the worst; for most of the land there is a pale, light, sandy coloured ground; but the country on your advancing farther into it continually improves; and at a hundred miles distance from Charles Town, where it begins to grow hilly, the soil is extremely fertile, the air pure and wholesome, and the summer heats much more temperate than in the flat country; for Carolina is for eighty miles from the sea an even plain, in which is no hill, no rock, and scarce even a pebble to be found. Whence, from this sameness, it must want the fine effect which its beautiful products would have by a more variegated and advantageous disposition; but nothing can be imagined more delightful than the back country, and its fruitfulness is almost incredible. Wheat grows extremely well there, and yields a prodigious increase. In the other parts of Carolina they raise but little wheat, it being apt to mildew, and spend itself in straw; evils which the planters take very little care to redress, as they turn their whole attention to the culture of rice, which is more profitable, and in which they are unrivalled, they being supplied with what wheat they want, in exchange for this grain from Pennsylvania and New York.

The land in Carolina is every where easily cleared, as there are little or no under-wood. The forests mostly consist of large trees at a considerable distance from each other; so that they can clear in Carolina more land in a week, than they can do in the forests of Europe in a month. Their method is to cut them about a foot from the ground, and then saw them into boards, or convert them into heading, staves, or other species of lumber, according to the nature of the wood, or the demands of the market. The roots soon decay, and before that happens, they find no inconvenience from them, where they have such plenty of land.

In the two provinces of which Carolina is composed is ten navigable rivers, that have a very long course, and a great number of smaller ones that fall into them, all abounding in fish: but in most of the great rivers there are falls fifty or sixty miles from the sea, and as you approach their sources these become more frequent.

We shall now, after dwelling so long on the soil, begin with the produce of this province, and first with the corn.

The wheat, particularly of North Carolina, is very good, and the flour extremely white; rye thrives very well, but they sow very little of it; barley grows much better than might be expected from the manner in which it is managed here; oats also do very well, but the vast plenty of other grain prevents its being propagated in many places.

Here are several sorts of rice, some bearded and others not, besides the white and the red; but the white is the best. The rice of Carolina is esteemed as good as any brought to Europe, and increases so prodigiously, that one

one measure sown yields from eight hundred to a thousand. It grows best in the wet and wild land, that has never been cultivated or broken up before. This anciently formed the staple of this province; but while the rigour of the act of navigation obliged the planters to send all their rice directly to England, to be re-shipped for the markets of Spain and Portugal; the charges incident to this regulation lay so heavy upon the trade, that the cultivation of rice, especially in time of war, when these charges were greatly increased by the rise of the freight and insurance, hardly answered the charges of the planter; but now the legislature permits the inhabitants of Carolina to send their rice directly to any place to the southward of Cape Finisterre; this has revived the rice-trade, and this branch alone of their commerce is at the lowest estimation worth a hundred and fifty thousand pounds sterling a year.

Indian corn, or maize, proves a most useful grain in these parts; it being in great plenty all over the province. Millet also does very well here, especially in light and loose ground: they sow it in April and May, and it prospers best in moist and rainy weather; but the plenty of other grain prevents there being much of it sown; it being only used in Carolina for fattening their poultry. Guinea wheat likewise thrives very well here, and serves for the same use as the former.

There are several sorts of pulse in this province, as the bushel-bean, so called from one bean producing a bushel; the miraculous-pea, which is so called from its long pods and prodigious increase; the bonavis, calivances, nanticoacs, and several other kinds, all of which are excellent food. There are likewise kidney-beans, and the large European bean; but this last degenerates: yet there are several sorts of European peas, which come to as great perfection as in most parts of Europe.

Here are likewise a great variety of garden-roots, pot-herbs, and sallads; with pompions, cashaws, squashes, and many others.

Among the medicinal plants are asarabacca, carduus benedictus, ipecacuhana, saraparilla, bastard china-root, and a great number of others: with the valuable indigo plant, and others used in dying.

The fields and woods are adorned like those of Virginia, with a vast variety of flowers, among which are many of those raised with great care in our gardens, and others peculiar to America.

The forest-trees are likewise very numerous; among these are many kinds of oak, the ash, fycamore, the elm, the beech, four sorts of pine, the service-tree, the maple, horn-beam, and the cypress. This last is not an evergreen in Carolina, the leaves turning red in winter, and not recovering their verdure till the spring. They are the tallest and thickest of any trees in this part of the world, some of them being above thirty-six feet in circumference: the nuts they bear yield an odoriferous balsam used as a cure in all new green wounds, gonorrhœas, and old gleans; and, being drank with Alicant, stop all kinds of fluxes. The planters and Indians commonly make their periaguas and canoes of this wood, and some of these periaguas are so large that they will carry thirty or forty barrels of pitch or tar in them, though formed of one entire piece of timber. Of these trees are likewise made curious pleasure boats.

Here are also in the forests the mulberry, the hickery, which is of the walnut kind, and is of three sorts, the white, the red, and the flying-barked hickery, so called from its brittle and scaly bark; the black walnut-tree, the chesnut-tree, the honey-tree, and the sugar-tree.

The palmeto-tree, when at its full growth, is forty or fifty feet in height, and about two feet in diameter. The leaves grow only in great clusters on the top, and are exactly in the form of a fan.

The sweet gum-tree receives its name from a fragrant gum it yields in spring, by making an incision in the bark and wood. This gum is used internally as a sovereign remedy for several internal disorders, and outwardly for cutaneous complaints.

The black gum-tree bears a well-tasted black berry, and the white gum-tree has flowers in bunches, and its wood beautifully veined, whence several kinds of curious furniture are made of it.

The cedar-tree is here of two sorts, the red and white. The red cedar is encompassed with a vast number of branches, which gradually shortening as they approach the top of the tree, form an exact pyramid. The leaves are small and round, like those of the pine, but shorter and not so sharp-pointed; it bears berries all the year, which are sweet and pleasant to the taste. Of this wood tables and other furniture are made, rooms are wainscotted with it, and of it are made coffins for the dead. It is admired for its fragrant smell, and its durability, for no worms will touch it.

The tulip-tree grows here to so large a size, that the trunk is sometimes above twenty feet in circumference. Some of these trees bear white tulips, and others those that are party-coloured. The wood makes handsome tables, &c.

The bay-tree, and the bay-tulip-tree, are beautiful ever-greens.

The sassafras is very common, and the trunk is sometimes two feet in diameter. The wood, which is light and durable, is, notwithstanding its medicinal virtues, made into bowls, posts, and other things made to stand in the ground.

The sumach-tree grows about nine or ten feet high, with soft and hairy leaves, indented on the edges, and a red ridge running through the midst of them. The flowers which come forth in July are of a greenish yellow, and grow with the leaves in long red stalks in clusters, after which follow small reddish seeds in bunches like grapes. This tree is of great use in Europe in dressing skins, and especially Spanish leather.

Many of the fruits of Great Britain grow wild in the woods, and of these are all the kinds we have mentioned in treating of Virginia; with a number of other American fruits, of which we shall only mention the following:

The papau-tree is only about eight or ten inches in diameter, but has the broadest leaves of any of the trees in the woods of Carolina. It bears a fruit about the bigness of a hen's egg, which resembles an apple, but contains a large stone within it. When it is ripe it is of a beautiful yellow, and as soft and sweet as any fruit can be; of it the planters make puddings, tarts, and many other dishes.

The Indian-fig, commonly called the prickly-pear, is an admirable plant, which grows in great plenty, and seems to be nothing but a multitude of leaves, or a tree made of leaves, without trunk or boughs; for a leaf set in the ground takes root and produces other leaves, growing one above another till they are pretty tall like a tree, the leaves spreading out like boughs. These leaves are long, broad, thicker than a man's hand, of a deep green, and set full of long, sharp, and slender prickles. From the tops of the leaves rise long yellow flowers, resembling those of the pomegranate-tree, after which is produced a fruit which resembles the common fig; but within is full of red pulp of a blood colour, very sweet and luscious; but occasions such a tincture in the urine of those who eat it, that it seems like pure blood, and yet is perfectly innocent. The tops of these figs are encircled with scaly leaves like a crown, in which are contained small grains that are the seeds, which being sown bring forth plants with round bodies like the trunk of other trees, with the leaves growing on them like the former; but if these leaves are plucked off and planted in the ground, they bring forth trees of only leaves. Upon this plant grow certain excrescences, from which are said to proceed the cochineal insect, so much valued for dying the richest scarlet.

S E C T. VI.

Of the Cattle of Carolina, and the Manner in which they are managed by the Planters. Of the wild Beasts, and Insects. A Description of several remarkable Birds; and of the Fishes on the Coast and in the Rivers.

HORNED cattle, horses, and swine multiply surprizingly, there being as great numbers here of each species, as in any province possessed by the English in America. The veal is very good and white; but they gene-

generally preserve their calves to a larger growth, and therefore kill few for the market. The planters make folds adjacent to their habitations, in which they milk their cows every morning and evening; after which they turn them into the woods, where they feed all day. When they return at night, they carefully shut up their calves with a few of the cows in those folds, to protect them from the wolves, and other voracious wild beasts. The calves generally suck the dams all the time they are milking, otherwise the cows would not suffer any one to touch them. Their method of killing the black cattle is generally to shoot them in the fields or in the folds; they then cut off the head and feet, and take out the entrails, which they throw away as useless, except the fat. If the cattle be suffered to live to a proper age, the beef proves as large and as fat as any in the neighbouring colonies. They kill a great number of horned cattle in October and the other cool months, especially when they intend them for salting and exportation; for they are then in their prime of flesh. The exportation of salt beef is one of the great branches of trade of North Carolina.

It is surprising that they have such stocks of cattle, while there are such numbers of wolves, tygers, and panthers; but these are far from being so ravenous as those beasts in Africa; and it must be observed, that they very seldom dare to attempt to kill either calves or foals, for fear of their dams, who vigorously defend them. When a cow sees a wolf or any other ravenous beast near, she gives a signal by bellowing, upon which all the black cattle within her hearing come to her assistance. There are great numbers of horned cattle and horses that breed in the woods, and you may see great droves feeding promiscuously in the savannas among the deer, fifty or sixty miles distant from any habitation.

The horses are well-shaped, swift, and generally about thirteen or fourteen hands high; they will travel incredible journies, though they are never shod, on account of the softness of the ground, which is covered over with grass without any gravel or stones, yet the planters generally use them very ill; and seldom allow them corn after long journies. They frequently tie them to a tree for hours together, and sometimes for a day or two without thinking of giving them any subsistence, on which account they sometimes break loose, and run into the woods, where they remain for weeks together with the saddles on their backs. The horses which they keep in the inclosures, and sometimes feed with Indian corn, are very serviceable in journies and hunting.

When the planters hunt the wild horses in the woods, they go two or three together on horseback, and as soon as they espy a wild horse, pursue him; and indeed their horses are so well trained, that they will neither hurt themselves nor their riders against a tree, and will go full speed for hours together till the wild horse stands still, when one of the hunters alights, claps the bit into his mouth, and a saddle on his back, and rides him to his own, or the next plantation, where he is fed with Indian corn and salt, which in a little time renders him as tame as any in the plantation, and fit to pursue his wild species in the woods at the next hunting-match, or for any other use.

The sheep have generally two or three lambs at a time, and are never suffered, like the other cattle, to ramble in the woods; but are kept in inclosures in the plantations, from whence they come every evening to the planters houses, and at night are put into their folds to defend them from wild beasts. The mutton is generally exceeding fat, and as well-relished as any in Europe. Their wool is fine, and esteemed a good commodity.

There are but few goats in Carolina, they being so mischievous to gardens, orchards and other trees, that the planters are not fond of keeping many of them, though they are as fat, and their flesh as well relished as any in Europe.

The swine are exceeding numerous, and the pork is said to excel in goodness any in Europe. The plenty of acorns, nuts, strawberries, and other fruit with which the woods naturally abound, gives a most agreeable taste to their flesh. The planters export vast quantities of

pork to the West-Indies, and several other places where provisions are scarce.

Among the wild beasts are buffaloes, elks, stags, fallow-deer, bears, and jackalls, panthers, and tygers.

The American tyger is said to be the fiercest animal of this country; his skin is of a fallow colour, most beautifully mottled with several kinds of spots, and larger than a greyhound. These animals are large, strong, and swift; they are never to be met with in the settlements; but more to the westward. The American tyger has a great resemblance to a cat; the tail is very long, and ends in a point: its eyes are bright; and when hungry it will fear neither man nor beast.

The other animals are the mountain-cat, the wild cat, the pole-cat, the minx, the wolf, the racoon, the opossum, beavers, otters, rabbits, squirrels of several kinds, musk-rats, &c. several kinds of mice, alligators, tortoises, or turtle, several sorts of lizards, the rattlesnake, horn-snake, water-snake, and many others of the serpent kind.

Among the insects are plenty of bees, not only in hives but in hollow trees in the woods, wherein are frequently found vast quantities of honey and wax.

The fire-fly lives in the open air, and is so called from its appearing at night, like a shining spark of fire. These are as long as the drones among the bees, but much thicker, and of a brownish colour. Their light is under their wings, and at first sight appears frightful to strangers, though they have no manner of harm in them. Dr. Brickell says, that he has frequently taken them, and breaking off their wings, placed them on a book in a dark room, and whatever way they went, he could plainly see the letters. They appear in May, and remain most part of the summer, when they are sometimes so numerous that the woods seem covered with sparks of fire. They are never seen in the day, but fly all night.

The spider is here a poisonous insect, which hurts by stinging. Of these there are many species; but the most remarkable is the mountain-spider, which is seldom found any-where but in the woods near the mountains. Several sorts of these spiders make their webs so strong, that they often entangle small birds; those persons who have the misfortune to be stung by them are afflicted with different disorders, according to the nature of spiders, that have communicated their poison. Some have violent pains at the heart; others shortness of breath; others trembling, cold sweats, and vomiting; others laughing, singing, with a number of other symptoms that frequently end in death.

The birds of Carolina, are the bald, the black, and the grey eagle; the fishing-hawk, the sparrow-hawk, the ring-tailed hawk, the goshawk, and the herring-tailed hawk, so called from its beautiful forked tail; this last is also named the snake-hawk, from its feeding on snakes, it managing with great dexterity, the largest in these parts. It is of the size of a falcon, and is a much longer bird, of a fine aurora colour, with the pinions of the wings and end of the tail of a jet black. They never appear here but in summer, and are very familiar. They will fly for hours together near the place where the snakes are, till they have an opportunity of killing some of them. They seize it in their talons near the head, and fly and drag it some distance before they tear it in pieces, and then devour it. On account of their destroying these pernicious reptiles, the planters will not suffer them to be killed.

The parakeeto, or parakeet of this province, is a species of the parrot, generally about the size of a small pigeon; it is for the most part of a fine green, only the head and part of the wings are of a beautiful orange colour, and they have thick beaks exactly resembling those of a hawk. They build their nests in hollow trees, in low swampy ground; but never appear abroad in winter. They are very mischievous to orchards, and peck the apples, to eat the kernels; they are very fat in mulberry and other fruit-time, and are excellent food, far preferable to any pigeon. They are often taken alive with traps, and bird-lime, and in two or three days become tame and familiar; but are not so apt to learn to speak as a parrot.

There

There are here falcons, various sorts of owls, the cuckow, the rail, jackdaw, wood-pecker, and magpye, rooks, crows, swallows, bats much larger than those in Europe, martins, nightingales, wrens, larks, gold-finches, wood-peckers, and almost all the small birds common in England.

There are great plenty of wild turkeys, some of which weigh about forty pounds. There are two sorts of swans, the largest of which are called trumpeters, from the noise they make. They come in winter, and remain till February, in such flocks that each side of the fresh water rivers and creeks seem at a distance like land covered with snow. About Christmas they are frequently so fat as to be scarce able to fly; they are larger than those in Europe, and very good meat. In spring they go to the northern lakes to breed. The second sort are called hoopers, from the noise they make. There are likewise three sorts of wild ducks.

Here are pheasants, woodcocks, snipes, curlew, the green plover, the grey, or whistling plover, partridges, turtle-doves, wild pigeons, the will-whillet, which is so called from its cry, and resembles the curlew; the cat-bird, thus named from making a noise like a young cat. The mocking bird, which receive their name from imitating the notes of other birds, is one of the finest singing birds in the world. There are two sorts of them, one has feathers much of the colour of our green plover, with white in the wings, like those of a magpye. This has a more melodious and soft note than the other, and is generally of the size of our thrush. They are fond of the dwellings of men, and frequently resort thither; but though they are bold and brisk, yet they are of a tender constitution; for they neither sing in winter, nor in the midst of summer, and it is with great difficulty that any of them that are brought over, will live in England. They may be bred up tame, and will sing in cages, yet the planters seldom take them, except it be to sell to those trading to Europe. They commonly make their nests, and breed in orchards, and other places near the dwelling-houses, feeding on mulberries, and several other berries and fruit. The other sort is called the ground-mocking bird, and is of a light cinnamon colour; it sings exceeding well; but does not resort to the houses, it delighting to live among the myrtle trees, where it breeds its young.

There are two sorts of red-birds; the cocks of both are of a pure scarlet, and the hens of a dusky red; but one sort has a fine tuft of scarlet feathers on the head, and the other has none. They have strong and thick bills, and are near as large as our black-birds; they whistle and sing like a thrush, but more melodiously. They feed on Indian corn, and several sorts of berries and seeds produced in the country, and, when taken, may be easily rendered tame; but it is said that when they are shut up in cages for some years, they become milk-white, and so stupid that they scarce know how to feed themselves, which is never known to happen while they are in the woods.

Here are also the fieldfare, the throistle, the whipoorwill, so called from its frequently repeating those words; the yellow-wing, whose wings resemble gold; the crane, the stork, the king's-fisher, the pelican, the cormorant, and many others.

Among the fish are several species of the whale, the porpoise, the sword-fish, the shark, the pilot-fish, the devil-fish, so called from a large pair of horns, and being of a monstrous size and strength, the boneto, the drum-fish, of which there are two species, rock-fish, mullets, plaice, soals, shad, skate, thornbacks, eels of several sorts, smelts, herrings, sturgeon, trout, gudgeons, perch, carp, dace, &c. with many sorts of shell-fish.

S E C T. VII.

Of the Persons, Manners, and Customs of the Inhabitants of Carolina; their Diseases, Way of Life, Houses, Diversions, and Trade; their Method of preparing Indigo, Turpentine, Rosin, Pitch, and Tar; with the Goods they import from England.

THE descendants of the Europeans in Carolina are a straight, tall, well-limbed, and active people, whose children are seldom troubled with rickets, or with the many other distempers with which the Europeans are

afflicted. The men who frequent the woods, and labour out of doors, have a brown complexion; but as for the women, who do not expose themselves to the weather, they are frequently very fair, and well-featured; they have bright sparkling eyes, and are as finely shaped as any women in the world. Red-haired people of either sex are seldom born in the country.

The women generally marry very young, some at thirteen or fourteen, and those that continue unmarried till they are twenty, are reckoned old maids, which is here a very indifferent character. The women are very fruitful, most of the houses having a number of small children; and many women from other places, who have been long married without having the blessing of children, have soon after their removal to Carolina become joyful mothers. They seldom miscarry, and have very easy labours.

The children at nine months old are generally able to walk and run about the house, and are as apt to learn as any children in Europe. The girls are, for the most part, handsome and well-featured; they are usually more forward than the boys; and are not only bred to the needle and spinning, but to the dairy and domestic affairs, which many of them, though very young, manage with a great deal of prudence. Both sexes are very dexterous in the management of the canoe, to which they are bred from their infancy.

The planters, from the richness of the soil, live in the most easy and pleasant manner, and you shall seldom hear them repine at any misfortune, except the loss of their friends, there being here plenty of all the necessaries of life. Poverty is here an entire stranger; the planters, who live well, are the most hospitable people that are to be met with, to all strangers, to those who by any misfortune have lost the use of their limbs, or become unable to work, and to such as have no visible way to support themselves. To such objects the country allows fifty pounds a year for their support; so that there are no beggars or vagabonds in the country.

The men are very ingenious in building their canoes and houses; but, for the most part, live in an indolent and luxurious manner, which occasions many diseases among them.

The principal diseases are agues, the cachexy, the cramp, white and bloody-flux, the venereal disease, the yaws, which is of the venereal kind, said to be brought here by the negroes from Guinea, and communicated to several of the Europeans, by cohabiting with the blacks, by which means it is hereditary in many families. The colic, or dry belly-ach, which is often attended with such violent convulsions that the limbs, especially the hands, are so contracted, that they have continued in this condition all their lives. The prickly heat, which sometimes comes in the extremity of the hot weather that suddenly follows the cold, and is attended with extreme itchings all over the body, especially the legs, which if scratched immediately become inflamed, and turn to sores and ulcers.

The established religion is that of the church of England; besides which there are Presbyterians, Baptists, and Roman-catholics, liberty of conscience being fully allowed. Hence the planters live in the greatest harmony imaginable; no disputes now ever arise about their religious principles, they treat each other with friendship and hospitality: yet, with respect to morals, they have in other respects their share of the corruptions of the age; for as they live in the greatest ease and plenty, luxury of consequence predominates, which is seldom without its attendant vices.

Their houses are built after two different manners: the most substantial planters generally use brick and lime made of oyster-shells, there being no stone fit for that purpose at a distance from the mountains. The meaner sort erect theirs with timber, and the outside with clapboards. The roofs of both sorts of houses are covered with shingles. They have generally sash-windows, and large decent rooms, with good closets, and are fond of having a beautiful prospect by some noble creek or river. Their furniture, as with us, consists of tables, chairs, pewter, brass, &c. imported from England; and those in affluent circumstances have tolerable quantities of plate, with other ornaments and valuable furniture.

The cloathing used by the men consists of English cloth, druggets, durois, green linen, &c. The women have silks, calicoes, printed linen, calamancoes, and all kinds of stuffs, some of which are manufactured in the province.

Their diet, as with us, consists of beef, mutton, pork, venison in abundance, wild and tame fowl, fish of several delicate sorts, fruit, several kinds of fallads, good bread, butter, milk, cheese, rice, and roots. Their liquors are principally rum, brandy, malt liquor, which they import, cyder, persimon-beer, made of the fruit of that tree, and cedar-beer, made of cedar-berries; they also make beer of the green stalks of Indian corn; but the common table-beer is made of molasses. They also drink chocolate, tea, and coffee.

The principal diversions are fishing, fowling, and hunting wild beasts, as deer, bears, racoons, hares, wild turkeys, with several other animals. They are very fond of horse-racing, which is performed in a very odd manner; for near each town, and in many parts of the country, they have what is called race-paths, which seldom exceed a quarter of a mile in length, and only two horses start at a time. They are also very fond of gaming, especially cards and dice, at which they play very high. They greatly admire cock-fighting, and procure cocks from England and Ireland. They are also very fond of dancing, at which they will spend many hours together.

They have an annual feast at the wheat-harvest, which is celebrated in the beginning of June, when the planters let each other know that they design to reap that grain on a certain day; some send their negroes to assist, and others go only to partake of the feast; and it is not unusual for people to come twenty or thirty miles on this occasion. The entertainments are grand, and the whole scene pleasant and diverting. This annual revelling is very expensive to the planters; but as it is customary few omit it, nor have they ever these public diversions at reaping any other grain but the European wheat.

The produce of this country for exportation to Europe and the islands are rice, indigo, pitch, tar, turpentine, rosin, tobacco, peas, beef, pork, tallow, hides, deer-skins, furs, cotton, horses, wheat, Indian corn, potatoes, honey, bees-wax, myrtle wax, several sorts of gums, snake-root, masts for ships, planks, and boards of most sorts of timber.

We shall now give an account of the principal manufactures carried on in Carolina, and shall begin with indigo, a dye made from a plant of the same name, which was probably so called from India, where it was first cultivated, and from whence we had for a considerable time the whole of what was consumed in Europe. This plant when grown resembles the fern, and when young is hardly distinguishable from lucern-grass. Indigo is generally planted after the first rains succeeding the vernal equinox: the seed is put into the ground in small straight trenches, about eighteen or twenty inches asunder, and is fit for cutting the beginning of July. It is cut again towards the end of August, and if they have a mild autumn there is a third cutting at Michaelmas. The indigo land must be weeded every day, and the plants cleansed from worms. Each acre yields sixty or seventy pounds weight of indigo, which at a medium is worth fifty pounds.

The indigo when cut is first laid in a vat about twelve or fourteen feet long, and four deep, to the height of about fourteen inches, to macerate and digest. Then this vessel, which is called the steeper, is filled with water: the whole having lain about twelve or sixteen hours, according to the weather, begins to ferment, swell, rise, and grow insensibly warm; at this time spars of wood are run across to prevent its rising too much, and a pin is then set to mark the highest point of its ascent; when it falls below this mark they judge that the fermentation has attained its due pitch, and begins to abate; upon which the manager opens a cock, and lets off the water into another vat, which is called the beater; and the gross matter that remains in the first vat is carried off to manure the ground.

When the water strongly impregnated with the particles of the indigo has run into the second vat, they agitate it till it heats, froths, ferments, and rises above the

rim of the vessel in which it is contained: to allay this violent fermentation oil is thrown in as the froth rises, which instantly sinks it. When this beating has continued twenty, thirty, or thirty-five minutes, a small muddy grain begins to be formed; for the salts and other particles of the plant before dissolved in the water are now re-united, and begin to granulate. When this is completed they let in some lime water from an adjacent vessel, gently stirring the whole. The indigo now granulates more fully, the liquor assumes a purplish colour, and the whole is troubled and muddy; it is now suffered to settle; then the clearer part is permitted to run off into a succession of vessels, from whence the water is conveyed away as fast as it clears at the top, till nothing remains but a thick mud, which is put into bags of coarse linen. These are hung up and left for some time, till the moisture is drained off, and to finish the drying this mud is turned out of the bags, and worked upon boards of a porous timber with a wooden spatula. It is also frequently exposed to the morning and evening sun, but for a short time only, and then put into boxes or frames, where it is again exposed to the sun in the same cautious manner, till with great labour and attention the operation is finished, and that valuable drug called indigo fitted for the market. The greatest skill and care is required in every part of the process, without which there is great danger of spoiling the whole.

In all parts of Carolina, but especially North Carolina, the people make great quantities of turpentine, rosin, tar, and pitch, which are all produced from the pine. Turpentine is drawn by merely cutting incisions in the tree, forming several channels which meet at the bottom in a point, where a receiver is placed. These channels are cut as high as a person can reach with an ax, and the bark is peeled off from those parts of the trunk that are exposed to the sun, that its heat may the more easily force out the turpentine, which flows into the receiver. This turpentine being boiled in kettles becomes rosin.

Tar is made by preparing a circular floor of clay, declining towards the center, from which is laid sloping a wooden pipe, which reaches about ten feet without the circumference. Under the end the earth is dug away, and barrels placed to receive the tar as it runs. Upon the floor is built a pile of dry pine wood split in pieces, and surrounded with a wall of earth, or clay, which covers it all over, except a little at the top, where the fire is at first kindled. When the fire begins to burn they cover this opening likewise, to prevent there being any flame, and to leave only sufficient heat to force the tar downwards into the pipe in the center of the floor. The heat they temper as they please by thrusting a stick through the earth and letting in the air, in as many places as they think proper. Pitch is made by boiling tar in large iron kettles set in furnaces, or by burning it in round clay holes made in the earth.

The commodities they receive from Europe, in exchange for all the above articles, are linens of all sorts, particularly blues, brown and stamped linens, Osnaburghs, men and women's apparel ready made, broad cloth, blue and red stuffs, calamancoes, druggets, kerseys, camblots, all light stuffs for men and women's summer wear, haberdashers goods, stockings of all sorts, a few gloves, thin wigs, linen caps, tobacco-pipes, glass for sash-windows, looking-glasses; all sorts of hard-ware, as knives, forks, scissars, saws, hatchets, chissels, bills, hoes, shovels, wedges, nails; and all manner of tools for carpenters, shoe-makers, and coopers; locks of many different kinds, traps of all sorts, grindstones; all manner of whetstones, guns, powder, ball, shot, flints, paper, ink, saddles, bridles, fish-hooks of all sorts, fans, necklaces, beads, ribbons, thimbles, shoe-buckles, buttons, &c.

S E C T. VIII.

Of the Divisions of Carolina, and its Towns; the public Roads; Regulations relating to Debtors, the transported Felons, and Slaves.

THIS province, as we have already observed, is divided into North and South Carolina; the former extends about three hundred miles along the sea-coast, and

and is separated from South Carolina by an imaginary line drawn in the thirty-fourth degree from the Atlantic ocean to the Apalachian mountains. It is subdivided into fourteen townships. The principal rivers are Ronoac, or Albemarle river, the river Neuse, and Clarendon river, upon which are seated the principal towns in the province, namely, Wilmington, on Clarendon river, which is the largest town in the province, and has much the greatest trade; Neuborn on the Neuse, and Edenton on the river Albemarle; at which three places the general assembly of North Carolina sit alternately for making laws; but the planters being dispersed over the country, none of these towns are worth mentioning. The number of inhabitants are computed to be about seventy thousand whites, and twenty thousand negroes.

The bounds of South Carolina are much reduced from their original extent, Georgia being taken off to the southward, as far as the river Savanna, which runs in a curve round the south and west part of the province, out of North Carolina. The extent of the province upon the Atlantic ocean to the east is upwards of a hundred miles, and west from the sea upwards of two hundred. There is no doubt but that the silk-worm might be employed here to great advantage, here being his natural food in great plenty: indeed some attempts that way have been made with good success.

The only town in either of the Carolinas worthy of notice is Charles Town, one of the finest in North America for size, beauty, and trade. This is the metropolis of South Carolina: it is seated between two navigable rivers, Ashley on the west and south, and Cowper river on the east, in the thirty-second degree thirty minutes north latitude. The streets are wide and straight, intersecting each other at right angles; those running east and west extend about a mile from one river to the other. Its harbour is good in every respect but that of a bar, which hinders vessels of more than two hundred tons burthen from entering. The town is regularly and pretty strongly fortified by art and nature. Here are two very handsome churches built with brick, besides several other edifices for public worship belonging to different sects of dissenters. Near the center of the town is a neat market-house, and at a small distance is the state-house, a handsome and commodious brick building. In the neighbourhood of the town are convenient barracks sufficient for a thousand men. Charles Town contains about a thousand dwelling-houses, four thousand male inhabitants, and six thousand negro slaves: it is the seat of the governor, and the place of meeting of the assembly. Several handsome equipages are kept here; for the planters and merchants are rich and well bred, the people expensive in their dress and way of living, and every thing conspires to render this the liveliest and politest place in North America. However, great part of the town was burnt down on the twenty-first of February, 1741, by which much valuable merchandize was entirely destroyed. It has also frequently suffered by inundations and unhealthy seasons.

The town of Beaufort is seated on the island of Port Royal, on the borders of Georgia, in the thirty-first degree forty minutes north latitude, and a hundred miles south of Charles Town; the island and continent forming a fine capacious harbour of such depth, that it is capable of containing the whole royal navy of England. The island on which the town is seated consists of near a thousand acres, and is navigable all round for boats and periaguas, and one-half of it for shipping, where large vessels may load and unload from the shore. The town, however, is not yet considerable, but bids fair in time for becoming the first trading town in this part of America.

The number of inhabitants in the whole province of South Carolina amounts to about sixty thousand whites, and above double that number of blacks.

The roads are as good as in most parts of the world, and travelling as pleasant, being made broad and convenient for all sorts of carriages, as coaches, chaises, waggons, and carts, especially for horsemen, the lands generally lying level, and the beautiful and delightful prospects affording a high entertainment to the traveller. It is a general rule throughout all North America, that wherever you come to any of these roads, with the trees

marked or notched on each side, it is a sure sign that it is a public road from one Christian town to another.

We shall now give some account of several regulations relating to Carolina in general, and more particularly to North Carolina.

In this country few or no debtors are confined in prison above twenty-four hours; for the sheriff generally takes them home to his house, or takes their word for their appearance at the next court, to be held in any of the precincts or baronies, where they sentence him to become a servant to the creditor for as long a time as they imagine the debt deserves; but if the person has been a planter, and has contracted debts which his misfortunes have rendered him unable to pay, or is in years, they frequently make a collection among themselves, by which means they discharge the debt, or satisfy the creditor; and by these means none are barbarously kept in confinement, and rendered a useless burthen to the public.

To prevent people's spending their time idly in a public-house, it is enacted by the laws of the country, that no person shall be liable to pay above forty shillings for liquor drank in any public-house.

No vagabond or inferior person is suffered to travel through the country without a pass from the governor, or some of the justices of the peace; a regulation that is in some measure necessary, to prevent the transports from Europe running away from their masters.

The convicts transported to these parts from Europe are indentured for a limited time, during which they serve as servants, and are more or less regarded according to their behaviour and the reason of their being transported. As soon as they have fulfilled the obligation of their indenture, their masters are obliged to give each man-servant a new suit of cloaths, a gun, powder, shot, ball, and ten bushels of Indian corn; and by the laws of the country they are intitled to fifty acres of land, which they seldom take up, but dispose of for trifles. Those who have acted with prudence, care, and good conduct while they were servants, if their masters have no employment for them, recommend them to others. Their business is then to mark all the calves, foals, and young pigs with the planter's brand; and this being his chief business, he is allowed for his service every seventh calf, every seventh foal, and half of the young pigs bred during his stewardship; and likewise the seventh part of all sorts of grain and tobacco produced on the master's plantation; and whatever quantity of corn, rice, or tobacco he plants by his own industry at his leisure hours, is all his own property. Thus, in three or four years time, with good management, he may have a sufficient stock of cattle, grain, money, and all other necessaries to enable him to turn planter. But this is the case of very few of those transported hither for their crimes, they being mostly a dissolute, debauched, and indolent people; and if they run away from their masters, they are obliged to serve double the time they are absent after the expiration of their indentures.

Few masters of ships will venture to carry any on board their vessels without obtaining a sufficient security that they are freemen and not in debt, and therefore oblige them to publish an advertisement, some time before their departure, requiring all persons to whom they are indebted to come and receive what is due to them, which is fixed on the court-house door, for all persons to peruse; but if the master of a ship takes away a person bound, or in debt, without first taking these precautions, his person and ship are liable to be seized, and he is obliged to pay whatever the creditors can make appear to be due to them, or any other losses they have sustained, by his taking them away. Notwithstanding the severity of these laws, some of the transports run away; but if they are taken they have neck-yokes put on them, like those worn by the negroes, which they constantly wear till they have given sufficient testimonies of their good behaviour.

There are a great number of negro slaves born in the country, who prove more industrious and tractable than those brought from the coast of Africa; at least being born in slavery, they have never imbibed that love of liberty which is apt to make men restive and stubborn under the galling yoke of oppression. "I have frequently seen them whipped, says our author, to that degree,

"that

“ that large pieces of their skin have been hanging down their backs ; yet I never observed one of them shed a tear, which plainly shews them to be a people of very harsh and stubborn dispositions :” but might he not rather say, that it shews them to be possessed of invincible courage and magnanimity ? The laws against these unhappy beings of our own species are extremely rigorous ; so that if a negro cut or give the slightest wound to his master, or any other Christian, with an unlawful weapon, as a sword, scymetar, or even a knife, and there is blood shed, if it be known among the planters, they immediately meet and order him to be hanged, which is always performed by another negro ; and generally the planters bring most of their blacks with them to behold their fellow-negro die ; and it is not even in the power of the master to save him. Indeed he suffers nothing by the loss of his slave, for the province is obliged to pay him the full value of what the unhappy wretch is judged to be worth.

There are some Christians so charitable as to have the negroes born in the country baptized, and instructed in the Christian faith in their infancy ; but this does not in the least exempt them from servitude, and they are afterwards as far from being at their own liberty, as they would have been had they never been entitled to the name of Christians ; nor does it appear that they afterwards take much care about their being an ornament to that profession.

Their marriages are generally performed with little ceremony ; for the man makes the woman a present of a brass ring, or some other toy, which if she accepts of, she becomes his wife ; but upon any disgust, she returns his present, and then the marriage is dissolved. If after cohabiting with each other for a year or two, a woman has no children by the first husband, the planters oblige them to take a second, third, fourth, or fifth ; a fruitful woman being much valued by the planters. All the children go with the mother, and are the property of the planter to whom she belongs.

Their children are carefully brought up, and provided for by the planters till they are able to work in the plantations, where they have convenient houses built for them, and they are allowed to plant a sufficient quantity of tobacco for their own use, a part of which they sell ; and on Sundays they usually gather the snake-root ; with this and the tobacco they buy hats and necessaries, as linen, bracelets, ribbons, and other toys for their wives and mistresses.

The children of both sexes wear little or no cloaths, except in the winter, and many of the young men and women work naked in the plantations in hot weather, except having a piece of cloth about their waist, and therefore the planters are at no great expence for their cloathing.

Several blacks born in the country can read and write ; others are bred to trades, and prove good artists ; and others are very industrious in improving the plantations, planting rice, corn, and tobacco, and making vast quantities of turpentine, tar, and pitch, they being better able to undergo fatigues, in the sultry heats of summer, than the Europeans. The planters at their death used to make some of their negroes free ; but it is now an established law in some of the provinces, that if they do not quit the country in about eleven days after they have thus obtained their freedom, they become the property of the first person who seizes them. Hence, before the expiration of that short term, they generally either leave the country, or voluntarily become subject to a new master. But it would certainly be more consistent with justice, with the laws of humanity, and with the spirit of the Christian religion, to suffer these negroes, who have from their good behaviour, and the benevolence of their masters, obtained their freedom, to become planters ; to become united to the Christians by the bands of friendship, and by mutual good offices ; and to be allowed all the advantages of freemen. The prospect of such a reward might have a happy effect on the slaves, by making obedience and fidelity the guides to liberty, wealth, and honour ; and the strongest defence of the whites, by having a number of the blacks firmly united in the same interest with them.

S E C T. IX.

A Concise History of Carolina, and of its Settlement, and Progress.

THE extensive territory of the two Carolinas and Georgia are a part of the discovery made by Cabot in 1497 ; but no advantage having been taken by the English in consequence of this discovery, the Spaniards in 1512 attempted a settlement ; but not succeeding, abandoned the country, which lay neglected by the Europeans. Chatillon, the celebrated leader of the Protestants in France, who was not only a great admiral, but an able statesman, procured two vessels to be fitted out for discoveries upon that coast ; probably intending to retire thither, with those of his persuasion, should his brave endeavours to preserve their liberties fail. These ships sailed in the year 1565, under the command of M. Ribaut, and in two months arrived on the coast of Florida, as all this country was then called, from its abounding in flowers.

Ribaut landed in several places to the north of Altamaha river, taking possession of the country in the name of his master, and calling it Carolina in honour of his sovereign Charles IX. He at last settled at the mouth of Albemarle river, and giving the Indians to understand in the best manner he was able, that he and those that were with him were all enemies to the Spaniards, this secured them a friendly reception, and the good offices of the inhabitants ; and he there erected a fort, to which he gave the name of Charles-fort. But soon after a civil war breaking out in France, he was obliged for the want of supplies, to abandon the settlement ; and had he not been so happy as to meet with an English ship from which he procured provision, both he and his people would probably have perished by famine.

The admiral, not discouraged, was so well satisfied with the account they gave him of the country, that in 1564 he fitted out five or six ships, in order to make another attempt to settle a colony. This was accordingly done at the place of their landing in the first expedition. The Spaniards, who had intelligence of their proceedings, dispatched a considerable force to attack the colony, who, not satisfied with reducing it, barbarously put all the people to the sword, after having given them quarter. Not content with this they committed great outrages upon the natives, by both which they paved the way for the vengeance that soon after fell upon them for these unnecessary and unprovoked acts of cruelty : for notwithstanding the admiral and his party were by this time destroyed in the dreadful massacre of St. Bartholomew, and though the design of a colony died with him, one M. de Gorgues, a private gentleman, fitted out some ships, and sailed to that coast merely to revenge the murder of his countrymen and friends. The Indians gladly embraced the opportunity of joining in the punishment of the common enemy. The French and they had laid siege to two or three forts the Spaniards had erected there, took them, and, without mercy, put the whole garrison in each to the sword. The adventurers, satisfied with this action, returned, and happily for us, the French court, blinded by their bigotry, did not understand the advantages that might have been obtained from giving America to the Protestants. Had they taken this step, we should probably have had either no settlements in America, or they must have been small in extent, and precarious in their tenure.

After the French expedition, Carolina remained unnoticed by the Spaniards, French, and English, till Sir Walter Raleigh projected an establishment there, which was afterwards fixed in Virginia, and it was not till the year 1663, that any settled resolution was taken for fixing a colony here. In that year the earl of Clarendon lord high chancellor of England, the duke of Albemarle, the lord Craven, the lord Berkeley, lord Ashley afterwards earl of Shaftesbury, Sir George Carteret, Sir William Berkeley, and Sir George Colleton, obtained a charter from king Charles II. for the property and jurisdiction of that country from the thirty-first degree of north latitude to the thirty-sixth, and being invested with full power to settle and govern

govern the country, they had the model of a constitution framed, and a body of fundamental laws compiled by the celebrated Mr. Locke.

On this plan the lords proprietors themselves stood in the place of the king, and gave their assent or dissent, as they thought proper, to all laws, appointed all officers, and bestowed all titles of dignity; and each lord in turn acted for the rest. In the province they appointed two other branches, which in a great measure resembled the legislature in England. They constituted three classes of nobility: the lowest composed of those to whom they had made grants of twelve thousand acres of land, whom they styled barons: the next order had twenty-four thousand acres, or two baronies, with the title of cassiques, who were to answer our earls: the third had two cassique-ships, or forty-eight thousand acres, and were called landgraves, a title analogous to a duke. This body formed the upper house. The lower house was formed as it is in the other colonies, of representatives from the several counties and towns, and the whole was called not an assembly, but a parliament.

Their first settlement was at a point of land toward the southward, between two navigable rivers, called Ashly and Cowper rivers, where they laid the foundation of a city called Charles Town, the present capital of the province. They expended about twelve thousand pounds in the first settlement; and the lords proprietors observing what advantages the other colonies derived from opening a harbour for refugees, and influenced by the humane disposition of that excellent man who formed the model of their government, gave an unlimited toleration to the people of all religious persuasions. This induced a great number of dissenters, whom the government, contrary to justice and all the laws of policy, treated with a very severe hand, to remove with their fortunes and families into Carolina; and hence they soon became, at least, as numerous as the church-men. But they could not preserve themselves from the jealousy and hatred of those of the church of England, who had brought a persecuting spirit with them from their native country, and having a majority in one of their assemblies, attempted to exclude all dissenters from a right of sitting there. This produced daily dissensions, tumults, and riots, which for many years hindered the colony from making that progress which might be expected from the fineness of the country. The people also fell into disputes with the lords proprietors, and provoking the Indians by a series of unjust and violent actions, gave occasion to two wars, in which, however, they were victorious, and subdued almost all the Indian nations within their own bounds on this side the Apalachian mountains.

These intestine distractions and wars kept the colony so low, that an act of parliament was made to prevent the ruinous consequences of these divisions by putting the province under the immediate care of the crown, and the lords proprietors accepted a recompence of about twenty-four thousand pounds, both for the property and jurisdiction; except earl Grenville, who kept his eighth part of the property, which comprehends near half of North Carolina, on that part which borders on Virginia. Their constitution, where it differed from that of the other colonies, was altered; and the country, for the more commodious administration of affairs, was divided into two distinct independent governments, called North and South Carolina. This happened in 1728. Soon after a firm peace was established with all the neighbouring Indian nations, the province began to breathe and obtain strength on the return of peace and tranquility, and its trade has annually advanced since that time with a rapid progress.

S E C T. X.

Of G E O R G I A.

Its Situation, Extent, Climate, Produce, principal Towns, and Number of the Inhabitants.

GEORGIA received its name from his late majesty George II. It lies to the southward of Carolina, from which it is separated on the north by the river Sa-

vanna; it has the Atlantic ocean on the east; the river of St. John, which divides it from East Florida, on the south; and on the west it is bounded by Louisiana lately ceded by the French.

What has been said of the heat, thunder, and lightning of Carolina, may be said with propriety of them here, Georgia lying still more to the southward. The planters sometimes suffer by thunder and lightning destroying their timber and houses, and its killing their slaves and cattle.

The land lying low near the coast is woody, but at the distance of twenty-five miles begins to rise into hills, which at length terminate in the Apalachian or Alegany mountains. From the foot of these mountains to the coast the country is level. The river Savanna is of such a length, that canoes may sail up it six hundred miles, and boats half that way. The coast of Georgia is defended from the fury of the Atlantic ocean by being lined all along with a range of islands, and both these and the continent being thick set with trees, render the intermediate channel very pleasant. About seventy miles from the shore of Georgia are sand-banks, and the water shoaling gradually till within six miles of land, the banks become so shallow as to be impassable, except in the channels between the bars, which were formerly thought a sufficient security from any attempts of an enemy's fleet, till the Spaniards passed these channels in 1742, and landed in the island of St. Simon, which would have inevitably fallen into their hands, had not their scheme been frustrated by general Oglethorpe.

After passing the bars, ships find a secure and commodious harbour in the mouth of the river Savanna, and south of it is a still more capacious road, named Teky-Sund, where a large fleet may ride in between ten and fourteen fathom water, being land-locked, and having safe entrance over the bar. The flood-tide on this coast mostly rises seven feet.

This province abounds in cattle, and with a multitude of wild beasts, birds, and poisonous reptiles, which are in general the same as in Carolina.

Rice is said to grow here rather better than in Carolina, which, with corn and indigo, may be esteemed its principal commodities. They have made some beginnings towards cultivating the vine; and great expectations have been long raised, of their producing large quantities of silk; this was one of the principal views of the trustees at the first settlement of this province; indeed both these branches may hereafter become considerable, the climate and soil being proper for them, as hath been sufficiently proved by a variety of experiments.

The principal towns in Georgia are Savanna, the capital, seated in the thirty-first degree fifty-eight minutes north latitude. The houses and ware-houses are built at a distance from each other, to prevent the spreading of fire, and form several spacious squares and wide streets. The town is extremely well situated for trade, as the navigation of the river Savanna on which it stands, and from which it takes its name, is very secure, and ships of three hundred tons burthen may lie within six yards of the town, where the worm does not eat into them. In the town is a church, a meeting-house, a wharf, and some other public buildings; and near it the orphan-house, founded by Mr. Whitfield, which is converted into a college for the education of young men for the ministry.

About four miles within land from the river are the villages of Highgate and Hampstead, which lie about a mile distant from each other. The inhabitants settled there apply themselves chiefly to gardening, and supply the town of Savanna with greens and roots.

Two hundred miles farther up the river, which is navigable so far for large boats, is Augusta; which stands upon a spot of ground of the greatest fertility, and is so commodiously seated for the Indian trade, that from the first establishment of the colony it has been in a very flourishing condition, and very early maintained six hundred whites in that trade only: for their trade with the Creeks, the Chickesaws, and the Cherokees is very considerable for skins: they also deal with them for a few furs; but these are of an inferior sort; it being observed, that, by a wise disposition of Providence, the animals

that bear fur have it more thick, and of a softer and finer kind, in proportion as you approach to the northward; for the greater the cold, the better they are clothed.

The inhabitants of this province, who are a mixture of Episcopalians and Dissenters, amount at present to about eight thousand whites, and twenty thousand negroes.

The governor is appointed by his majesty, and the form of government is the same as in the other royal governments, and particularly the two Carolinas, Virginia, New Jersey, and New York.

SECT. XI.

A History of the Settlement of the Province of Georgia.

THE province of Georgia was divided from South Carolina and a settlement begun there in 1732, in consequence of a representation made to his late majesty George II. by some generous and compassionate noblemen and gentlemen, who observing that a considerable number of people in these kingdoms were, by a variety of misfortunes, rendered incapable of subsisting in such a way as to be useful to themselves and the community, formed the design of settling that part of America which properly formed our frontier towards the Spaniards and French; and though within the bounds of the province of South Carolina, was in reality no part of it, as not being at all settled, and therefore rather a burthen than an advantage to the province to which it belonged. They therefore applied to the crown for sufficient power to set this undertaking on foot, and meeting with all the encouragement they could expect or desire, easily obtained a very extensive charter. Their next care was to raise a fund sufficient to send over a considerable number of people, and provide them with all kinds of necessaries, towards which they subscribed liberally themselves, obtained considerable sums by way of collection, and had a grant from the parliament of ten thousand pounds.

In forming the plan of this frontier settlement, it was resolved to consider each settler in the double capacity of a planter and a soldier, and not only to provide them tools for the cultivation of the land, but arms for their defence, and to have them taught the use of both. It was also resolved, that upon the first settling of their colony, towns should be laid out, and lands allotted all the men for their support, as near those towns as possible. It was agreed that every lot of land should consist of fifty acres, and that it should be granted them in tail male, as the properest tenure for the colony in its infancy; and, with respect to any hardships that might arise from this tenure, they determined to remedy them occasionally, till such time as the condition of the colony should render an alteration necessary. They also resolved to prohibit the use of negroes, which they considered as absolutely inconsistent with the design of forming a frontier colony, and in many respects both inconvenient and dangerous.

Having concluded on these dispositions, it was resolved to send over a hundred and fourteen persons, men, women, and children, out of such as were in low circumstances, and on that account unable to follow any business in England, and who if in debt had leave from their creditors to go; and of such as were recommended by the minister, church-wardens, and overseers of their respective parishes; and James Oglethorpe, Esq; one of the trustees, generously offered to go and form the settlement at his own expence. At length the people being examined whether any of them had any objections to the terms and conditions proposed, they declared they were fully satisfied with them, and executed articles under their hands and seals, testifying their consent. But four of them desiring their daughters might inherit as well as their sons, and that their widows dower might be considered, the trustees resolved, that all who should desire it should have the privilege of naming a successor to the lands granted them, who, in case the possessor should die without issue male, should hold the same to them and their heirs for ever; and that the widows should have their thirds as in England: this resolution was immediately

communicated to all the people, who now expressed themselves fully satisfied. The trustees then prepared a form of government, and established under their seal a court of judicature for trying causes, as well criminal as civil, in the town of Savanna, the name given to the first town to be raised: they also appointed a bailiff, a recorder, two constables, and two tythingmen out of such of the settlers as appeared most discreet and prudent.

Mr. Oglethorpe set out from Gravesend with the colony, and arrived at Carolina on the fifteenth of January, 1733. That gentleman chose a pleasant, convenient, and healthful spot ten miles up the Savanna river. While the town was building he kept a strict discipline, allowing none of the people to swear or get drunk; they were debarred the use of spirituous liquors, and instead of rum had English beer. In the mean time some of the land was ploughed up, and part of it sowed with wheat. Two or three gardens were also sowed with pot-herbs, &c. and fruit-trees planted. The limits of the town were palisadoed, and every thing went on with the utmost regularity.

Things being in some forwardness, and every man being appointed his proper station and employment, Mr. Oglethorpe went to Charles Town to solicit succours for his colony, where both the assembly and people in general contributed largely to the assistance of the newcomers. Five hundred pounds of this money he laid out in cattle, and having given directions for whatever his people might want at Charles Town, returned to Savanna.

On his arrival he found that the chiefs of the Lower Creek Indians were come to treat of an alliance with the new colony. He received them in one of the new houses, and in the most amicable and friendly manner concluded a treaty of alliance and trade with them.

This treaty being concluded, Mr. Oglethorpe returned to England, taking with him a number of the Indian chiefs and principal warriors, who were presented to his majesty, and afterwards took a tour through the kingdom. They here desired the trustees that the weights, measures, prices, and qualities of goods to be purchased by them with skins, might be settled: that no body might be allowed to trade with them without a licence from the trustees, that if they were injured they might know where to complain; and that there might be but one store-house in each Indian town for supplying them with the goods they might want to purchase; and that in each the traders should be obliged to furnish them at the fixed prices, alledging that the traders had often, in an arbitrary manner, raised the price of goods, and defrauded them in their weights and measures, which had frequently created animosities between the English and Indians. In compliance with this request the trustees procured several acts of parliament, among which was one for maintaining peace with these Indians, and another to prevent the importation and use of spirituous liquors in Georgia.

Things being thus settled, two embarkations were made the same year, chiefly of Saltzburghers, who, with others that went before, built and settled a town called Ebenezer, upon the river Savanna. The next year the colony of South Carolina sending over a memorial relating their danger from the French and Spaniards, the parliament granted the trustees an extraordinary supply of twenty-six thousand pounds, and very considerable benefactions were made both in Great Britain and Carolina; on which account great numbers of people were sent, chiefly consisting of persecuted German Protestants, and others from the north of Scotland.

Some Highlanders arrived in Georgia in 1735, settled on the river Alatomahar, about sixteen miles from the island of St. Simon, which is seated at the mouth of that river, and there built a town called Darien, which name they afterwards changed to that of New Inverness.

On the sixth of February following arrived four hundred and seventy persons, under the direction of Mr. Oglethorpe, and were settled upon the island of St. Simon, which is about forty miles in extent, has a rich and fruitful soil, and is full of oak and hickory trees, intermixed with meadows. The Creek Indians upon this occasion came down, and claiming a right to the land, were treated with and prevailed upon to agree, that the

English

English should possess it, and all the adjacent islands; which step being taken, the English built there the town of Frederica, so called from prince Frederic, his present majesty's father. And this being then the southern barrier, a regular fortress was built there, strengthened with four bastions and a strong battery; other fortifications were also raised in different places. The colony now became so considerable, as to excite the jealousy of the Spaniards. However, the governor of St. Augustine concluded an amicable agreement with Mr. Oglethorpe and the English colony, upon very safe and advantageous terms; but it soon appeared that this governor was not in the secret of the court of Spain; for the Spanish ministry disapproved of the treaty, and prepared to attack Georgia; on which a regiment of six hundred men was sent over for the defence and protection of the place, and as an encouragement to these soldiers the trustees allowed each of them five acres of land, and after being seven years in the service they should have a regular discharge, and be entitled to a grant of twenty acres.

In the beginning of the year 1737, the parliament granted the trustees twenty thousand pounds more for the farther settling and securing the colony, on which the trustees made another embarkation of persecuted German Protestants, and all the towns laid out in Georgia received great supplies.

In the mean time the trustees, by their letters and instructions to the magistrates, had constantly exhorted and encouraged the people to cultivate their lands; but in 1738, finding that many continued in idleness, they gave orders that none who neglected to cultivate their lands should receive supplies from the stores. Soon after a part of the people sent over a memorial, complaining of the want of a fee simple in their lands, and of their not being permitted the use of negroes. But those who were settled on the frontier, and were consequently most exposed to the Spaniards, having by their industry improved their plantations so as to draw from them a comfortable subsistence, sent over a counter memorial, in which they represented the disadvantages and dangers that would arise from the permission of negroes. However, an almost general spirit of discontent soon prevailed; and tho' such great sums had been expended, and such prudent regulations taken in the settlement of this colony, its progress was far from answering the expectations of the trustees and merchants. The prohibition of rum, tho' specious in appearance, had a very bad effect, the settlers wanting something to support their strength and spirits under the extraordinary and unusual heat of the climate, and where its dampness in several places exposed them to agues and fevers. But what was worse, this prohibition in a manner deprived them of the vent they had for the only commodities they could send to market, lumber and corn, which could sell no where but in the sugar islands; and with this restriction of rum they could take very little from them in return. They were obliged to work themselves, while the natives of Virginia and Carolina were in a much easier situation, and had their labour performed by their slaves. Indeed Virginia and Carolina were originally settled without the help of negroes; but this they did not consider, and they were unwilling to submit to extraordinary hardships, while they found their neighbours in a much more easy situation. Many quitted the laborious life of planters to reside more at their ease at Savanna, by the exercise of their several trades and professions. In short, horse-races and other diversions were soon set on foot, and such a spirit of idleness began to prevail as easily accounted for their eagerness in desiring the use of negroes.

At length a spirit of discontent almost generally prevailed; they quarrelled with one another and with their magistrates; they complained; they remonstrated; and obtaining no satisfaction, many of them left Georgia, and dispersed themselves among the other colonies; so that of above two thousand people, who had been carried thither at a great expence from Europe, in a little time 'tis said that not above seven or eight hundred were to be found in this province: upon which the trustees, in 1752, surrendered their charter to the crown, and the government took the country under their own care; annulled all the particular regulations that had been made; allowed

them the unlimited use of negroes, with the importation of rum, and left Georgia exactly on the same footing with Carolina; since which time it has been gradually, but slowly, encreasing in the number of its inhabitants.

Of F L O R I D A.

Its Situation, Extent, Climate, Soil, and Produce; with a particular Description of the Cabbage-tree, and a concise Account of the tame and wild Animals.

THE country to which the Spaniards have given the name of Florida, and which, by the late treaty, was ceded to Great Britain, was first discovered by Sebastian Cabot, in 1496, eighteen years before it was known to the Spaniards. That nation gave it a very great extent, including under the name of Florida all the country from the twenty-fifth degree six minutes to the thirty-ninth degree thirty-eight minutes north latitude, including Virginia, Carolina, and Georgia; but what is properly called the peninsula of Florida is bounded by Georgia on the north, by the Mississippi and the gulph of Mexico on the west, by that of Florida on the south, and by the channel of Bahama and the Atlantic ocean on the east; extending from Georgia to Cape Florida, between the twenty-fifth degree six minutes and the thirtieth degree fifty-eight minutes north latitude, and its most eastern coast lies in about the eighty-first degree thirty minutes west longitude from London.

The air, though hot, is pure and wholesome, and the soil remarkably rich and fruitful, frequently producing two or three crops of Indian corn in a year, and, with proper cultivation, might be made to bear every sort of grain, &c. It abounds with all kinds of timber, particularly oak, cypress, palms, cedar, pines, and chesnut-trees; but above all sassafras is found in the greatest plenty: excellent limes, mulberries, oranges, peaches, cocoas, and plums, also grow here in great abundance, with many other fruits of a delicious flavour; olives and vines likewise of various sorts are the natural produce of the country, and the land is thought to be as proper for the cultivation of the grape as the warm countries of Europe. Cotton also grows wild here in great abundance; hemp and flax are also very common.

One of the most singular trees in this or any other country is the cabbage-tree, by some authors called the palmeto royal; "and well, says the reverend and learned Mr. Hughes, may it be called royal, from its great height, majestic appearance, and beauty of its waving foliage: neither the tall cedar of Lebanon, nor any of the trees of the forest, are equal to it in height, beauty, and proportion." The trunk bulges out a little near the ground, which gives it the becoming appearance of a substantial basis to support its towering height. It is generally as straight as an arrow; and scarce can a pillar of the nicest order in architecture be more regular, especially when it is of about thirty years growth. It rises above a hundred feet in height, and the trunk near the earth is then about six or seven feet in circumference, the whole body growing tapering to the top. The colour of the bark resembles that of an ash-tree, and is faintly clouded at about the distance of every four or five inches with the vestigia of the fallen-off branches: this colour of the bark continues till within about twenty-five or thirty feet of the extremity, where it alters at once from an ash-colour to a beautiful deep sea-green, and thus continues to the top. About five feet above the beginning of the green part, the trunk is encircled with its numerous branches; all the lowermost spreading horizontally with great regularity, and the extremities of many of the higher branches bend wavering downwards, like so many plumes of feathers. These branches, when full grown, are about twenty feet long, and are thick set on the trunk, rising gradually superior one to another, and the top is terminated by a beautiful upright green conic spire. These branches are decorated with a very great number of green pointed leaves, some of them near three feet long, and an inch and a half broad, growing narrower towards their points, as well as gradually de-

creasing

creasing in length towards the extremities of the branches. It is observed that the lowermost branch drops monthly from the tree, carrying with it an exfoliated circular lamen of the green part of the tree from the setting on of the branches to the ash-colour part. This, and the branch to which it is always fixed, fall together. When the loss of this lower branch happens, the green conic spire, which issues from the center of the uppermost branches, and rises superior to all, bursts, and throws from its side a young branch, which continues the uppermost, till another of the lowermost branches drops off: then the spire sends forth again another branch superior in situation to the last. Thus the loss of the branches below is supplied by those above.

The inside texture of the leaves appears to be so many longitudinal thread-like filaments, which, being spun, are used in making cordage of every kind, as well as fishing-nets. What is called the cabbage lies in many thin, white, brittle flakes, which have something of the taste of almonds, and when boiled has somewhat the taste of a cabbage; but is sweeter and more agreeable.

The sea-coast is very flat, sandy, and full of shoals; and on the level shore are a prodigious number of oysters adhering to the mangrove trees, with which the southern coast is covered. Among the more precious productions may be reckoned cochineal, of which there is both the wild and the cultivated; but the latter is by far the most valuable. The indigo plant grows very plentifully in many of the southern parts of the province. Ambergris is likewise frequently to be met with on the coast, from the most southern cape of Florida as far as Mexico.

Animal food is here in great plenty, and very good in its kind, particularly beef, veal, and mutton. The country also feeds a multitude of swine, the flesh of which is very good, there being no want of acorns, chestnuts, and such food as is proper for their nourishment. Horses are also bred here fit for the saddle and draught, and so cheap, that they may be purchased for any trifle brought from Europe.

The wild beasts found in the country are the panther, bear, catamountain, buffalo, deer, hare, goats, rabbits, beavers, otters, foxes, racoons, flying squirrels, the armadillo, warre, opossum, guano, and several kinds of snakes.

Fowl are here in great plenty, as cranes, wild geese and ducks, herons, turtle-doves, partridges, thrushes, jays, hawks, and crows; the curosoe, the maccaw, the humming-bird, and an almost infinite number of others, some of which have their plumage elegantly variegated. The rivers abound with fish, and also with that destructive animal the alligator.

S E C T. XIII.

East and West Florida separately considered. The Situation, Advantages, and Disadvantages of each.

THE country of Florida is now divided into two distinct governments, under the names of East and West Florida, and we shall begin with the former, on account of its being contiguous to Georgia.

East Florida is bounded on the north by Georgia, from which it is separated by the river St. John; on the east by the Atlantic ocean and the gulph of Florida, which last separates it from the Bahama Islands; on the south by the gulph of Florida, which there separates it from the island of Cuba; and on the west by the gulph of Mexico and West Florida.

The eastern and southern part of East Florida consists of about twenty-four islands of pretty large extent, and a still greater number of smaller ones, all formed by narrow freights and bays, which run in from the west and join others from the south and the east. These freights are improperly called rios, or rivers. One of the principal of the bays is named Laguna del Espiritu Santo, or the lake of the Holy Ghost, which extends from north to south about twenty-seven leagues, and is near eight leagues wide: it has several communications with the bays on the west side of the peninsula, as well as with the gulph of Florida.

Bahia de Carlos, or Charles's-bay, is seated on the west coast, extending about fourteen leagues almost south-east from its entrance, and is about five leagues over in the broadest part; but has only three fathoms water. It has several openings between the islands, the chief of which communicates with the Laguna del Espiritu Santo, just described.

The Bahia del Espiritu Santo is about four leagues to the north-east of the Bahia de Carlos, on the western coast, and is a large and noble bay extending above twenty leagues in length, and six in breadth, where broadest, having from five to seven fathoms water, except at the outlet that goes into the Laguna del Espiritu Santo, where it is no more than two fathoms. This bay, which lies from south to east, is in about twenty-seven degrees thirty minutes north latitude, and is capable of receiving the largest fleet that ever was collected in this part of the world; and may, in case of any rupture, be of great importance to the crown of Great Britain; for the galleons in their passage from Vera Cruz to the Havanna, are obliged, by reason of their north-east trade-winds, to stretch away to the northward, and generally keep as near the coast of Florida as possible.

On the south-east of Florida is a large chain of islands and rocks, called Cayos de los Martyres, which extend in a circular form, in twenty-four degrees forty minutes north latitude, at the distance of thirteen leagues from Punta Florida, the most southern point. In 1733 a fleet of fourteen galleons, on their return through the gulph of Florida for Old Spain, ran foul of these rocks, occasioned by the ignorance of the admiral, Don Roderigo de Torres. One of the captains disobeying the admiral's signals, by that means avoided the danger, and saved his ship; but the other thirteen were entirely lost, with great part of their treasure: and for many years after these rocks were much frequented by the Spanish and Indian divers, who were often so successful as to recover great quantities of dollars.

The soil of East Florida in general is not so good as that in Georgia; but the north part of it adjacent to Georgia is much like it, and may be improved to the same purposes as Georgia, for raising of corn, rice, indigo, and silk; and in the west part of this province is some very good land, capable of being improved to great advantage. However, great part of the coast, both of the continent and the prodigious cluster of islands included in East Florida, is very sandy and barren; but farther within land it is said to be very fertile.

There are some good settlements begun in this province under the direction of colonel Grant, the present governor: there is a prospect of its soon becoming a flourishing province, and as inhabitants are at this time flocking to it from several countries in Europe, it will doubtless be in a short time a place of considerable consequence.

St. Augustine, the principal town in this province, is seated near the borders of Georgia, in the twenty-ninth degree fifty minutes north latitude, and was built by the Spaniards, who surrendered it at the late peace. The city runs along the shore at the foot of a pleasant hill, adorned with trees, and is of an oblong form, divided by four regular streets, crossing each other at right angles. Down by the sea-side, about three quarters of a mile south of the town, stands the church and monastery of St. Augustine. The best built part of the town is on the north side leading to the castle, which is called Fort St. John. This is a square building of soft stone, fortified with whole bastions, a rampart twenty feet high, with a parapet nine feet thick, and is cazemated. The town is likewise fortified with bastions, and inclosed with a ditch: the whole well furnished with cannon. The harbour is formed by the north end of Santa Anastasia, an island nine leagues in length, and a long point of land divided from the continent by the river St. Mark, which falls into the sea a little above the castle. At the entrance of this harbour are the north and south breakers, which form two channels, whose bars have from eight to nine feet water over them at low tide. On the north and south are two Indian towns without the city walls.

The exports at present from East Florida are but small, the produce of their trade with the Indians being the chief

chief they have to spare; for as the country was four years ago almost entirely uncultivated, and there are but few inhabitants, no great improvements can yet be expected.

West Florida is bounded on the eastward by East Florida, on the south by the gulph of Mexico, on the west by the river Mississippi, and on the north by the country of the Chickataws; and is a narrow slip extending from east to west along the coast of the bay of Mexico. It was seized upon by the French, who begun a settlement at Pensacola in 1720, and enjoyed it till the treaty of Fontainebleau in 1763, when it was ceded to his Britannic majesty, who formed it into a distinct government.

Captain Robinson, who took a view of this country so lately as the year 1763, says, "the country all round is wonderfully delightful and fertile, and about Pensacola abounds with various herbs, shrubs, evergreens, and meadows well stocked with cattle. From Pensacola, he adds, I coasted eastward for two hundred miles, in a brigantine, to St. Mark d' Apalaché, scarcely ever losing sight of land. We were becalmed so close to the shore as to be able to pitch a biscuit upon it, near forty miles east of Pensacola, the firmament being very serene. In this state I stood contemplating on the rich and bountiful hand of nature: looking which way I pleased, I was equally attracted with a view of the most ravishing prospects. The shore level, rising gradually into eminences, clothed with the finest verdure and spontaneous productions, interspersed promiscuously, as mulberries, cedar, coco, vanilla, moho, cabbage-trees, &c. the last towering their round tops above the rest, as if conscious of their sovereign dignity. About sixty miles farther east we were again impeded in our voyage by the same cause, close to the pleasant little town of Santa Joseph. We made no stay here, by reason the wind was up very soon, but the face of the country is as before described, only a few miles round St. Joseph it is somewhat more mountainous. Soon after we arrived at St. Mark d' Apalaché, the second town in Florida, on the northern extreme of Apalachy-bay. In sailing along to the above place, the coast was much the same as already mentioned. This town is exceedingly beautiful and pleasant, standing on the slope of a hill, and tolerably regular built of stone, except some few baracas. Here are two convents, one of Jesuits, and the other of Franciscans: the exterior parts of the town are fortified in the Spanish mode, rather as a defence, I suppose, against the natives, than the Europeans. From the excellent and central position of this fine port, it carries on a good trade in its own river, and the interior parts as far as the Apalachian mountains. It is looked upon to carry on more commerce than all the other settlements in Florida put together.

"Curiosity induced me one day to take a journey of eight or nine miles into the country. I found abundance of extreme fine mulberry-trees, larger than any I ever saw in Italy: the leaves are well known to be the food of the silk-worm, the climate and all other necessities being adapted for their nourishment: nevertheless, it remained unregarded by the Spaniards, though it has produced, ten years ago, silk as good as any in Europe. On my return to the town of St. Mark d' Apalaché, I met with exquisite grapes interspersed up and down, exceeding the muscadine in bulk, and with something of their flavour."

There are at present in this province about six thousand inhabitants; but their number is increasing very fast, it being more healthy and inviting than East Florida, especially in the western parts near the bank of the Mississippi; and it is not to be doubted but that in a few years this will be a rich and flourishing province.

The principal town in West Florida is Pensacola just mentioned, seated on the island of Santa Rosa, which is thirty-three miles in length, and separated from the main land by a channel half a league over, but only navigable for small boats. The landing-place is within the bay in very shallow water, the town being seated on a sandy shore as white as snow, that can only be approached by small vessels. The road is, however, one of the best in all the gulph of Mexico, in which vessels may lie in

safety against every kind of wind. The bottom affords excellent anchorage; and the sea, which is never agitated, on account of its being surrounded by the land on every side, is capable of containing a great number of ships. Pensacola was lately defended by a small fort surrounded by stoccadoes, and the principal house is the governor's, which is a very handsome building, adorned with turrets on the top. As many of the French who inhabited this town before the treaty have chosen to become British subjects for the sake of keeping their estates, this will contribute to the speedy peopling this province, where there are several other small towns; the inhabitants already carry on a considerable trade with the Indians, and export great quantities of skins; the French inhabitants also raise a great deal of rice.

S E C T. XIV.

The Persons, Dress, Manners, and Customs of the Indians of Florida.

THE Indians of Florida are of an olive complexion; their bodies are robust, and finely proportioned; but both sexes go naked, except having a deer skin round their waist. They stain their skin with the juice of plants; and have black and long hair, which they have a method of twisting and binding upon the head so as to render it very becoming. The women, who are handsome and well shaped, are so active that they will climb with surprising swiftness to the tops of the highest trees, and swim across broad rivers with their children on their backs. The men make use of bows and arrows, which they manage with great dexterity; the strings of their bows are made of the sinews of stags, and they arm the end of their arrows with sharp stones or the teeth of fishes.

With respect to their religion, they worship the sun and moon, and have an extreme aversion to all Christians, which is the less to be wondered at, as the horrid cruelties exercised by the Spaniards on the natives of the adjacent island of Cuba, and other places, could not fail of exciting the utmost abhorrence and dread in their minds. The Spaniards, according to their usual custom, charge them with many vices, in order to cast as fair a colour as they can over their inhuman behaviour to the Indians, both of this and other countries, whom they first butchered, and then represented as savage barbarians, in order to palliate the crime, and in some degree apologize for such cruel proceedings.

Their œconomy, with regard to the management and distribution of their corn, which is accounted the common stock of the public, is worthy of notice. The crop, which is calculated to serve only half the year, is collected into granaries appointed for that purpose, and afterwards regularly delivered out to every family, in proportion to the number of persons it contains. The soil is indeed capable of affording much more corn than they are able to consume, but they choose to sow no more than will serve them for that term, retiring for the remainder of the year into the deep recesses of the forests, where they build huts of palm-trees, and live upon roots, wild-fowl, and fish. They are also very fond of the flesh of alligators, the young of which are delicious, but have a strong musky smell. Their meat is dressed in the smoke upon a gridiron made of sticks, and water serves them for their common drink.

The people are in general satisfied with one wife; but the chiefs are indulged with more, though the children of only one of them succeed to the father's dignity.

The government of the Floridans is in the hands of many chiefs, who are called cassiques: they are generally at variance and at war with each other; but this is far from being carried on in an open manner; on the contrary, they usually make use of surprize, or stratagem, exercising great cruelty upon such as they take prisoners, yet spare the women and children, whom they carry off and settle among them. When they have obtained a victory, they at their return home assemble all their friends, and feast three days and nights, spending the time in singing and dancing. In their war-like expeditions they carry with them honey and maize, and sometimes

times fish dried in the sun. The chief marches at their head, carrying a club in one hand and a bow and arrows in the other; his quiver hangs at his back, and the rest follow tumultuously with the same arms. They make their attacks with a horrible noise, not unlike the war-whoop of the Indians of the Six Nations.

They, however, attempt nothing rashly; but previously hold a consultation, having a sort of council, which consists of twelve or fourteen chosen members, who have remarkably distinguished themselves by their bravery in war, and have a considerable influence upon that account. They assemble daily at the hut of the chief, who has a higher seat than the rest, entering according to seniority, and with their hands thrown above their heads each sing their *Ha he ya*, while the rest join with *Ha ha*; after which they all take their seats. If the matter in debate be of great moment, their priests, who are also a kind of conjurers and physicians, with all who are distinguished by their great age, are called in, and their opinions particularly asked. Then the cassique carries round a kind of liquor like our tea, made by the infusion of the leaves of a certain tree.

The burial of a deceased cassique is celebrated among them with great solemnity: they place upon his tomb the bowl out of which he was accustomed to drink, and stick innumerable arrows in the earth around him, bewailing his death for three days with fasting and loud lamentations: the generality of them also cut off their hair, as a singular testimony of their sorrow. Their chieftains also set fire to and consume all the arms and household-furniture, together with the hut that belonged to the deceased; after which some old women are deputed, who every day, during the space of half a year, at morning, noon, and evening, bewail him with dreadful howlings: a custom that has been formerly practised among some of the most civilized nations, particularly among the Romans, who frequently hired women to weep at the funerals of their friends and relations.

SECT. XV.

Of the Country in the back Settlements on the Banks of the Mississippi, the Misauris, and the Ohio.

THE river Mississippi rises on the southermost part of the Central Mountains already described, and has a course of three thousand miles before it enters the gulph of Mexico. It rises from a lake of a considerable size, opposite to which is an opening in the mountain, from which a large stream flows to the lake, carrying with it a red sulphureous substance, by which the water is tinged, and on this account it is called the Red Lake. This lake has on its south and south-east sides a fine fertile country.

The Mississippi runs nearly south-west from this lake for upwards of two hundred miles, where it is joined by a small stream from the westward; and then turning nearly south-east for above three hundred miles, is joined by the Muddy River, and before that by another not so large, flowing to it from the north-east. The Muddy River rises from the south of the Central Mountains out of a large bog, and runs south, inclining to the west, till it meets the Mississippi, which, after its junction, is near two miles wide. The current from the head to this place is generally pretty rapid, and has frequent and large falls; but the country on both sides of the river, and of the branches that flow into it, is exceeding fine and fertile: the timber lofty, but thin, and the trees scattered at a distance from each other: the plains large and beautiful: the air and climate, even quite to the head, moderate and agreeable: the winters short and rarely severe; though farther eastward, in the same latitude, they are quite the reverse; and the farther you travel to the westward, the more mild and temperate it grows, and the country is more agreeable and fertile. The lakes and the rivers here abound with fish, and the wild oats, or rice, grow here in great plenty. On the wide extended plains are a multitude of wild cattle, and great plenty of deer, elks, and buffaloes, with some beavers, hares, and panthers. Here are wild-fowl in abundance, especially

turkies, and another kind of wild-fowl, much larger and nearly as tall as a man: they run very swift, but cannot fly, except it be from some eminence, and a small distance at a time.

This fertile country is at present inhabited by a nation called the White Indians, from their having a much fairer complexion than any other of the original inhabitants of the continent. This nation is so numerous as to be able to raise between twenty and thirty thousand men. They use no weapon but bows and arrows, tomahawks, and a kind of wooden pikes; on which account they frequently suffer greatly in battle, when attacked by the eastern Indians, who have the use of fire-arms, and frequently make excursions against them, killing and taking prisoners great numbers of them. These Indians dwell together in large towns, and have commodious houses; they raise Indian corn, tame the wild cows, and use both their milk and flesh; they keep a great number of dogs, and are very expert in hunting; but have little or no commerce with any other nation known to the Europeans.

The Mississippi, from the place where it is joined by the Muddy River, runs near two hundred miles to the south, with a strong and in some places a rapid current: it is then joined by a large river from the west, which rises four hundred miles from the Central Mountains; its waters chiefly rise from the north and north-easterly part of the Misauri ridge, a double chain of mountains so called, that extend towards the isthmus of Darien. This is named by the Indians the Bloody River, on account of the long and bloody wars that have happened between the Indians here and those to the eastward. Four hundred miles farther down, another river flows in from the north-west, that rises near the Bloody River. The two last rivers are both inhabited by the Illinois Indians, who likewise possess the western banks of the Mississippi for several hundred miles, till you come to a river that flows into it from the east, and rises near the Green-bay, having but a short carrying-place to the stream that discharges itself into that bay, and to another that falls into Lake Meshigan, near Fort St. Joseph. The country near this branch of the Mississippi was once inhabited by the Illinois, but they are now mostly retired to the west side of the Mississippi, only a few still remain at the mouth of the above river, where the French had likewise begun a settlement, which extended fifty miles along the Mississippi, and a considerable way up the river Illinois. There they raised excellent tobacco, and carried on a large trade with the Indians up the Mississippi and on the lakes. They likewise raised excellent wheat, barley, and other corn; and had formerly a good fort here, well garrisoned for their protection. Since this place was ceded to the crown of Great Britain, the French settled a garrison on the other side of the river, where the greatest part of the inhabitants have retired; but as there were a considerable number of Germans among them, they chose to stay on this side, and become British subjects. Near this fort is a village of Indians, but their largest settlement is on the west side, some miles above this, where they have a town, in which are contained near eight thousand men. They have also many large towns on the branches that fall into the river from the west.

These Indians live very comfortably, have pretty good houses, and make great use of horses; their country also abounds with buffaloes, deer, elks, &c. The soil and air are agreeable and pleasant: in some parts the trees are tall and handsome, and in other parts, for several hundred miles, there is scarce any timber to be found.

About a hundred and fifty miles below where the Mississippi is joined by the Illinois on the east side, the Misauris falls into it on the west. This last river rises from the east and south-east of the above Misauri ridge of mountains, in many different streams, for near a thousand miles on this side, which unite with each other at different places, and, after an easterly and south-easterly course of near two thousand miles, flow into the Mississippi.

It is perhaps impossible to find a finer country in any part of the earth, than that which is extended on each side of the Misauris, with respect to the salubrity of the air or the fertility of the soil. There are in this country near

near a thousand Indian towns, the inhabitants of which are called the Misauri Indians, and are able to raise a great number of fighting men; these people have nearly the same manners and customs as the Illinois, who are also very numerous. The goodness of the country they both inhabit, must render life easy and agreeable to persons who, like them, are content with gratifying the demands of nature, without endeavouring to encrease these demands, by studied refinements in dress, equipage, or the modes of living. Health, joy, peace, and plenty, seem here to take up their abode; while care, anxiety, ambition, and the love of gold seem banished from this happy region.

The Mississippi, after being joined by the Misauris, is about six miles wide, and continues its course southerly, no considerable stream falling into it after this, for between two and three hundred miles, when it is joined by the Ohio. The country on each side the Mississippi to this place is exceeding fine, nearly resembling that just described; but it enjoys a somewhat warmer climate. It is claimed by the Tweeghtwees, or Yeahtanees, on the east side down to the Ohio, and eastwardly from the Mississippi as far as the Wabach.

The Ohio rises in several branches, one of which is near Presque Isle, within six miles of the Lake Ontario. About ten miles down this branch stood Fort Du Beauf, from which place it is navigable for canoes and small boats quite to the mouth. The course of this branch is southerly for seventy or eighty miles below the last-mentioned fort, where was another fort called Venango; but both this fort, with that of Presque Isle and Fort Du Beauf, were all destroyed by the Indians in 1763. About twenty miles above this last fort are several little towns of the Mingos, who now belong to the Five Nations. Opposite to Venango fort this branch is joined by another large one from the north-east, which rises in the country of the Five Nations; and about half way from thence to Fort Pitt is another, which joins it from the north-east, and after their meeting it is called the Ohio, till you come to Fort Pitt, where it is joined by the Monongahela, which rises from the west side of the Allegany mountains in a great number of small streams, that soon unite and form this river.

Fort Pitt stands upon a point of land between the rivers Monongahela and Ohio, and is a regular well-built fortress, kept in good order, and well garrisoned: it is a very necessary post for the protection of our frontiers; and indeed there are none in this country more so, except Niagara and Detroit. Near Fort Pitt is a good coal-mine, made use of by the garrison for fuel; but what is a still greater advantage, the country is extremely well watered by springs and rivulets, and has an easy communication with the sea down the Mississippi, and with great part of the interior country of North America by its several branches, the Wabach, Misauris, Yeahtanees, the Ohio, &c. and with the great lakes by the way of Presque Isle, where, at a small expence, the waters of the lake might be turned into the Ohio; and even at present the carrying-place extends but a small distance.

From Fort Pitt the general course of the Ohio inclines to the south for near a thousand miles, according to the course of the river. At Fort Pitt it is a mile wide, but grows much wider before its junction with the Mississippi, it being joined by several streams in its course thither.

The country between the lakes and the junction of the Ohio and Mississippi for several hundred miles, and all the country between Fort St. Joseph and the Green-bay, and between Detroit and the Illinois, and even much farther north than Detroit, is level, and has excellent soil; the climate is healthy and agreeable, and the winters short and moderate: its natural productions are numerous and valuable: it is sufficiently, but not too much, covered with trees, which are tall, beautiful, and fit for building; and, in short, no country in the world is capable of richer improvements.

Below the river Ohio on the east side of the Mississippi,

down to its mouth, the country is possessed for near two hundred miles to the eastward by the Chicketaus, a nation that can raise ten thousand fighting men. This country is indeed sandy, and inferior to that just described; but it produces rice and indigo in great perfection, of which the French have made sufficient proof.

The Chicketaus generally dwell in large towns near the banks of the Ohio, on the streams that fall into that river on the east. Their houses, though not very handsome, are pretty compact, in order to secure them against the Musketoos, which at some seasons of the year are very troublesome. They keep cows, hogs, and horses; and the latter in great abundance. They likewise raise plenty of corn, beans, and potatoes; but have little game, except deer.

The Cherokees dwell at the south-west end of the Apalachian mountains, from the head of the river Tanefee, which flows into the Ohio, about a hundred miles before its confluence with the Mississippi. Their country extends in length about four hundred miles from the north-east to the south-west, and is about two hundred miles wide. It is very mountainous and difficult of access every way. They live in as good order as any Indians on the continent, building their houses with wood, and covering them with clay mixed with straw, in such a manner as to render them close, warm, and comfortable. They have many small towns dispersed among the mountains on the branches of the rivers Tanefee and Savanna. They have great plenty of horses, some black cattle, and many swine. These people raise a great deal of corn, and fence in their fields, which is practised by no other Indians. They have also orchards of peach-trees, and keep poultry. They attend to gardening, and are likewise very famous for hunting, their country abounding with deer, elks, and bears; and they have plenty of turkies in the vallies between the mountains. The Cherokees can raise about two thousand fighting men.

The river Tanefee is entirely uninhabited below the mountains as far as its confluence with the Ohio; yet the country is claimed by the Chicketaus, a brave warlike people, who have only one town, which is seated on a plain, by a small creek that rises about thirty miles to the south of the Tanefee. Their town is picquetted in, and defended by a fort. Their houses are built in much the same form as those of the Chicketaus. These people raise a great deal of corn, have some black cattle and swine, and a considerable number of horses; but can only raise five hundred fighting men.

To the south-west of the Cherokees live the Creek Indians, who are seated partly between them, the Chicketaus, and Georgia, in a level country. They can raise about two thousand fighting men, and live in the same manner and have the same commodities as the Cherokees and Chicketaus. All the country of the Creeks are infested with alligators and snakes of a very large size; and at certain seasons of the year they are much plagued with the musketoos.

The soil is good from the Misauris down to the west side of the Mississippi, till you come near its mouth. The French had lately a settlement a little above its confluence with the Ohio on the west side: about a hundred miles farther down another scattered settlement of theirs begun, and was continued for near a hundred miles, from whence to New Orleans it is better settled. The produce of this country is rice, Indian corn, and some wheat. The isle of Orleans is a very beautiful and fertile spot, on which the French had, if they have not still, a considerable town; and their number in this province is said to amount, at the time of the late peace, to about a hundred thousand persons. The negroes are also very numerous, and the soil towards the south proper for producing rice and indigo, and towards the north for raising wheat.

Having now described the provinces of North America subject to Great Britain, we shall proceed to the West Indies; but shall first give a Description of Bermudas, or the Summer Islands.

C H A P. IV.

Of the BERMUDAS, with a Description of the WEST INDIAN Islands belonging to GREAT BRITAIN.

S E C T. I.

Of the BERMUDAS, or SUMMER ISLANDS.

Their Name, Situation, Number, Extent, and Climate; a particular Description of the Soil, Vegetables, and Animals, particularly of the Island of St. George; with the Manners of the Inhabitants.

THE Bermudas, or Summer Islands, received their first name from their being discovered by John Bermudes, a Spaniard, in the year 1503, after which they were frequently touched at by his countrymen in their passage to the West Indies. They received their second name from Sir George Sommers, who was shipwrecked upon them, with Sir Thomas Gates, in 1609, in their passage to Virginia. These islands are very numerous, but lie pretty contiguous to each other, and are supposed to amount to about four hundred; but most of them so small and barren as not to be habitable. They lie in the thirty-second degree twenty minutes north latitude, and, according to the most accurate observations, in the sixty-fourth degree forty-eight minutes west longitude. Their greatest extent, which is from the north-east to the south-west, is computed at about twenty miles, and their greatest breadth about five: however, scarce an eighth part is inhabited. Their distance from the Land's-end is computed between fifteen and sixteen hundred leagues, from the Madeiras about eleven or twelve hundred, and three hundred from Cape Hatteras in Carolina, which is the nearest land to them. All these islands, except St. George's, St. David's, and Cooper's, have only a few houses scattered up and down.

St. George's, the largest of these islands, is only about sixteen miles in length, and not a league over in the broadest part: but is fortified with rocks every way, extending far into the sea. To its natural strength the inhabitants have added several good forts, with batteries and other out-works, especially towards the east, where it lies most uncovered, so well disposed, that they command the several channels and inlets on that side. There are only two places at which ships can safely enter, and the rocks lie so thick that, without a good pilot from the shore, a vessel of ten tons burthen could not find the way into these harbours, which being once known the largest ships in the world may enter: but they are so well fortified, that should an enemy, assisted by the most skilful pilots, attempt either of them, they might be easily kept out. Indeed all the islands in general are so environed with rugged and dreadful rocks, that they seem to threaten all the ships that venture near the coast with present destruction; and so many have been wrecked upon them, that the Spaniards gave them the name of Los Diabolos, or the Devils.

The air of these islands has been always esteemed extremely healthful, and the appearance of every thing in St. George's island, and the other fertile ones, is perfectly delightful, whence people have been accustomed to remove thither from the other colonies, in order to repair their broken constitutions. The heat in summer is very supportable, and with respect to winter it is here unknown; some even affirm, that there is but one season, and that there is here a perpetual spring, in which the trees never lose their verdure; for though the leaves at one time of the year fall off, others have first budded out: but, notwithstanding the fineness of the climate, these islands are subject to storms of thunder and lightning.

The country is mostly mountainous, but has some fertile plains. The earth is of various colours, but the brown is esteemed the richest; the whitish, or sandy, is

reckoned the next; and the reddish the worst. Upon the whole, the soil, though thin and very stony, is rich and fruitful; but their water is generally brackish, except what falls from the clouds, and is preserved in cisterns.

Maize, which is the principal support of the people, is twice reaped; for what they sow in March, they reap in July: in a fortnight after they sow again, and reap in December. They also raise some tobacco. The cedars of these islands are said to exceed all those of the other parts of America, particularly in their fragrantcy, durableness, beauty, and the hardness of the wood; and they are here in such plenty, that this wood answers in all respects our oak timber; for they not only build their best sloops, brigantines, and other vessels with it, but some of their houses, churches, and other public buildings. Their palmeto, which is a kind of wild palm, is no less useful and common. Its fruit, which in colour, shape, and size resembles our damson, is very delicious; the wood is serviceable for building and fuel, and the leaves, which are generally between eight and ten feet long, serve to make a very good covering for their houses. The date, or palm-tree, likewise yields a fine fruit, and their forests abound with variety of odoriferous and medicinal woods, some black, others yellow, and some red. The berries of these last trees have the styptic quality of a sloe, and are much used by the English to cure the flux, which they frequently get by eating the luscious palm-berries, and other rich fruits. All European and American trees are said to grow here in great perfection, especially the mulberry, olive, laurel, Barbary pear, and orange-trees, which are peculiarly excellent; the fruit, in point of size, scent, and flavour, far exceed those either in the East or West Indies. They have also a very singular plant called the Summer Island red wood, the berry of which is as red as the prickly-pear, and gives the same kind of tincture; out of it come worms, which turn into flies, that are somewhat larger than the cochineal fly, and have a medicinal virtue much exceeding it. They have also a plant called the poisonous-weed, that grows much in the same manner as our ivy; but this is the only noxious thing in any of these islands.

With respect to quadrupeds, there were none in the Bermudas but hogs, when Sir George Sommers was shipwrecked there, and these he found by sending out two or three of his own to feed, which rambling home, a huge wild boar followed them, and being killed, was found excellent meat. The hogs they afterwards killed were all black, whence it is concluded that the Spaniards left them there to breed, they being of the same kind with those they carried to the continent of America. They have also all the other species of European cattle, but they are not very numerous.

These islands abound with a prodigious variety of fowl, as swans, widgeons, herons, ducks, snipe, teal, moorhens, bitterns, osprays, baldcoots, cormorants, and hawks of all sorts; bats, owls, and other birds of the night are also very common, and there are multitudes of small birds. The English at their first coming found a kind of water-fowl peculiar to those islands, called cowkees; they breed in the holes of the rocks, and in burrows like rabbits. This bird is of the size of a sea-mew, and being of so gentle a nature as to be easily caught, and being also very good to eat, such numbers have been taken of them that they now are become scarce. Here are likewise found the trumpet-bird and the pemlico, the last of which is seldom seen in the day-time.

The insects in these islands are generally the same as in our other plantations, except the spider, which is thought to be larger here than in any other country in

the world; but the beautiful colour with which they are adorned takes off very much from that distaste which otherwise the sight of creatures of this kind, and of so enormous a size, would naturally occasion.

It has been already observed, that the number of these islands is uncertain: the principal of them are St. George, St. David, Ireland, Somerset, Long-island, Bird-island, Cooper, and Nonfuch. We have also observed that the first of these is the most considerable; it is therefore here proper to add, that it is divided into nine districts, called by the inhabitants tribes; namely, St. George's tribe, Hamilton's tribe, Smith's tribe, Devonshire's tribe, Pembroke's tribe, Paget's tribe, Warwick's tribe, Southampton's tribe, and Sandy's tribe. All the inhabitants of the lesser islands are ranged under one or other of these eight tribes, and the number of people in all the islands is computed at about ten thousand.

St. George, the capital town, is seated at the bottom of a haven in the island of the same name, and is defended by seven or eight forts mounted with about seventy pieces of cannon. The town has a handsome church, together with a fine library, with a noble state-house for the meeting of the governor, council, and assembly, and about one thousand houses more very neatly built.

The government is like that of Virginia, Carolina, Florida, &c. the crown appointing the governor and council, and the representatives of the people composing the assembly. They are said to have fewer bye-laws than any of our settlements, which may be imputed to the smallness of their trade; for this country produces no considerable commodity by which the inhabitants can obtain riches; for their commerce chiefly consists in timber and provisions, in building ships, and sending some tobacco to England.

The people of the Summer-islands seem to content themselves with the plenty and pleasure of their country, and with enjoying a safe and quiet retreat from the troubles and cares of the rest of the world. Indeed the inhabitants have constantly maintained an excellent reputation, and the Bermudas have been equally remarkable for the beauty of the country, and the integrity, simplicity, and honesty of the people. The beauty and the healthfulness of these islands, and the amiable characters of the inhabitants, induced the learned dean Berkeley, afterwards bishop of Cloyne, to erect an academy at the Bermudas for promoting useful learning and true religion in the West Indies, and the Society for the Propagation of the Gospel assisted him in procuring a patent from king George I. for erecting a college there. That gentleman and three fellows of Trinity-college in Dublin, with several of the Doctor's relations, embarked on this undertaking; but were driven by a storm to Long-island, in the province of New York, from whence the Doctor, with his companions, went to Boston and several other towns in New England, where they preached; but the design of erecting a college being laid aside, they returned home, and soon after doctor Berkeley was promoted to the see of Cloyne in Ireland.

S E C T. II.

A concise History of the Settlement of the Bermudas.

WE have already observed, that Sir George Sommers was wrecked on these islands; but he here caused a vessel to be built in which he pursued his intended voyage to Virginia, but left two men who had committed some crime for which they would have been put to death, had they been brought to England. These were there when he afterwards returned to the islands, they having lived on the productions of the place, and built them a hut on St. George's island. These men, whose names were Christopher Carter and Edward Waters, also staid behind Sir George's second company, and even persuaded one Edward Chard to remain with them; and now Carter, Waters, and Chard, though the sole lords of the country, soon quarrelled, when Carter, tho' he hated both, not liking to be alone, prevented their fighting, by threatening to declare against the man who struck first. At last necessity made them friends, and

they joined together in making discoveries. In one of their expeditions they found a large piece of ambergris among the rocks that weighed eighty pounds, besides other smaller pieces. This treasure made them almost beside themselves, and in order to obtain an opportunity of making use of it, they resolved on the most desperate attempt that men could form; which was to build a boat after the best manner they could, and to sail either to Virginia or Newfoundland, just as the wind happened to blow; but before they could put their project in execution, they were prevented by the arrival of a ship from England; for captain Matthew Sommers, Sir George's brother, had promised to come to them, or to send a vessel to their relief. This ship had sixty persons on board, sent by the new-formed Bermudas company to make a settlement, of which Mr. Moore was governor. That gentleman pitched upon a plain in St. George's island, and there built a cabin of palmeto leaves, large enough for his wife and family; and the rest of the adventurers following his example, it soon grew into a town of considerable extent. This is now St. George's town, just described. Mr. Moore proved an excellent governor, and in 1614, disappointed the Spaniards in an attempt to conquer these islands.

This gentleman was succeeded in the government by captain Daniel Tucker, who having a better education, and greater experience, established a regular polity, traced out plantations, and obliged every man to build uniformly in the town, and to lay out regular plantations in the country; by which means the islands were much improved, and the exportations to England increased. He likewise established a militia, and placed the islands in such a posture of defence as to put it out of the power of any of their enemies to hurt the colony.

However, the severity of captain Tucker's government gave great disgust to the licentious, and five of them executed as desperate a design to escape, as Waters and his two companions had proposed. They were sensible that the governor would not give them leave to return to England, and therefore hearing that he had a great desire to go a fishing out at sea, but was afraid of doing it because several fishing-boats had been driven off by the weather, they proposed to build a boat of two or three tons burthen, with a deck, and so fitted, that she should live in all weathers. The governor consenting to this, they began to build in a private place, under the pretence of its being convenient for getting timber and launching the boat. One of these five was a gentleman, another had contrived the design, another was a ship-carpenter who undertook to build this little vessel, and the other was a common sailor who promised to navigate it. They finished the boat sooner than was expected, and the governor sending for it, in order to go on board a ship that was ready to sail to England, the men on coming to the place could neither find the boat nor the builders, and all that they could hear of them was, that the boat being finished the night before, those who built it went off to sea in order to try how it would sail; but at last they found, by some letters they left behind, that they had set sail for England.

These rash adventurers had, on some pretence, borrowed a compass-dial of a neighbour, and then going on board the ship bound for England, exchanged such things as they could spare for provisions; and one of them, at parting, told the mariners, that though they were forbidden to go with them, they hoped to be in England before them, at which the master of the ship laughed, and away these fearless adventurers sailed with a fair wind and weather that lasted twenty-one days. They then met with a storm, which continued forty-eight hours, and drove them a little out of their course to the westward; but the wind coming fair again, and continuing ten days, they went on cheerfully. In that time they met with a French privateer, and went on board to beg some relief; but, instead of assistance, were plundered of all the little they had; the French had even the inhumanity to take away their compass, and then cruelly turned them adrift. In this miserable condition they sailed on, growing every day weaker and weaker. Their provisions were almost spent, their fire-wood quite gone, not a drop of fresh

water left, nor food for above a day, when at length, to their unspeakable joy, they made land, which proved to be Ireland; where going on shore in the county of Cork, they were nobly entertained by the earl of Thomond, to whom they related their extraordinary voyage, which lasted forty-two days.

But to return, in 1619 Mr. Tucker resigned to captain Butler, who arrived with four ships, in which he brought five hundred passengers, and there being as many English before on the island, the colony began to make a considerable figure. This governor divided the islands into districts; and now the government, by a governor, council, and assembly, was established, it before consisting only of the governor and council; and the laws of the country were settled as much like those of England as the circumstances of the place would admit.

SECT. III.

Of the BAHAMA, or LUCAYAN Islands.

Whence the West Indies obtained that Name. The Situation and Extent of the Bahama Islands, with a concise Account of Bahama and Providence Islands, and an Account of their Settlement and Revolutions.

WE now return from the Bermudas to the British islands near the middle of the continent of America, where all the islands have obtained the name of West-Indies, from the opinion the great Columbus had entertained, that by sailing to the west he should discover India, and be able to bring from thence the rich spices, which for a considerable time had been brought by the way of the Red Sea, carried by land through Egypt, and there sold to the Venetians and other maritime republics in the Mediterranean, who obtained immense wealth by supplying all the rest of Europe with these articles of luxury. Columbus was right in his general idea; but these islands, which he imagined lay near the coast of India, were some thousand leagues to the west of them; nor was he prepared for such a voyage. It was with difficulty and great danger that he reached these; the mariners, at that time never accustomed to sail far out of sight of land, were frequently in despair, and dreading lest they should perish in the boundless ocean into which he had carried them, frequently, in the midst of their terror, intreated him to return; and at length resolved to throw him over-board, and then endeavour to sail back to Spain. But Columbus, bold and undaunted, raised their hopes, by shewing them at one time, weeds floating in the sea; at another small birds, which he observed could not fly far from land; and at last a cane, with a staff, which had been evidently cut; and at length they landed in one of the Bahama islands we are now going to describe, where the mariners no sooner got on shore, than they fell prostrate, and in a transport of joy kissed the earth.

The Bahama islands are seated to the east and south-east of Florida, and the north of Cuba, stretching from the north-east to the south-west between the twenty-first and twenty-eighth degree of north latitude, and between the seventy-second and eighty-first of west longitude. These islands are very numerous; but there are only twelve worthy of notice. Between them and the continent of Florida is the gulph of Bahama or Florida, through which the Spanish galleons sail in their passage to Europe.

Bahama, from which the rest of these islands take their name, is seated in the twenty-sixth degree forty-five minutes north latitude, at the distance of fifteen or twenty leagues to the east of Florida, and eight or ten to the west of the island of Lucaya, from which it is divided by a channel, which, notwithstanding its great breadth, is very dangerous from its being full of rocks and sands. Bahama is about fifty miles in length; but scarce anywhere sixteen miles in breadth, and in many places not half so broad. It is however very pleasant and fruitful, the air serene and temperate, and the soil remarkably rich, it being watered by a multitude of springs and brooks of fresh water. It formerly produced plenty of guaiacum, sassafras, sarsaparilla, and red-wood; but these were all destroyed by the Spaniards; so that its chief

produce at present is Indian wheat, fowl, and a particular sort of rabbit; the rest of their provisions and other necessities they obtained from Carolina and Florida, and the people both here and in the island of Providence are able to assist the ships that are driven upon their coast by the boisterous winds and impetuous currents, which are here very violent.

Providence island is seated in the center of some hundreds of these islands, some of them many miles in length, and others are only small rocks rising above the water; so that it is extremely dangerous for ships to be forced in among them by a tempest. This island lies in the twenty-fourth degree thirty minutes north latitude, and is about twenty-eight miles long and eleven broad, where it is widest. It is a beautiful little island, abounding with trees, plants, fowl, and fish. The most considerable profit formerly made by the planters arose from the misfortunes of such as were shipwrecked, and whom they relieved; or from those who in a winter voyage to the continent of America were driven to the Bahama islands, and put into Providence for provisions, where the traders who purchased them from Carolina kept store-houses to supply those who wanted, and these afforded great relief to the unfortunate mariners. They likewise made some advantage of the wrecks that were thrown in upon them. The principal produce of the island is salt and brailetto-wood, which they carry to Carolina. They also sow pease and Indian wheat.

The other islands, notwithstanding some authors reckon that they amount to between four and five hundred, are hardly worth describing; at least we have no particulars relating to them that can engage the attention of the curious reader. The most considerable of them, besides those just mentioned, are Eleuthera, Harbour-Island, Lucaya, Andros, Cigateo, which may be termed of the second magnitude. Those of the third are Cat-Island, the first land discovered by Columbus in America, Yumeta, Samana, Mayaguana, Yuma or Exuma, Ynagua, Caicos, and Triangulo. As to the rest, they are rather barren rocks than islands.

With respect to the history of these islands, they were the first-fruits of the New World discovered by Columbus; we have already observed that he landed in Cat-Island, which was then called Guanahani; but was called by Columbus St. Salvador, and it owes its present name to the English inhabitants. The native Indians, a simple, harmless, inoffensive people, received the first discoverers with the utmost astonishment, flocked in crowds to the European vessels, and admired every thing they saw; but though they behaved in a most inoffensive manner, the Spaniards after Columbus's time, not thinking those islands worth making a settlement upon, to the disgrace of humanity, extirpated all the natives they found, though they were very numerous; and thus wantonly murdered many thousands of innocent persons, without any advantage to themselves.

These islands lying out of the course of ships bound to the continent of America, it was long before they were known to the English: but in 1667 captain William Sayle, in a voyage to Carolina, was forced among them in a storm, and had an opportunity of examining them carefully, particularly a large island to which he at first gave his own name; but being a second time driven upon it, gave it the name of Providence.

On his return to England he let the proprietors of Carolina know the situation and circumstances of these islands, observing, that in case they were settled, they might not only be a great benefit to this nation, but be a constant check on the French and Spaniards, if a breach should happen between either or both of those nations. These reasons being mentioned to king Charles II. that prince made a grant of the Bahama islands to George duke of Albemarle, Anthony lord Ashley, John lord Berkeley, William lord Craven, Sir George Carteret, and Sir Peter Colleton.

The first governor sent by the proprietors to Providence-Island was Mr. Chillingworth, who sailed thither about the year 1672, when several people from England and the other colonies went to settle there; but living a licentious life, and Mr. Chillingworth endeavouring to bring them to reason, they assembled in a tumultuous manner,

manner, and having seized him shipped him off for Jamaica, and then lived as they thought proper. Though a colony so unruly afforded little encouragement for any man to put himself in their power; yet, six or seven years after, the proprietors made Mr. Clarke governor, whose fate was much worse than that of his predecessor; for the Spaniards, jealous of every new English colony towards the south, landed in Providence-Island, destroyed all the stock which the inhabitants could not carry off, and burnt their houses. But what is still more extraordinary, Mr. Trott, one of Mr. Clarke's successors, always asserted, that after the Spaniards had killed Mr. Clarke, they roasted him on a spit. This is indeed very improbable; it is however certain that he was killed, and that the people removing to other colonies, the island remained uninhabited till about the time of the Revolution, when a number of persons removed thither from Europe and the continent of America, and the proprietors appointed a new governor.

About ten years after Providence and the adjacent islands contained near a thousand inhabitants, some tobacco was planted, a sugar-mill was set up, and other improvements were made; but in 1708 the Spaniards and French landed, surprized the fort, took the governor prisoner, plundered and stripped the English, burnt the town of Nassau, together with the church, ruined the fort, and nailed up the guns; after which they carried off the governor, and about half the blacks, the rest saving themselves in the woods; but within about a month they returned, and took most of the negroes who were left. After this second invasion the English inhabitants of the Bahamas thinking it in vain to stay any longer, dispersed, removing to Carolina, Virginia, New England, and other places. Mean while the proprietors appointed one Mr. Birch to go over governor, who landing in Providence, and finding it a desert, did not give himself the trouble to open his commission; but after remaining there two or three months, during which he slept in a tent erected in the woods, he returned back, and left the place uninhabited.

The Bahama islands at length becoming a receptacle for pirates, the house of lords, considering that it would be of fatal consequence should they fall into the hands of an enemy, addressed her majesty queen Anne, that the island of Providence might be put into a posture of defence; but this advice being neglected, their lordships four years after addressed king George I. on the same subject, who was pleased to give directions for dislodging the pirates, making settlements, and erecting a fortification. Captain Woodes Rogers, who was now appointed governor, sailed for Providence in 1718, with a naval force for subduing the pirates. In the mean while colonel Bennet, governor of the Bermudas, sent a sloop to the island, ordering them to surrender, pursuant to a late proclamation. Those who were on shore gladly accepted the mercy offered them, adding, that they did not doubt but their companions who were at sea would follow their example. Accordingly captain Henry Jennings, and fifteen others, followed the sloop to the Bermudas, and surrendered themselves. Soon after four other captains, with a hundred and fourteen of their men, likewise surrendered. But Vane, one of the captains of the pirates, knowing that captain Rogers was coming to reduce those robbers by proclamation, or by force, set fire to a French ship of twenty-two guns, which he had taken, in order to burn the *Rose* frigate, which had just arrived at Nassau: however, the *Rose* got off by cutting her cables, and though the governor, with two men of war, then entered the harbour, Vane, and about fifty of his men, made off in a sloop; and, notwithstanding the governor sent a vessel after them, they made their escape.

Mr. Rogers having taken possession of the fort, caused his majesty's commission to be read in the presence of the officers, soldiers, and about three hundred people, whom he found there at his arrival, and who had been almost daily exercised in arms for their defence in case of an attack from the French or Spaniards; and the governor brought with him above a hundred soldiers, who, with the others, were judged sufficient to secure the island. He began to regulate the government, and nominated six of the adventurers who came with him to be of the

council, to which he added six out of such of the inhabitants that had never been pirates. Two hundred more of the pirates soon after surrendered, and a few years after the number of the inhabitants was computed at fifteen hundred, out of whom were formed three companies of militia, who took their turn every night in the town guard at Nassau. The face of affairs being thus changed, the town of Nassau was rebuilt, and plantations laid out. Soon after the neighbouring island of Eleuthera was likewise settled; about sixty families fixing themselves there, erected a small fort for their defence. The like was done in Harbour Island, where the plantations soon grew more considerable, and a larger fort was built for the protection of the inhabitants. Cat Island was also settled. Captain Rogers likewise defeated the Spaniards, who, after three several preparations, attacked him with two thousand men, which force he repulsed, and burnt two of their ships of war in their retreat. At length Mr. Rogers returned to England, and was succeeded in his government by captain Fitz-Williams; and ever since this last settlement of these islands they have been continually improving, though they advance but slowly.

Of J A M A I C A.

Its Situation, Extent, Face of the Country, and Climate.

JAMAICA, the largest of all the British islands in America, was named by Columbus St. Jago, which it retained while in the possession of the Spaniards; but after its being taken by the English, it obtained its ancient name. It extends from seventy-five degrees fifty-seven minutes west longitude from London to the seventy-eighth degree thirty-seven minutes west longitude, and from the seventeenth degree forty-eight minutes to the eighteenth degree fifty minutes north latitude; it being about a hundred and sixty miles in its greatest length from Point Negril on the west to Point Morant on the east, and seventy in its greatest breadth from the Pitch of Portland on the south to Gallina Point on the north; but grows less towards each end. It lies near four thousand five hundred miles south-west of England, a hundred and seventy leagues to the northward of Porto Bello and Carthagena, twenty leagues south of Cuba, and twenty-four to the west of Hispaniola.

The island being within the tropic, has the trade wind continually there: it is on the south side of the island, and is called the sea-breeze. It comes about eight o'clock in the morning, and increases till twelve at noon, and decreases as the sun grows lower, till there is none at four in the afternoon. The land breeze begins about eight in the evening, blowing four leagues into the sea; it continues increasing till twelve at night, and decreases again till four. Thus, as the land-wind blows at night, and the sea-breeze during the day, no ships can come into port except in the day, nor go out but at break of day, or soon after.

The whole island is divided into one continued ridge of hills, which run from east to west through the middle of it, and are generally called the Blue Mountains, on each side of which are hills much lower. The mountainous part is very steep, and the highest hills on the north and south sides are surrounded by very deep channels made by the violent rains, which almost every day fall on the mountains, and first wearing a small channel for their passage, and afterwards carrying all before them, make their channels extremely deep. Most of the savannas, or plains, cleared of wood and fit for pasture, lie near the south side of the island; they resemble our meadow land, and a person may ride several miles without meeting with the least ascent: some of these plains are within land environed with hills; after rain they are very green and fertile; but after a long drought look yellow and parched.

The principal harbours in the island are Port Royal, which is fine and capacious; Old Harbour, which lies seven or eight miles west of St. Jago; Port Morant, at the east end of the island; and Port Negril, at the west end: besides which there are several others on the south

and

and north sides ; but it is dangerous approaching the coast without a pilot on account of the coral rocks, with which it is almost encompassed.

With respect to the rivers of Jamaica, they are said to amount to near a hundred, yet none of them are navigable; for rising in the mountains in the middle of the island, they precipitate themselves down the rocks to the north and south, falling into the sea before they have run many miles, frequently carrying down with them large trees and great pieces of rocks ; and several of these rivers have cataracts fifty or sixty feet high. However, in dry years water is very scarce in the savannas at a distance from the rivers ; so that many cattle die with driving to water. It is remarkable that some of the rivers in the mountains in several places rise above and sink under ground, and in particular the Rio d' Oro falls and rises two or three times. Another peculiarity is, that some of the springs and rivers petrify their channels by encrusting them with a cement which unites the gravel and sand in their bottoms.

There are also several hot springs, and many others that are salt and form lakes, particularly Riotto, a lake that receives a great deal of water, and yet has no visible discharge. In these, and in ponds formed by sea-water, great plenty of salt is made, by the heat exhaling the moisture.

The mountains, and indeed the greatest part of the island, are covered with fine woods that never lose their verdure, but look for ever green, and are gay in every season. The beauties of December equal the bloom of April : you see a thousand various kinds of trees adorning the brow of every hill, irregularly mixing their different branches, appearing in a gay kind of confusion, forming groves and cool retreats : the cedar, the mahogany, the *lignum vitæ*, and unnumbered others mingling their boughs ; some rearing their lofty heads, and others thriving under their friendly shade. Nor are the beauties of the better cultivated valleys inferior to these ; they too wear the verdant robe of nature, and please no less when they are laid out with the nicest art and care, and produce the richest plants, as the sugar cane, the ginger, pimento, and others, which are more valuable to their owners than a share in the mines of Potosi or Peru. They likewise boast of the finest orange and lemon-trees in great plenty. Fruit is so common that few regard them ; on the way sides you may pick the citron, the star-apple, the guava, and the mamee ; and every thing resembles a kind of paradise. But these advantages are balanced by many disagreeable circumstances : the rivers contain the dreadful alligator, the fens and marshes the guana and galliwas, with numberless snakes and noxious animals. You are exposed during great part of the year to the scorching heat of the sultry sun, and the warm climate renders the island sickly.

The longest day in summer is about thirteen hours, and the shortest in winter about eleven. At nine in the forenoon the air grows intolerably hot, and could scarce be endured were it not for the sea-breeze already mentioned. Indeed the hot and moist temperament of the air would soon bring on pestilential diseases, that would in a short time turn all to a desert, had not the wise Contriver of all things prepared those friendly gales, the sea and land breezes, to temper the air and render it so refreshing, that none need be afraid of going about their lawful employments.

The nights are sometimes pretty cool, and the dews are so great within land, that in a morning the water drops from the leaves of the trees, as if it had rained ; and a man riding in the night will find his cloaths and hair very wet in a short time. These cold and piercing dews, which happen every night after the pores have been opened by the extraordinary heat of the day, are justly reckoned extremely unwholesome, and new-comers who expose themselves to their influence seldom escape without a severe sickness.

Instead of dividing the year into spring, summer, autumn, and winter, its only divisions are the dry and wet seasons ; nor are these regular, but vary in many parts of the island. Thus about the Blue Mountain valley, and several hilly places, they have more or less rain every day in the year, and plant the sugar-cane at the same

time they are cutting others for use. On the north side the seasons are pretty regular ; they begin to plant in August, and continue till Christmas, all which time they are sure of rain ; after that till the end of March they have none ; but then it begins again, and continues during the months of April and May. Several parts of the island, which were once the choicest and richest spots, and had fine sugar-works, which used annually to produce many hundred hogheads of that valuable commodity, are now only fit for grazing cattle, they being dry for almost nine months in the year. This is ascribed to the cutting down of the woods ; for the trees gathered and retained great quantities of vapours, which were diffused in rain. The months of July, August, and September, are called the hurricane months, because then they have been observed to happen most frequently.

It lightens almost every night, but without much thunder, which when it happens is very terrible ; it roars with astonishing loudness, and the lightning in these violent storms frequently does a great deal of damage. In February or March they expect earthquakes, which have sometimes been as dreadful as any recorded in history ; these we shall hereafter have occasion to mention. Indeed the inhabitants observe several days in the year in a solemn manner on account of storms and earthquakes.

According to the best observations, there is not one-third of the country inhabited ; there are indeed plantations round the island, but none at any great distance from the sea ; and even these are so far from being cultivated, that the greatest part of the ground is not cleared, but is overgrown with wood ; for a gentleman who has a patent for three or four thousand acres, has perhaps five hundred of them well laid out and improved, and the rest is useless : yet the soil is in some places so exceeding fertile, that one acre has been known to yield several hogheads of sugar.

S E C T. V.

Of the Vegetables of Jamaica, with a particular Description of the Sugar Plant, its Culture, and the Manner of making Sugar ; the Pimento Tree, the Cacao or Chocolate Tree, the wild Cinnamon Coffee Tree, and Ginger ; with a concise Account of the Beasts, Birds, Insects, and Fishes.

NO sorts of European grain grow here ; they have only maize, or Indian corn, Guinea corn, pease of various kinds, but none of them resembling ours, with variety of roots. Fruit, as hath been already observed, grow in great plenty, citrons, Seville and China oranges, common and sweet lemons, limes, shadocks, pomegranates, mamees, fourlops, papas, pine-apples, custard-apples, star-apples, prickly pears, allicada pears, melons, pompions, guavas, tamarinds, and several kinds of berries, which are every where to be found in the roads.

The sugar-plant grows in a long stalk, or cane, divided by joints, two, three, four, or five inches asunder, and about six feet high ; the sprouts and leaves at the top rising so as to make it near eight feet in all. The body of the cane seldom exceeds an inch in diameter, the colour of its tops is a pure grass-green ; but the cane itself when ripe, yellowish. It is covered with a thin skin or bark, and is of a white spongy substance full of juice, which the servants and others suck ; and nothing is pleasanter and more nourishing when it is ripe, and taken with moderation. Upon this occasion, they cut the rind, and put the spongy part into the mouth, when the juice will come more freely than the honey out of the comb. This sweetness is extremely agreeable, and far from being surfeiting ; the juice is a little thicker than that of an apple, and without the least ill taste. Of this juice are made sugar, rum, and molasses.

The season for planting sugar-canes is from August to the beginning of December, and they do not arrive to maturity, till they have been a year and a half in the ground. Their manner of growing is in sprouts, three, four, or five from one root. The cane-tops make very good food for horses and black cattle ; but the solid canes are carried to the mill.

They

They are planted by digging long trenches in the earth, about six inches deep, and as many broad, laying a double row of canes along in the trench, one by another, then the earth is thrown in, and another trench dug at about two feet distance, till all the land is planted by laying the canes along. Thus they produce the greatest number of sprouts; for this way a branch shoots out of every joint of the cane. The first planters used to thrust a piece of cane perpendicularly into a hole, at certain distances, which yielded no shoot but from the top, and having three or four sprouts whose whole weight depended on one root, when they grew tall and heavy, the storms loosened the roots; but by this new way of planting the root is secured, and the produce increased. They come up soon after they are planted, and in about twelve weeks they grow two feet high.

The next care of the planter is to weed the canes, and to dung them; but this last is done either when they are planted or when they are grown two feet high, and this is the greatest trouble and expence the planter is at; for was it not for this dunging, a third part of the negroes would do his business.

When the canes are ripe they are cut down, stripped of their leaves and tops, bundled up in faggots, and carried to the mill by mules, or in carts drawn by horses. The mills are turned by oxen or horses; and some substantial planters have erected wind-mills: there the juice is pressed out by wooden rollers cased with iron, and at the bottom of the mill is a hollow place which receives the juice, from whence it is conveyed by leaden pipes into a cistern near the boiling-house, where it must not remain above one day, for fear it should grow sour. From thence it is conveyed through a gutter fixed to the walls of the boiling-house to the clarifying-copper, or boiler, and there boiled till all the gross matter rising to the top is skimmed off. It is then carried into a second, and so into a third, fourth, fifth, sixth, and seventh; and is continually kept stirring and boiling till it comes to a consistency; and yet all this boiling would only reduce it to a thick clammy substance; but to turn it to grain they pour in some lime-water, on which the sugar begins to rise up with a turbulent and ungovernable fury, occasioned by the fermentation of the liquor from the lime-water and the vehement heat of the fire; when, to prevent its running over, they throw in a small piece of tallow no bigger than a nut, which soon makes it fall. The liquor is at length emptied into a cooler, where it remains till it is fit to be potted. The pots are wide at the top, they taper downwards, and a hole is left for the molasses to drain. In refining the sugar, the first degree of pureness is permitting the molasses to drain away with the top of the pot open, by which means the air hardens the sugar, before it has time to refine by separation. The second degree is procured by covering the pots at the top with clay; the first requires but one month to refine, and the other four.

We shall now describe the principal trees, and shall begin with the pimento, which produces Jamaica pepper, or allspice. It is as thick as a man's thigh, and rises straight above thirty feet, covered with a very smooth skin of a grey colour: it is branched out on every hand, having the end of its twigs set with leaves of several sizes, the largest being four or five inches long, and two or three broad in the middle, whence it decreases in both extremes ending in a point. The ends of the twigs are branched into bunches of flowers, each stalk sustaining a flower bending back, within which bend are many stamens of a pale green colour; these flowers have a branch of crowned berries, the crown being made up of four small leaves, at first greenish; but when ripe is black, smooth, and shining, containing in a moist green aromatic pulp two large seeds separated by a membrane. This tree grows in all the hilly parts of the island; but chiefly on the north side. It flowers in June, July, and August, and the fruit soon ripens. There is no difficulty in curing the pimento, or Jamaica pepper: they climb the trees, and pull the green unripe fruit, which they expose to the sun till it becomes of a brown colour, and is fit for the market. According to Sir Hans Sloane, this is the best, the most temperate, mild, and innocent of all spices.

The body of the cacao, or chocolate-nut tree, is commonly about four inches in diameter, and it is about twelve from the ground to the top of the tree; the chocolate-nuts grow in pods, or long shells, shaped like a cucumber, each having three, four, or five kernels of about the size of chestnuts, separated from each other by a pleasant refreshing white substance, nearly of the consistence of the pulp of a roasted apple, moderately sharp and sweet. A bearing tree generally yields from two to eight pounds of nuts a year. The manner of curing them is to cut them down when ripe, and lay them in a heap to sweat three or four days in the pods; after this the pods are cut, the nuts taken out, put in a trough, and covered with plantain leaves, where they sweat again about sixteen or twenty days. After this they are put to dry three or four weeks in the sun, and then they become of a reddish dark colour. The pods grow only out of the body, or great limbs and boughs, and at the same time there are blossoms, with young and ripe fruit on the same tree.

The wild cinnamon is about twenty or thirty feet high, having many branches and twigs hanging downward, which form a very handsome top. The bark consists of two parts, one outward and another inward; the outward is thin, of a whitish grey colour, and of an aromatic taste: the inward bark is much thicker than cinnamon, paler, and of a much more biting and aromatic taste, something like that of cloves. The leaves shoot out near the ends of the twigs without any order, standing on foot stalks, each of them two inches in length, and one in breadth. They are of a yellowish green colour, and are smooth and shining, without any incisures about their edges. The ends of the twigs are branched into bunches of scarlet or purple flowers, which falling off, are succeeded by clusters of roughish green berries, of the size of a large pea, that contain a pale green thin pulp, and four black shining seeds of an irregular figure. All the parts of this tree, when fresh, are very hot and aromatic; but the inward bark of the tree is what is chiefly in use both in the English plantations in the West Indies and in Europe, and it is easily cured by only cutting off the bark, and letting it dry in the shade. The ordinary sort of people in the West Indies use it instead of all other spices, it being thought very good to consume the immoderate humidity of the stomach, to help digestion, and expel wind. Rum loses its disagreeable smell if mixed with this bark.

Coffee is now much cultivated here: it is a large shrub, with leaves of a dark green; the berries grow in great clusters, and one bush will produce several pounds. The berry is inclosed in a fine scarlet pulp, which is too luscious to be palatable; however, many eat it. When it is ripe it turns black, and then they gather the fruit, separate the berries from the husk, and expose them to the sun till they are well cured and fit for the market.

Here are also the cabbage-tree, the cedar, and the mastic tree, which grow to a great height; the mahogany tree, the cotton tree, the manchineel, and a great number of others. The island likewise abounds in abundance of dyers woods, as fustic, red-wood, logwood, and others.

Among the drugs and medicinal herbs are guaiacum, china root, sarsaparilla, cassia, vanilloes, ginger, &c. Ginger shoots forth blades from its root not unlike those of wheat. The stalk seldom exceeds eighteen inches in height; from its sides grow sharp-pointed leaves about five inches long, the extremity of the stalk ending in a soft pointed spire. When the plant is dug up, the roots are races of ginger, which are scraped clean, and dried in the sun. The usual time of planting this root is in May and June, and of digging it up in February and March.

Among the animals are the land and sea-turtle, and the alligator. Here are all sorts of fowl wild and tame, and in particular more parrots than in any of the other islands; besides parroquets, pelicans, snipes, teal, Guinea hens, geese, ducks, and turkeys; the humming-bird, and a great variety of others. The rivers and bays abound with fish.

With respect to the reptiles and insects, the mountains breed numberless adders and other noxious animals, as the fens and marshes do the guana and galliwasps; but these last are not venomous. Among the insects are the ciron, or chegoe, which eats into the nervous and membranous parts of the flesh of the negroes, and the white people are sometimes plagued with them. They get into the toes and eat the flesh to the very bone. These insects get into any part of the body, but chiefly the legs and feet, where they breed in great numbers, and shut themselves up in a bag. As soon as ever a person feels them, which is not perhaps till a week after they have been in the body, they pick them out with a needle or the point of a penknife, taking care to destroy the bag entirely, that none of the breed, which are like nits, may be left behind.

SECT. VI.

The Food, Dress, Buildings, Learning, Coin, Distempers, Manners, and Customs of the Inhabitants of Jamaica; their Treatment of their Servants, and their Cruelty to their Slaves.

THE common bread here is plantain, yams, and cassava; the first is of an oblong form, grows in clusters on the tree, and when pulled green and roasted eats very deliciously. The yams are a kind of potatoe, but of a much larger size, some of them weighing several pounds. Cassava is the root of a shrub taken and squeezed, the juice being a mortal poison, though when properly prepared it is very wholesome and agreeable food; when dry it is grated and put in water, where it stands a considerable time; the water being poured off, and the flour dried, it is made into cakes, and baked on a griddle over the fire. These cakes are white and crisp, and are preferred by the Creoles to any other bread whatever. These several kinds of food are not peculiar to this island, since they are eaten in most of the other islands and on the continent of North America. They do not want flour, for this they obtain from New England and other of our northern colonies. In every house they have an oven, and bake as they find occasion.

There are such plenty of hogs, that many plantations have several hundreds of them, and their flesh is exceeding sweet and delicate. Their beef, however, is tough and lean; but the mutton and lamb are tolerable; however, the cattle bred on the island are but very few. The sheep have their wool resembling the hair of a goat, and they seem to be of a larger size than ours. They have variety of wild-fowl, as well as common poultry; and the tortoise, or turtle caught on the coast are much admired. They have also salt cod from Newfoundland, and a great deal of salt beef from Ireland and the plantations on the continent, for the servants are seldom allowed fresh provisions.

The common drink for persons in affluent circumstances is Madeira wine mixed with water; while those of inferior rank drink rum punch, which being frequently drank to excess, has obtained the name of kill-devil; for thousands lose their lives by it, especially those who are just come to the island; for they cannot drink it to excess without exposing themselves to imminent danger; as by heating the blood, it brings on fevers, which in a few hours send them to the grave. They have also ale and claret, but they are extravagantly dear.

With respect to dress, the heat renders many cloaths insupportable, and therefore the men generally wear only thread stockings, linen drawers, a vest, a handkerchief tied round the head, and a hat upon it. Wigs are never used but on Sundays, or in court time, and then gentlemen appear very gay in coats of silk, and vests trimmed with silver. The servants wear a coarse linen frock, which buttons at the neck and hands, long trowsers of the same, a checked shirt, and no stockings. The negroes generally go naked, except those who attend gentlemen, who take care to have them dressed in their own livery.

The ladies make as gay an appearance as any-where in Europe; they dress as rich, and appear with as good a

grace. Their morning habit is a loose night-gown, carelessly wrapped about them; before dinner they put off their dishabille, and show themselves in all the advantage of a rich, neat, and becoming dress. The servant-maids have generally a cotton or striped Holland gown, and plain head-cloaths. Many of the negro women in the country go quite naked; for they do not know what shame is, and are surprized at an European's bashfulness; but in the towns they are obliged to wear a kind of petticoat, and some of them are neatly dressed.

The gentlemen's houses are generally built low of one story, and consist of five or six handsome apartments beautifully lined and floored with mahogany; they have generally a piazza, to which is an ascent by several steps, and this serves as a screen against the heat. In the towns are several houses two stories high; but this is disapproved of, because they are seldom known to stand the shock of an earthquake, or the fury of a storm. The negroes have nothing but a parcel of poor miserable huts built with reeds.

There are few gardens that deserve notice; the chief curiosities they produce are English peas, cabbages, some kinds of European fruits, and others peculiar to the climate. The apple tree seldom comes to any perfection, and bears but a very few years; the same may also be said of other fruits that thrive with us: indeed the plants and fruits which flourish there would alone be sufficient to render them more delightful than can be imagined; but they despise the orange, the lemon, the cacao, and pomegranate; and prefer to the fine shade and fragrance of these a number of shrubs that are of no manner of use.

Learning is here at a low ebb: there are indeed a few gentlemen well versed in literature; but the generality seem to have a greater affection for gaming than for useful learning. Indeed those whose fortunes can allow it, frequently send their children to Great Britain, where they have the advantage of a polite and liberal education; but in general a boy, till he is seven or eight years of age, spends his time with the servants and negroes, acquires their broken way of talking, and their manner of behaviour. He then, perhaps, goes to school; but young master must not be corrected; if he learns it is well, if not it cannot be helped. After learning to read he goes to the dancing-school, commences beau, and then visits and rakes with his equals. Some of the ladies read; they are all fond of dancing, but take little care to improve their minds.

The current coin is entirely Spanish, and English money is seldom seen, except in the cabinets of the curious. There is no place perhaps where silver is so plentiful; they use no copper, and the lowest piece is a ryal, which here passes for seven-pence halfpenny; but a half-penny in Britain will go farther. You cannot dine for less than a piece of eight, and the common rate of boarding is three pounds a week. The difference between their money and British is twenty-five per cent. thus seventy-five pounds sterling make one hundred pounds Jamaica currency.

The common distempers here are high fevers and the belly-ach. The fevers are generally extremely violent, and a few hours will carry off the person afflicted by this disorder. Few miss it on their first arrival, and for this reason many die as soon as they come to Jamaica. The belly-ach, or dry-gripes, is perhaps the severest pain that can be endured; it frequently takes away the use of their limbs, which are never recovered. The common remedies for this disease are gentle doses of physic and clysters. After they are somewhat recovered, the cold bath proves of great use in restoring them to their former vigour. The physicians here generally make fine estates, and Jamaica has had several of them who have made a considerable figure in the learned world.

This island contains three sorts of inhabitants, masters, servants, and slaves. Some of the gentlemen are extremely polite, and use their inferiors with a great deal of good nature. However, most of them have a haughty disposition, and require great submission; but a stranger, who knows how to apply to their humour, generally gets into good business; yet, those who are so unfortunate as to mistake it, may look for business in another place.

The

The servants who behave well are respected and encouraged; those who are found honest, and worthy of their trust, sometimes not only dine on the same provisions with their masters, but wear as good cloaths, are allowed a horse when they go abroad, and a negro boy to attend them. But others, who are either stupid or roguish, are hardly used, often put in the stocks, and beat very severely: their salt provisions are weighed out, and they have nothing but what the law obliges the master to give. The servants labour is not very hard, it being much less than that of the day-labourers in Great Britain. Those who have no trade, by which they can be of service to their master, are only employed in looking after the negroes at work, or in overseeing the boiling of the sugar.

The condition of the blacks is indeed much worse, their servitude being perpetual, and they are obliged to toil for the benefit of others without the least advantage to themselves, and the most trivial error is punished with a terrible whipping. "I am inclined to touch the hardships which these poor creatures suffer in the tenderest manner, (says our author, who seems to be a person of judgment and candor) from a particular regard which I owe to many of their masters; but I cannot conceal their sad circumstances entirely. I have seen some of them scourged in the most cruel manner for no other reason, but to satisfy the brutish pleasure of an overseer, who has their punishment mostly at his discretion. I have seen their bodies all in a gore of blood, the skin torn off their backs with a cruel whip, beaten pepper and salt rubbed in the wounds, and a large stick of sealing-wax dropped leisurely on them. It is no wonder if the horrid pain of such inhuman tortures incline them to rebel. At the same time it must be confessed, that they are generally perverse, which is owing to the many disadvantages they lie under, and the bad example they daily see." We could wish that it was possible to disprove this account. There are no doubt many persons of humanity in Jamaica; but when the lash is committed to abandoned wretches insensible to humanity, and who have been transported from England for their crimes, it cannot be wondered at, that wretches like these, when raised to power, should prove savage and inhuman tyrants.

They, however, are not the only persons guilty: the laws themselves are in the extremest degree inhuman, and no country in the world exceeds them in the cruel methods by which they put these unhappy negroes to death. A rebellious black, or he that twice strikes a white man, is condemned to the flames: he is carried to the place of execution, and chained flat on his belly, with his legs and arms extended; then fire is set to his feet, and he is burnt gradually up. Others they starve to death, with a loaf hanging before their mouths. "I have seen these unfortunate wretches, says our author, gnaw the flesh off their shoulders, and expire in all the frightful agonies of one under the most horrid tortures. Perhaps indeed, he adds, such severities may be in some sort excused, when we consider the state of the country, and how impossible it would be to live amidst such numbers of slaves, without watching their conduct with the greatest strictness, and punishing their faults with the utmost severity." *A new History of Jamaica in thirteen Letters to a Friend.*

But surely such inhumanity can be in no case necessary. We cannot here help borrowing the words of the judicious author of a work lately published, entitled, *An Account of the European Settlements*, who, after observing, that, notwithstanding the great care taken to make them propagate, the ill treatment they receive so shortens their lives, that instead of encreasing by the course of nature, many thousands are annually imported to supply the place of those who die by the hardships they receive, then adds, "I know that they are stubborn and untractable for the most part, and that they must be ruled with a rod of iron. I would have them ruled, but not crushed with it. I would have a humanity exercised which is consistent with steadiness. And I think it clear, from the whole course of history, that those nations which have behaved with the greatest humanity to their slaves, were always best served, and ran the least hazard from their

rebellions. And I am the more convinced of the necessity of these indulgencies, as slaves cannot go through so much work as freemen. The mind goes a great way in every thing; and when a man knows that his labour is for himself, and that the more he labours the more he is to acquire, this consciousness carries him through, and supports him beneath the fatigues under which he would have otherwise sunk.

"The principal time I would have reserved for the indulgence I propose to be granted to the slaves is Sunday, a day which is profaned in a manner altogether scandalous in our colonies. On this day I would have them regularly attend at church; I would have them, particularly the children, carefully instructed in the principles of religion and virtue, and especially in the humility, submission, and honesty which become their condition. The rest of the day might be devoted to innocent recreation. To these days of relaxation, and with the same exercises, should be added some days in the grand festivals of Christmas, Easter, and Whitsuntide; and perhaps four or five days in the year besides. Such methods would by degrees habituate their masters not to think them a sort of beasts, and without souls, as some of them do at present, who treat them accordingly; and the slaves would of course grow more honest, tractable, and less of eye-servants; unless the sanction of religion, the precepts of morality, and all the habits of an early institution, be of no advantage to mankind.

SECT. VII.

The Manners and Customs of the Negroes.

THE owners of these slaves set aside for each a small parcel of ground, and allow them the Sundays to cultivate it: in it they generally plant maize, Guinea corn, plantains, yams, cocoas, potatoes, &c. This is the food which supports them, unless some of them, who are more industrious than others, raise a stock of fowls, which they carry to market on the Sundays, the only market-day in Jamaica, and sell for a little money, with which they purchase salt beef, fish, or pork, to make a dish which they call pepper-pot.

These slaves, on their first arrival from the coast of Guinea, are exposed naked to sale: they are then generally very simple and innocent creatures, but they soon become roguish enough; and when they come to be whipped, excuse their faults by the example of the whites.

Their notions of religion are very inconsistent, and vary according to the different countries from which they come; but they join without distinction in their solemn sacrifices and gambols. They generally believe that there are two gods, a good and a bad one: the good god they tell you lives in the clouds, and is very kind and favourable to mankind; for it was he that taught their fathers to till the ground, and to hunt for their subsistence: while the evil god sends storms, earthquakes, and all kinds of mischief. Hence they love the former, and fear the latter. They have no idea of heaven, farther than the pleasure of returning to their native country, whither they believe every negro goes after death. This thought is so agreeable, that it cheers the poor creatures, and renders the burthen of life easy, which would otherwise be quite intolerable. They look on death as a blessing, and it is surprizing to see with what courage and intrepidity some of them meet it; they are quite transported to think their slavery is near an end, that they shall revisit their happy native shores, and see their old friends and acquaintance. When a negro is about to expire, his fellow-slaves kiss him, wish him a good journey, and send their hearty good wishes to their relations in Guinea. They make no lamentations; but with a great deal of joy inter his body, firmly believing he is gone home and happy.

When any thing about a plantation is missing, they have a solemn kind of oath, which the eldest negro always administers, and is by them accounted extremely sacred; but this they never take without the express command of their master or overseer. They then range themselves

selves in the spot of ground appropriated for the burying-place of the negroes, and one of them opens a grave, when he who acts the priest takes a little of the earth, and puts it into every one of their mouths, and they imagine that if any has been guilty their belly will swell and occasion their death.

None of them are allowed to touch any arms, unless by their master's command; or to go out of the bounds of the plantation to which they belong, without a special permit signed by their owner or the chief overseer. They are kept in such awe, that they are afraid to let even the least thought of liberty appear; and when they see the whites muster and exercise, they are struck with terror. This indeed is not the case with the Creolian negroes, who all of them speak English, and are so far from fearing a muster, that they are very familiar with it, and can exercise extremely well.

SECT. VIII.

The Divisions and principal Towns of Jamaica, its Government, and Trade; with a particular Account of the Log-wood Cutters in the Bay of Honduras, and the Trade carried on with the Spaniards in America.

THE whole island is divided into nineteen districts, or parishes, each of which sends two members to the assembly, and allows a competent maintenance to a minister. Anciently Port Royal was the capital of the island; it stood upon the very point of a long narrow neck of land, which towards the sea formed part of the border of a very noble harbour of its own name. In this harbour above a thousand sail of the largest ships could anchor with the greatest convenience and safety; and the water was so deep at the quay of Port Royal, that vessels of the greatest burthen could lay their broad-sides to the wharfs, and load and unload at very little expence or trouble. This convenience weighed so much with the inhabitants, that they chose this spot for their capital, though the place was a hot dry sand, that did not produce one of the necessities of life, and not even fresh water. However, this advantageous situation rendered it a considerable place, and it contained two thousand houses very handsomely built, and that were let at as high a rent as those of London. It grew to all this in about thirty years time, and there were few places in the world which for the size could be compared to this town for trade, wealth, and an entire corruption of manners.

However, on the ninth of June, 1692, an earthquake, which shook the whole island to its foundations, overwhelmed this city, and buried nine-tenths of it eight fathoms under water. This earthquake not only demolished the city, but made a terrible devastation all over the island, and was followed by a contagious disease which was near giving the finishing hand to its destruction.

The city was rebuilt after the earthquake, but it was again destroyed; for ten years after a terrible fire laid it in ashes: yet the extraordinary convenience of the harbour induced the inhabitants to rebuild it once more. But in 1722 one of the most dreadful hurricanes on record reduced it a third time to a heap of rubbish. Warned by these extraordinary calamities, the custom-house and public offices were removed from thence, and the principal inhabitants settled on the opposite side of the bay at the town of Kingston. Port Royal has, however, three or four handsome streets, several cross lanes, a fine church, an hospital for sick and disabled soldiers, and a yard for the king's naval stores, with conveniences for the workmen employed about his majesty's ships of war. The harbour is guarded by one of the strongest forts in the West Indies, which has a line of near a hundred pieces of cannon, and a garrison of soldiers maintained at the expence of the crown.

Kingston is commodiously seated for fresh water, and all manner of accommodations. The streets are broad, perfectly straight, and cut each other at equal distances and right angles. It is about a mile long, and contains above a thousand houses, many of them handsomely built, though low, with porticos, and every convenience

for a comfortable habitation in that climate. Here the inferior courts sit, and the receiver-general, secretary, and surveyor, are obliged to keep offices. It has one or two churches, the Jews have two synagogues, and the Quakers a meeting-house. The fortifications of the harbour were greatly improved by the late governor Knowles.

Not far from Kingston the river Cobre, a considerable but not navigable stream, falls into the sea; and upon its banks stands St. Jago de la Vega, or Spanish Town, the seat of the government, and the place where the courts of justice are held, and consequently the metropolis of Jamaica, though it is inferior in size to Kingston. However, though it has less business, it has more gaiety. Here reside many persons of large fortunes, who make a very splendid figure. It is surprizing to see the number of coaches and chariots perpetually plying, besides those belonging to private persons. Here is a regular assembly, a theatre, in which plays are acted, and it being the residence of the governor, and the principal officers of the government, who have very profitable places, all conspire with the genius of the inhabitants, which inclines them to an ostentatious and expensive way of life, to render it a very splendid and agreeable place.

We shall now proceed to give a summary account of the government of Jamaica. The king of Great Britain, as in all the other royal governments, appoints the governor and council, while the representatives of the people are chosen by the freeholders. The governor is captain-general, admiral, and chancellor of the island; has power to issue out all sorts of commissions; to summon and dissolve assemblies; to make counsellors; to pardon all crimes, except treason or murder, and even for those to grant a reprieve; to place and displace all officers who are not by patent: in a word, to act with sovereign authority under his majesty; and has a negative voice in all acts of the assembly. As he is chancellor, he is empowered to grant administrations and executorships of the estates of persons dying intestate; and this last brings in a considerable profit. His standing salary is two thousand five hundred pounds a year; the assembly vote the governor as much more, and this, with the other great profits of his office, make it in the whole little inferior to ten thousand pounds a year.

The council, who are twelve in number, are generally men of the best estates and quality in the country, and are appointed by letters of mandamus from the king. On the death or dismissal of any of these, the governor nominates others to supply their places. It is their duty to advise and assist the governor, and even to be a check upon him, if he exceeds the bounds of his commission. This body forms the upper house in the assembly, where it has the same power as the house of peers in England.

The grand court, which takes cognizance of all civil pleas, as well as of crimes that merit corporal punishment, sits four times in the year. Their session is limited to twenty-one days, during which they frequently dispatch a great deal of business. The chief justice has six assistants, who are generally men of the greatest knowledge, and of the fairest characters. There are many inferior courts, who decide causes of less than twenty pounds value, and justice is generally impartially distributed, and without delay.

The militia is under the direction of officers appointed by the governor, and all from sixteen to sixty are obliged to enlist.

The revenue of the island is reckoned to amount to seventy thousand pounds, out of which are paid a great number of public officers, who have very large salaries.

The trade of Jamaica principally consists in the following articles: first, sugar, of which they imported in 1753 twenty thousand three hundred and fifteen hogsheads, some so large as to be a ton weight; which cannot be worth less in England than four hundred twenty-four thousand seven hundred and twenty-five pounds sterling, most of which comes to London and Bristol; and some part of it is sent to North America, in return for the corn, peas, beef, pork, cheese, plank, staves, pitch, and tar, which they obtain from thence. The second is rum, of which they export about four thousand puncheons. The third is molasses, in which they make a

great

great part of their returns for New England, where there are great distilleries. These are all the produce of their grand staple the sugar-cane. The fourth is cotton, of which they send out two thousand bags. The fifth are various drugs, as cacao, coffee, a considerable quantity of pimento, ginger, sweetmeats, drugs for dyers and apothecaries, mahogany, and manchaneel plank. Some of the most considerable articles of their trade are with the continent of New Spain and Terra Firma; for in the former they cut great quantities of logwood, and both in the former and latter carry on an extremely profitable trade in negroes, and all the kinds of European goods carried thither from Spain by the flota.

Both the logwood and contraband trade have been the subject of much contention, and even the cause of a war between England and Spain. The cutting of logwood in the bay of Honduras on the southern side of the peninsula of Yucatan has been long claimed as a right by England, and this privilege was confirmed to his Britannic majesty's subjects in the most express terms by the late treaty of peace in 1763.

The logwood cutters are chiefly composed of vagabonds and fugitives from all parts of North America, and their way of life is suitable. They live in a kind of lawless manner, though they elect one among them whom they call their king, and to him pay as much obedience as they think fit. The country is low and extremely marshy; the air molested by musketoes, and the water dangerous with alligators; yet a life of licentiousness, a plenty of rum, large gains, and a want of thought, have reconciled them both to the hardships of their employment and the unwholesomeness of the climate. They go always well armed, and are said to amount to about one thousand five hundred men. This trade in some years employs near six tons of shipping, finds employment for a number of seamen, consumes a great deal of our manufactures, and the value of returns are said to be about sixty thousand pounds sterling a year. This trade is generally carried on by vessels from New England, New York, and Pennsylvania, who take up the goods they want in Jamaica.

There is still a more profitable trade carried on between this island and the Spanish continent, which has also been the cause of much dispute between the courts of England and Spain. A ship from Jamaica having taken in negroes, and a proper sortment of goods there, proceeds in time of peace to a harbour called the Grout, about four miles from Porto Bello. A person who understands Spanish is directly sent ashore to give the merchants of the town notice of the arrival of the vessel; the same news is likewise carried with great speed to Panama, from whence the merchants set out disguised like peasants, carrying jars almost filled with silver; but the top covered with meal, to deceive the officers of the revenue. Here the ship frequently remains trading five or six weeks together. The Spaniards usually come on board, leave their money, and take their negroes, and their goods packed up in parcels fit for one man to carry, after they have been first handsomely entertained on board, and received provisions sufficient for their journey home. If the whole cargo is not disposed of here they bear off eastward to the Brew, a harbour about five miles from Carthagena, where they soon find a vent for the rest. There is no trade more profitable than this; for they are paid in ready money, and the goods sell higher than at any other market. It is not on this coast only but every where upon the Spanish main that this trade is carried on; nor is it by the English only, but the French from Hispaniola, the Dutch from Curassou, and even the Danes have some share in it. However, when the Spanish guarda costas seize upon one of these vessels, they make no scruple of confiscating the cargo, and of treating the crew little better than if they were pirates.

S E C T. IX.

A concise History of Jamaica.

THE island of Jamaica was discovered by Columbus in his second voyage, in the year 1594; his son Diego was the first European governor of the island, and

built the city of St. Jago de la Vega, now Spanish Town. On the first arrival of the Spaniards the Indians appeared in arms, and bravely resolved to maintain their liberties against these bold intruders; and had certainly been successful, at least for a while, had not the Spaniards at length taken the advantage of their simple natures, and deluded them by specious shews of peace and well contrived protestations: but they in a short time felt the dismal effects of giving faith to the Spaniards, who were no sooner in a condition of putting their bloody designs in practice, than they began a horrid massacre, murdered, butchered, and destroyed, in a few years, to the amount of sixty thousand of the natives, and scarce left one alive. Some took refuge in the woods, and retired to the caves and fastnesses, whither they were pursued and hunted by those savage tyrants, and cut to pieces. Before this desolation, Jamaica was one of the best peopled of all the Antilles; but such was the destructive slaughter which the Spaniards made, that the very name of an Indian was in a few years rooted out, and none left to preserve the memory of that once flourishing people.

This island was possessed by the Spaniards till Oliver Cromwell being sensible of the advantages they obtained from their provinces in America, sent a considerable squadron of men of war, commanded by the generals Penn and Venables, in 1654, to take the fine island of Hispaniola. This they attempted, but being repulsed with loss, the principal commanders fearing to return to England without success, wisely resolved to try what could be done against the island of Jamaica, before the inhabitants of that island could receive encouragement by the news of their defeat in Hispaniola.

The fleet and troops soon arriving at Jamaica, they severely punished the officers who had shewn an ill example by their cowardice, and issued orders, that if any man attempted to run away, the next man to him should put him to death; and if he failed to do it, he should be liable to be tried for his life. Fortified with these resolutions, the troops were no sooner landed, than advancing towards the fort, they made themselves masters of it with little loss, and the next morning, when the sun arose, marched towards a savanna near the town, when some Spaniards advancing to meet them, desired to treat. But this Venables refused, unless they would send his men a constant supply of provisions, of which they were in great want. To this the Spaniards consented, and having performed their promise, the following articles were agreed upon: That all the forts, arms, ammunition, and necessaries of war, with all the shipping in the harbours of the island, and all wares, merchandize, &c. should be delivered up for the use of the protector and the commonwealth of England. That all the inhabitants of the island, except some that were particularly named, should have their lives granted. That those who chose it should have leave to stay, and the others be carried to New Spain; or some other of his Catholic majesty's American dominions; together with their apparel, books, and papers. That the commission officers alone should be permitted to wear their rapiers and poniards; and that the artificers and meaner sort of people should be permitted to remain in the island, and enjoy their goods, provided they conformed to the laws that should be established. Thus the whole island was reduced, and the conquest was confirmed to Great Britain by a subsequent treaty. However, many of the Spanish negroes retiring to the mountains, maintained their ground there, and being afterwards joined by several other fugitives from the English plantations, became very formidable; nor could they be subdued, though a body of regular troops were sent over to the assistance of the planters. However, governor Trelawny entering into a treaty with them, it was agreed that they should remain an independent state, and be governed by their own magistrates, on condition of their harbouring no more fugitives. They are said now to live in a very friendly manner with the English, and, in case of an invasion, some imagine they would contribute greatly to the defence of the island; while others suppose that these negroes are not yet to be trusted, and for this reason some of the best lands in the island which lie in their neighbourhood are not cultivated.

After the Restoration the Spaniards ceded Jamaica to the king of England. Some of the troops employed in its reduction had settled there; many of the royalists, who had been uneasy at home, had sought an asylum in this island, and not a few planters from Barbadoes were invited thither by the extraordinary fertility of the soil, and the other advantages which it afforded. The latter taught the former settlers the manner of raising the sugar-cane, and making sugar; for at first they had wholly applied themselves to the raising of cacao, as the Spaniards had done before them. It was very happy for them that they fell into this new practice, for the groves of the cacao trees planted by the Spaniards began to fail, and the new plantations did not answer.

What gave fresh life to this settlement, and at once raised it to a surprizing pitch of opulence, which it has since hardly equalled, was the resort thither of the pirates called the Buccaneers; men who fought with the most desperate bravery, and spent their plunder with the most lavish extravagance, were welcome guests in Jamaica. They often brought three or four hundred thousand pieces of eight at a time, which were immediately squandered in excessive gaming, wine, and women. Thus vast fortunes were made, and the returns of treasure to England were prodigiously great. By this means the inhabitants had raised such funds, that when the source of this wealth was stopped up by the suppression of the pirates, they were enabled to turn their industry into better channels; and they increased so fast, that it was computed there were sixty thousand whites and a hundred and twenty thousand negroes in the island.

But while the inhabitants were filled with the gayest hopes and wallowing in riches, they suffered one of the most violent earthquakes that perhaps was ever felt. Of this we have taken notice in treating of the destruction of Port Royal, in which city two thousand whites and blacks perished. It will be proper here to add, that the houses all over the island were thrown down, and the surviving inhabitants forced to dwell in huts. Two great mountains falling stopped the course of a river, that was dry from that place for a whole day, by which means vast quantities of fish were taken up, to the great relief of the distressed. An high mountain was split, and part of it falling into a level plain, covered several settlements; and almost all the ships and sloops were lost in the harbour: but we have not room to describe the terrors of this dreadful scene. A general sickness soon followed, which also carried off a great number of the inhabitants.

The enemies of Great Britain were not idle spectators of such a dreadful event; the French proposed to make an easy conquest of a ruined island, where poverty, sickness, and every hardship now prevailed; so much was Jamaica changed. They invaded the island with firm hopes of success: but though the inhabitants had so many difficulties to struggle with, they still retained their pristine spirit and native courage; the invaders were repulsed, and only eighteen of them left to carry the news of their defeat. These losses seem not yet to have been sufficiently repaired. It is said that at present the white inhabitants scarcely exceed twenty-five thousand souls, and yet the blacks are computed to amount to near ninety thousand, an amazing disproportion!

S E C T. X.

Of the CARIBBEE ISLANDS.

A concise Description of Anguilla and Barbuda; their Situation, Extent, and Produce.

WE now proceed to such of the Caribbee Islands as are subject to Great Britain. This name seems to have been given to some of these islands before they became subject to the Spaniards; who, to colour over their massacring the inhabitants, pretended that the name of Caribbee signifies cannibals, and that the inhabitants of all these islands were eaters of human flesh: but it does not appear that there ever was a nation either here, or in any part of the American continent, that deserved to

have the odious and horrid name of man-eaters. Eleven of these islands, with the Granadillos, all of which are small, and some of them very inconsiderable, belong to the English; these are Anguilla, Barbuda, St. Christopher's, Nevis, Antego, or Antigua, Montserrat, Dominica, St. Vincent, Barbadoes, Tobago, Granada, and the Granadines, or Granadillos. The first six, with Porto Rico, Guadaloupe, &c. are also termed Leeward Islands; and the last, with Martinico, &c. are named Windward Islands.

We shall begin with Anguilla, or Snake Island, a long and narrow tract winding somewhat in the manner of a snake, whence it received its name. This, which is the most northerly of the Caribbee Islands possessed by the English, is seated in the eighteenth degree twenty minutes north latitude, and is ten leagues in length and three in breadth.

This island is woody, but perfectly level. Its climate is nearly the same with that of Jamaica. It abounds with tame cattle, with which it has been stocked by the Europeans; and also with the opossum, musk-rat, alligator, and other animals common in the same climate. The English settled here in 1650, in a fruitful soil, where they applied themselves to the planting of tobacco, the raising of corn, and the breeding of cattle, for which purpose they brought a stock with them. At present they chiefly subsist by husbandry, and make a little sugar. They are far from being remarkable for their industry, or their numbers; and have been frequently pillaged by the French, who in 1745 made a descent on the island, to the number of a thousand men, when six hundred of them marching up to attack a breast-work, were so well received by the continual fire of a hundred men posted there to defend it, that they were obliged to return with the loss of a hundred and fifty men, besides some of their colours and fire-arms.

Barbuda is seated in the seventeenth degree forty-seven minutes north latitude, and in the sixty-first degree forty-five minutes west longitude, thirty-five miles to the north of Antigua, fifty-three north-east of St. Christopher's, and ninety south-east of Anguilla. It extends twenty miles in length, and twelve in breadth. The land is low and fertile: on the west side it has a good road well sheltered, and clear of rocks; but from the north-west and south-west points two shoals of sand run above two leagues into the sea.

This island produces citrons, oranges, pomegranates, Indian figs, grapes, pine-apples, the sensitive plant, cocoas, cotton, pepper, ginger, cinnamon, cassia, Brasil wood, and ebony; with tobacco, indigo, maize, potatoes, yams, with other roots and drugs.

Here are plenty of cows, sheep, goats, and fowl; the breeding of all which is the chief employment of the inhabitants, who make good profit of selling them to the other islands; the English here living much after the same manner as our farmers, and have no immediate trade with England. Here are likewise serpents of various kinds, some very large and not poisonous, but are of service in destroying rats, toads, and frogs; but the bite of others is incurable, if a remedy be not immediately administered.

This colony was planted as early as any of the Leeward Islands, except St. Christopher's: but was so often disturbed by the Caribbees, that the people were frequently forced to desert their plantations; for there hardly passed a year in which they did not make one or two incursions, and that generally in the night, for they durst not attack them by day; so that the English grew weary of dwelling in a place where they were so much exposed to the fury of the natives; and therefore deserted the island: but the Caribbees diminishing daily in number, and the Europeans in the other islands increasing, the English again possessed themselves of Barbuda: in a few years the inhabitants amounted to five hundred, and they are now increased to about thirteen or fourteen hundred. It is subject to a gentleman of the name of Codrington, who chuses the governor, and enjoys the same prerogatives as the other lords proprietors in America.

S E C T.

S E C T. XI.

S T. CHRISTOPHER'S.

Its Situation, Extent, Air, Soil, and Face of the Country; its Vegetables, and Animals. Its Inhabitants, and the Forts erected for their Defence, with a Description of the Town of Basse Terre.

THE island of St. Christopher, commonly called by our sailors St. Kitt's, lies between the seventeenth degree ten minutes and the seventeenth degree forty minutes north latitude, and the middle of the island is in the sixty-second degree forty minutes west longitude from London, it being about ten miles to the north of Nevis, and fourteen leagues from Antigua. It extends twenty-five miles and a half in length; but its greatest breadth is no more than seven.

The air is exceeding hot; but pleasant, pure, and healthful, and agreeably tempered with cool breezes. The days and nights are almost equal during the whole year, and it would seem to be constant summer were it not for the rainy season and the hurricanes.

In the thick woods, which are plentifully stocked with cabbage-trees, are swarms of monkeys, who venture out in the night to steal potatoes and other provisions. At the top of the Conorrhoe hills, is a plain not three hundred yards wide, ending at the edge of a cavity of a prodigious depth, and about a mile in circumference, containing sulphur, from which rise continual clouds of steam. A furlong to the south-east is a large rocky hill, called Mount-Milery, from a rash man, who attempting to ascend a precipice, fell backwards, and was killed. This is the highest point of land on St. Christopher's, and it is said to rise about a mile and a half perpendicular from the sea. In the sulphureous cavity above-mentioned, are two or three round holes in the earth, vulgarly called the Devil's Coppers. They are two yards asunder, and each about three feet in diameter. The reverend Mr. Smith says, that when he saw them, they boiled fiercer than ever he saw a sugar-copper. On this hill, there is a great quantity of pure brimstone, and on its top is a powder magazine.

St. Christopher's is represented by some writers as one of the most delightful islands in the world. Its mountains, notwithstanding there are dreadful rocks and thick woods between them, rise one above another, and are adorned by rows of trees that wear a perpetual verdure, intermixed with handsome houses covered with shining slate. The soil, which is light and sandy, is not only proper for the cultivation of tobacco, but for that of sugar, cotton, ginger, and fruit of all sorts. It is well supplied with springs, and at the foot of the mountains on the south-west part of the island has some hot ones proper for baths: yet in some places the water is scarce. The valleys and sides of the hills are very fertile; but the mountains are less so; yet for the most part are overgrown with palmeto, cotton-trees, lignum-vitæ and other trees. There are no trees in the island like ours, except such as originally come from hence. The soil abounds with maize, pine apples, prickly pears, with two sorts of pepper; one that grows in a little red husk about four inches in length, and the other in small pods. Here are also mastic and locust trees, bana, musk-melons, water-melons, the papa, the manchaneel-tree, and many others. It principally abounds with sugar-canes, and is supposed to produce about ten thousand hogheads of sugar one year with another, with a considerable quantity of rum. The island also affords a great deal of salt, which is produced in a salt lake, supposed to contain about eighty acres, where the sun exhaling the water during the hot weather, leaves a crust of salt at the bottom that exactly resembles rock-crystal.

The animals are generally the same as those in the other Caribbee islands; but the most remarkable of its beasts is the rocket, a kind of lizard, whose skin resembles a withered leaf, with yellow or blue spots. It has sparkling eyes, always holds up its head, and is in perpetual motion. Its tail turns up towards its back in a circle and a half, and when pursued it puts out its tongue.

The most noted of the birds, besides those common to the Caribbees, are the orinoca eagle and the crow-fowl. The feathers of the former are a light grey, curiously diversified with black spots, and the ends of the wings and tail are yellow. It attacks only such birds as have crooked beaks and sharp talons like itself, and always seizes them flying.

The crow-fowl, which is as big as a large duck, is ash-coloured, has a great head, small eyes, and a short neck, under which is a craw that will hold two gallons of water. It lives upon fish, which it watches from trees on the shore, and sometimes dives in for them above a fathom under water. It is so intent on its prey that it is easily shot; but is not fit for food.

Their other birds are a few swans, a small kind of screech-owls, mountain-thrushes, noddies, spoon-bills, pelicans, boobies, and common pigeons, besides two or three wild forts, ground-doves, humming-birds, and some bats.

Tho' no bees are hived, either here or in the island of Nevis, yet there is a great deal of honey produced by the wild-bees; but it will not make mead, on account of the warmth of the climate.

The inhabitants are computed to amount to about eight thousand whites and eighteen thousand negroes. When it was inhabited by the French, they dwelt nearer together than the English, who live scattered up and down the country for the convenience of planting; but have as fine houses as any in America, they being of cedar, adorned with walks and groves of orange and lemon-trees.

The fortifications of the island are a fort erected on Brimstone-hill, said to be impregnable, and planted with forty-nine pieces of cannon. Charles-fort, which is furnished with forty pieces of ordnance, and a sufficient quantity of stores; and Londonderry-fort, on the east-side of Basse-Terre. There are also six batteries raised at so many landing-places, mounted with forty-three cannon in all.

The island is divided into the parishes of St. John, Christ-church, and St. Mary on the north; St. Anne, St. Thomas, and Trinity, on the south-sides; and in each is a handsome church, wainscotted and furnished with pews, which, as well as the pulpit, are of ebony, cedar, red wood, brazil, and other precious sorts of wood, of a beautiful colour, and fragrant scent.

Basse-Terre, the capital of the island, is a fine town built by the French, under the cannon of their fort. The houses are of good brick, free-stone, and timber; and among other buildings, are a town-house, an hospital, and a large church. They erected their castle on the east side of a high mountain, shaded with lofty ever-green trees, about a mile and a half from the sea. This castle is built of brick and free-stone, has very noble halls and apartments, wainscotted with cedar, and a fine prospect of delightful plantations of the sugar-cane and ginger, with a long walk of lemons and orange-trees, leading to a large court before it. This castle, which was defended by five sconces, mounted with cannon, has a chapel on one side, and on the other great stone cisterns, into which water is brought by pipes under ground. Between the place and the mountains, is a large and beautiful garden, that produces the most delightful flowers and plants of Europe and America, and is adorned with a fountain.

The island has a militia consisting of one regiment of foot, a troop of horse, and another of dragoons, amounting in the whole to about one thousand three hundred and forty men.

S E C T. XII.

Of the Settlement and Revolutions that have happened in the Island of St. Christopher

ST. Christopher's was discovered by Christopher Columbus in his first voyage to America, who gave it this name from the figure of its mountains, there being in the upper part of this island a very high mountain, bearing on its summit another of a smaller size, as St. Christopher

topher is painted like a giant carrying our Saviour on his back. Sir Thomas Warner, an English adventurer, and M. Desnambuc, a French gentleman, who commanded for the French in America, arrived at St. Christopher's on the same day, and both took possession of the island in the names of their respective masters. This happened about the year 1623. It was then inhabited by the Caribbees, and the Spaniards used to put in there in their West-India voyages, to take in fresh water, they being on such good terms with the Caribbees, that they sometimes left their sick on shore, of whom the natives took great care.

The above gentlemen leaving some of their men on the island, returned to their respective countries for recruits, when their masters approving of their conduct, sent them back in 1626 with supplies of men and provisions, and with commissions to the governors of the new settlements. M. Desnambuc arrived there about the month of January, 1627, with about three hundred people, after a long and sickly voyage. Sir Thomas had as many men, and had proceeded a good way in his settlement before the arrival of the French. The two governors, therefore, to prevent any disputes about the business of their respective territories, set boundaries to their several divisions, with this particular regulation, that hunting and fishing should be equally free to the inhabitants of both nations; that the salt-ponds and most valuable timber should be in common, together with the mines and havens; they even concluded an offensive and defensive league against all their enemies, after which they proceeded with great harmony.

The English, however, receiving supplies of men and provisions from London, throve better than the French; and not only became strong enough to keep what they had, but to spare men for settling plantations at Nevis, of which Sir Thomas Warner took possession, and left a settlement there in 1628.

The Spaniards being in the mean time alarmed at the progress of the English and the French, in the Caribbee-islands, thought the safety of their own plantations required their preventing those nations settling in their neighbourhood, and therefore, the next year, sent Frederic de Toledo with twenty-four ships and fifteen frigates to dispossess the English and French of St. Christopher's. Don Frederic seized some English ships near the isle of Nevis, and then anchored under the cannon of a fort called Basse-Terre, commanded by M. Rossey. Neither the French nor English forts were then in a condition to oppose such an enemy. Rossey, after a small opposition, abandoned Basse-Terre, and retired to Cabes-Terre, another fort commanded by M. Desnambuc in person; but neither could prevail on their men to defend themselves there, nor to retire to the mountains, where they might have been able to oppose a great army; and nothing could satisfy them but embarking and leaving the place, and with this Mr. Desnambuc was obliged to comply. In the mean time the English, being in great consternation at hearing the news of Desnambuc's retiring with his colony, some endeavoured to escape by sea, others fled to the mountains, and all who were left, sent deputies to treat with the Spaniards. Don Frederic, who had them now in his power, commanded all on the island instantly to depart, on pain of being put to the sword; and to hasten their going, sent them the English ships he had taken at Nevis; but these ships not having room for all the people, with their families, he consented that those who could not embark, should stay till they could be removed. Don Frederic now weighed anchor, taking with him six hundred of the English who were fittest for his service. But he was no sooner gone than the English who were left, resolved to go on with the settlement; when the French, who had gone no farther than to Antigua and Montserrat, sending a ship for intelligence to St. Christopher's, and being informed that the Spaniards were gone, and the English busy in rebuilding and planting, rejoiced at this happy and unexpected turn, and sailing back to St. Christopher's, resumed the possession of their former habitations.

The English now continued carrying on their colony, and increased so fast, that in 1632, they spared more men for new settlements at Barbuda, Montserrat, and

Antigua, and at the same time had good houses at St. Christopher's, with wives and families; but few of the French married, or took much pains about furnishing themselves with many of the accommodations of life. M. Desnambuc died about the year 1637, and an American company, which he had caused to be set up in France, continued only till the year 1661, when their share of this and the other islands was sold to the knights of Malta, of whom in 1664, they were bought by the West-India company. Sir Thomas Warner did not long survive the French governor; but, before his death, the colony was greatly increased.

About the time of the Revolution, animosities arose between the two nations, and were carried to a great height. The French, even before war was declared either in England or France, entered the English pale, and destroying all before them with fire and sword, forced the inhabitants to fly to their forts for safety, which, however, for want of timely succours, they were obliged to surrender, together with their part of the island, on the 29th of July 1689, and could obtain no better terms than being removed to Nevis.

The French, however, had not been above eight months sole masters of the island, when a most dreadful earthquake destroyed their possessions; the earth in many places opened nine feet, destroyed their sugar-mills and houses, overturned their Jesuits college, and all the other stone-buildings. The next year the English, under colonel Codrington and Sir Timothy Thornhill, recovered the island, and remained sole masters of it, after having removed one thousand eight hundred French-men, with their families, to Hispaniola; and tho' the French were restored to their part of the island by the treaty of Ryswick, yet in 1702, upon the breaking out of Queen Anne's war, Codrington again attacked the French settlements, and drove every man out of the island; and the country being yielded to the crown of Great-Britain, by the peace of Utrecht, all the French territory was sold for the benefit of the public, which must have produced a very large sum, since eighty thousand pounds of the money was in bank till the year 1733, when it was appropriated by parliament for the marriage portion of the princess Anne to the prince of Orange.

SECT. XIII.

Of the Isle of NEVIS.

Its Situation, Extent, Climate, Soil, and Plants; with a Description of the Diddledoo Trees. Of the Cattle, and wild Animals, is described the Land-Pike, the Soldier-Snail, the Fly-Catcher, the Land-Crab, and others.

THE island of Nevis is three or four miles south-east of the south-east point of St. Christopher's, whence they are full in sight of each other; and from hence may be distinctly perceived, in a clear day, the islands of Eustachia, Saba, St. Bartholomew, Antigua, Guadeloupe, Montserrat, and Redondo. It is only six leagues in circumference, and has a high mountain in the middle of it, said to be exactly a mile and a half perpendicular, and is covered with plantations and trees.

The climate is said by some to be even hotter than that of Barbadoes, though the latter is much nearer to the line. Fevers are very rife here, especially in October, when the trade winds veer from the east to the north.

The land is very fertile; English beans blossom in the mountain plantations, but never pod; yet samphire, cucumbers, common lettuces, kidney-beans, cellery, and nasturtiums, &c. are excellent. Among the trees is one called the diddledoo, resembling a codling tree; but with narrow thin leaves. It bears a lovely blossom of the finest yellow and scarlet colours, and is esteemed a sovereign remedy against the green-sickness.

Though the vallies are fruitful, the rising ground is stony, and the plantations grow worse in proportion as they rise towards the summit of the mountain. The produce of this is much the same as in the other Caribbee islands: they have oranges, limes, and lemons; but sugar, which is the staple commodity, answers all the purposes

purposes of money, and all the trade of the island is managed by it. Their sugar is for the most part muscovado; tobacco, cotton, and ginger, were formerly much cultivated; but all these have been neglected to make way for the sugar-cane, which produces such plenty of sugar, that fifty or sixty ships have been laden with it, in this small island, within a year for Europe.

As no hay is made here, their saddle-horses are fed with grass weeded out from among the sugar-canes, as also with the green blades of Indian corn, Guinea corn, and New England oats; but their mill-horses, asses, and mules, are generally fed in pastures, except during the sugar harvest, when they live on the sugar-cane tops and the skimmings of the sugar coppers. The sheep of this island have neither horns nor wool; but are hairy and smooth skinned, and have generally small red or black spots like those of a fine spaniel. They breed twice a year, if not oftener, and have generally two, three, or four lambs at a time, and even suckle them all. The rams are of a pale red, with a thick row of long, straight, red hair hanging down from the lower jaw to the breast, as far as the fore-legs. Their swine, which feed upon Indian corn, Spanish potatoes, and the juice of the sugar-cane, are exceeding sweet, white, and fat. They have rabbits, and some black cattle; but their salt beef, hams, pickled salmon, sturgeon, and oysters, are brought to them from Europe and the northern colonies. The fowls and the turkeys, which are fed with the same diet as the swine, are excellent food. Some of these, together with the geese and ducks, are brought from the northern colonies, but they have plenty of Mulcovy ducks of their own breeding. The ground-doves are here about the size of a lark, of a chocolate colour spotted with dark blue: their heads resemble those of a robin-red-breast, and their eyes and legs are of a fine red.

Here are several sorts of lizards, some of which are so large as to be five feet from the head to the tail, which is of the same length.

The land-pike is so called from its resembling the fish of that name; but instead of fins it has four feet, which are so weak that it crawls slowly along, and winds its body like a pike fresh taken out of the water. It is about sixteen inches in length; its skin is of a silver grey, covered with little shining scales. In the night they make a noise under the rocks more hideous than the croaking of frogs and toads. They are seldom seen but in the evening, and have been frequently sold upon pretence of their being salamanders.

One of the most extraordinary animals is a kind of snail called the soldier, because having no shell of its own, it creeps into the shells that are drove to the shore, in which it accommodates itself like a soldier, who takes up his quarters in other people's houses. As it grows bigger it gets into larger shells, which it finds empty, and appears of several forms and figures, according to the diversity of the shells of which it takes possession. For its defence it has something resembling the claw of a large crab-fish, with which it closes the entrance of the shell, and thus secures its whole body, all of which, except the head and claw, is very tender. This claw is jagged within, and takes such firm hold of whatever it fastens on, that it takes away the piece. This creature marches faster than the common snail, and does not mark its track with any slime. When put near the fire it forsakes its quarters; and if its shell be presented to it to enter it again, it goes in backward. M. Rochefort says, that when there are many of these met together in order to change their quarters, if they find a shell which several would be glad of, they contend for it with great eagerness, and an obstinate engagement ensues, in which they grapple with one another, till the weaker being forced to submit, the victor takes possession of the shell in dispute, and peaceably enjoys it in right of conquest.

Here is a pretty little flying insect, with four legs, and of various beautiful colours, called a fly-catcher; for it comes into rooms, and presently clears it of all the flies and other vermin. It also lies down on planks, waiting for the flies, and puts its head into different postures on its seeing them shift their places. It frequently stands with its mouth half open, and when it sees an advantage leaps directly on its prey, which it seldom misses; and is so

tame, that it will come on the table when people are eating, and catch the flies that crawl on their hands or cloaths.

There are here land-crabs much smaller than our sea-crabs; these make little burrows like rabbits in the woods high up the mountains; but come down every year to the sea to wash and shed their shells, and then are easily caught at night by torch-light. Their claws are long and slender, which enables them to travel pretty fast. The only venomous creatures here are centipedes and scorpions.

Here are different sorts of shell-fish, and in the ponds near the sea are crabs of a beautiful sky blue, with a brownish yellow shade all round the edges. They are much less than our European ones, but finer shaped both in the body and claws; yet the fine colours of their shells vanish with the life of the creature.

S E C T. XIV.

Of the Inhabitants of Nevis; its principal Towns; the Negroes, and the Laws made against them. The Government of the Island; the Value of Money, and the Revenue of the Clergy.

THOSE of the inhabitants that are descended from the Europeans are computed at about three thousand, and the negroes at three times that number, of whom at least four thousand are employed in the sugar trade. The militia is computed at about three hundred men, but there is only one fort in the island, which is mounted with nineteen guns.

Though much shipping comes to the island it has not one good harbour, nor any tolerable anchoring except on the south-west side, where are several rocks and shoals, between which ships ride in safety; but in case of an hurricane they put out to sea, and if possible run into Antego.

The only town in the island is Charles Town, which has large houses and shops well stored, and is defended by a fort. The market is kept here every Sunday, from the rising of the sun to nine o'clock in the morning. Mr. Smith says, the gentlemen both of this island and St. Christopher's purchase iron-wood and lignum-vitæ from the islands of Santa Cruz, St. Bartholomew's, Desada, &c. to serve as posts to the sugar-houses, mills, &c.

The negroes are here generally fed with salt herrings, maize, and Spanish potatoes. Some of them are fond of eating grasshoppers, as others are of cane-rats, which they wrap up in banana leaves, and bake in wood embers. During sugar harvest they work almost incessantly night and day, and on Sundays bring to the market Indian corn, yams, and garden-stuff of all sorts. The laws are here no less severe with respect to the negroes than in other parts of the West Indies, they being scarce considered as men. Hence a negro cannot be evidence against a white man. If he strikes one, the law condemns him to lose the hand he strikes with; and if he should happen to draw blood, he must die. If a white man happens to kill a black he is not tried for his life, but the law obliges him to pay thirty pounds Nevis money to his master for the loss of his slave.

There are here three public annual fasts, namely, in the first weeks of July, August, and September, to beg that God would preserve them from the hurricanes that too often come in those months; and if they escape, they have a public thanksgiving in October.

The government of Nevis is by a governor, council, and assembly, who can make any law that will last twelve months; but not longer, unless it be confirmed by the king.

This island, with St. Christopher's, Antigua, and Montserrat, are under one governor, who has the title of captain-general and governor in chief of all the Caribbee Islands, from Guadaloupe to Porto Rico. His post is worth about three thousand five hundred pounds a year. Under him each island has its particular deputy-governor, who has a salary of two hundred pounds a year, and a separate independent legislature, consisting of a council and an assembly of the representatives.

The salaries of the clergy amount to sixteen thousand pounds weight of muscovado sugar each; the fees for a funeral sermon are three pound, or five hundred pounds weight of sugar; and for every christening, marriage, and burial twelve shillings and six-pence.

This is the observation of the Rev. Mr. Smith, rector of St. John's parish in this island; but he observes, that an English shilling goes here for one shilling and six-pence; and that the French, Spanish, and Portuguese coin bear near the same proportion. He adds, that the king gives twenty pounds out of the Exchequer to every clergyman sent hither by the bishop of London to vacant parishes, to defray the charges of the voyage.

S E C T. XV.

A History of the Island of Nevis.

THE first colony was settled here in 1628 by Sir Thomas Warner, who also planted St. Christopher's. At first there hardly passed a year in which the Caribbeans did not make one or two incursions generally by night; so that the colony was several times obliged to quit the island; but, notwithstanding this, it throve at length to such a degree, that in twenty years they consisted of between three and four thousand men, who lived by the trade they carried on in sugar; and about the year 1688 it was so improved, that it was supposed to contain ten thousand whites, of whom near two thousand were fit to bear arms, besides twenty thousand negroes; but the next year half of the men were cut off by a dreadful mortality, and on the sixth of April, 1690, was a violent earthquake, which instantly levelled with the ground all the houses in Charles Town built either with brick or stone: in several places the earth clove about a foot asunder, and hot stinking water spouted out of it to a great height. The sea left its usual bounds several times for above one-third of a mile. The earth was in many places thrown up in great quantities, and thousands of large trees buried. Some spacious cisterns, of which almost every house had one for saving rain-water, threw it out by the violence of the earthquake eight or ten feet high; and so strong was the agitation of the sea at the same time, that sloops felt it between St. Lucia and Martinico: others passing by the island of Redondo, fifteen miles north-west of Montserrat, found the earthquake so violent there, that great part of it tumbled into the sea, with a noise as loud as that of the discharge of cannon, accompanied with a great cloud of dust ascending into the air.

In 1706 the French under M. D'Ibberville made a descent both on this island and St. Christopher's, and having prevailed on the negroes to lay down their arms by giving them hopes of being set at liberty, they marched to attack the English, who being overpowered by numbers fled to the mountains, where they capitulated, and consented to remain in the island as prisoners of war, till a like number of French prisoners were released by way of exchange elsewhere. In the mean time they were to be used civilly, and their houses and sugar-works preserved; but the French, with the usual regard to the faith of their agreements, treated them very ill, burnt their houses and sugar-works, and forced several of them to sign an agreement, promising in six months time to send a certain number of negroes to Martinico, or money instead of them. After this they left the island, tempting three or four thousand negroes to go off with them, on the promise of an easy life in the French islands; but actually carried them to the Spanish West Indies, where they sold them to work in the mines. One of these negroes happening to escape when they got ashore, found means to inform his countrymen, who were left behind at Nevis, how basely the French had used them; upon which they took arms, fell on the French who were left in the island to see the capitulation performed, and cut them to pieces.

The agents at London, both for this island and St. Christopher's, now applied to the lords of trade to have a consideration for their losses, which they represented as amounting to several hundred thousand pounds; and in order to this the commissioners sent one of their clerks

to the Leeward Islands, to take an exact account of what damage had been sustained by this invasion. Both colonies also sending an address on this subject to queen Anne, it was referred to the house of commons, who granted the sufferers a hundred and three thousand two hundred and three pounds to enable them to settle there again. In the mean time the people of the island met with an enemy even more terrible and destructive; for in the year 1707 they were reduced to the greatest distress by a hurricane, which threw down their houses, tore up the trees and plants by their roots, and almost entirely destroyed their sugar-works.

This colony has not yet recovered from these calamities; and it will perhaps be many years before it will be so populous and flourishing as it was sixty years after its first establishment.

S E C T. XVI.

Of ANTIGUA, or ANTEGO.

Its Situation, Extent, Harbours, Climate, Soil, Produce, Parishes, Towns, and History.

THE island of Antigua is seated in the seventeenth degree thirty minutes north latitude, and in about the sixty-first degree forty minutes west longitude, to the east of Nevis and St. Christopher's, and is somewhat of a circular form, about six leagues from east to west, the same distance from north to south, and about sixty miles in circumference. It is more famous for good harbours than all the other English islands in these seas; yet is so encompassed with rocks, that it is in many parts of dangerous access, especially to such masters of ships as are not well acquainted with the passages between these rocks. The principal harbours are Willoughby-bay, near two leagues to the south-east of Green Island; Nonsuch harbour, a spacious bay at the east end of the island; Five Island harbour, on the west side of the island, so called from five little islands that lie to the west of it; St. John's harbour, due north from the former, and about two miles from it by land, is a kind of double harbour, which is really the best in the island, yet a sandy bar runs across the mouth of it, the deepest part of which is at the south-west end. This harbour is defended not only by a fort at the mouth of St. John's river, mounted with fourteen guns, but by seven other batteries raised for the defence of so many landing-places. Falmouth harbour is defended by Fort Charles and Monkhill fort. Here are also English harbour and Carlisle harbour.

The climate is here hotter than that of Barbadoes, and very subject to hurricanes. The soil is sandy, and much of it overgrown with wood: the island has also but few springs, and not so much as a single brook, so that its chief dependance for fresh water is what falls from the clouds, and therefore the inhabitants are sometimes distressed for want of it: yet, notwithstanding all these inconveniences, it is a thriving and very considerable plantation. It produces much the same commodities as the other Caribbee Islands, particularly sugar and tobacco. Their sugar was, however, at first so black and coarse, that being rejected by our sugar-bakers, it was generally shipped off for Holland and Hamburgh, where it fetched only sixteen shillings per hundred, at a time when other muscovado sugar fetched eighteen or nineteen shillings: but the planters have since so far improved their art, that as good muscovado sugar is made here as in any of the sugar islands, and they have also learned the art of clay-ing it.

This island contains about seventy thousand acres, and produces, one year with another, sixteen thousand hog-heads of sugar. They plant but little tobacco; but what they do plant is better than what it was formerly.

The island has more venison than any other of the Caribbee Islands, and has a considerable number of black cattle and fowl, with most of the animals common to the other islands.

The island is divided into five parishes, and has the following small towns; namely, on the north-west part is St. John's town, the capital, which is one of the most regular towns in the West Indies, and has the most commodious

modious harbour of any of the Leeward Islands; but consists of only two or three hundred houses. On the south side are Falmouth, Parham, and Bridge town; and in the center of the island is St. Peter's. The people here are computed at about seven thousand whites, and thirty thousand blacks.

This island is said to have been first discovered by the English in the time of Sir Thomas Warner, already mentioned, and that some English families settled upon it in 1636; but the first grant of this island from the crown appears to have been made by king Charles II. about the year 1663, to William lord Willoughby, of Parham, who planted a colony there about the year 1666; he was made governor of the Caribbee Islands, and lost his life the same year in a hurricane near Martinico. But it does not appear that Antego made any considerable figure among the Leeward Islands till the year 1680, and it seems that its improvement since has been chiefly owing to the care of colonel Christopher Codrington, the deputy-governor of Barbadoes, who removed hither; and after planting a good part of it, made this island the seat of his government, when he was captain-general of all the Leeward Islands. This rendered Antego populous, rich, and flourishing.

In 1681 the inhabitants suffered greatly by a terrible hurricane, and also by another in 1689, when most of the houses, sugar-works, and wind-mills were thrown down. The Indians in the neighbouring islands, in league with the French, came hither in their periaguas, and landed more than once in general Codrington's time; but after killing a few of the inhabitants, who lived near the sea, always retired. This colony, in return for these visits from the friends of the French, sent three hundred men to Marigalante, drove the French inhabitants into the woods, burnt their town, nailed up their guns, demolished their fort, and brought away the plunder they had obtained. This island had afterwards frequent quarrels with the governors, and at length, in October 1736, a general stop was put to all business, occasioned by the discovery of a plot by which the negroes intended to murder all the white inhabitants. It was to have been put in execution on the eleventh of that month, the anniversary of his late majesty's coronation, when the governor usually treats the gentlemen and ladies of the whole island with a ball, which happening then to be postponed to the thirtieth, on account of the death of the governor's son at St. Christopher's, proved the preservation of their lives. The chief negroes in the plot were three persons named Court, Tomboy, and Hercules, who belonged to three different planters. The first of them was to have been king, and the other two his generals. During the intended ball gun-powder was to have been conveyed into the cellar in order to blow up the house. At the same time Court and his two generals were to head a party of four hundred men each, one from the east end of St. John's Town, and the two others from Otter's and Morgan's pastures, all armed with cutlasses, to fall on all the white people, women and children, in the town, at the same time that the house blew up, which was to have been a general signal to other parts of the island, to be conveyed throughout the whole by fires lighted up on certain eminences. The negroes of the several plantations were then to rise and destroy all the whites in their respective districts, and to make themselves masters of the whole island. But the three negroes above-mentioned being suspected, on account of their former crimes, were taken up, and evidence being daily brought against them, were convicted on the nineteenth of October; and on the next day Court and his two generals were carried to the place of execution. Court being stretched out on a wheel, after being exposed an hour and a quarter in that situation to the sun, begged leave to plead, and confessing every thing that had been alledged against him, he, with his two generals and two others, were all broke on the wheel. Four more of the principal conspirators were burnt the same day, as were seven on the next; six were hung alive in chains on gibbets and starved to death, one of whom lived eight days and nine nights without sustenance; after which their heads were cut off, fixed on poles, and their bodies burnt. Fifty-eight others were at several times chained to stakes and burnt alive.

S E C T. XVII.

Of MONTSERRAT.

Its Situation, Extent, and Produce; with a Description of the Musk-Herb, and the Tree called Iron-Wood; with a concise History of the Island.

THE island of Montserrat was discovered by Columbus in 1493, who gave it this name, from its resembling a mountain so called near Barcelona. It lies twenty-five miles almost south-south-east from Nevis, forty north-west from Guadaloupe, twenty west-south-west from Antigua, and two hundred and forty from Barbadoes. It is somewhat of an oval form, about nine miles in length, the same in breadth, and about eighteen miles in compass.

Its mountains are covered with cedars, cypress trees, acomas, and the musk-herb, which grows like brambles without thorns, and bears yellow flowers that afterwards turn to pods full of seeds that have the smell of musk.

In the mountains is also the tree termed iron-wood, which does not exceed thirty feet in height, and the trunk is, in proportion, somewhat slender. It is covered with a whitish bark, but that upon the upper branches is of a reddish grey. The leaves, which are smooth, and of a yellowish green, are two inches and a half long, and above an inch broad. The flowers are many and white; these rise in groupes upon one common pedicle, and are succeeded by small berries half an inch long, whose outward tegument, as well as the inward pulp, is of the finest red, interspersed with small seeds. This tree has the name of iron-wood from its hardness, its great weight, and the closeness of its grain. It is so heavy, that it will sink in water; it is proof against all weathers, and, in several ages, scarce suffers any decay.

The valleys of this island are well watered and fruitful: climate and soil are much the same with those of the other islands, as are also its animals and trade. Its chief produce is indigo, great quantities of which used to be exported to Great Britain. The inhabitants likewise make some sugar, which is said not to be so fine as that of Jamaica and Barbadoes.

This is, in short, a well planted island, pretty much frequented by ships, though it is surrounded with rocks, and has no place that can be properly called a haven; so that on the approach of a hurricane such ships that happen to be on the coast are obliged to put to sea, and with all possible expedition to sail to St. Christopher's or Antigua.

No settlement was made upon this island till the year 1632, when Sir Thomas Warner, the first governor of St. Christopher's, settled a small colony here. It at first flourished more than Antigua; but the latter island has since got the start of it. It is computed that it has at present about four thousand whites and one thousand two hundred negroes. They have two parish-churches lined with cedar, whose pulpits and pews are also of that and other sweet-scented kinds of wood.

In 1668, when the French had taken Antego, they attacked this island with a considerable force under M. de la Barre, and after much loss took it, together with sixteen cannon, a great number of negroes and cattle, and took the governor, with above three hundred English, prisoners of war. The English had made such a gallant defence, and killed such a number of brave French officers, that the conquerors were so exasperated, that instead of admiring and esteeming them for their courage, they meanly set fire to every thing, except what belonged to the Irish, who were the first that submitted; so that above forty sugar-houses, and several ware-houses filled with rich merchandize, were destroyed. M. de la Barre left five hundred Irish, who took the oaths to the conqueror, and with their families made up above two thousand souls; and then carried his prisoners and booty to St. Christopher's. This island was however afterwards restored to the English.

In the late queen Anne's war, three thousand five hundred French, under M. Cossart, landed at Car's bay upon this island, and soon made themselves masters of it, except Dodon fort on an inaccessible hill, to which the inhabitants

habitants fled with their best effects; but the French, after having spent ten days in plundering the island at pleasure, returned to Guadaloupe.

The affairs of this island afford nothing remarkable after this, except a dreadful hurricane which happened in 1733, and blew down three fifths of the houses in the island. A cattle mill-house, which weighed at least twenty thousand pounds, was carried some distance from its situation, and broke into ten thousand shivers by the force of the fall; and a large copper that would hold two hundred and forty gallons was carried over a high wall, and the sides jammed close together by the force of the fall; but the greatest loss was the destruction of the sugar-canes, and the whole damage, exclusive of the shipping, was computed at no less than fifty thousand pounds of their currency.

SECT. XVIII.

Of DOMINICA, ST. LUCIA, and ST. VINCENT.

Their Situation, Extent, Soil, Produce, and History.

DOMINICA, which owes its name to its being discovered by Columbus on a Sunday, is the last of those called the Leeward Caribbee islands, according to our maps; but the Spaniards consider it as the most northerly of the Windward islands. It is seated in the fifteenth degree twenty minutes north latitude, and in the sixty-first degree twenty-four minutes west longitude, about half the way between Guadaloupe and Martinico, and fifteen leagues from each. This island extends about thirteen leagues in length from the north-west to the south-east, and near as much over in its broadest part.

Dominica is divided into the Caves-Terra and Basse-Terra; that is, into the high and low-land part. The soil is good, and the sides of the hills bear the finest trees in the world; and, according to some authors, it is one of the best of the Caribbee islands, on account of its fruitful vallies, large plains, and fine rivulets. It is watered by several rivers abounding with fish, and produces mandioca, cassava, bananas, and the finest figs. It has also potatoes and ignamas, with a great deal of millet and cotton.

Here are great numbers of ringdoves, partridges, and ortolans. The inhabitants breed hogs and poultry; of the former are two sorts of wild ones descended from such as were first brought from France and Spain.

The Caribbeans retiring hither for the most part on their being driven out of the other islands by the Europeans, are therefore most numerous here. The French having frequented the island more than the English, are said to be best beloved by the natives. The French always opposed the attempts of the English to settle here, because it would enable them in time of war to cut off the communication between Martinico and Guadaloupe: the English, however, frequently made use of it to wood and water. But this island was, however, ceded to the king of Great Britain, in express terms, by the late treaty of peace.

The island of St. Lucia received its name from its being discovered on the day dedicated to the virgin martyr St. Lucia. It is situated in the thirteenth degree forty-five minutes north latitude, and in the sixty-first degree west longitude, lying about six leagues south of Martinico, and north from St. Vincent, and is twenty-one miles to the north-west of Barbadoes, which, it is said, may be seen from thence in a clear day. St. Lucia is twenty-three miles in length, and twelve in breadth. It has several hills, at the foot of which are fine pleasant valleys, which contain good land, well watered with rivers. In these valleys are tall trees that afford excellent timber.

The air is esteemed salubrious, the hills being not so high as to intercept the trade-winds, which always fan it to the east, and by these the heat of the climate is mitigated. It has also several good bays and harbours, which afford good anchorage for ships.

The English first settled on this island in 1637, and lived here without any disturbance from the natives or any others, till the year 1639, when they were driven

out by the Caribbees, who were exasperated against them; for an English vessel being becalmed before Dominica, some of the Caribbeans of that island, thinking her to be a French ship, from her bearing a flag of that nation, went aboard with their fruit, and drinking freely of brandy, the master hoisted his sails, and the Caribbeans suspecting his design, endeavoured to recover their canoes; but being hindered, leaped over-board and swam to the island, except two, whom the villainous master of the vessel put in irons, and sold for slaves. Those who escaped complaining of this treachery to the natives of Martinico and St. Vincent, they massacred the English at Barbadoes, Antigua, and others of the new settlements; then coming to St. Lucia in the night-time, surprized the English in their beds, killed the governor and most of the inhabitants, plundered their ware-houses, burnt their habitations, destroyed their provisions, and in short did incredible mischief, which obliged those who escaped to fly to Montserrat. This affair so terrified the English, that they gave over all thoughts of settling again in the island.

In 1644 M. de Parquet, governor of Martinico, sent about forty men from Granada, under M. de Rousselan, who took possession of the island, erected a fort, which they fortified with cannon and pateraroes, encompassed it with a palisado and good ditches, and raised a fine habitation near it, where they planted vegetables proper for food, and cured tobacco. As Rousselan was well beloved by the natives, on account of his marrying one of their women, the French enjoyed a perfect tranquility till the year 1654, when he died, and was succeeded by la Riviere, who expecting to live with the natives upon as good terms as his predecessor, erected a fine habitation, where he had not lived long with his family, before the Caribbeans formed the barbarous design of assassinating him. That la Riviere might not suspect their design, they paid him several visits, in order to sell him fruit; after which they one day came in great numbers to his house, where he gave them a friendly reception and plenty of liquor; but, while he suspected nothing, they treacherously murdered him, with ten of his men, and, after plundering his house, carried off his wife, two of his children, and a negro slave.

He was succeeded by M. Haquet, who took all proper precautions not to be surprized by the Caribbeans, yet could not escape the snares they laid for him; for in 1656, on the pretence of selling him a considerable quantity of turtle, which they had left upon a hill not half a mile from the fort, they decoyed him thither, with only three soldiers to attend him; and, while they amused the soldiers, threw him from the hill into the sea: yet not being much hurt he got safe to land, through a shower of arrows, and taking out one of his pocket pistols, they were so frightened that they fell on the ground. He seized that opportunity to escape to the fort, but just before he reached it, one of them shot him in the flank with an arrow, and he died three days after. M. Parquet, the governor of Martinico, sent M. le Breton to succeed him, who having been formerly his lady's footman, the garrison resolved to assassinate him; and one of them shooting at him when he was without the fort, le Breton thought it his best way to take shelter in the woods, where not being able to find him, they were in fear of being called to an account for their crime, therefore stripping the fort and the governor's house, seized a vessel in the road, and escaped to the Spaniards.

Eleven days after a French vessel passing by and finding the colony gone, but the guns, pateraroes, and apartments in good condition, the captain left four of his seamen there, with ammunition and provisions, to keep the fort; and as he was setting sail M. le Breton made a signal to him from an eminence, on which he was received on board his vessel, and another garrison was soon after sent.

In 1663 the English purchased this island from the natives, by a treaty concluded with the Indians by Mr. Warner, the son of Sir Thomas by a Caribbean woman; and the English sending a considerable force in 1664, had the fort delivered to them without resistance, on condition that the French governor, with the garrison, cannon, arms, and baggage, should be sent to Martinico.

Fourteen

Fourteen or fifteen hundred men were now settled on the island, but they being soon after seized with the bloody flux, six hundred of them died in less than three months, among whom was the governor and principal officers; upon which those who survived abandoned the island on the sixth of January 1666, after setting fire to the fort, and dispersed themselves into the other English colonies.

Though the island was deserted, it was still considered as a part of the British dominions, and was accordingly included in every commission of the governor of Barbadoes, who sometimes asserted his jurisdiction over it by going thither in person with great pomp, displaying the king's colours, firing guns, &c. However, in 1719 the French king granted this island to the marshal de Etree, who sent a colony to possess, settle, and plant it; on which the English ambassador at Paris represented the affair with such spirit, as a violation of the rights of his Britannic majesty, that orders were sent to the marshal de Etree's colony, to evacuate the island; which they accordingly did.

Three years after king George I. granted this island and that of St. Vincent to the duke of Montague, who settled a colony here; but soon after a sloop arrived from Martinico, the master of which brought a copy of a mandate from the king of France, in which it was declared, that neither St. Vincent nor St. Lucia belonged to the king of England: that the first of them ought to continue in the possession of the Caribbeans, and that the second belonged to the king of France, who had been willing, however, at the request of the king of England, to suspend the settlement of that island; and that the chevalier de Fouguiere, governor-general of the islands, should summon them to retire in fifteen days; and if they did not depart, he should compel them to it by force of arms.

Mr. Uring, the governor, took every prudent step to secure the colony, by sending to the governors of the other islands, and the captains of the men of war then stationed there, to procure their assistance; but they declining to act in a hostile manner against the French in time of peace, who sent between two and three thousand men against him, he was obliged to surrender; when it was agreed, that the English might re-embark all their cannon, stores, arms, and baggage, without molestation; that the French should also evacuate the place; and that the island should remain inhabited by neither the French nor English, till the dispute between the two crowns relating to it was decided; but that the ships of either nation should be at liberty to frequent its ports for wood and water. It was soon after determined by both crowns that this island, with that of St. Vincent and Dominica, should remain neutral. However, the French before the late war began to settle these islands; but, by the late treaty of peace, resigned all claim to them to his Britannic majesty.

The island of St. Vincent is seated in the thirteenth degree thirty minutes north latitude, and in the sixty-first degree west longitude, fifty miles to the north-west of Barbadoes, and ten leagues to the south-south-east of St. Lucia. It is about twenty-four miles in length, eighteen in breadth, and sixty in compass.

This island has a deep fat soil, capable of producing every thing proper for the climate, and has abundance of rivulets and springs of excellent water. It has several mountains with plains at the bottom, which, if cultivated, would be exceeding fruitful. There are here large straight trees of all the kinds produced in America: tobacco has been cultivated here, and is esteemed excellent; together with mandioca, Turkey wheat, potatoes, ignamas, gourds, and the finest large melons; indigo also thrives here remarkably.

It is said that the Caribbeans, the original inhabitants of this island, people only a part of the island, there being also a great number of negroes, some of whom are descended from a ship load of Africans either driven or run ashore here about ninety years ago, and many fugitives from Barbadoes and the other islands. These are now numerous, and have many villages, where they are said to live well: both these different people are tenacious of their liberties, and jealous of foreigners, though they

readily furnish them with cassavi bread, fruit, and other provisions, in exchange for knives, hatchets, and the like.

We shall now proceed to Barbadoes, an island better known, and of which we are able to give a more accurate and circumstantial account.

S E C T. XIX.

Of B A R B A D O E S.

Its Situation, Extent, Face of the Country, and Climate: of the Land sliding from the Hills into the Vallies; with a Description of Cole's Cave, the Water, and bituminous Fossils in the Island.

THE island of Barbadoes extends from the thirteenth degree ten minutes to the thirteenth degree twenty-three minutes north latitude, and from the fifty-eighth degree forty-nine minutes three quarters to the fifty-ninth degree two minutes and a half west longitude from London; stretching in its greatest length from Goulding's-green, in St. Lucy's parish, to Ananias-point, in Christchurch parish, twenty miles three quarters, and its greatest breadth from Kirtrige's-point, in St. Philip's parish, to a point in St. James's parish, thirteen miles three quarters, and the circumference of the whole island from some of the surrounding principal points is almost fifty-four statute miles.

Its first appearance to the sea eastward is somewhat hilly, but to the south-west and the north-west is more level. The surface in general appears covered with an agreeable verdure, variegated with lofty trees, and large buildings, affording many beautiful prospects. The highest part of the island is a rocky cliff, whose perpendicular altitude is nine hundred and fifteen feet above high-water mark.

The atmosphere is in general serene, clear, and seldom cloudy; and from the total absence of hail, frost, or snow, it is never liable to those many and sudden vicissitudes so common in the climates more to the southward and northward of the tropics. The air is in general very healthy, which is chiefly owing to the regularity of the trade-winds, and to its having neither bogs nor marshes, in which the stagnated waters being exhaled to vapours might prove pernicious; nor large forests, which not only obstruct the passage of the winds, but generate a moist air, caused by the great quantity of vapours which perspire through the leaves, as well as from the shaded moist soil.

The soil in the low deep lands is chiefly black, in shallower parts somewhat reddish, on the hills frequently of a whitish, chalky, and marly nature, and near the sea it is generally sandy. By this variety Providence has wisely adapted different soils to the different nature of the several kinds of trees, shrubs, and plants. Where the soil is black, as it imbibes the rays of the sun, and reflects few or none, the circumambient air is there not near so hot, as where the soil is sandy or gravelly. As the fertility of this, as well as others of the West India islands, depends upon seasonable rains, a long chain of hills, interspersed with deep vallies, are providentially situated to the eastward of some parts of the island, to intercept the clouds and vapours. Hence that part of the island called The Thickets, in St. Philip's parish, being low land, and having no hills nor high cliffs to the eastward to make any resistance to these clouds, is often scorched with drought, when the middle and more hilly parts of the island are replenished with rain.

It sometimes happens that large pieces of ground planted with canes, and even land with plantain and banana trees growing upon it, have slid down to the vallies from the sides of the hills. This happens in very rainy seasons; for as the soil upon these hills is commonly not above eight or nine inches deep, and of an oozy and sopy nature underneath, it easily separates from the next immediate substratum, which is of a slippery chalk, flat stones, or loose gravel. When the soil slides in large pieces, its motion is less violent than when it is confined in narrow chasms in the meeting of two hills, especially if the situation be very steep; for there the collection of water being

considerable and heavy, instead of gliding softly between the two strata, it breaks out in different places at once, and then runs down the precipice a mingled torrent of earth and water.

The beautiful prospects from several hills over the vales below is quite enchanting; we ought not here to omit Hackleton's cliff, where nature at one view displays a great variety of surprizing landscapes. Here the high impending rocks yield a dreary rueful appearance: the several deep chasms below, over which they project, are imbrowned with the thick foliage of lofty trees. The adjacent steep declivity consists of irregular precipices and broken rocks, the whole view terminating on the sea, over whose craggy shores the foaming waves incessantly break. The view appears solemnly awful, except when the eye is relieved by a glimpse or sometimes a full view of the neighbouring plantations. To complete this uncommon contrast, a deep rapid river runs through the vallies at the bottom of these precipices, which though in the dry seasons is almost without water, yet in the rainy months of June, July, and August, it often overflows its highest banks.

The island abounds with caves, the most remarkable of which, called Cole's cave, is situated almost in the bottom of a melancholy hideous gully, or a deep chasm made between hills by repeated torrents of rain. This gully is about a hundred and sixty-five feet deep, from whence you can see nothing above you but the tops of high rocks and impending cliffs, through the gloomy branches of lofty trees. The descent towards the entrance of this cave is by a steep craggy precipice of great height, where your security from falling depends much upon the good hold you take of the roots of trees and branches of underwood. Having rather slid than walked down in this manner a considerable way, you are suddenly within an inclosure of very high perpendicular rocks, where the light of the sky is admitted by two holes in the roof. On the west side of this gloomy apartment lies the mouth of the cave, which is of considerable size. Upon your first entrance into it the light of the day begins to grow weak, and proves but an uncertain guide. Twenty yards farther it appears no stronger nor brighter than the glimmering of a star in a dull hazy night, and a few steps more envelops you in total darkness. "From hence, with the assistance of a candle and lanthorn," says the learned and reverend Mr. Hughes, from whom we have taken this account, I began my subterraneous tour; and, soon after my entrance, turned upon my left hand, to take a view of what is called the Dry cave. This has the top and roof crowded with innumerable petrified icicles hanging downwards. The sides of the cave were likewise in several places thick set with them, especially where there was a cavity: there they grow from the upper to the under shelves of the rocks, like so many balustrades, but more in number, irregular, and sometimes in two or three divisions. The next thing remarkable in these subterraneous apartments is the Wet cave, which, near its first separation from the Dry already described, is very spacious and lofty; but its bottom much furred, and torn up by the repeated torrents of rain, which in wet seasons run through it. Soon after our entering it, we were agreeably surprized with the murmurs of a distant stream, which a little farther we found a considerable spring of the most transparent water, issuing from a large projected rock, or rather the impending side of the cave. The roof near this place is remarkably pitted with several holes, representing shallow cones, of diameters from nine to twenty inches; but their greatest depth did not exceed twenty-four inches. These holes probably owe their origin to large cavous icicles which formerly hung from them, but were broken off by some convulsions of the earth. The spring here made a small basin or bathing-place, and from henceforward the cave gradually lessened in height and breadth, and the icicles hanging from the top and irregular sides were more in number, but less in magnitude. Here I began to want air, and at last the passage became so narrow and low, that I was obliged to stoop much, and the icicles were so small

"that the largest of them did not exceed my little finger in length and diameter. This place, distant near a quarter of a mile from the entrance, was my *ne plus ultra*, being so much fatigued, and wanting air so much, that I durst not, without presumption, proceed farther."

The island has several springs, and a few rivulets. The inhabitants of St. Andrew's, and some part of St. Joseph's parish, are plentifully supplied with fresh water by digging holes in the sand, from ten inches to three feet deep; and these are almost instantly supplied with fresh water percolated through the sand; but in other parts the inhabitants are obliged to preserve rain water in reservoirs, which are generally dug near a descent.

Among the fossils the most remarkable are the following: An oily bituminous exudation issuing from some hills in St. Andrew's and St. Joseph's parishes, of a dirty black, inclining to a green. It is procured by digging a hole or trench in or near the place where it issues out of the earth: this by degrees fills with water, having a thick film or cream of this liquid bitumen swimming upon the surface; from whence it is skimmed off, and preserved in earthen jars or other vessels. The most proper season for gathering it is in the month of January, February, and March. It is of so inflammable a nature, that it serves to burn in lamps. As to its medicinal qualities, it is used with great success in paralytic and nervous disorders, and in the cure of cutaneous eruptions.

There is another species of bitumen of a solid substance, called here *munjac*. This is dug out of the earth at different depths on the sides of hills in St. John's and St. Andrew's parishes, and nearly resembles that bitumen found in the Dead Sea. If by accident any of these veins take fire, they continue to burn a long time, though in a dull slow manner, for the veins being surrounded with earth it crumbles, and falling into the flame, stifles it.

In St. George's parish are often dug up lumps of a transparent resinous substance resembling resin, from which it is chiefly distinguished by the fragrance of its smell, and upon comparing it with the gum of the birch gum tree it appears to be of the same species.

S E C T. XX.

Of the Vegetables of Barbadoes; with a particular Description of the Palm-Oil Tree, the Burgamot Tree, the Forbidden-Fruit Tree, the Guava, and the Manchineel Tree. Among the Animals are described the Surinam Scorpion, and a particular Account of a Battle between a Sailor and a Shark.

THE trees of Barbadoes are vastly numerous; that called the palm-oil tree grows about fifty feet high; its branches somewhat resemble those of the cabbage-tree, but are much less uniform, shorter, and less verdant: the middle rib of each leaf is thickly studded with sharp-pointed prickles, each two inches long. The fruit is inclosed in a pod, which opening exposes to view many small nuts covered with a husky tegument of a yellowish colour, containing in its many interstices, when ripe, a considerable quantity of fine sweet oil, which the slaves, after the whole fruit is first roasted in the embers, greedily suck. When this outward husky covering is taken off, the nut appears, which is of a somewhat blunt conic shape, and the inside filled with a white kernel.

The burgamot-tree resembles that of the orange, but the fruit is somewhat larger; it has, however, very little juice, and what it yields is exceeding sour: what is most valuable is its oil, which is extracted by slicing the outward skin, and squeezing the fruit into a glass, on which the oil immediately separates from the juice, and swims upon the surface. This being carefully drained off and preserved, is what alone ought to be called the genuine burgamot oil. The Portuguese have a method of making snuff-boxes of the rind, which retain for a long time the grateful fragrance of the oil.

What is here called the forbidden-fruit tree has the trunk, leaves, and flowers like those of the orange. The fruit, when ripe, is something larger and longer than the finest

finest orange, which it also exceeds in its delicious taste and flavour.

Here are also the four orange, the Guinea orange, the golden orange, so called from its being of a deep yellow within; the shaddock, the citron, the St. Helena lemon, the Spanish lemon tree, and the lime; the pomegranate and the guava tree.

The latter is distinguished into two sorts, the white and the red; and these, with regard to their shape, into the round and the pear-fashioned, or perfumed guavas. The latter have a thicker rind, and a more delicate taste than any other. This tree, if carefully cultivated, grows to about eighteen feet in height, has a very smooth bark, of a reddish grey, with sharp-pointed leaves and white flowers. The perfumed guava is round, and about the size of a large tennis-ball; the rind, or skin, is generally of a russet stained with red, lined with an apple-like substance, as thick as a crown-piece. The inside is full of an agreeable pulp mixed with innumerable small white seeds. The rind, when stewed, is eaten with milk, and preferred to any other stewed fruit. From the same part is made marmalade, and from the whole fruit the finest jelly perhaps in the world.

Besides the trees already mentioned there are the pineapple, and a great variety of other fruits, with many trees admired for the beauty and solidity of the wood, particularly *lignum vitæ*, red wood, iron wood, and many others; we shall only add the following, which is one of the most remarkable of the American trees, and is found in most of the Caribbee Islands, as well as Barbadoes.

The manchaneel tree is remarkable for the beauty of the timber, and its juice being one of the strongest poisons yet discovered. Historians have, however, exaggerated the accounts they have given of the poisonous nature of this tree; for it has been pretended, that the heads of the persons who sleep under its shade swell, and they become blind; that if the leaves but touch the naked skin, they raise pustules, which cause deadly pains, unless helped with water and salt, or fasting spittle. This, however, is not true, nor is any ill consequence to be feared from the leaves touching the naked body, unless they are bruised, and the white milky juice they contain is suffered to pervade the pores; which if it does, it raises blisters like those of the confluent kind in the small-pox, causing acute pains; but simple drops of rain water falling from those leaves upon the skin will not have any bad effect, which Mr. Hughes tells us he has experienced upon repeated trials.

This tree is of a very quick growth, and is seldom or never found growing to any perfection, but in a loose and sandy soil, near the sea or other water. The trunk, when full grown, is generally from two feet and a half to three feet in diameter, branching, most commonly, from three to fifteen feet high from the ground. The heart, which is very small, in proportion to the bulk of the tree, is very hard and solid, of a pale yellow, with a greenish cast, interspersed with small blackish veins, the grain smooth, and the wood durable: the bark is of a sleek whitish grey, the branches many in number, and covered with thick, smooth, shining leaves, among which are long pendulous catkins. It bears a fruit of the same make as the round sort of crab-apples which we have in England, and is of a beautiful colour and fragrant smell. The pulp of these manchaneel apples does not exceed one-seventh of an inch in depth, the inside being a hard stony kernel, in which are included the seeds. The juice of the apple is of the same colour and quality as that of the leaves, and yet the reverend gentleman just mentioned observes, that he has known a woman big with child, who longed for them, to have eaten of them, without any apparent bad effect; but adds, he cannot say that the fragrance of the smell, or their tempting looks, have induced others to follow her example by so dangerous an experiment: yet if some of this crude milky juice does but fall upon a horse, the hair of the part affected soon falls off, and the skin rises up in blisters, which will require a long time to heal. Formerly no one dared to cut down these trees, without first having made a large fire round them, in order to burn the bark and dry up the sap and juices that fly from them in cutting: but now naked negroes venture to cut them down, only using the

caution of previously rubbing their whole bodies with lime-juice, which prevents the sap from corroding or ulcerating their skins. Bruising and mashing the tender leaves and boughs, and then throwing them into fish-ponds, has often been practised by villains to destroy the fish, which soon after grow stupid, float with their bellies upwards on the top of the water, and frequently die. Some sorts of fish that will eat these apples, are often found dead in the water, and if taken while alive and eaten often prove poisonous; even the large white crab that burrows in the sand is not, if near these trees, to be made use of for food. We shall conclude this account with mentioning a remarkable instance of the goodness of Providence, that wherever a manchaneel tree grows, there is found either a white wood or a fig tree near it, the juice of either of which is an infallible antidote against the poison; salt water is no less efficacious, and as these trees grow by the sea-side, this remedy is also near at hand.

Among the vegetables of a lower growth are Guinea and Indian corn, and a vast variety of plants, the most valuable of which is the sugar-cane, and many medicinal herbs.

With respect to the animals, the sheep bred here are, as in the other Caribbee Islands, hairy like goats: for to be covered with wool would be as prejudicial to them in these hot climates as it is useful in cold countries, for shelter and warmth; yet as cloathing is necessary, especially in the rainy season, to the inhabitants, the want of wool is abundantly supplied by the cotton tree, of which there are here several sorts which annually supply the inhabitants with the finest wool in the world.

They have coach-horses from England, saddle-horses from New England, and others for carts and common uses from Bonavista, the Cape Verd Islands, and Curasou. They have also a breed of their own, which is mettlesome, swift, and hardy, but not strong enough for much service. The first planters brought black cattle from Bonavista and the Isle of May, and a few of their breed still continues. They have asses, which are of extraordinary use, because they can carry burthens where horses cannot pass.

Among the number of animals, either peculiar to or brought to this island, there is not one that is mortally venomous; while many of the neighbouring French islands are infested with vipers, and other poisonous snakes. There are here but three species of reptiles that can be properly called venomous, the black spider, the forty-leg, and the Surinam scorpion.

A full grown scorpion of the common sort is about ten inches long, the skin soft but scaly, and of a dull copper colour. The reverend Mr. Hughes observes, that the very young ones are surprisingly preserved from danger; for when this threatens, the parent scorpion opens her mouth and swallows them, and afterwards voids them when the danger is over.

The Surinam scorpion is, however, only three inches in length, from the head to the extremity of the tail. From the fore-part of the neck rise two claws, about three quarters of an inch long, divided into three joints, each claw near its extremity ending in a long, slender, whitish forceps. It has two eyes, which are black, small, and shining, with four pair of legs, the hindermost being the longest: each joint of the legs, as well as the back, is marked with several faint whitish lists, the intermediate space being of a russet colour, mixed with blackish spots. The tail is divided into six joints, and at the extremity of the last appear two small horny crooked strings in the form of a wide extended forceps, the upper being double the length of the lowermost: the longest coming from the upper side of the last joint of the tail, the other from the lowermost part, the intermediate space being fleshy. When this scorpion walks or runs she generally curls up her tail in a ring, and when provoked extends it to its full length, and with a quick motion darts it into her adversary. Those who have the misfortune to be stung by them, endure very acute pain for several hours, and the flesh near the wound generally turns livid; but the wound is not mortal. These scorpions are chiefly to be found among old boards, old books, or other loose papers. They never bear any young but once: the female carries her young upon her back,

back, and as these grow in strength the parent decays and dies.

Monkeys are not very numerous in this island; they chiefly reside in inaccessible gullies, especially where there are many fruit-trees. They do great mischief to the neighbouring planters, by digging out of the earth their yams and potatoes, and sometimes breaking and carrying off the ripe sugar-cane. But as a premium is granted for destroying both these and the racoons, they rather decrease than multiply.

The most destructive quadrupeds, with respect to their sugar-canes, are the rats, which are so numerous that the annual loss to the inhabitants of the parishes of St. Joseph and St. Andrew alone is computed at no less than two or three thousand pounds.

The birds of this island are not very numerous; there are none of them remarkable for their notes, nor for the beauty of their feathers, excepting the humming-bird. The tame fowls are much the same as those in England; besides which they have the Guinea fowl, Muscovy ducks, and rumplefowls.

The shores afford a great variety of shell-fish, some of which are exceeding beautiful, and a variety of other productions. "We are no sooner, says our author, advanced to the shore on the west side of the island, but we are, especially in calm mornings and evenings, pleased with the sight of groves of corals, sea-feathers, and sea-roids; the former grow in thick clusters, yielding an embrowned shade, and remain, as sturdy oaks, unmoved; the latter, with their numerous pliant branches, wavily bend with the undulating flow motion of the water. The interspersed, vacant, sandy spaces resemble so many bright lawns, which please by a kind of regular confusion."

Among the more extraordinary kinds of fish are the flying-fish, the toad-fish, the ink-fish, which is so called from its discolouring the water with a black liquid when in danger of being caught, by which means it becomes invisible to the enemy; the cat of nine-tails, and the scuttle-fish, both of which, as well as the ink-fish, eject a black liquid; the old-man, the old-wife, the dolphin, the mud-fish, the star-fish, and the shark. This last fish we have already described in the course of this work; but we cannot forbear mentioning a very unequal and hazardous combat with that voracious animal by a common sailor, which may perhaps be considered as heroic an instance of disinterested friendship and personal bravery as any recorded in history. The account we find in the reverend Mr. Hughes's Natural History of Barbadoes, and shall give it in his own words.

"About the latter end of queen Anne's wars, captain John Beanis, commander of the York Merchant, arrived at Barbadoes from England. Having disembarked the last part of his lading, which was coals, the sailors, who had been employed in that dirty work, ventured into the sea to wash themselves; there they had not been long, before a person on board espied a large shark making towards them, and gave them notice of their danger; upon which they swam back and reached the boat, all but one; him the monster overtook almost within reach of the oars, and gripping him by the small of the back, his devouring jaws soon cut him asunder, and as soon swallowed the lower part of his body; the remaining part was taken up and carried on board, where his comrade was. His friendship with the deceased had been long distinguished by a reciprocal discharge of all such endearing offices, as implied an union and sympathy of souls. When he saw the severed trunk of his friend, it was with an horror and emotion too great for words to paint. During this affecting scene the insatiable shark was seen traversing the bloody surface in search after the remainder of his prey; the rest of the crew thought themselves happy in being on board, he alone unhappy, that he was not within reach of the destroyer. Fired at the sight, and vowing that he would make the devourer disgorge, or be swallowed himself in the same grave, he plunges into the deep armed with a sharp-pointed knife. The shark no sooner saw him, but he made furiously towards him; both equally eager, the one of his prey, the other of revenge. The moment the shark opened his rapacious

jaws, his adversary dexterously diving, and grasping him with his left hand somewhat below the upper fins, successfully employs his knife in his right hand, giving him repeated stabs in the belly: the enraged shark, after many unavailing efforts, finding himself overmatched in his own element, endeavours to disengage himself, sometimes plunging to the bottom, then mad with pain, rearing his uncouth form, now stained with his own streaming blood, above the foaming waves. The crews of the surrounding vessels saw the unequal combat, uncertain from which of the combatants the streams of blood issued; till at length the shark, much weakened by the loss of blood, made towards the shore, and with him his conqueror; who, flushed with an assurance of victory, pushes his foe with redoubled ardour, and, by the help of an ebbing tide, dragging him on shore, rips up his bowels, and unites and buries the severed carcass of his friend in one hospitable grave."

This story, our author adds, is of so extraordinary a nature, that he would not have dared to give it his reader, had he not been authorized by the testimony of a very credible gentleman, who was ready to confirm, by oath, the truth of what is here related.

SECT. XXI.

Of the different Inhabitants, the Divisions of the Island, and a particular Description of Bridge Town, the Capital; with the Government and Trade of Barbadoes.

THE inhabitants of Barbadoes consist of the masters, who are either originally English, Scots, or Irish; with a few Dutch, French, Portuguese, and Jews: the white servants, and the black slaves. The masters, who consist of the merchants and planters, both clergy and laity; lawyers, physicians, &c. live very elegantly, having a number of servants for their plantations and household, rich equipages, fine liveries, and the most wealthy of them have pleasure-boats in which they make the tour of the island.

The white servants are either by covenant or purchase, and are of two sorts, such as sell themselves in Great Britain or Ireland, for four years or more, and such as are transported thither for their crimes. When the term of the covenant-servants is out, the British servants have each five pounds, the others but forty shillings. Their work is not so hard as that of our day-labourers, yet their encouragement is greater; and if they are good for any thing, they may be employed upon their own terms when their time is expired. They are not allowed near so much flesh as those who are employed in our country farms, yet they do not want; for the planters give them English biscuit, which the negroes have not; and the chief of them are supplied from their masters' tables.

The servitude of the blacks is perpetual, and those masters who are men of humanity have a double interest in taking care of them, because if a negro dies the owner loses forty or fifty pounds; while by the death of a white servant he only loses the wages he pays to another to supply his place, during the remainder of his term. The business of the blacks lies mostly in the field, except those who are taken into the sugar-mills, store-houses, and dwelling-houses, where the handsomest and neatest maids are made menial servants, and the cleverest fellows lacquies, coachmen, and grooms: others are frequently employed as coopers, joiners, masons, and the like. A slave who is a good mechanic is worth a hundred and fifty or two hundred pounds, and even much more has been given for a boiler of sugar. The negroes are purchased out of the Guinea ships, after being all viewed naked, and are frequently allowed two or three wives, that they may increase the planter's stock; for their posterity to all generations are slaves, unless they are restored to liberty. The women are very constant to the man who passes for their husband. Their choicest fare is plantanes, which they boil or roast; and they have twice or thrice a week either salt fish, mackarel, or salt pork, with some bread made of Indian corn of the produce of the country, fetched from Carolina.

Every

Every negro family has a cabbin built with sticks, withs, and plantane leaves. These stand round the planter's house, with a garden, where they plant yams, potatoes, cassava roots, &c. and breed goats, hogs, and fowls, for their own eating or for sale. The negroes born in Barbadoes are much more useful than those brought from Guinea, and those that come children from Africa make much better servants when they are grown up, than those that come over at years of maturity; but it is reckoned that a fourth part of the negroes die in seasoning.

Every plantation has a chief overseer, who is allowed a hundred or one hundred and fifty pounds a year, besides two or three under him, with accomptants, and other officers. The country being too hot for hunting and hawking, the planters and other gentry are obliged for the most part to divert themselves by playing at cards, dice, tables, quoits, and bowling; likewise by resorting to balls and concerts.

The principal diseases of this island are the dry-gripes, so called from its affecting that part of the body with great costiveness and pain; but this dreadful disease was formerly much more frequent and fatal than it has been of late. There are likewise other kinds of colics, the yellow jaundice, hysteric disorders, diarrhoeas, and dysenteries; fluxes are also very common, especially in the rainy seasons, when by catching cold the perspiration is interrupted, and what should have been exhaled through the skin is thrown upon the bowels; they are also caused by eating immoderately of fruit. The yellow fever is another fatal disease, as are also the small-pox, the measles, the leprosy, and the yaws. The last appears in fleshy knobs as large as a thimble, covering the face, breast, arms, and other parts of the body.

The precincts of this island, with their respective parishes, are as follow:

In the south part of the island are St. Michael's or Bridge precinct, containing the parishes of St. Michael, St. George, and St. John. In St. James's, or the Hole precinct, are the parishes of St. Thomas and St. James; and in St. Peter's, or Speight's precinct, is the parish of St. Peter, with All Saints chapel.

In the east part is Offine's precinct, which contains the parishes of Christ church and St. Philip's.

In the north is St. Andrew's Overhill, or Scotland precinct, which contain the parishes of St. Andrew and St. Joseph.

In the west is only the parish of St. Lucy.

Bridge Town, the capital, is reckoned the finest and the largest in all the Caribbee Islands. It is seated in the south-west part, in the thirteenth degree north latitude, and in the sixtieth degree west longitude, and was at first called St. Michael's, from the name of its church; but received its present denomination from a bridge erected over the waters, that after rains flow from the neighbouring marshes. It is situated in the innermost part of Carlisle-bay, which is large enough to contain five hundred ships. The houses, which are of brick and stone, are lofty, and amount to about twelve hundred; they have glazed windows, and many of them are sashed: the streets are broad, and one of them, named Cheapside, has the rents as dear as those of the houses of Cheapside in London. The wharfs and quays are very neat and convenient, defended by several forts. The first to the west is James fort, which is mounted with eighteen guns: the next to this is Willoughby's, built on a small neck of land that runs out into the sea, and is mounted with twenty guns: there are three batteries between this and Needham's fort, which is also mounted with twenty guns. Above Needham's, and more within land, is the Royal citadel called St. Anne's. Charles fort is built on Needham's-point, and lies out in the sea to the windward of the bay and town. From this a platform runs to Ormond's fort. On the east side of the town is a small fort of eight guns, and a magazine built of stone, where the powder and stores of the island are kept under a strong guard. In short, this is both the strongest and richest town in all the Caribbees; the store-houses and shops being generally as well furnished as those in London.

The church, which is as large as many of our cathedrals, has a noble organ, a good ring of bells, and a

curious clock. In the town are also large taverns and eating-houses, with a post-house, packet-boats being established by the government to carry letters monthly to and from this place. This is the seat of the governor, council, and assembly; and also of the court of chancery. The number of militia for this town and St. Michael's precinct is no less than twelve hundred men, who are called the Royal regiment of foot guards. There is here a college founded and well endowed by the liberality of that great man colonel Christopher Codrington, who was a native of this island, and was distinguished by a great number of amiable and useful qualities. The town has also a convenient free-school, and an alms-house of twenty poor widows.

There are several other towns; but they are small: indeed every part of the island is strewed with gentlemen's houses, encompassed by fields of sugar-canes, and the bloom and fragrance of orange, lemon, lime, and citron trees, guavas, papas, aloes, and a vast multitude of other elegant and useful plants. Even the negro huts, though mean, contribute to the beauty of the country; for they shade them with plantane trees, which give their villages the appearance of so many beautiful groves.

The government of this island resembles that of the others, and the inhabitants support the expence of their own establishment, which is very considerable, with great credit. The governor's place is worth at least five thousand pounds a year, and the rest of the officers have considerable incomes. The people provide very handsomely for their clergy, who are of the church of England, which is the religion established here as it is in the other islands; and here are very few Dissenters. There is in general a greater appearance of order and decency than in any other colony in the West Indies; and there is no place comparable to Barbadoes, in the number of the people, the cultivation of the soil, and those elegancies and conveniencies which result from both.

The island can raise five thousand men of its own militia, and has generally a regiment of regular troops, though it is seldom complete. It is fortified by nature all along the windward shore by the rocks and shoals; so that near two-thirds are utterly inaccessible. On the leeward side it has good harbours; but the whole coast is protected by a line of several miles in length, defended by twenty-two castles and forts, and twenty-six batteries. All freemen here are obliged to enter themselves in the regiment of their own district, and there is a law here obliging all persons who design to leave the island to give notice of it at the secretary's office, three weeks before their departure.

The number of inhabitants amounts at present to twenty-five thousand whites, and near eighty thousand negroes; and there are shipped from hence above twenty-five thousand hogheads of sugar, valued at three hundred thousand pounds; besides rum, molasses, cotton, ginger, and aloes: an immense peopling and produce for a country that does not contain above a hundred thousand acres of land.

The inhabitants of Barbadoes trade with New England, Carolina, Pennsylvania, New York, and Virginia for lumber, bread, flour, Indian corn, rice, tobacco, salt beef and pork, fish, pulse, and other provisions; with Guinea for negroes; with Madeira for wine; with Tercera and Fayal for wine and brandy; with the isles of May and Curassou for salt; and with Ireland for beef and pork. The other goods which they import from Great Britain and Ireland are Osnaburghs, which are the chief wear of their servants and slaves; linen of all sorts, with broad cloth and kerseys for the planters, their overseers, and families; silks and stuffs for their ladies and household servants; red caps for their slaves of both sexes; stockings and shoes of all sorts; gloves and hats; millinery-ware and perukes; laces for linen, woollen, and silks; strong beer, pale beer, pickles, candles, butter, and cheese; iron-ware, as saws, files, axes, hatchets, chissels, adzes, hoes, mattocks, gouges, planes, augers, nails; lead, powder, and shot; brass and copper-ware; all sorts of India goods and toys, coals, and pantiles.

The voyage is commonly five or six weeks outward-bound, and six or seven homeward. The planters send

to Guinea guns, powder, ball, perpetuanas, hats, and other wearing apparel, which they have from England, and dispatch small vessels thither to bring slaves for their plantations, which must be recruited every year with twenty or thirty negroes to every four or five hundred acres; so that, notwithstanding the means used to make the slaves propagate, this island alone is said to receive a supply of a hundred thousand negroes every thirty years; and yet at the end of that time their number was never found to be increased. It cannot be here improper to mention, that upon a parliamentary enquiry in 1728, it appeared, that in three years only the number of negroes sent to Barbadoes, Jamaica, and Antigua alone amounted to forty-two thousand.

SECT. XXII.

A concise History of the Island of Barbadoes.

IT is not distinctly known when this island was first discovered and settled, but it was probably about the year 1625. When the English first landed here they found the country extremely wild, it having not the least appearance of its ever having been peopled even by savages. There was no kind of beast of pasture, nor any marks of cultivation; yet as the climate was good, and the soil appeared fertile, some gentlemen of small fortunes in England resolved to become adventurers. The first planters had not only the desolateness of the place and the extreme want of provisions to struggle with, but the trees were generally so large, of a wood so hard and stubborn, with wide spreading tops, that they proceeded in the necessary work of clearing the ground with a difficulty that must have subdued any ordinary patience. And even when they had tolerably cleared a small spot, the first produce it yielded for their subsistence, probably for want of sowing the seed in a proper soil, was so small and ordinary, at the same time their supplies from England were so slow and precarious, that nothing but an invincible courage, and a firmness that cannot be sufficiently commended, could have carried them through the discouragements they met with in the noble work of cultivating and peopling a deserted part of the earth. But by degrees things wore a more favourable aspect; some of the trees yielded fustic for the dyers; cotton and indigo were found to agree well with the soil; tobacco then becoming fashionable in England, answered tolerably; and the country gradually began to submit to culture, and to lay aside its savage appearance.

This happy change, and the storm that some time after began to gather in England, encouraged many to go over; but still the colony received no encouragement from the government, which at that time understood the advantages of colonies but little; and the court took no other notice of this island than to grant it to the earl of Carlisle, which proved of no advantage to the settlement. However, as this colony had the hardiest breeding, and the most laborious infancy of any of our settlements in this part of America, so it was far stronger, and grew with greater speed, even to a height that seems incredible; for in this small island in the year 1650, which was little more than twenty years after its first establishment, it contained upwards of fifty thousand whites of all ages and sexes, with a much greater number of blacks and Indian slaves. The former of these slaves they bought; but the latter they acquired by the most base and dishonourable methods; for they seized upon those unhappy people, without any pretence, in the neighbouring islands, and carried them into slavery: a practice which rendered the Caribbee Indians their most inveterate enemies.

The small island of Barbadoes, peopled by upwards of a hundred thousand souls, was not yet above half of it cultivated, nor was the industry of the inhabitants at a stand. A little before the period just mentioned they learned the art of making sugar; and this enlarging the sphere of their trade, they grew prodigiously rich and numerous.

The government in England being about this time in the hands of Cromwell, confined the trade of Barbadoes to the mother country; for before it had been entirely managed by the Dutch. The severity with which the

royal party were treated, now obliged several gentlemen of very good families to settle in the island, which were far from being peopled like several other colonies by fugitives, and persons in unhappy circumstances. After the Restoration it continued still advancing by very hasty strides. King Charles II. soon after his ascending the throne, created thirteen baronets from the gentlemen of this island, some of whom were worth ten thousand pounds a year, and none so little as one thousand.

On the thirty-first of August, 1675, the island was afflicted with a most dreadful hurricane, which it is said was not inferior in its deplorable consequences to the earthquake that happened at Jamaica; for it left never a house or tree standing, except the few that were sheltered by some neighbouring hill or cliff. Some hours before the storm began the heavens were overcast with thick clouds of a black reddish hue; the air calm, but sultry; and the more it lost its expansive force, the closer the clouds condensed, and the blacker they appeared. In the afternoon, when the violence of the storm began, the wind was high, and varying almost in an instant to every point of the compass; but settled chiefly at north, being attended with dreadful rain, thunder, and lightning. The sea, where not guarded with high cliffs, overflowed its banks above an hundred yards, and during the day-light nothing was to be seen but one rueful spectacle of almost universal ruin. The night as it came on was ushered in with a continued rumbling noise in the air, with the increase of wind, rain, thunder, and lightning; especially the latter, which now with redoubled force darted, not with its usual short-lived flashes, but in rapid flames, skimming over the surface of the earth, as well as mounting to the upper regions. The next morning, when the storm was abated, the whole island, says our author, afforded a lively but terrible idea of the tenth Egyptian plague; for there was scarce a house but lamented one dead in it, or in general something equal or worse. Several families were entirely buried in the ruins of their houses, and there were few that escaped but with the loss of some relation, friend, or acquaintance.

This dreadful calamity happened in the meridian of this settlement, when their whites were computed to be much more than fifty thousand, and their slaves were increased to upwards of a hundred thousand of all kinds. They employed four hundred sail of ships, one with another of a hundred and fifty tons, in their trade. Their annual produce, consisting of sugar, indigo, ginger, exported cotton, &c. amounted to upwards of three hundred and fifty thousand pounds, and their circulating cash at home was two hundred thousand. Perhaps no country in the world was ever peopled in the same proportion; nor has land of the same dimensions which produces any thing like the same profits. But since that time the island has been upon the decline. The growth of the French sugar islands, and the settlement of Antigua, St. Christopher's, Nevis, and Montserrat, as well as the greater establishment in Jamaica, have drawn away a vast number of the people. A terrible contagion attacked the island in the year 1692; it raged like a pestilence; twenty have died in a day in their principal town, and all parts of the island suffered in proportion. This sickness continued, with some abatements, for several years, and is said to have rendered the climate less healthful than it was before. At the same time with this distemper war raged, and the Barbadians, who raised a good number of men, lost many of them in fruitless expeditions against the French islands. All these causes contributed to reduce the number and opulence of this celebrated island; but it is only in comparison with itself, that it can be considered in any other than the most flourishing condition, even at this day.

SECT. XXIII.

Of TABAGO, or TOBAGO.

Its Situation, Extent, Climate, Soil, Produce, particularly its valuable Spices, an Account of its Animals, and a concise History of its several Revolutions.

TABAGO, the most easterly of all the Caribbee Islands, is seated in the eleventh degree ten minutes

north latitude, about thirty-five leagues to the south-east of St. Vincent, forty leagues east of Grenada, twelve leagues north-east of Trinidad, and between thirty and forty north-east of the Spanish Main. It is thirty-two miles in length from the south-east to the north-west, and about nine broad from east to west, the whole being above seventy miles in compass; so that it is rather larger than Barbadoes, or indeed than any of our Leeward Islands. At a small distance from the north-east extremity is a small island called Little Tabago, which is two miles in length and a mile in breadth.

The climate of Tabago is not so hot as might be expected from its being seated so near the equator; and it is said to enjoy one favourable circumstance, which is of the greatest advantage, this is its lying out of the course of those hurricanes that have sometimes proved so fatal to the other West India islands.

The surface of the island is agreeably diversified with hills and vales; its north west extremity is mountainous; but no part of it is rugged or impassable. Its soil is of different kinds; but in general its mould is black, rich, and proper for producing, in the greatest plenty, whatever is raised in other parts of the West Indies. The many springs on the island contribute to its healthfulness, and its bays and creeks are so disposed as to be very commodious for all kind of shipping: yet its situation requires fortifications, especially as the natural richness of the island serves but to render it the more inviting to invaders.

The valuable trees which grow in Tabago are perhaps its richest produce; for, besides its producing the different kinds of wood to be found in the West India islands, the Dutch, by whom it was once settled, affirm, that both the true nutmeg and the cinnamon tree, with that which produces the real gum-copal, grows upon this island. The Dutch can indeed be scarcely supposed to be deceived in the natural properties of those valuable trees, which they acknowledge to be, in some respects, different from those in their plantations in the East Indies; yet a great doubt remains, whether they are the original productions of Tabago, or whether they had not been imported and planted there from the East Indies. Tho' the latter is the most probable opinion, yet as the fact itself, which is undisputed, evinces that those rich spices may be cultivated upon the island, it renders it an object highly worthy the attention of the public. This island is also said to produce five different kinds of pepper, the long, the cod, the bell, the round, and Jamaica pepper, all which we are told grow upon the island without culture.

The soil naturally produces Indian and Guinea corn; but no English grain, except pease and beans, can be raised there. The fig-trees produce as good fruit as those of Spain and Portugal. The pomegranate, the pine-apple, the banana, the prickly-apple, oranges of two sorts; lemons and limes of both kinds, sour and sweet, are found in plenty upon this island; and the marmalade made of its guavas is inferior to none. Plantanes grow here of an excellent kind, as do tamarinds, grapes, the custard-apple, the sour-apple, the papaw-apple, the mammee-apple, and the yellow plum are plentiful here. The cherries that grow upon the island are but indifferent. The cocoanut, of which we have given a description in treating of Asia, grows here to such perfection, that the Indians call it God's-tree, as producing both meat, drink, and cloathing. Cucumbers, musk and water melons, pomkins, and gourds, likewise thrive here. The inhabitants have also potatoes, yams, cassava-root, onions, carrots, parsnips, and turnips.

Horses, cows, asses, sheep, deer, goats, and rabbits, were probably introduced by the Courlanders and Dutch, and their breed are still to be found on the island. Here are also the pickery, which resembles a hog, armadilloes, and guanoes.

Its shores are stored with excellent fish, particularly with turtle of every kind, and mullets of a most delicious taste, with other sorts unknown in England: no island, perhaps in the world, can boast of such variety of fowl.

We shall now give a concise history of this island, which was first discovered by Columbus in 1498; but it does not appear that the Spaniards ever made any settlement upon it. At length, in 1628, William, earl of Pembroke, obtained a grant of this island from king

Charles I. but dying soon after, the design of peopling it dropped. About the year 1632, some Zealanders trading in these seas, took such a liking to this island, that upon their return home, they engaged the company of merchants, to which they belonged, to settle it; and it received the name of New Walcheren, from one of the largest islands in the province of Zealand. The new colony soon increased to about two hundred; but being attacked by the Spaniards and Indians, they were all of them exterminated.

Some years after, James duke of Courland sent a colony of his own subjects to this island, who settled upon what was afterwards called Courland Bay, and erected a small regular fort, with a town in its neighbourhood. Here they lived so inoffensively, that they remained unmolested either by the Caribbees or the Spaniards; and found the soil so good, that the colony soon made an excellent appearance. They were supplied from their own country with all kinds of utensils, and flourished to such a degree as to awaken the jealousy of the Dutch, who revived their claim. In 1654, Mess. Adrian and Cornelius Lampsin of Flushing, two Dutch merchants, fitted out some ships, and landed some men on Tobago; but finding the Courlanders too powerful to be opposed, took possession of a different part of the island now called Rockley-Bay, acknowledging themselves under the protection of the duke of Courland.

But the duke, having given umbrage to Charles Gustavus of Sweden, had the misfortune to be taken prisoner in 1658, and to be carried to Riga. This news reaching Tobago, the Dutch besieged and took the Courlanders fort, and thus became masters of the whole island; but promised to restore the fort as soon as the duke should recover his liberty.

The court of France soon after inserting Tabago among the other islands granted to the French West-India company; and the Dutch planters, thinking this a favourable opportunity for establishing themselves under so powerful a protection, Lampsin, in 1662, applied to the court of France, where he had such interest, that he was created baron of Tobago, and becoming sole proprietor of the island, under the crown of France, sent over M. Hubert de Beveren as governor. The new governor called the town his countrymen had built, Lampsinburg; and gave the same name to the harbour, and also to a regular fortress he erected at the same time. He likewise built Fort Beveren; and besides raising several other forts for the security of the colony, laid the foundation of a new town, which he intended to call New Flushing. Mean while the planters proceeded with great spirit; they laid out cacao walks, which served equally the purposes of beauty and profit; erected indigo-works and sugar-mills; and Tobago seemed as if it would soon rival the most flourishing of the English West-India settlements.

The duke of Courland, being at length restored to his liberty by the treaty of Oliva, demanded of the States General the restoration of his fort on the island of Tobago; but not meeting with any success, he applied to Charles II. king of England, who granted to him that island, on consideration of certain services reserved to the crown of Great Britain; this only served to put the Dutch at Tobago on their guard: but soon after, in the first Dutch war, the English privateers destroyed the Dutch forts and colony of Tobago; however, in the succeeding war carried on by the French and Dutch against England, the English were, in their turn, dispossessed of the island, and the Dutch reinstated in it. It afterwards served as a rendezvous for the combined fleets of the two nations, who by this means did prodigious damage to the English trade; but before the end of the war, Sir John Harman attacked and defeated their joint squadrons, and totally destroyed the remains of that of France. The Dutch, however, after the defeat of their fleet, and that of their allies, not only kept possession of Tobago, but in five years time fortified it with three strong forts, and a numerous artillery; so that it was considered as impregnable; yet Sir Tobias Bridges, in 1673, made a descent upon the island, which he not only plundered, but carried away four hundred of the inhabitants prisoners.

The peace which took place the next year between the English and Dutch, left the latter once more in possession

sion of this island; and they even conquered from the French the island of Cayenne. They kept it however but a short time; for the count of D'Etrees, vice-admiral of France, soon after reconquered Cayenne, and appeared before Tobago. James Binkes, the admiral of Zealand, was then lying in Great Rockley harbour, with a strong squadron of Dutch ships, which the count attacked by sea and land, on the third of March 1677; when, after a desperate engagement, the Glorieux, the count's ship of seventy guns, with several others, being blown up, he was obliged to retire, having first destroyed in the engagement great part of the Dutch squadron. Towards the end of the year the count was reinforced with a stronger squadron, when landing his men, he regularly invested the principal fort in the island, which he found so strong, that he was obliged to bombard it; but the third bomb that was thrown fell upon a magazine of powder, which blew up the fortress, together with admiral Binkes, and the greatest part of the officers and garrison. The count then completed the reduction of the island, and on the twenty-seventh of December the same year, entirely destroyed the Dutch colony.

After this, the English published proposals for settling the island; but these were never carried into execution: and at the peace of Aix-la-Chapelle, Tobago was one of the four islands that were declared neutral. Notwithstanding this, the marquis de Caylus, governor of the French islands, sent troops and men to fortify and settle it; but the British court warmly remonstrating to the court of France, against so manifest a violation of the peace, the French disavowed his proceedings, ordered him home, and the settlement to be discontinued. In this state it remained till the definitive treaty of Fontainebleau, by which Tobago was ceded to Great Britain; after which the government of it was given by his present majesty to colonel Melvil, and measures taken to sell the land in shares, and people the country.

S E C T. XXIV.

Of GRANADA, and the GRANADILLAS, or GRANADINES.

A Description of Grenada, or Granada, and of the smaller Islands; their Situation, Extent, Produce, and History.

THE chief of these islands, named Granada, or Grenada, is situated in the twelfth degree north latitude, and in the sixty-first degree forty minutes west longitude. It is the last of the Windward Caribbees, and lies thirty leagues north of New Andalusia, on the continent. It is said to be about thirty miles in length, in some places fifteen in breadth, and about sixty-six in circumference.

Granada and the Granadines produce very fine timber; the latin tree, which grows here, has a tall body, and its leaves, when tied together, serve as thatch for houses; experience has proved, that its soil is fit for producing sugar, tobacco, and indigo; and upon the whole it carries with it all the appearances of becoming as flourishing a colony as any in the West Indies of its dimensions.

A lake on the top of a high hill in the middle of the island supplies it with streams of fresh water, which render the soil extremely fertile, and it abounds with wild game; among the fowl are wood-pigeons, thrushes, and parrots; and among the fish are eels, mullets, and cray-fish.

Several bays and harbours lie round the island, some of which might be fortified to great advantage; so that it is very convenient for shipping, and has the happiness of not being subject to hurricanes. The chief port, called Lewis, is on the west side, in the middle of a large bay, with a sandy bottom; and it is said that a thousand vessels from three hundred to four hundred tons may ride secure from storms, and that a hundred ships of a thousand tons each may be moored in the harbour: besides, a large round basin, which is parted from it by a bank of sand,

if cut through would contain a considerable number of ships. At present large ships, on account of this sand-bank, pass within eighty paces of one of the mountains that lie at the mouth of the harbour; the opposite mountain lying at about half a mile distance. One of these mountains, when the English reduced the island, was strongly fortified, and might have made a good defence, but surrendered without firing a gun.

With respect to the history of this island, it will be proper to observe, that in 1638 the famous M. de Poincy attempting to make a settlement here, was driven off by the Caribbees. Afterwards M. Parquet, governor of Martinico, carried over two hundred men from that island, furnished with presents to procure the favour of the natives, and with arms to subdue them, should they prove untractable. The number of the French are said to have frightened the savages into submission; and we are told that their chief not only welcomed the new settlers, but, in consideration of their being presented with some hatchets, knives, scissars, toys, and the like, yielded to Parquet the property of the island, only reserving to themselves their habitations. The French began with raising tobacco, which proved remarkably good; but they had scarcely got in one crop, when they began to discover that all the seeming complaisance of the natives was dissembled; who now took every opportunity of cutting off their new guests. This produced a war, and the colony having received a reinforcement of three hundred men from Martinico, drove the natives to a mountain, where, having exhausted all their arrows and other weapons, they rolled down trunks of trees on their enemies. They were soon after joined by other savages from the neighbouring islands, and attacked the French with fresh vigour, but were again defeated; yet were so desperate, that forty of them who had escaped the sword, threw themselves from a precipice into the sea. The French then vented their rage on the habitations of the natives, levelled them with the ground, and destroyed their provisions.

Fresh supplies of Caribbees however arriving, the war was renewed, and they killed many of their enemies; on which the latter came to a resolution of exterminating the whole race upon the island, and a hundred and fifty attacking them by surprize, inhumanly murdered, not only the men, but the women and children; and likewise set fire to their canoes, to cut off all communication between the survivors and the Caribbees of the neighbouring islands. The French were here the savages, and not the Caribbees.

These barbarities exasperated the Caribbees still more against the French; they became their irreconcilable enemies, and by their frequent opposition at last obliged Parquet to desist from his design of peopling the island, his property in which he sold to the count de Cerillac in 1657 for thirty thousand crowns. The count sent thither as governor a person of brutal manners, who by his behaviour made the better sort of the French abandon it; and soon after he was shot by those that remained. In 1664 there remained no more than a hundred and fifty planters out of five hundred, who, when the count bought it, were settled on the island; yet he sold it to the French West India company for a hundred thousand crowns: but in 1674 they were obliged to surrender all their rights in it to the king.

After this the island continued to be inhabited chiefly by the French; but was never fully settled. In the last war, when Granada was reduced by the English, the French inhabitants, who were not very numerous, were so amazed at the reduction of Guadaloupe and Martinico, that they lost all spirit, and surrendered without making the least opposition. Afterwards the full property of this island, and of the Grenades, which bear nearly the same products as Grenada, were confirmed to the crown of Great Britain by the definitive treaty of 1763, and are now in part settled by the subjects of Great Britain.

We have now concluded our account of the British dominions in America; an amazing tract of country, much improved, and still capable of immense improvements.

C H A P. V.

Of the FRENCH AMERICAN Dominions, particularly LOUISIANA,
and the FRENCH WEST INDIAN Islands.

S E C T. I.

Of LOUISIANA.

Its Situation, Extent, and Produce; with a concise Description of New Orleans; and some Observations with regard to the French Policy, with respect to their Colonies.

LOUISIANA was, till lately, considered as a much more extensive country than it is at present; M. de Lisle extending it on the north to Canada; on the east to the provinces of New York, Pennsylvania, Virginia, Carolina, and Georgia; on the south to the Gulph of Mexico; and on the west to New Mexico, New Spain, and unknown countries inhabited by Indians. But by the seventh article of the late treaty of peace, a great part of this country, containing all on the east-side the river Mississippi, was ceded to Great Britain; and of this we have already given as accurate an account as it was possible for us to obtain.

The country at present named Louisiana, extends from the twenty-ninth to the fortieth degree of north-latitude, and from about the eighty-eighth to the ninety-sixth or ninety-seventh degree west-longitude from London. The soil is very indifferent near the mouth of the Mississippi; but the country contains a great deal of excellent land, well stocked with a variety of trees, planted by the hand of nature; the soil on the south is adapted to the cultivation of indigo, cotton, tobacco, and rice, and the north, to that of wheat; but several spots of great extent, on the eastern side of the Mississippi, are no less fertile.

With respect to the vegetables, and the wild animals, they are, in general, the same as those we have described in treating of Virginia, and the other British plantations. The Mississippi, with the many smaller rivers that water this country, abound with a variety of fish; but their banks are much infested with alligators, and snakes of a very large size; as the air of the low-lands, near the rivers, is with musketoes.

The isle of Orleans, at the mouth of the Mississippi, is a very beautiful and fertile spot of ground, on which the French have a considerable city, named New Orleans, which is the capital, and indeed the only city of Louisiana. It is fortified in a regular manner, and according to some French authors, has about six hundred handsome houses, and five parish churches; with straight and handsome streets, that cross each other at right angles: but the buildings are chiefly of wood, and not remarkable for their beauty.

The French have several other settlements in the country, and are supposed by major Rogers, to amount to about one hundred thousand; the negroes are also very numerous; and he observes, that as the number of the inhabitants increases very fast, it may in a short time become a very formidable colony.

Before we proceed farther, in the description of the French colonies, it will give some satisfaction to the reader to know the plan of conduct which France has pursued, with regard to this interesting and important subject. They are sensible that as the mother-country is ultimately to receive all the benefits of their labours and acquisitions, the prosperity of their plantations must be derived from the attention with which they are regarded at home: for this reason, the plantations are particularly under the care and inspection of the council of commerce, a board composed of twelve of the most considerable officers of the crown, assisted by the deputies of all the considerable trading cities and towns in France, who are chosen out of the richest and most intelligent of their traders, and paid a handsome salary for their at-

tendance at Paris, from the funds of their respective cities. This council sits once a week, when the deputies propose plans for redressing every grievance in trade; for raising the branches that are fallen; for extending new ones; for supporting the old; and in fine, for every thing that may improve the working, or promote the vent of their manufactures, according to their own lights, or the instructions of their constituents. They have a watchful eye upon every article of commerce; and not only propose improvements themselves, but hear the proposals of others, which are neither disdainfully rejected, nor rashly received. They neither render the access to them difficult, by affecting state; nor admit the vexatious practice of fees, and perquisites, in their inferior officers; nor suffer forms and methods to load and incumber that business they were solely intended to advance. They summon and examine those who are supposed to be the most competent judges of the matter before them, even the meanest artificers; but though they examine these men, they are determined by their own opinion. When they are satisfied of the usefulness of any regulation, they propose it to the royal council, where their report is always received with particular attention. An edict to enforce it accordingly issues; and is executed with a punctuality that distinguishes their government, and which alone can render the wisest regulations any thing better than serious mockeries. To this body the care of the plantations is particularly entrusted.

The government of their several colonies is in a governor, an intendant, and a royal council. The governor is invested with a great deal of power; which on the side of the crown, is checked by the intendant, who has the care of the king's rights, and whatever relates to the revenue; and on the side of the people, it is checked by the royal council, whose office it is to see that the people are not oppressed by the one, nor defrauded by the other; and they are all checked by the constant and jealous eye which the government at home keeps over them; the officers of all the ports of France being charged, under the severest penalties, to interrogate all captains of ships coming from the colonies, on the reception they met with at the ports to which they have sailed? how justice was administered to them? what charges they were made liable to, and of what kinds?

That the colonies may be as little burthened as possible, the governor's salary is paid by the crown: he has no perquisites, and is strictly forbidden to carry on any trade, or to have any plantations in the islands, or on the continent; or any interest whatever in goods or lands within his government, except the house he lives in, and a garden for his convenience and recreation. All the other officers are paid by the crown, out of the revenues of the mother country; the fortifications are built and repaired, and the soldiers paid out of the same funds.

In all the French islands judges of the admiralty are appointed, to decide in a summary manner all disputes between merchants, and whatever has any relation to trade. These judges, before they are appointed, are strictly examined as to their skill in the marine laws, which have been improved and digested in France, with such care and good sense, that all law-suits are quickly decided; though in other respects, the practice of the law admits of as much chicanery, and has as many, if not more delays, than with us.

That the colonies may be properly replenished with people, every ship that sails from France for America, is obliged to carry a certain number of indented servants: thus all vessels of sixty tons, or under, are to carry three

three; from sixty to a hundred, four; and from a hundred and upwards, six servants, of sound and strong bodies, between the ages of eighteen and forty. Before their departure, they are examined by the officers of the admiralty, to see whether they are the persons required by law; as they are also by the commissary, on their landing in America, where they are to serve three years. The avarice of the planters makes them always prefer negro slaves, because they are more in subjection than the Europeans, may be more worked, are subsisted with less difficulty, and are besides the entire property of their master, which would in time render the safety of the colony extremely precarious. The planters are therefore obliged to keep a certain number of white servants in proportion to their blacks; and the execution of this law is enforced by the commissary, who adjusts the price, and forces the planters to take the number of servants required by the ordinance, who would otherwise be a burden upon the masters of ships who brought them.

As to the negroes, they are not left, as with us, with their bodies and souls wholly at the discretion of the planter. Their masters are obliged to have them instructed in the principles of the Romish religion. Methods are also taken to protect the slaves from the cruelty of the planters, and to preserve the colony from the ill effects that might arise from treating them with a lenity not consistent with their condition. In short, the Code Noir, and other ordinances relative to these unhappy beings, shew a very just and sensible mixture of humanity and steadiness. Their planters, however, as well as ours, have the common error of working these unhappy creatures in a manner not suitable to their constitutions, and the nature of the climate.

We shall only add, that all debts, though contracted by the planters in France, are levied with great ease; for the process being properly authenticated, is transmitted to America, where it is admitted as proved, and levied on the planter's estate, of whatever kind it be. Care is however taken, that while compulsory methods are used to make the planter do justice, the state shall not lose the benefit arising from the industry of an useful member of the community; the debt is always levied according to the substance of the debtor; in such a manner, that one of the parties is not sacrificed to the other; the creditor is satisfied; the debtor is not ruined; and the credit of the colonies is kept up at home, by the sure methods that are used for recovering all demands in the plantations.

Some of these regulations, for which we are obliged to a judicious work lately published, entitled, *An Account of the European Settlements in America*, would doubtless be of great use, were they to be introduced into our colonies, especially the islands, where proper regulations are much wanted, and where they might be easily rendered conformable to the mode of those royal governments.

SECT. II.

Of HISPANIOLA, or ST. DOMINGO.

Its Name, Situation, Extent, Climate, and Produce. A concise Account of the Buccaneers, and the Manner in which a Part of this Island became Subject to the French. Their Trade; the principal Places in the Island; with a concise Account of St. Lewis, and of the Isle of Vache, or Cows-Island.

WE shall now proceed to the island of Hispaniola, or St. Domingo, which was discovered by Columbus in his first voyage in 1492, and by him called Hispaniola; but afterwards building a city, which he called St. Domingo, in honour of his father Dominic, the name was first extended to that quarter, and at length the whole island was called St. Domingo, by which name it is as well known as by that of Hispaniola.

This island, part of which belongs to the Spaniards, is the largest of all the Antilles, next to Cuba, it extending from the seventeenth degree thirty-seven minutes,

to the twentieth degree north latitude, and from the sixty-seventh degree thirty-five minutes, to the seventy-fourth degree fifteen minutes west longitude; it being about four hundred and twenty-six miles from east to west, and almost one hundred and twenty-four where broadest, from north to south. It lies in the middle between Cuba and Jamaica, on the north-west and south-west, and Porto Rico on the east, and is separated from the latter only by a narrow channel.

The climate is extremely hot, but cooled and refreshed by breezes, yet the air is not reckoned unwholesome; for some of the inhabitants are said to live to above a hundred years of age. Its salubrity is said to be owing in a great measure to its beautiful variety of hills and vallies, woods and rivers, which every where present themselves to the view.

This island is allowed to be the most fruitful and the pleasantest in the West Indies; its forests contain cabbage-trees, palms, elms, oaks, pines, and other trees, taller and larger, with more beautiful and better tasted fruit than in most of the other islands, particularly pine-apples, bananas, oranges, lemons, citrons, limes, grapes, dates, and apricots. Here are also all the birds common to the West Indies. In the savannas, or meadows, are innumerable herds of black cattle, that run wild in the country; horses enough in the French part of it to supply all their neighbouring colonies, besides wild horses and wild hogs of the breed brought over by the Spaniards. The hunters shoot the beves for their hides, as they do in Cuba: besides, there is scarce a country in the world better watered, either by brooks or navigable rivers, which are all full of fish, as the coast is with turtle. In the sands of these rivers gold-dust is found, and it had formerly mines of gold, silver, and copper.

The chief commodities of the island are hides, sugar, indigo, cotton, cacao, coffee, ginger, tobacco, salt, wax, honey, ambergrise, and various kinds of drugs and wood for dying; but it produces little corn. The French here are said to equal, if not outnumber, the Spaniards, who both together fall very short of what the extent and fertility of the island is capable of supporting.

This country was treated with the utmost severity by the Spaniards, who in battle and cold blood destroyed no less than three millions of men, women, and children, and entirely extirpated the inhabitants, by many of whom, at their first settlement in this island, they had been treated with kindness.

We have already mentioned the Spaniards attempting to ruin St. Christopher's, when divided between the English and French; but by this unjust act they brought upon themselves a very severe revenge: for several of the French inhabitants, who were expelled from St. Christopher's, being reduced to great indigence, began to think of desperate courses. They betook themselves to piracy, and uniting with some English, Dutch, and other resolute fellows, they resolved to begin a piratical war with the Spaniards. At first they satisfied themselves with taking their ships, and destroying their trade. This they did effectually; but soon encouraged, and strengthened by this success, they landed upon the continent of New Spain and Terra Firma, burning and plundering the open country. Their number and boldness increasing with their success, they assembled and took some of their strongest fortresses and opulent cities, particularly Porto Bello, Campeachy, and Maracaibo; they even took the city of Panama by storm, and burnt it, after defeating an army which came to its relief. In all these places, and in the others they had taken, they gained an incredible booty, and committed the most unheard of cruelties. Another party of these pirates passing the streights of Magellan, and entering the South Sea, rendered the whole coast of Peru, Chili, and the coast of Mexico one scene of desolation; while they were every where attended with success, because they every where acted with the bravery and conduct that, in a more just cause, would have merited the highest honours.

These pirates, whom we improperly call Buccaneers, the French denominated Flibustiers, from the Dutch fly-boats, in which they made their first expeditions. The Buccaneers are persons who hunt wild cattle in America

merica for their hides and tallow: some of whom joined the Flibustiers in their first expeditions, and from them the English gave the name of Buccaneers to the whole body. These people frequently brought their prizes and plunder to Jamaica, as we have already observed, by which they greatly enriched that island. Others finding that the Spaniards were so weak in Hispaniola that they had in a manner deserted a considerable part of the island, made it a place of rendezvous. They who hunted the cattle found the deserts left by the Spanish tyranny a proper place for exercising their proper professions. To these two sorts of people were added a third, who were some of the French in the Lesser Antilles; who finding how much might be gained by supplying men who were lavish in their expences, and not very exact in their bargains, and perceiving that no part of America afforded a better soil, passed over to the island, and exercised the employment of planters and merchants. These three sorts of people, who were mutually of use to each other, lived in very good harmony. Indeed they were several times dislodged by the Spaniards; but they still returned with new strength; so that it was with difficulty that the Spaniards were able to retain one part of the island.

The French court beheld in silence the progress of these people, and whenever complaints were made they disavowed their proceedings: but when they at length found the French in Hispaniola numerous, strong, and wealthy, they owned them as subjects, sent them a governor, and regular forces to defend them in what they had done: the old method of piracy was still connived at, while the trade of skins increased and the plantations extended. At length the French obtained a legal right by the cession which the Spaniards made them of the north-west part of the island, by the treaty of Ryswic in 1697, the best and most fertile part; and this is the principal settlement of the French in the West Indies, and in all America.

This settlement begins at a large plain called Bahaia on the north side of the island, about thirty leagues east of Cape Francois, extending all along the coast; from thence to the west, reaching on the south side as far as Cape Morgon; it being two hundred leagues in circuit, and, including the windings, about a hundred more.

This colony, if it may be so called, has since met with great encouragement from France, which in 1726 had no less than thirty thousand whites, and a hundred thousand negroes; they made sixty thousand hogheads of sugar of five hundred weight each; the indigo was half as much in value as the sugar; they likewise exported large quantities of cotton, and also sent a considerable quantity of cacao and ginger to France. Since that time they have raised coffee here to a very great amount, and all the other branches of their commercial products have since that period increased to an astonishing degree. A Spanish writer of great judgment, who was well informed, and who wrote about seventeen years ago, reckons the produce of the plantations near Cape Francois, the capital of French Hispaniola, and which were exported from that single town, at thirty thousand tons in sugar, tobacco, indigo, and coffee, which at the lowest calculation cannot amount to less than six hundred thousand pounds sterling. If to this be added the exports of the two considerable ports of Petit Guaves and Leogane, and the other inferior ones, which are supposed to send out at least as much as the capital, the exported produce of the island must be annually worth one million two hundred thousand pounds. There is another branch of trade of extraordinary advantage to the mother-country, which is that they carry on with the Spaniards wholly in the manufactures of France, and for which they receive their returns in silver; and this article alone is said to bring annually to France no less than two millions of dollars.

The principal places in the island are Cape Francois, which is situated on the northern part, and is by the French often called the Cape, by way of eminence. It stands in the nineteenth degree thirty-five minutes north latitude, and in the sixty-eighth degree forty-nine minutes

west longitude, and contains about eight thousand whites and blacks. In the middle of it is a spacious square, about three hundred paces in length and breadth, at which seven or eight streets terminate: but this town was destroyed in the beginning of the reign of king William by the English and Spaniards in conjunction. The town is neither walled nor paled in, and is said to have only two batteries, one at the entrance of the harbour, and the other before the town.

Leogane, on the west side, though inferior in point of size, is a good port, a place of considerable trade, and the seat of the French government, which is in the hands of the governor and an intendant, who are mutually a check upon each other. There are besides two other towns considerable for their trade, Petit Guaves at the west end of the island, and Port Louis on the south-west part.

The capital city belonging to the Spaniards is St. Domingo, situated in the eighteenth degree seven minutes north latitude, and in the sixty-ninth degree twenty-seven minutes west longitude. It is a large well-built city, with a good port, and has several magnificent structures, particularly the houses of the king of Spain's collectors; with a fine cathedral, seven large monasteries, and two nunneries; besides a mint, and a college, which has a revenue of four hundred ducats; an university, and an hospital endowed with twenty thousand ducats a year. This city is the seat of an archbishop, and the residence of the governor-general of the Spanish Indies and of the judges of the royal courts. The greatest part of the little trade the Spaniards have in this island is carried on from this port, which has fifteen fathoms water at the bar, is large and safe, it being defended by several batteries and a castle, with other fortifications. The town is built of stone after the Spanish manner, and has a large square market-place in the middle of it, about which are the cathedral and other public buildings; and from this square the principal streets run in a direct line, they being crossed by others at right angles. The town is almost of a quadrangular form, and its situation very delightful, between a large navigable river on the west, the ocean on the south; and a fine fruitful country on the north and east.

In the French part of Hispaniola are the two following islands.

St. Louis is about six leagues to the north-east of the isle of Vache, and is scarce half a mile long and not a quarter of a mile over; but the French have here a fort. This island is just high enough not to be over-flown at high water. It is separated from Hispaniola by a strait not three quarters of a mile in breadth, where small vessels ride in deep water close to the shore. There is not a drop of fresh water in the island, and the rain soaks through it immediately as if it were a sieve; so that those who live upon it fetch their water every day from a little river in Hispaniola, at the distance of a mile and a half. In 1737, an hurricane in this little island levelled a town with the ground, except the church and two houses: several dwellings about the fort were also blown down; the ships that were at anchor under it were cast upon the coast, or driven out to sea; but some vessels and magazines were burnt by lightning, several persons were drowned, and all the sugar-canes and cotton trees in the island and its neighbourhood were destroyed.

Vache, or Cows-Island, is about three leagues from Hispaniola, and five or six leagues in length. The soil is very good, and it has two or three tolerable ports, one of which is able to receive ships of three hundred tons burthen. The island is conveniently seated for a trade with the Spanish colonies on the continent of America, and for maintaining an intercourse with the island of Cayenne, the only French settlement on the coast of South America. It received its name from its being used for the grazing of black cattle and hogs, and here the Buccaneers used formerly to rendezvous to share the spoils they took from the Spaniards.

There are many other small islands round Hispaniola, most of which are uninhabited.

S E C T. III.

Of ST. BARTHOLOMEW, MARIGALANTE,
and DESEADA.

*Their Situation, Extent, and Produce; with a short View
of their History.*

ST. Bartholomew's is situated in the eighteenth degree north latitude, and in the sixty-second degree thirty minutes west longitude, twenty-five miles north of St. Christopher's, and thirty north-east of Saba; it is reckoned only fifteen miles in circumference, but produces tobacco and cassava, and is covered with trees that give it a delightful appearance, as the sope tree, the calabash tree, the canapia tree, which yields a very pleasant and salutary gum, lignum-vitæ, and iron-wood. On the shore are found the fish called the sea-star and the sea-apple; and has also an infinite variety of birds. It has, however, no fresh water, but the rain saved by the inhabitants in cisterns. It is encompassed by so many rocks, that it is dangerous for ships of great burthen to come near it. The harbour is, however, a very good one, and from thence in time of war the French greatly annoy our trade.

This island was peopled in 1648, by Poincy the French governor of St. Christopher's; and as the soil was thought but indifferent, the French were suffered to enjoy it without molestation till the year 1689, when Sir Timothy Thornhill landed upon it. The inhabitants had, during their long tranquility, fortified their island with batteries and breast-works, which extended over two acres of ground, and were double palisaded round with stakes six feet high. Sir Timothy however made himself master of these works, and after ravaging the island, carried off about seven hundred of the inhabitants with their cattle and effects, sending the men to Nevis, and the women to St. Christopher's. The English government thinking this proceeding too severe, suffered the inhabitants to return to the island, but they were to possess it as English subjects. However, at the peace of Ryswic it was restored to the crown of France. During the first war with France, that broke out under George II. this island was so convenient to the French for privateering, that above fifty English ships were carried into its harbour; and therefore, two privateers from Antigua attacked the French by surprize, and reduced the inhabitants before they had time to defend themselves, making near four hundred white people prisoners, of whom one hundred and forty were fit to bear arms, and also three hundred negroes. It was however restored to the French, who have retained the possession of it ever since. Its chief productions for exportation are drugs and lignum vitæ, with lime-stone, which the inhabitants send to the neighbouring islands.

The island of Marigalante is seated in the sixty-first degree west longitude, and in the fifteenth degree forty minutes north latitude, about thirty miles north-east of Dominica, and forty south-east of Guadaloupe: it was discovered by Columbus in 1493, who gave it the name of his own ship.

This island, which is about sixteen miles from north to south, and four from east to west, is full of hills; along the eastern shore run high rocks, so perpendicular, that they seem formed by art, and give shelter to a prodigious number of tropic birds, they being as full of holes as a pigeon-house. On the south-east side of the island are black rocks; but the western shore is plain. The island has several large grottos, with many little streams and ponds of fresh water: it is covered with trees; and particularly abounds with tobacco, and the wild cinnamon tree. Its product is the same with the rest of the Caribbee islands, and the plantations are on the south side. At the time of its being last reduced by the British arms, it annually produced no more than a thousand hogheads of sugar.

The French began to send colonies hither about the year 1647; and, after a long contest, remained in possession of it; but it was afterwards twice plundered by the Dutch; and in 1691, general Codrington and comodore Wright failed thither from the Leeward islands,

and landing their men, took the town and fort without opposition, made the governor and his lieutenant prisoners, and ruined the plantations. Since that time Marigalante could scarcely be called an object of military operations, and the English became twice masters of it, exclusive of its last submission, without resistance, and by the late definitive treaty it was restored to France.

Deseada, or Desirada, that is, The Desireable Island, received its name from Columbus, it being the first of the Caribbee Islands he discovered in his second voyage in 1493. It is situated in the sixteenth degree twenty minutes north latitude, and in the sixty-first degree twenty minutes west longitude; about twenty miles to the north-east of Guadaloupe. It extends sixteen miles in length, and two in breadth. Some part of it is very fertile, the soil being proper for the cultivation of sugar and cotton, of which last it produces the best in all the French islands. Deseada was of importance during the late war, on account of the convenient shelter its ports afforded to privateers; it was however then taken by the English; but was restored to France by the definitive treaty of 1763.

S E C T. IV.

Of GUADALOUPE.

Its Name, Situation, Mountains; with a particular Description of a Volcano, called the Mount of Sulphur. The Climate, Vegetables, and Animals. With a concise Account of the little Islands called Xaintes, or All-Saints. A History of Guadaloupe, and an Account of its Trade.

THE island of Guardaloupe, or Guadaloupe, was thus called by Columbus, from the resemblance of its mountains to those of that name in Spain. It is situated in the sixteenth degree six minutes north latitude, and in the sixty-second degree west longitude, about thirty leagues to the north-west of Martinico, and is the largest, as well as the finest island belonging to the French in those parts, it being about forty-five miles in length, and thirty-eight in breadth; and is divided into two parts by a small arm of the sea, or rather a narrow channel, through which no ship can venture; but the inhabitants pass it in a ferry-boat. The country on the east side, which is called Grand Terra, is destitute of fresh water, which abounds in the other division, and is defended by fort Louis, with a redoubt which commands the road. The western part is called Basle Terra, and here the metropolis stands, which is defended by a citadel and other fortifications.

This island is encumbered with many high mountains and precipices, to which the inhabitants used to convey their most valuable effects in time of danger: here are also many beautiful plains watered by brooks and rivers, which fertilize the soil, and enable it to produce a great quantity of sugar, cotton, indigo, tobacco, and cassia; bananas, pine-apples, rice, maize, ginger, mandioca, and potatoes.

In this island is a hill, called the Mountain of Sulphur, which rises to a great height; the top of it is bare, with nothing upon it but fern, and some sorry shrubs laden with moss; but it affords a fine view of Dominica, Marigalante, Martinico, Montserrat, Nevis, and the other neighbouring islands. Upon the highest part is a rugged platform covered with burnt stones of all sizes, and from several clefts and chinks issue smoke. On the east side are two mouths which open into a pit of sulphur, one of which is an oval hole of about a hundred feet in its greatest diameter, out of which also frequently rises thick clouds of black smoke, accompanied with sparks of fire. The negroes who sell brimstone fetch it from this mountain. About two hundred paces below the lowest of these mouths are three pools of very hot water, four or five paces from one another; that of the largest is very dark coloured, and smells like the water in smith's forges: the second is whitish, and has the taste of allum: the third is blue, and has a vitriolic taste. Here are also several small springs, which uniting their streams, form several torrents. The middle and bottom of this burning mountain are extremely different from

from the top of it, they being covered with tall trees and herbage; watered by a number of rivulets, and cultivated with all possible care and industry.

Near the little island of Goyaves are found springs that are boiling hot, and are said to contain many medicinal properties, particularly in the cure of dropsies.

In the Grand Terre are several indentings made by the sea and the land, capacious enough to shelter vessels from storms, and shaded by palmeto trees, to which they may be fastened. That called the Great Col de Sac affords excellent riding for ships of all burthens.

The air is clear and salubrious, and among the vegetables are the copau tree, famous for its sanative balsam or oil: the milk shrub, from whose fibres are prest a liquor that resembles milk; and the corbary tree, which bears fruit covered with a shell, within which is a downy pulp of a saffron colour, that yields a gum, which being hardened in the sun becomes very clear and solid, so that the native Caribbees formerly used it for bracelets and other ornaments.

The most remarkable bird is one said to be peculiar to this island and Dominica, though it is a bird of passage. It is called the devil bird, from the blackness of its plumage, and is of the size of a young pullet. Its wings are long, its legs short, and its feet, which are like those of a duck, have strong claws: its beak is crooked, sharp, hard, and in length about an inch and a half: its eyes are large, and serve to distinguish fish, which it catches at night in the sea; but it is unable to bear the light in the day-time when flying; so that these birds often rush upon interposing objects and fall down. After their fishing in the night they repair to the Devil's Mountain, where they lodge by pairs in holes like rabbits. They continue there during the months of October and November, tho' they are seen singly in other months; but all of them disappear in May, and are never seen again till September. The negroes of the island have a peculiar way of hunting these birds with dogs and hawks. Their flesh, when cured of its fishy taste, is good and nourishing food, and, during their season, the negroes and poor of the island subsist upon them.

The gulphs on the coasts of Guadaloupe contain turtles, sharks, land-crabs, and many kinds of fish.

The bees of Guadaloupe are entirely different from those of Europe, they being black, smaller, and without stings. They never hive but in hollow trees, and their wax, which is of a dark purple approaching to black, is too soft for candles, and cannot be bleached. These bees, instead of making combs, deposit their honey in bladders of wax, of about the form and size of a pigeon's egg: but this honey is said never to harden, nor become of any other consistence than that of olive oil.

The island is pestered with an insect called a raver, shaped like a May bug, of an offensive smell, and preying upon paper, books, and furniture; and whatever they do not gnaw is discoloured by their ordure. These offensive insects, which are very numerous and appear chiefly by night, would be intolerable, were it not for a large spider which entangles them in its web, and takes all opportunities of surprizing them, on which account the inhabitants are very careful not to offer the least injury to these spiders.

Under the government of Guadaloupe are comprehended Desada, just described, and the islands of Xaintes, or All Saints. These last are three in number, and their soil is pretty much the same with that of Guadaloupe. The westernmost island, which is the best, is about nine miles in compass; but none of these islands seem ever to have been properly inhabited, on account of their being destitute of fresh water, though they produce all the other necessaries of life.

We have no account of the history of this island from the time of Columbus to the institution of the French general company of the American islands in 1635, who being unable of themselves to plant or cultivate their islands, empowered M. St. Olive, their lieutenant-general of St. Christopher's, and M. du Pleffis, to contract with some merchants of Dieppe for settling Guadaloupe. The religious differences in France soon produced adventurers, who, besides the inducement of enjoying liberty of conscience, were stimulated by views of interest.

Those merchants contracted with four hundred men, who were obliged to serve them four years, but many of the protestant adventurers were far from imagining that the new settlement was under the direction of cardinal Richlieu, who sent with them four Dominican friars, provided with full powers from pope Urban VIII.

The adventurers happened to make an unfortunate choice of the place on which they landed, for the soil was bad: as an addition to this misfortune, D'Olive and Du Pleffis disagreed in the partition of their command, and had been guilty of an unpardonable oversight, in not being provided with sufficient stores; for on examining them, they found no more left than could maintain them for two months, on which the two chiefs dividing them, as well as the men and ammunition, agreed to separate.

The natives, so far from shewing any dislike to them, assisted them in raising their huts, and not only furnished them with cassava bread, but with seed for raising tobacco, cotton, and pease; and taught them to catch turtle and fish. The French probably made an ungrateful return for this kindness, since they were soon after afflicted with a dreadful famine, of which many died: others retired to St. Christopher's, and those who remained were reduced to the horrible necessity of devouring even the dead bodies of their companions, which they dug from their graves. Mean while a ship arriving from Dieppe with one hundred and forty men, landed a month's provision; but that being spent, the famine and mortality still continued. However, by some means or other, some of them lived for near five years; but their bodies were reduced to such a state of weakness, as to be unable to clear the ground, or raise either corn, plants, roots, or fruit.

Amidst these calamities Du Pleffis died, and the command devolved solely on D'Olive, whose insatiable avarice and cruelty equalled the affliction of the famine. D'Olive broke with the natives, numbers of whom he massacred, as the readiest means of procuring subsistence. They applied to the Caribbees of the neighbouring islands, who attacking the French, such numbers were cut off, that those who remained scarce deserved the name of a colony. During this period it appears several reinforcements were sent them both from Europe and St. Christopher's; but the French writers tell us, that all their convoys of provisions miscarried. Mean while D'Olive's ambition for command would not even suffer him to entertain the thoughts of resigning this miserable colony; and he sent over a Dominican, as his agent to the court of France, which was filled with complaints against him, to solicit speedy supplies. The Dominican represented the colonists as rebellious heretics, and D'Olive was appointed sole governor of the colony. The governor on receiving his commission, assembled his officers to hear it read; but while this ceremony was performing, the Dominican church, with all its rich furniture, was consumed by fire. D'Olive's repeated applications for fresh supplies were now without effect, and the dreadful situation he was in affected his brain; and becoming blind, he went to St. Christopher's, where he was put under an arrest by M. de Poincy, governor-general of the French islands. Supplies of men were now sent to Guadaloupe; but their officers behaved with such tyranny, that the men broke out into rebellion, and M. de Poincy was obliged to send over five hundred men from St. Christopher's to reduce them.

The colony after this suffered greatly by other bad governors, by hurricanes, and by swarms of caterpillars.

It was afterwards under the New West-India Company; but in 1674, was taken into the king's hands, whose ministers adopted a commercial system, and it soon became the most flourishing colony subject to France. It was fortified with forts and redoubts, which were in so good a condition in 1702, when admiral Bembow made a descent upon the island, with a considerable body of land forces, that he did not think proper to attack them; but was satisfied with destroying many of their plantations and open villages.

However, in 1759 a fleet of ten men of war, besides frigates and bomb-ketches, under the command of com-

modore Moore, with a body of land forces commanded by general Hopson, after making an unsuccessful attack on Martinico, sailed for Guadaloupe. This squadron began to bombard the town and citadel of Basse Terre, and notwithstanding many batteries erected on the shore, the houses and churches were that night every where in flames, and the powder of the magazines blown about the enemies ears. The next day the English landed, and found both the town and citadel abandoned, but the island was far from being taken. The French, with their armed negroes, threw up intrenchments on the mountains, and bravely resolved to defend themselves as long as possible. Soon after general Hopson died, and the command devolved upon major general Barrington. The English were harrassed by perpetual alarms, and fatigued with constant duty; they however gained one pass after another, and still advanced, alert in the hour of caution, and invincible whenever they attacked. They frequently suffered from concealed fires out of the woods, and from lurking parties of armed negroes, that could not be discovered. At length the French governor, finding all resistance vain, sent a flag of truce, by which means Guadaloupe was surrendered to the English.

After the French king took Guadaloupe under his immediate protection, it became incomparably the most profitable colony belonging to that crown. Many mercantile writers of great credit, who were upon that island, after its being conquered by the English, confidently affirmed that before that period, it produced more sugar than all the British sugar islands put together: some have raised the quantity annually exported from Guadaloupe, and its dependencies, to the incredible number of one hundred and fifty thousand hogsheds; but more moderate calculations have fixed them at one hundred thousand, besides its coffee, cinnamon, and other commodities.

Since the French by the treaty of 1763, re-entered into possession of this island, they seem more sensible than ever of its importance, and have endeavoured to bring it nearly to the constitution of a Spanish colony, by publishing an ordinance that no foreign vessel should navigate nearer its coasts than the distance of a league, or send any boat ashore, without a written permission from the intendant, on the penalty of the confiscation of the vessel and cargo, paying three hundred livres, and suffering a year's imprisonment.

SECT. V.

Of MARTINICO.

Its Situation, Extent, Climate, the Face of the Country, and its Produce. Its Government, principal Towns, Trade, and History.

MARTINICO is not only the chief, but the largest of the French Caribbee Islands, and is situated between the fourteenth and fifteenth degrees of north latitude, and between the sixtieth degree thirty-three minutes, and the sixty-first degree ten minutes west longitude, about twenty leagues north-west of Barbadoes. It is near sixty miles in length from the north-west to south-east; but is of a very unequal breadth, and about one hundred and thirty miles in compass.

The air is hotter here than at Guadaloupe, but hurricanes have neither been so frequent nor so violent as in that and some of the other Caribbee islands. Though Martinico is generally said to be healthful to the people settled upon it, yet it is certain, that the great quantity of water that runs through it, creates an humidity, very noxious to the constitutions of the inhabitants. The island is likewise much subject to epidemical diseases, which are chiefly brought over in ships from Asia and Africa.

The country is hilly within the land, and at a distance resembles three distinct mountains. Also on the north side are three rocks, so situated, that at sea, they give it the appearance of three separate islands.

It is said to have no less than forty rivers, some of which are navigable a great way up the country. However, besides the streams, which in the rainy season over-

flow the dales and savannas, there are ten rivers that are never dry, which run from the mountains into the sea, and sometimes overflowing their banks, carry away trees and houses. Some of the hills are cultivated, and on their steep ascents grows tobacco, which is better than that in the valleys: other hills are overgrown with trees, that afford shelter to wild beasts, and abundance of snakes. The other produce of the island is much the same with that of Barbadoes, namely, sugar, cotton, indigo, ginger, aloes, pimento, Indian figs, bananas, pine apples, melons, cassia, mandiacas, potatoes, and other roots. With respect to the first, it is computed that here are made, one year with another, ten thousand hogsheds of sugar, each weighing about six hundred pounds weight. The chief provisions, besides hogs, are Guinea pigs, turkies, wood-pigeons, ortolans, frogs, and lizards. The coast abounds with commodious bays and harbours, in which are plenty of turtle.

Martinico is not only the chief of the French Caribbee Islands, but the residence of the governor-general and an intendant. It is likewise the seat of a sovereign council, which superintends all their other islands, and even their settlements in Hispaniola. This council consists of the governor-general, the intendant, the governor of the island, an attorney-general, the lieutenant-governor for the crown, and twelve counsellors. Their power is very extensive, for this council judges in the last resort upon all matters brought by way of appeal. The governor-general, if upon the island, is president of the council, or, during his absence, the intendant. If both are absent the eldest counsellor then present collects the votes, and pronounces the sentence of the court. The other officers of the island are two lieutenant-governors, one for Capes Terre, and another for Basse Terre, with a secretary of the marine, who has a very extensive commission. This island, before it was subdued by the English, could raise ten thousand white inhabitants fit to bear arms, and above forty thousand negroes. Besides this force, some companies of regulars were always quartered in the island; so that the French pretended that it was impregnable.

The principal places in Martinico are St. Peter's and Port Royal.

St. Peter's, the capital of Martinico, was built in 1665, in order to overawe the mutineers of the island, who rebelled against its proprietors, the second West India company, who were at the same time the proprietors of all the French Antilles. The town extends along the shore, and a battery, which commands the road, is erected on the west side, which is washed by the river Royolan, or St. Peter. The principal entry to the fort is from the east. Upon the high ground, which overlooks the town, is built a wall, which extends thirty-five fathoms, is well mounted with cannon, and has a large tower at each extremity: this fortification commands the parade and the town. The fort has neither ditch nor covert-way; but the walls are four feet and a half thick, with a parapet and battlements of stone; and the gates are defended by strong palisadoes. The parade is a square which extends each way about three hundred feet, and is surrounded on three sides by houses, from which run five streets, and on the other side is the fort. The town is divided into three wards; the middle, which is properly St. Peter's, begins at the fort, and runs westward to the battery of St. Nicholas, which is mounted with eleven guns, and is seated on an eminence. Under the walls of the second ward ships at anchor ride more securely than under the fort, on which account this ward is called the Anchorage; it extends from the battery of St. Nicholas to that of St. Robert, which bounds the town on the west side. The third ward, called the Gallery, extends along the sea-side from Fort St. Peter to the Jesuits river, and is the most populous part of the city; but the fortifications, formidable as they appear on paper, made a very inadequate defence against the English when they reduced the island. The houses of St. Peter's ward are neat, commodious, and elegant, particularly those of the governor of the island, the intendant, and the other officers. The parish-church of St. Peter is a magnificent stone building belonging to the Jesuits, a hundred and twenty feet long, and thirty-six wide, with a noble front of the Doric order. The church of the Anchorage, which belongs to the Jacobine

cobine friars, is likewise of stone, and is ninety feet long by thirty. There are also two chapels belonging to each church. Nothing can be more delightful than the walk from the yard in which this last church stands to the Jacobine convent. It is formed by two rows of fine orange trees, and crossed by two others half a mile in length. The kitchen-garden of the convent is furnished with all kinds of delicious fruit. The Jesuits cloyster is built with marble and free-stone, and commands a very fine prospect over a great variety of gardens and vineyards.

Fort Royal, the next place of great consequence in Martinico, is twenty-one miles distance by land, and twenty-seven by water from Fort St. Peter, but the road is so very inconvenient, that travellers generally chuse to go by water. This fort is built on an eminence fifteen fathoms above the surface of the sea, by which it is almost surrounded, there being only a neck of land about fifteen fathoms over; so that the fort may be said to be built on an isthmus. It is of earth, and defended by two small demi-bastions and a half-moon, a wet ditch, a glacis, and a covert-way palisadoed. On the flank of one of the demi-bastions is the harbour, from which a flight of steps leads up to a fortified platform. On that side the fort is shut up by a double wall, and towards the sea is a parapet with some port-holes. The soil on which the town is built is a kind of quicksand, but though it contains regular streets and a large church belonging to the Capuchins, it is said to be much inferior to St. Peter's.

Cul de Sac Robert is seated in a large bay almost two leagues deep, with two small islands at its entrance, which, by breaking the force of the waves, render the bay a fine, safe, natural harbour; for it will hold many of the largest ships, and these may in several places reach the shore by a plank.

Fort Trinity lies at the bottom of Trinity-bay, and is formed by Point de Caravel on the east side, and on the west by an isthmus about two hundred feet broad. The lieutenant governor of Capes Terre has his residence in Trinity Town, in which are a considerable number of merchants, and, for its convenient situation for the European trade, and the safety of its port, is become one of the most thriving places in the island, it having very considerable manufactures of cotton, sugar, cocoa, and other commodities, the produce of the island being much the same with that of Barbadoes.

In 1637 M. d'Esnambuc brought from St. Christopher's, which then belonged to the crown of France, a hundred soldiers to Martinico, all well provided for forming a colony. He landed at Bassé Terre, which lies on the west and south parts of the island, and it is said the inhabitants yielded up all that coast, on which he built a fort called St. Peter. The natives retiring to Cape Terre, the new colonists applied themselves to the cultivation of potatoes, cotton, mandiaca, and tobacco; and d'Esnambuc retiring to St. Christopher's, left du Pont, his lieutenant, governor in Martinico. The French pretend that the inhabitants forming plots against them murdered them whenever they had an opportunity, but by their own accounts they were the aggressors. Hostilities daily multiplying, they gave no quarter to the natives, who sending to the neighbouring islands, were joined by other Caribbees, to the number of fifteen hundred, who landed from their canoes under their fort. The French governor had removed all his men and provisions within his intrenchments, and the Caribbees, imagining the fort to be abandoned, advanced within pistol-shot of the walls. This was what du Pont had foreseen, and watching his time, he poured upon them a full discharge of his cannon and musketry, which killing one-half of them, the survivors fled to their canoes. This secured the French the quiet possession of their settlements, which they greatly enlarged, and soon after the natives sued for peace.

The French now divided the island into five wards, or parishes, each containing a church, or chapel, an armoury, store-houses, dwelling-houses, and other conveniences. At length they learned from M. Poincy the art of cultivating the sugar-cane, from which they soon reaped great advantages.

About the year 1646 many of the inhabitants refused to pay their imposts to the West India company, which

produced an insurrection that was quelled by the death of the chief ringleaders. About this time the Portuguese recovering from the Dutch the possession of Brasil, the former landed at Martinico with some rich Jews who offered to settle there, which was strongly opposed by the Jesuits, on the pretence that they would introduce Judaism and heresy into the island; but the wealth with which they were possessed, induced the governor to allow them a settlement in a separate quarter. However, the climate not agreeing with them, many of them died, while others removed from the island, and the few who staid set up public-houses, by which they acquired fortunes.

At this time the Caribbees took arms, and nothing but the most horrid massacres ensued: many of the more dissolute among the French spirited up the natives, and Parquet, who was then governor, was besieged in his own house, where he must have perished had not some Dutch ships arrived, who seeing several parts of the island in flames, landed three hundred men, and defeated the natives. This gave Parquet an opportunity of taking the field, and the original inhabitants, together with the negroes who had joined them, were every where slaughtered or obliged to fly to Dominica and St. Vincent, by which means the French became masters of Capes Terre, and at last of the whole island.

In 1650, the old West-India company sold Martinico, St. Lucia, Grenada, and the Grenadines, to Parquet, for fifty thousand livres; but in 1664, Lewis XIV. obtained the possession of this island, and granted it to a new West-India company; but ten years after suppressed that company, and all the above islands became part of his domain. After this Martinico was attacked by the famous Dutch admiral De Ruyter; and the English made many unsuccessful expeditions against this island.

In 1700, the French settled in Martinico were computed at fifteen hundred, besides the negroes they employed, and a great number of Caribbees, who were readmitted into the island, but were obliged to work as slaves, and to live among the French, that they might have no opportunity of forming plots and conspiracies. In 1727, was a dreadful earthquake, which, with short intervals, lasted eleven hours, and threw down St. Peter's fort. Many people lost their lives, and besides churches, convents, and other public buildings, above two hundred sugar-works were ruined. One mountain was levelled, another cleft in two, and copious streams of water issued from the chasm. However, a few years recovered the island, the inhabitants having the Guadaloupe sugars shipped from hence, with many other advantages.

The English had in vain attempted to take Martinico, but in 1761 the court formed the resolution of sending an armament against that island superior to any that had ever been seen in those seas. Eleven battalions were drawn from New York, a considerable draught was made from the garrison of Belleisle, and all the troops that had been cantoned in the Leeward Islands were ordered to rendezvous at Barbadoes: general Monckton, who had bravely distinguished himself at the conquest of Quebec, was appointed to command the land forces, while rear admiral Rodney had the command of the fleet.

On the seventh of January following the whole armament arrived at St. Anne's-bay in Martinico, where Sir James Douglas, a captain under Mr. Rodney, silenced some batteries that were raised on the shore; but in this service the English lost the *Raisonable*, yet all her men, guns, and stores were saved. After having found a safe landing-place, and having silenced all the batteries, the troops landed without opposition. Several skirmishes passed after their being on shore, to the disadvantage of the French, and the English encamped upon the heights above the Cas de Navires; but upon examining the country they found the grounds intersected with gullies and ravines, with rivulets between them, and wherever they were passable the French had erected batteries for their defence.

Though the French regulars were not very formidable, yet the militia, the mulattoes, and negroes, all of whom were in arms, were numerous, brave, and well disciplined. The English happened to land at a place where there were greater obstructions than any-where else in the island.

island. The view of the army was bounded by two great eminences, Morne Garnier and Morne Tortonson, both of them fortified with the utmost care, though they seemed almost inaccessible by nature. Morne Tortonson was first to be attacked, and batteries were raised to defend the British troops in their passing a very wide gulley, lying between them and it. Three dispositions were made for the attack. It was begun by the grenadiers under major Grant; brigadier Rufane, with his division, assisted by a thousand seamen in flat-bottomed boats, fell upon the enemies redoubts along the shore; and brigadier Walsh, with his brigade, and the left infantry under colonel Scott, after attacking the left of a plantation, were to endeavour to get round the enemy. All these operations were performed with astonishing impetuosity and success. The attack began at break of day, and by nine in the morning the enemy, having been driven from post to post, were obliged to abandon Morne Tortonson to the English, who were to the last degree amazed, upon viewing its strength and situation, at the dangers they had surmounted, and the numerous redoubts of the French, all of them mounted with cannon. The enemy, after suffering severely, fled, part of them to Morne Garnier, and part of them to Fort Royal, the British grenadiers pursuing them to the bridge of the last mentioned place, where they even made some prisoners.

General Monckton took possession of certain posts proper for carrying on the attack against Morne Garnier, and erected batteries on Morne Tortonson for carrying on that against Fort Royal. Some days after the French presuming that their enemies were entirely discouraged, and wanted only a pretext to make the best of their way back to their ships, attacked the British light infantry, and colonel Haviland's brigade, who, with the utmost ardour and intrepidity, repelled their enemies, improved their own defensive situation into a most vigorous charge, and being well supported, pursued the enemy across the ravine, where they seized their batteries, and took post even in the enemy's redoubt; and happily improving the advantage, Morne Garnier was by nine at night, with all its works, in the possession of the English.

General Monckton now prepared to batter the citadel of Fort Royal, from the eminences he had gained, which the enemy perceiving, on the third of February beat the chamade, and accepted of a capitulation.

The conquest of Martinico in a manner closed the operations between the English and French in America, during the late war. It even struck the court of Versailles with greater consternation than they had even felt for the loss of Canada, and the rather because their ministers at foreign courts had, in no very decent terms, reproached that of London with want of judgment in fitting out an armament against an island, that might securely bid defiance to all their power, by its artificial, as well as natural strength, and the number, spirit, and martial disposition of its inhabitants. The people of Martinico remained with great tranquility under the military government of the English during the short time they held it, and even seemed well pleased at their change of masters. In short, this island was restored to the French by the definitive treaty of 1763.

We have now finished the description of the French Caribbee Islands, only it is necessary here to observe, that St. Lucia, which, by mistake, we have placed among the islands ceded to Great Britain, was delivered to France by the late treaty of peace, and ought to have been placed here.

St. Croix, or Santa Cruz, another of the Caribbee Islands, has, till very lately, been considered as belonging to France, and is therefore placed among the islands of that nation in Salmon's Grammar, and all the other geographical works in which it is mentioned; but being deserted by France, it was seized by the late king of Denmark.

SECT. VI.

Of CAYENNE, or EQUINOCTIAL FRANCE.

Its Situation, Extent, and Produce; with a concise Description of the Isle of Cayenne.

THE country we are now to describe lies on the coast of Terra Firma, and consists of a part of the continent, and an island called Cayenne.

Equinoctial France is seated between the equator and the fifth degree of north latitude, and between the fiftieth and fifty-fifth degree of west longitude, extending two hundred and forty miles along the coast, and three hundred miles within land; it being bounded on the north by Surinam, on the east by the Atlantic ocean, on the south by Amazonia, and on the west by Guiana.

All the coast is very low, but within land there are fine hills very proper for settlements; the French have, however, not yet extended them so far as they might; but they raise the same commodities which they have from the Caribbee Islands, and in no inconsiderable quantities. With respect to the climate, vegetables, and animals, we shall give a particular account of them when we come to treat of Terra Firma.

The isle of Cayenne is seated at the mouth of a river of the same name, in the fifth degree north latitude, and is about forty-five miles in circumference. The anchorage for vessels is between Cape Caperon in the island and that of Corbin in Terra Firma, where above a hundred ships may ride securely. The island is excessively unhealthy, though not so bad as formerly. It has several pleasant hills, very convenient for settlements, and is almost cut in two by a river of salt water, which affords an easy communication between the several plantations, and facilitates the transportation of merchandize. The island is also watered by several springs proper for drinking, and for turning sugar mills. The French have a fort opposite the road, on a little rising ground at the point of the island; but though it is pretty conveniently situated, it wants fresh water, of which they can have none but the rain they save in cisterns. There are in the island several meadows which produce very good grass. The principal commodities of the island are sugar and roucou, for they have neglected the cultivation of indigo. However, since the year 1722, they begun to plant coffee shrubs, and the coffee berries are brought to be full as good as those of Arabia. The French who settled here about the year 1635, built the fort which they called St. Lewis, and near it is a small town of two or three hundred houses, inhabited by the soldiers of the garrison and by all sorts of tradesmen. About four leagues from the town to the north-east of the fort is a village called Armire, seated on a rising ground, the lower part of which is inhabited by Jews and negroes, and the upper part, which has a chapel, is inhabited by French and negroes. There are several other plantations of French scattered up and down the island, with some other fortifications besides the fort already mentioned.

Of the AMERICAN Dominions of the DUTCH and DANES.

S E C T. I.

*Of ST. EUSTATIA, SABA, and ST. MARTIN'S.**Their Situation, Extent, Climate, Face of the Country, Produce, Trade, and History.*

ST. Eustatia is situated three leagues north-west of St. Christopher's, and is only a mountain rising out of the sea like a pyramid, but almost round. The air is wholesome, but the island is subject to terrible storms of thunder, hurricanes, and earthquakes. Its chief produce is tobacco, and the Dutch are said to have here five thousand white people and fifteen thousand negroes. Its situation renders it the strongest of all the Caribbee Islands, there being but one good landing-place, which may be easily defended by a few men, and the haven is commanded by a fort mounted with guns. It is only the very top of the mountain that is covered with wood; for though it is so small, and inconveniently laid out by nature, the industry of the Dutch have made it turn out to very good account; and it is fully peopled; the sides of the mountain are divided and laid out into neat plantations, in which they raise sugar and tobacco. On the summit is a pretty large plain, which harbours wild beasts. In this, as well as in several of the adjacent islands, there are neither rivers nor springs of fresh water, but the inhabitants are so careful that they never want proper supplies of water from their ponds and cisterns which receive the rain. There are several store-houses well supplied with all necessaries, and particularly with European commodities, which they sell to their neighbours at a very high price, whenever they are disappointed with supplies from England or France; and they also carry on a contraband trade with the Spaniards.

The Dutch took possession of this island in 1635, and the States granted it to certain merchants of Flushing, who soon settled a colony upon it of about six hundred families. In 1665 it was conquered by the English, but was soon after retaken by the united forces of the French and Dutch, after which it had a French garrison; but it was restored to the Dutch by the treaty of Breda. In 1689 it was conquered by the French, from whom it was taken the very next year by the English, under Sir Timothy Thornhill, who allowed the French only their lives and their baggage, and is said to have had only eight of his own men killed and wounded in the attack, though the fort was mounted by sixteen great guns, encompassed by a strong double palisado, and defended on one side by a deep ditch and a narrow bridge over it to the gate, which admitted only one man at a time. The island was again restored to the Dutch by the treaty of Ryswic, and they have ever since remained in the quiet possession of it.

Saba is a small but pleasant island, thirteen miles north-west of Eustatia, and thirty south-west of St. Bartholomew's. It is four or five leagues in compass, and is said to have formerly belonged to the Danes. At first sight it seems only a rock, but a Dutch colony sent from St. Eustatia to manure it, found in it a valley sufficient to employ and subsist many families; but it has the misfortune of having no port. The fishing about it, especially for the bonetta, is very plentiful, and it is in no want of other necessary refreshments. The sea on its coasts is so shallow, that stones may be seen at the bottom, and nothing but sloops can come near, nor even they, but at a small sand creek on the south side of the island, to which the inhabitants draw their canoes. There is a road cut from the top of the rock to the bottom; but it is so steep, that it resembles an impregnable fortification, formed by the hand of nature. The in-

habitants, for their greater security, have in many places, by the side of the rock piled up heaps of stones on scaffolds, so disposed, that by only pulling a rope the scaffolds fall, and instantly discharge such a shower of stones, as are enough to crush a whole army to pieces. The French Buccaneers surprised, and thought to have mastered this island in 1688, but miscarried. Labat says, when he was here in 1701, the island was divided into two parts, containing no more than about fifty families, who lived in genteel, convenient, and well furnished houses, but traded for the most part in shoes, by making which, and raising indigo and cotton, they purchased slaves, good furniture, and were in easy circumstances. The inhabitants live in great harmony, and are said to make it a practice to dine at one another's houses; for there being no shambles here, as in the other more considerable islands, they kill their cattle in turn.

St. Martin's is seated in the eighteenth degree fifteen minutes north latitude, between Anguilla on the north-west, and St. Bartholomew on the south-east, about fifteen miles from each, and is twenty-one miles in length, twelve in breadth, and forty-two in circumference. It has commodious bays and roads on the north-west side, with some good salt pits, and lakes of salt water, which run a great way within the land, and abound with good fish and turtle; but has no fresh water, except what comes from the clouds, and is saved in cisterns.

In this island are several trees, from whence distil various gums; with plenty of the candle-wood-tree, the small sticks of which when dry, are lighted up instead of candles, and yield a very fragrant smell, arising from the gum contained in the wood: but its tobacco, which is esteemed the best in the Caribbees, is the chief commodity that employs the care of the inhabitants.

Here are great flocks of the birds called flamens, parrots without number, turtle-doves, and many other fowl.

Formerly the Spaniards kept a garrison here, to prevent other nations settling on the island; but about the year 1650, they blew up their fort, destroyed their cisterns, burned their houses, and abandoned the place. Then came the French and Dutch, and sharing the island between them, lived very friendly together, and had their particular churches in their respective quarters. The French had that part next Anguilla, which was in every respect the best half, and the other side of the island, in which the Spanish fort stood, remained to the Dutch, by virtue of the partition-treaty made between the two nations: but in 1744 some English, under the deputy-governor of Anguilla, assisted by two privateers from St. Christopher's, drove the French out of their half of the island, and took possession of it themselves, since which time it has belonged to the English and Dutch.

S E C T. II.

*Of CURASSOU, or CURACAO.**Its Situation, Extent, Produce, Trade, and the great Advantages the Dutch receive from it. With a concise Description of the Islands of Bonaire and Aruba.*

THE island of Curassou, or Curaçao, is the only place of importance possessed by the Dutch in the West-Indies. The northernmost point is settled in the twelfth degree forty-five minutes north latitude, about twenty-five leagues from the continent, and is about thirty miles long,

long, and ten broad. At the east end is a good harbour, called Santa Barbara; but the chief harbour is about three leagues from the south-east end, where the Dutch have a very good town, and a strong fort. Ships bound thither are obliged to keep close to the harbour's mouth, and have a rope ready to send one end ashore at the fort; for there is no anchoring at the entrance of the harbour, and the current always sets to the westward; but being got in, it is a very secure port. At the east end are two hills, but the rest of the land is pretty level.

Though it is naturally barren, it produces a considerable quantity both of sugar and tobacco; and here are also very great salt-works, which furnish a good deal for the English islands, and for which there is a considerable demand from our colonies on the continent; but the trade for which it is chiefly valued, is the contraband, constantly carried on between the inhabitants and the Spaniards, and that carried on between them, the English, and the French in time of war.

The Dutch ships from Europe touch at this island for intelligence, or proper pilots, and then proceed to the Spanish coasts for trade, which they force with a strong hand, it being very difficult for the Spanish guarda costas to take these vessels; for they are not only stout ships, with a number of guns, but are manned with large crews of chosen seamen, deeply interested in the safety of the vessels and the success of the voyage. They have each a share in the cargo, of a value proportioned to the station of the owner, supplied by the merchants upon credit, and at prime cost: this animates them with uncommon courage, and they fight bravely, because every man fights in defence of his own property. Besides this there is a constant intercourse between this island and the Spanish continent.

Curassou has numerous ware-houses, always full of the commodities of Europe and the East Indies. Here are all sorts of woollen and linen cloths, laces, silks, ribbons, iron utensils, naval and military stores, brandy, the spices of the Moluccas, and the calicoes of India, white and painted. Hither the Dutch West India, which is also their African company, annually bring three or four cargoes of slaves, and to this mart the Spaniards themselves come in small vessels, and carry off not only the best of the negroes, for whom they give a very high price, but great quantities of all the above sorts of goods; and the seller has this advantage, that the refuse of ware-houses and mercers shops, with every thing that has grown unfashionable and unsaleable in Europe, go off here extremely well, every thing being sufficiently recommended by its being European. The Spaniards pay in gold and silver, coined or in bars, cacao, vanilla, Jesuits bark, cochineal, and other valuable commodities. The ships that trade directly from Holland to the Spanish continent not only touch here, on their outward passage, to gain intelligence or assistance, but on their return put in here to complete what is wanting of their cargo with the sugar, tobacco, ginger, and other produce of the island itself.

The trade of Curassou, even in time of peace, is said to be annually worth to the Dutch no less than five hundred thousand pounds sterling; but in time of war the profit is still greater, for it is then in a manner the common emporium of the West Indies: it affords a retreat to ships of all nations, and at the same time refuses none of them arms and ammunition. The intercourse with Spain being then interrupted, the Spanish colonies have scarce any other market from whence they can be well supplied either with slaves or goods. The French come hither to buy the beef, pork, corn, flour, and lumber, which the English bring from the continent of North America, or which is exported from Ireland; so that the trade of this island flourishes extremely.

This is far from being owing to any natural advantage whatsoever: for it seems as if it were the fate of the Dutch to be every where obliged, both in Europe and America, to exert their ingenuity and patience in opposing an unfriendly soil; for the island is not only barren, and dependent on the rains for its water, but the harbour is naturally one of the worst in America. The Hollanders have indeed entirely remedied that defect; they have upon this harbour one of the largest, and by far the most

elegant and cleanly towns in the American islands. The publick buildings are numerous and handsome, the private houses commodious, and the magazines large, convenient, and well filled. Almost all kinds of labour is here performed by engines, some of them so admirably contrived, that ships are at once lifted into the dock, where they are completely careened, and then furnished with naval stores, provisions, cannon, and every thing proper either for war or trade.

Bonaire is seated in the sixty eighth degree ten minutes west longitude, and the middle of the island is laid down in the twelfth degree sixteen minutes north latitude. It is about twenty leagues from the continent, and is sixteen or seventeen leagues round. The road is on the south-west side near the middle of the island, where a pretty deep bay runs in. The inhabitants are chiefly employed in raising maize and Guinea corn, yams, and potatoes; and also in grazing.

Aruba, which also belongs to the Dutch, is seven or eight leagues to the westward of Curassou. The two last islands have no trade of consequence, but are chiefly employed in raising fresh provisions for the principal island, and for the refreshment of such ships as use those seas.

The trade of all the Dutch American settlements was originally carried on by the West India company alone. At present such ships as go upon that trade pay two and a half per cent. for their licences; the company, however, reserve to themselves the whole of what is carried on between Africa and the American islands.

S E C T. III.

Of DUTCH GUIANA, or SURINAM.

Its Situation, Extent, Produce, Trade, and Government.

DUTCH Guiana begins at the river Maroni, in the sixth degree twenty minutes north latitude, and extends to the mouth of the river Oroonoko. The mouth of the river Maroni is so choked up with sand banks, that often shift their places that no vessel of above twenty tons can enter it, and even those not without danger. The river runs mostly from south to north, it is about a league broad, and all the coast from Maroni to Surinam, which is about fifty-five miles, is low and commonly covered with water. This country is generally reckoned unwholesome. From the end of November to the month of July, the weather is pretty temperate, on account of the clouds which shelter the people from the sun, the great rains that fall at that time, and the north-east wind, which continually blows: but during the rest of the year the weather is sultry hot.

The climate is however greatly improved, and rendered much more salutary than it was formerly by the industry of the Dutch, who have cut avenues through the woods, and made passages for currents of air that carry off the unwholesome exhalations that proved fatal to the first colonists; and notwithstanding the inconveniences under which it once laboured, the great number of Dutch who have plantations here, have raised this colony to a very flourishing condition, so that it has extended itself thirty leagues above the mouth of the river Surinam; but it will probably never be extended much higher on account of the cataracts, which render it impossible to navigate the rivers, and the rocks which prevent their penetrating farther into the country; and even these have the advantage of forming a rampart for the security of the colony, against the inroads of the Indians who inhabit the mountains, and who cannot be civilized.

The chief settlement is at Surinam, a town built upon the river of the same name, in the sixth degree sixteen minutes north latitude, and this name now extends to the adjacent country for above a hundred miles round. Of this district the Hollanders regard themselves as the sovereign, and are said to behave with the haughtiness peculiar to that nation wherever they have gained the superiority; a conduct, says a modern writer, by no means agreeable to the phlegm of that people, or the wisdom of the constitution, since by gaining the detestation of the natives,

natives, they furnish the means to any enterprising European power to supplant them.

The planters and traders of this place take the name of the society of Surinam; the settlement being the joint property of the Dutch West-India company, the city of Amsterdam, and the proprietary of Samelsdyck: but in what manner their different rights arose, or how they were formed, we cannot learn.

The colony is now in the most flourishing situation, and a prodigious trade is carried on, not only with Europe, but with the West-India islands. The river of Surinam facilitates commerce, and the Dutch have been careful to improve the natural situation by all that art and industry could bestow. They have a fort called Zelandia, built with brick, about two leagues from the entrance, and at a little distance from it, a small town called Paramairamba, containing about four hundred houses. There are no less than seven or eight inland towns, all of which are rich, populous, and commercial, which evidently proves the assiduity with which that nation improves every advantage they have once obtained.

The chief trade of the colony consists in the produce of the country, as sugar, cotton, gums, tobacco, coffee, flax, skins, and wood for dying. For the tilling of the ground the proprietors have slaves, whom they purchase of the West India company, who carry thither every year a certain number from Guinea.

The country is under the command of a governor, who has under him a commandant, and is appointed by the directors of the West-India company, but must be approved by the States General, and take an oath to them, as well as to the directors. The governor has a sovereign authority in their name over the whole colony, both in civil and military affairs. Yet in those of moment he is obliged to assemble and consult with the political council, of which he is president, as he is also of the court of justice; yet he has only one vote in each, and is obliged to determine according to the majority of voices. The political council is composed of the governor, the commandant, who is the first counsellor, and nine other members. The council, or court of justice, consists only of five counsellors, a secretary, and a bailiff or mayor, besides the governor. This great officer has the disposal of all vacant employments, civil and military, till such time as he can receive orders from the court of directors; and forms such regulation as he imagines most conducive to the security of the colony against attacks of an enemy.

The troops kept in pay for the defence of the colony consist of four companies of foot, each commanded by a captain, a lieutenant, an ensign, and two serjeants, and of which the governor is colonel. Besides there is a militia composed of eight companies of burghers.

S E C T. IV.

St. THOMAS'S and St. CROIX, or SANTA CRUZ.

Their Situation, Extent, Produce, and Trade, with the Revolutions that have happened in the last island.

ST. Thomas's, the principal island subject to the Danes, is situated in the sixty-fourth degree twenty minutes west longitude, and in the eighteenth degree thirty minutes north latitude. It has a safe and commodious harbour, in which are two mounds, that seem as if formed by nature for raising batteries upon them. Though the island is only fifteen miles in circumference, it is subject both to the Danes and Brandenburgers, but the latter are under the protection of the former. Almost in the center of the harbour is a small fort, without ditch or outworks, and about fifty or sixty paces to the west of it begins the town, which chiefly consists of one long street; at the end of which is the Danish factory, a large building with convenient warehouses both for the stowage of their commodities, and for the reception of the negroes, in which they trade with the Spaniards. On the right side of this factory is the Brandenburg quarter, which consists of two little streets, full of French

refugees from Europe and the islands. Most of the houses are of brick, built and tiled after the Dutch manner, but only one story high, on account of the badness of the foundation; for before they have dug three feet deep, they meet with water and quicksand.

The island produces oranges, citrons, lemons, guavas, bananas, mandiaca, millet, potatoes, and most sorts of fruit and herbage, particularly sugar and tobacco; but it is much infested with musketoos. These islands, so long as they remain in the hands of the Danish West-India company, were ill managed, and nothing like the proper advantage was made of them; but that wise and benevolent prince, the late king of Denmark, bought up the company's stock, and laid the trade open, and since that time the island of St. Thomas has been so greatly improved, that it is said to produce upwards of three thousand hogheads of sugar at a thousand pounds weight each, and others of the West-India commodities in tolerable plenty. In time of war privateers bring in their prizes here for sale, and a great many vessels trade from hence along the coast of Terra Firma, and return with money in specie or bars, and valuable merchandize.

St. Croix is about five leagues east of St. Thomas's, eight from Porto Rico, and about thirty west of St. Christopher's. It is seated in the eighteenth degree north latitude, and in the sixty-fifth west longitude. It is about ten or twelve leagues in length, and about three on the east side where it is broadest. The air is extremely unhealthy, but this will probably continue no longer than till the woods, with which the island is at present almost covered, are farther cleared, and room left for a proper circulation of the air. The soil is black, easy to be cultivated, very fertile, and produces several fine trees proper for the joiner and cabinet-maker, with sugar canes, oranges, lemons, pomegranates, citrons, a sort of papay called mamee, which is said to bear once a month excellent fruit, shaped like a woman's breast, from whence it takes its name.

A large bay on the north side has a basin and a small island, and in another on the south side opposite to it, the country is indented by the sea with so many inlets, that it seems one continued marsh, intermixed with a number of small islands, whence it has been called the drowned country.

With respect to its history; the Spaniards destroyed the natives, and, as in other places, soon after deserted it, after which it lay for a long time desolate; but it had afterwards several masters in a short compass of time; the English and Dutch, after disputing the sole possession of it, shared it between them; but, in 1649, the English being most numerous, ejected their neighbours, and were soon after turned out themselves by the Spaniards from Porto Rico, who in a descent burnt the houses, put all the men they found in arms to the sword, and sent off the rest with their wives and baggage to the island of Barbuda. Some Dutch from St. Eustatia and St. Martin hearing that the English were expelled, and imagining that the Spaniards were also gone, came thither to repossess it, but the Spaniards being still there, and ten times more numerous, attacked them by surprise, and forced them to surrender prisoners; but while the Spaniards were preparing to carry them to Porto Rico, Poincy, the French commander, came with a superior force, upon which the Spaniards were glad to quit both the place and their prisoners, whom Poincy carried back to St. Eustatia; and the next year, which was 1651, having reimbursed the Dutch merchants at Flushing for the expences they had been at in settling the colony, he made an acquisition not only of this island, but of St. Martin's, St. Bartholomew's, and several others, for the use of the knights of Malta, of whom he was grand master. This island was afterwards purchased of those knights by the French West India company; but the French abandoning it in 1696, the Danes obtained the possession of it, and it belonged to the West India company till it was purchased by his late Danish majesty. It was however then a perfect desert, but it has begun to settle very fast, for several persons from the English islands, and among them some of great wealth, have gone to settle there.

We

We have now gone through the countries and islands in America possessed by the English, French, Dutch, and Danes; the remaining part belongs to Portugal and Spain; but, before we begin with their dominions, we shall conclude this chapter with the characters of the several European nations, as they regard America, which we shall extract from the ingenious author of a work intitled, *An Account of the European Settlements*.

“ There seems, says he, to be a remarkable providence in the casting the parts, if I may use that expression, of the several European nations who act upon the stage of America. The Spaniard, proud, lazy, and magnificent, has an ample walk in which to expatiate; a soft climate to indulge his love of ease; and a profusion of gold and silver to procure him all those luxuries his pride demands, but which his laziness would refuse him.

“ The Portuguese, naturally indigent at home; and enterprising rather than industrious abroad, has gold and diamonds, as the Spaniard has, wants them as he does, but possesses them in a more useful, though less ostentatious manner.

“ The English, of a reasoning disposition, thoughtful and cool, and men of business, rather than of great industry, impatient of much fruitless labour, abhorrent of constraint, and lovers of a country life, have a lot which indeed produces neither gold nor

silver; but they have a large tract of a fine continent; a noble field for the exercise of agriculture, and sufficient to furnish their trade without laying them under great difficulties. Intolerant as they are of the most useful restraints, their commerce flourishes from the freedom every man has of pursuing it according to his own ideas; and directing his life after his own fashion.

“ The French; active, lively, enterprising, pliable, and politic; and though changing their pursuits, always pursuing the present object with eagerness, are notwithstanding tractable and obedient to rules and laws which bridle their dispositions, and wind and turn them to proper courses. This people have a country, where more is to be effected by managing the people than by cultivating the ground: where a peddling commerce, that requires constant motion, flourishes more than agriculture and a regular traffic; where they have difficulties which keep them alert, and where their obedience serves them for personal wisdom. In the islands the whole is the work of their policy, and of a right turn their government has taken.

“ The Dutch have got a rock or two on which to display the miracles of frugality and diligence; which are their virtues, and on which they have exerted these virtues, and shewn those miracles.”

CHAP. VII.

OF PORTUGUESE AMERICA, containing BRASIL.

SECT. I.

Its Name, Situation, Extent, Face of the Country, Climate, Vegetables, and Minerals; with a particular Account of the Gold and Diamonds of Brasil, the Manner in which they are obtained, and the Regulations in relation to them.

THE Portuguese, by whom this country was first discovered, gave it the name of the Holy Cross; but it afterwards obtained the name of Brasil, or Brazil, from the great quantity of Brasil wood which grows there, which was known in Europe and called brasil, before the discovery of the extensive country that bears its name.

Brasil is seated between the mouth of the great river of the Amazons under the equator, and the river Plata in the thirty-fifth degree south latitude, and between the thirty-fifth and fifty-first degree of west longitude; it being bounded on the north by the mouth of the river Amazon and the Atlantic ocean, on the east by the same ocean, on the south by the river Plata, and on the west by a chain of mountains which divide it from Spanish America and the country of Amazons; it being two thousand five hundred miles in length along the coast from north to south, and about nine hundred miles in breadth. The settlements of the Portuguese, however, reach but a small distance within land.

With respect to the coast of Brasil, it is proper to observe, that, beginning at the mouth of the river of the Amazons, it runs eastward as far as Cape St. Roque, which is thirteen hundred and fifty miles, from whence it winds to the southward quite to the Spanish province of Paragua, so that almost the whole country lies under the torrid zone.

As to the face of the country, the land near the coast is, in general, rather low than high; but extremely pleasant, it being interspersed with meadows and woods, the trees of which are, for the most part, ever-greens; but on the west, far within land, are mountains in which are innumerable springs and lakes, from whence issue abundance of rivers, that fall into the great rivers the Amazon and the Plata, or run across the country from

west to east, and fall into the Atlantic ocean; these last are very numerous, and of great use to the Portuguese in turning their sugar-mills, and meliorating their lands, which they annually overflow.

The north of Brasil lying almost under the equator, this, like other countries in the same situation, is subject to great rains and variable winds, particularly in March and September, when they have such torrents of rain, with storms and tornadoes, that the country is overflowed, and the air at that season rendered unhealthy. But, with respect to the more southern provinces, no country within the tropics has the heat more tolerable, or the air more healthful, it being constantly refreshed with breezes from the sea, and in the inland parts the winds from the mountains are still cooler than those that blow from the ocean.

The soil of Brasil is generally good, producing very large trees of various sorts, fit for any use. Their savannas, or meadows, are covered with grass and herbs, and where cultivated produce every thing proper for the climate, as sugar-canes, tobacco, cotton, indigo, maize, and fruit.

The chief of the forest trees are the sapiera, the vermiatico, the commeserie, the guiteba, and the ferrie; speckled wood, three kinds of mangrove trees, and the manchineel.

The sapiera is a very tall tree, which has good timber, made use of in building houses; the vermiatico is also a tall straight-bodied tree, of which planks are made two feet broad, and of the trunks they likewise make canoes, they being only scooped hollow and shaped something like a boat at the head and stern: though they are so narrow as frequently to overset, yet they cannot sink, and the Indians, who excel in swimming, make no difficulty when they are overset to turn them up again.

The guiteba and commeserie are chiefly used in building of ships, and are as much esteemed for that use as oak is with us, and are even said to be a more hard and durable wood. The ferrie tree resembles the elm, and is very durable in water. Their mangrove trees are red, white, and black: the red are used in tanning leather,

of the white they make masts and yards for their barks, and of the black good planks; both the white and black being much larger than in the gulph of Mexico. There grows here also a wild cocoa-nut tree, neither so tall nor so large as those in the East or West Indies, nor are the nuts a quarter so big, but are in esteem for making beads for rosaries, bowls of tobacco-pipes, and other toys. At the top of the tree among the branches grows a long sort of black thread, resembling horse hair, but much longer. Of these they make cables, that are very strong, lasting, and serviceable, for they will not rot like cables made of hemp, though they lie exposed to heat and wet. They have also three sorts of cotton trees, but very little of the right West India cotton shrub of which cotton cloth is made.

With respect to fruits, they have several kinds of European grapes, oranges, lemons, pomegranates, and pomelcitrons, which were transplanted thither by the Portuguese. They have also jenipahs, papaws, cashews, fourtops, custard apples, cabbage trees, the true cocoa-nut, guavas, bananas, and plantanes.

The jenipah is a kind of fruit of the calabash or gourd kind, of the size of a duck egg, somewhat of an oval shape, and of a grey colour; but the shell is neither so thick nor so hard as that of the calabash. It is full of a whitish pulp mixed with small flat seeds, and both the pulp and seeds are taken into the mouth, but on sucking the pulp they spit out the seeds. It is of an agreeable sharp taste, and very innocent. The tree that bears it has some resemblance to the ash, is straight bodied, and of a good height, clear from limbs till near the top, where the branches put forth a small head.

The fourtop is a fruit as large as a man's head, of an oval shape, and when ripe green on one side and yellowish on the other. The coat or outside is pretty thick, and very rough, with small sharp knobs, and the inside is full of a spongy pulp, with black kernels of the shape and size of pumpkin-seeds. The pulp is very juicy, of a pleasant taste, and wholesome. The tree or shrub that bears this fruit, is only ten or twelve feet high, with a small short trunk, from which the branches grow pretty straight up. This fruit also grows both in the East and West Indies.

Besides these here are many sorts of fruit not to be met with any where else, as arisahs, mericasahs, petangoes, &c. The arisah is an excellent fruit, somewhat bigger than a large cherry, and shaped like a Catharine-pear, it being smaller at the stem, and swelling bigger towards the end. They are of a greenish colour, and have small seeds, are somewhat tart, yet very pleasant and wholesome.

The mericasah is an excellent fruit, of which there are two sorts; one that grows on a small tree or shrub, which is accounted the best, and the other growing on a kind of vine, which is usually planted about arbours for the sake of the shade, they having many broad leaves. The fruit is as large as a small orange; it is round, green, and when ripe it is soft, and full of a white pulp, mixed with little black seeds, and is very tart, pleasant, and wholesome.

The petango is a small red fruit, that also grows on small trees. It is of the size of a cherry, but not so round, having one flat side, and five or six small ridges. It is a very pleasant tart fruit, and has a large flattish stone in the middle.

The mungaroo is a fruit as large as a cherry, red on one side and white on the other, and contains small seeds.

The musteran de avo is a round fruit, of the size of a large haffle nut, covered with thin brittle shells of a blackish colour. It has a small stone in the middle, inclosed with a black pulpy substance.

They have likewise plenty of callavances, pine apples, water-melons, musk-melons, cucumbers, yams, potatoes, cassavas, cabbages, turnips, onions, leeks, and a variety of sallading, with several kinds of drugs, as sassafras, snake-root, &c.

No sort of corn thrives in Brasil like maize, for wheat and rye grow too rank, and run up into straw. Their seed time is at the beginning of the rainy season, and their harvest a little after it is over. The trees and shrubs proper to the country bear leaves, blossoms and

fruit all the year round; and the same is observed of their oranges, limes, and some other fruits that have been carried thither. It is said that those who would have ripe grapes all the year, only prune their vines at different times to effect it, and they produce a fine luscious grape as sweet as honey; and yet they can make no wine here that will keep.

As to their minerals they have gold and some silver; and here are found plenty of rich diamonds, jasper, emeralds, and other precious stones.

Gold was first found in the mountains which lie adjacent to the city of Rio Janeiro. The occasion of its discovery is variously related; but the common account is, that the Indians on the back of the Portuguese settlements, were observed by the soldiers employed in an expedition against them, to make use of this metal for their fishing-hooks; and their manner of procuring it being enquired into, it appeared that great quantities of it were annually washed from the hills, and left among the sand and gravel that remained in the valleys after the running off, or evaporation of the water. It is now little more than sixty years since any quantities of gold worth notice have been imported from Brasil to Europe; but from that time the annual imports from thence have been continually augmented by the discovery of places in other provinces, where it is to be met with as plentifully as at first about Rio Janeiro. And it is now said, that a small slender vein of it spreads through all the country, at about twenty-four feet from the surface; but that this vein is too thin and poor to answer the expence of digging. However, where the rivers or rains have had any course for a considerable time, there gold may always be collected, the water having separated the metal from the earth, and deposited it in the sands: whence it is esteemed an infallible method of procuring it, to divert a stream from its channel, and to ransack its bed. Indeed there are properly no gold mines in Brasil, all the gold being collected either from rivers, or the beds of torrents after floods.

The slaves, who are principally negroes, are kept in great numbers to examine the bottoms of rivers, the gullies of torrents, and to wash the gold found in them from the sand and dirt. The regulation of the duty of these slaves is very singular, for they are each of them obliged to furnish their master with the eighth part of an ounce of gold every day; and if they are either so fortunate or industrious as to collect a greater quantity, the surplus is generally considered as their own property, and they have the liberty of disposing of it as they think fit: so that it is said some negroes, who have accidentally fallen upon rich washing places, have themselves purchased slaves, and have afterwards lived in great splendor, their original master having no other demand on them than the daily supply of the above eighth part, which, as the Portuguese ounce is somewhat lighter than our troy ounce, may amount to about nine shillings sterling.

The quantity of gold thus collected in the Brasils, and annually returned to Lisbon, may in some degree be estimated from the amount of the king's fifth: this has been computed one year with another at one hundred and fifty arroves of thirty-two pounds Portuguese weight, which at four pounds the troy ounce, makes very near three hundred thousand pounds sterling; and consequently the capital of which this is the fifth, is about a million and a half sterling. The annual return of gold to Lisbon cannot be less than this, though it be difficult to determine how much it exceeds it. It has been supposed that the gold exchanged for silver with the Spaniards at Buenos Ayres, and what is privately brought to Europe, amounts to near half a million more, which will make the whole annual produce of the Brazilian gold near two millions sterling; a prodigious sum to be found in a country, which at the close of the last century was not known to furnish a single grain.

As to diamonds, the discovery of these valuable stones is still more recent, it being scarce forty years since the first were brought to Europe. They are found in the same manner as the gold, in the gulleys of torrents and beds of rivers, but only in particular places, and not so universally spread through the country. They were

frequently found in washing the gold, before they were known to be diamonds, and were consequently thrown away with the sand and gravel separated from it. It is well remembered that numbers of very large stones, that would have enriched the possessors, have passed unregarded through the hands of those who afterwards bore with impatience the mortifying reflection. However, about forty years ago a person acquainted with the appearance of rough diamonds, imagined that these pebbles, as they were then esteemed, were of the same kind: but it is said there was a considerable interval between the first starting of this opinion, and its being confirmed by proper trials, it being difficult to persuade the inhabitants, that what they had been long accustomed to despise, could be of such importance as this discovery supposed. And it is said, that in this interval a governor of one of their places procured a good number of these stones, which he pretended to make use of in playing at cards instead of counters. But it was at last confirmed by skilful jewellers in Europe, who were consulted on this occasion, that these stones were real diamonds, and many of them not inferior, either in lustre or any other quality, to those of the East Indies. Upon this determination the Portuguese in the neighbourhood of the places where they had been found, began to search for them with great assiduity; and they had even hopes of discovering considerable masses of them, as they perceived large rocks of crystal in many of the mountains from whence the streams came that washed down the diamonds.

It was however soon represented to the king of Portugal, that if such plenty of diamonds should be found, as their sanguine conjectures seemed to indicate, this would so debase their value, that besides ruining all the Europeans who had any quantity of Indian diamonds in their possession, it would render the discovery itself of no importance, and prevent his majesty from receiving any advantages from it. On these considerations the king thought proper to restrain the general search for diamonds, and for that purpose erected a diamond company, with an exclusive charter. This company, in consideration of a sum paid to his majesty, is vested with the property of all diamonds found in Brasil: but to prevent their collecting too large quantities, and thereby reducing their value, they are prohibited from employing above eight hundred slaves in searching for them. And to prevent any of his other subjects from acting the same part, and to secure the company from being defrauded by interlopers, he depopulated a large town, with a considerable district round it, and obliged the inhabitants, who were said to amount to six thousand, to remove to another part of the country; for this town being in the neighbourhood of the diamonds, it was thought impossible to prevent such a number of people who were on the spot, from frequently smuggling.

SECT. II.

Of the Beasts, Birds, Reptiles, Insects, amphibious Animals, and Fishes, of Brasil: containing a particular Description of the Ant-Bear and Armadillo.

THE beasts that were found in this country on its being first discovered, were in general the same with those of Mexico and Peru, particularly the Peruvian sheep, the pecaree, called by the Europeans the hog, from their bearing some resemblance to that animal, a great variety of monkeys, deer, hares, and rabbits, some lions and tygers; but these are neither so large nor so fierce as those of Africa; the ant-bear, the porcupine, the racoon, and flying squirrel, the armadillo, the opossum, the guano, and the sloth.

The ant-bear is as long and as tall as a middle sized dog; his hind legs resemble those of a bear, but his fore legs are more slender: his fore feet are flat, and divided into four toes, armed with long claws; but those behind have five toes. His head is long, with a sharp snout, small round black eyes, and very black ears: the tongue is said to be upwards of two feet in length, but very slender: he is obliged to bend part of his back when he keeps it within his mouth, the jaws being

otherwise too short to contain it. He lives upon ants, and when he has found any of their nests, he opens the upper part of them with his claws, that he may have room to put in his snout and his tongue: this is besmeared with a slimy liquor, and is soon covered with ants, when he draws it into his mouth and swallows them. This he repeats as long as they will run into the same snare. The tail of this animal in some measure resembles that of a fox; it is generally two feet long, almost flat, and covered with hair from fifteen to twenty inches long; it is harsh, very strong, and he can move it just as he pleases; when he turns it upon his back, it entirely covers it, and defends him from the rain, which he greatly dislikes.

The armadillo has his head, body, and tail, covered with a shield of a bony substance, forming most beautiful scales. On the upper part of the neck are two joints that he may move his head, and on the back seven divisions, with a yellow skin between each. The feet are covered with a thinner shield, but the lower parts of the body are without this covering. The head is like that of a hog, with a sharp snout. He has small eyes sunk deep in the head, and a narrow pointed tongue. The ears are naked, brown, and short, and the teeth of a middle size. The feet resemble hands, with five fingers and roundish nails. The tail at the root is near four inches thick, but grows gradually less to the end, where it terminates in a point. It lives upon melons, potatoes, and other roots, but will not eat flesh, and generally lies hid in the ground, which he turns up with the snout. This animal has a quick feeling, and will roll himself up like a ball. The flesh is white, fat, and delicate, but is best when seasoned with spices to quicken the taste.

Their fowls are maccaws, parrots, parroquets, the quam, the curasoe, the bill-bird, the cockreco, the crab-catcher, the fishing-hawk, and the humming bird; curleus, partridges, wood-pigeons, herons, and pelicans; they have also great variety of singing birds, several species of wild ducks, wild geese, and common poultry; and there is not any sort of the latter in Europe that has not been carried thither by the Portuguese. However, in these hot climates fowls of all kinds are dry meat, nor is their mutton very good; the pork is esteemed the best flesh, and is here thought of easy digestion. All the horses, cows, sheep, asses, hogs, and cats, were brought hither from Europe.

In some parts of Brasil the heat of the climate is thought to favour the generation of a great variety of poisonous insects and reptiles; and it is certain that no country produces a greater variety of serpents, some of which are said to be of an incredible length. The rattle-snake and other reptiles of the same species grow to an enormous size, and the serpent called ibibaboca is affirmed to be seven yards long, half a yard in circumference, and possessed of a poison instantaneously fatal to mankind. Indeed the accounts authors have given of the monstrous size of these reptiles in this country are so very improbable, that it is dangerous to give any credit to what they say. That they are large and numerous is not doubted; and it has been justly observed, that Providence has thought fit to give an alloy, by these inconveniences, to the many advantages of this invaluable country, in order to dispense her blessings more equally among the inhabitants of the earth in general.

Here are also scorpions, centeepees, spiders, and other insects that are venomous and of an extraordinary size. Their ants are almost as troublesome here as in Africa, marching in great bodies, and devouring every thing in their way. Here is also the fire-fly, which seems to differ but little from the glow-worm, except in having wings: when a number of these fix on the boughs of trees, they in the night appear at a small distance like so many stars. There are said to be here twelve several sorts of bees, some of which have vast nests in hollow trees in the woods, and others in holes of the rocks, and yield great quantities of honey and wax.

With respect to the amphibious animals, they have the three kinds of turtle, the hawks-bill, the loggerhead, and the green turtle; which last is most excellent food. The lakes and rivers abound with crocodiles, and they have a creature which the Portuguese call cachora de agua,

or the water-dog. It is as big as a mastiff, is covered with hair of a dark colour, and has a long head with four short legs : he lives in fresh water lakes and ponds ; but comes on shore to sun himself, and is said to be good food.

Their seas, lakes, and rivers are full of excellent fish ; the lean flesh of the whales, of which there are plenty on this coast, is eaten by the slaves and poor people of Brasil. The best fish on the coast is the manatee, which is as large as an ox. They have also the sword-fish, thrasher, paracood, cavally, old-wife, gar-fish, mullet, mackarel, snook, turpoon, oysters, crabs, shrimps, prawns, and other shell fish. Their best river fish resembles our perch, and they have others not unlike pike and carp.

S E C T. III.

Of the Divisions of Brasil ; with a Description of the City of St. Salvador the Capital, and the Manners of its Inhabitants.

BRASIL is usually divided into fifteen provinces, or captainships, of which eight only are annexed to the crown, the rest being fiefs made over to some of the nobility on account of their extraordinary services, who do little more than acknowledge the sovereignty of the king of Portugal, and his representative the viceroy of Peru. However, the whole gives the title of prince to the presumptive heir to the crown of Portugal. These captainships are, Paria, Maragnan, Siara, Poligi, or Rio Grande, Parayba, Tamara, Pernambuco, Seregippe, Batria de Todos Santos, Ilheos, Porto Seguro, Spirito Sancto, Rio Janeiro, St. Vincent, and Del Rey.

The principal city is St. Salvador, also called the city of Bahia, which is in the province of the same name, and was thus called from the commodiousness of its harbour. It is seated on a hill, in the twelfth degree eleven minutes south latitude. It is populous, magnificent, and beyond comparison the most gay and opulent city in all Brasil. The trade carried on here is prodigious; the gentry are polite ; but the vulgar, who have acquired wealth, are intolerably insolent and brutal. In this city are no less than twelve or fourteen thousand Portuguese, with three times that number of negroes. The harbour is capable of receiving ships of the greatest burthen, and its entrance is guarded by a strong fort called St. Antony. There are other small forts that command the harbour, one of which is built upon a rock about half a mile from the shore. Close by this fort all ships must pass that anchor here, and must also ride within half a mile of it, between this and another fort that stands on a point at the inner part of the harbour. Besides these there is another fort on the hill upon which the town stands.

Here are about four hundred soldiers in garrison, who commonly draw up and exercise in a large parade before the governor's palace, and many of them attend him when he goes abroad. They are decently dressed in brown linen, which, in these hot countries, is far more agreeable than woollen.

The city consists of about two thousand houses, the greatest part of which cannot be seen from the harbour ; but as many as appear in sight, being intermixed with trees, and placed on a rising hill, afford a fine prospect. The houses are handsomely built, mostly of brick or stone. The churches, convents, and hospitals, are not only built in the most sumptuous manner, but adorned with every thing rich and costly, particularly with fine paintings. The upper town has many splendid structures, particularly the cathedral of St. Salvador. The church which lately belonged to the Jesuits college is very magnificent, and built of marble brought from Europe ; and that college is a fine edifice. The viceroy's palace is a most sumptuous building, as is also the palace of the archbishop, the courts of judicature, the hospitals, &c. The principal streets are large, and all of them paved ; there are also several squares, and many gardens, both within the city and its neighbourhood, in which are a great variety of fruit-trees and flowers, fallading, and plants for the kitchen.

Most of the streets are, however, so steep as to be impassable for coaches or chairs, to supply which defect the rich cause themselves to be carried out in a kind of cotton hammocs, called serpentines, which are borne on the negroes shoulders by the help of a bamboo, about twelve or fourteen feet long. Most of these hammocs are blue, and adorned with fringes of the same colour ; they have a velvet pillow, and above the head a kind of tester with curtains, so that the person carried cannot be seen, unless he pleases ; but may either lie down or sit up, leaning on his pillow. When he has a mind to be seen he puts by the curtains, and salutes his acquaintance whom he meets in the streets ; for they take a pride in complimenting each other in their hammocs, and will even hold long conferences in them in the streets ; but then the two slaves who carry them make use of a strong well-made staff, with an iron fork at the upper end, and pointed below with iron ; this they stick fast in the ground, and rest the bamboo, or pole, to which the hammoc is fixed, on two of these, till their master's business or compliment be over. Scarce any man of fashion, or any lady, will pass the streets without being carried in this manner.

The lower class of the people are insolent, and the soldiers given to all manner of vice ; and some of them are dangerous assassins. The women are more strictly watched than in Portugal, yet sometimes find means to elude the vigilance of their keepers. However, the husbands make no scruple to stab or poison their wives, if they find them false.

The chief mechanic trades in this city are hatters, smiths, shoe makers, sawyers, carpenters, coopers, taylor, and butchers. All these buy negroes, whom they train up to their several employments. These slaves are also very useful as porters, for as there is here a great trade by sea, and the landing-place is at the foot of the hill too steep for the passage of carts, there is great need of slaves to carry the goods up into the town : but the merchants have the convenience of cranes with ropes, one end of which goes up, while the other is let down. The house in which the crane stands on the brow of the hill towards the sea, and there are planks set shelving all the way up, against which the goods slide as they are hoisted up or let down.

S E C T. IV.

Of the different Inhabitants of Brasil, their Manners and Customs ; with a more particular Account of the Brasilians.

THE present inhabitants of Brasil are Portuguese, Creoles, Mestizes, Negroes, and Brasilians. The Portuguese of Europe, who enjoy the places of trust and profit, are the fewest in number ; the Creoles, or those born of Portuguese parents in Brasil, are more numerous ; and the Mestizes, or mixed breed, are still more numerous than either ; for few of the Portuguese have been without black or tawney mistresses, and the issue of these having intermarried they are multiplied extremely. The Negroes are also very numerous, and those slaves are much more valued than the Brasilians, they being of a more robust constitution and fitter for labour ; for as they come from the coast of Africa opposite to Brasil, which is much hotter, they endure fatigue in the hot season better than the original natives ; nor are the latter very numerous, the Portuguese in their invasion of the country, like the Spaniards in their conquests, destroying the unfortunate natives by all the cruel ways they could invent.

The portrait given us of the manners and customs of the Portuguese in America by the most judicious travellers, is very far from being favourable. They are described as a people who, while sunk in the most effeminate luxury, practise the most desperate crimes : of a temper hypocritical and dissembling ; of little sincerity in conversation, or honesty in dealing ; lazy, proud, and cruel. In their diet penurious ; for, like the inhabitants of most southern climates, they are much more fond of shew, taste, and attendance, than of the pleasures of free society,

society, and of a good table; yet their feasts, which are seldom made, are extravagantly sumptuous.

The pride, indolence, luxury, and cruelty of the masters has, among other causes, been attributed to their being bred up among slaves, who perform all the business; and to their being permitted to keep a prodigious number of negroes, not merely to work in the field, nor for domestic employments, but solely for state, to attend their persons, and form their train. These become as corrupt as their masters, who make them the instrument of their crimes; and giving them an unbounded and scandalous licence, employ them as bullies or assassins whenever they are disposed to terrify or seek revenge. Indeed nothing can be conceived more adapted to create the worst disorders than the unnatural junction of slavery, idleness, and a licentious life. They are suffered to go armed, and there are vast numbers who have merited or bought their freedom; and this is suffered in a country where the negroes are said to be ten to one of the Portuguese and Creoles.

However, this picture is perhaps too highly coloured; it at best does not resemble those in the northern captainships, nor those in the most southern, by the Rio Janeiro, who are far from being so effeminate and corrupted as those of St. Salvador, which, besides being in a climate favourable to indolence and debauchery, is the capital city, and in all respects worse than the others.

Before the Portuguese planted Brasil the country was not divided into provinces, but was all one great common, every tribe and family inhabiting and cultivating what part of it they thought fit, and removing their dwellings wherever they pleased; only every man was considered as the proprietor of the ground he planted, till he removed and left it for another place he liked better. Their towns usually consisted of five or six great houses, each of which contained two or three hundred people, and sometimes many more. Over these the head of the tribe or family presided. Their houses were built of long poles, reeds, and palmeto leaves; and their furniture only consisted of hammocs of cotton net-work fastened to poles, in which they slept; some earthen pots and pans, and their gourds and calabashes, which being cut in half, served them for pails, tubs, and drinking-cups; for they have them of all sizes: besides which they had baskets, in which they carried their provisions. The ornaments of their houses were their bows, arrows, spears, and other arms.

In this extensive country were also some nations that had no settled abode; but living in tents, continually removed from place to place; and both these and the former slept as often without doors as within, tying their hammocs to the boughs of trees, and making fires near them to prevent the ill effects of the cold dews that fell in the night, or to keep off the wild beasts and noxious vermin.

The Portuguese and Dutch writers call the Brasilians who inhabit the north part of the country Tapuyers, and those who dwell in the south Tupinambes; but divide these into several petty nations differing in language, tho' very little in their manners and customs.

The Tapuyers are of a good stature, and of a dark copper colour; their hair black and hanging over their shoulders; but they have none on their bodies or faces, and go almost naked, the women only wearing at their waist a slight covering of leaves. Their ornaments are glittering stones hung upon their lips or nostrils, bracelets of feathers about their arms, and a circlet of feathers upon their heads. Some paint their bodies of all manner of colours, while others rubbing them with gums stick beautiful feathers upon them, which makes them at a distance look more like fowls than human creatures.

The Tupinambes, who inhabit the south of Brasil, are of a moderate stature, and of a less dark complexion than their northern neighbours, who lie nearer the line; but neither of them are so black as the Africans in the same latitude, for there were no negroes in America before they were transported thither by the Spaniards and Portuguese. These people have however flat noses, which are not natural, but made so in their infancy; a flat nose there being esteemed a beauty: they have also black curled hair on their heads, and paint themselves like the northern Brasilians.

The general food of all the Brasilians was cassava bread, of which they made cakes like our sea biscuit; they also used to feed on other roots, fruit, and herbs, with such venison as they took in hunting, and with fish and oil. They have been represented by many writers as cannibals, and all the Brasilians have been charged with eating human flesh; but this appears to be nothing more than a slander cast upon them to give a colour to the cruel treatment they have met with from their conquerors. The general liquor drank by the natives is spring water, of which they have the best and the greatest variety in the world; but they have other kinds of liquor made of the juice of their fruits or honey, with which they sometimes get very drunk, sitting whole days and nights over their cups. They were formerly acquainted but with few arts, except spinning, weaving, and forming their bows, arrows, lances, darts, and building their houses, which did not want any great contrivance. They had, however, some knowledge of the virtues of several herbs and drugs, which they frequently administered with success to the sick. Hunting, fishing, and fowling, were rather their business than diversion, they being necessary for the support of their families, in a country where they had neither corn nor tame cattle. Drinking, singing, and dancing, were their principal diversions; these they practised on their rejoicing days, on a victory, or the birth of their children. They are still great smokers, and take the strongest tobacco: their pipes are a hollow cane or reed, and the bowl a large nut shell, that holds almost a handful of tobacco.

The Portuguese will not allow that the Brasilians had any kind of religion, and yet confess that they had priests, and admitted of a state of rewards and punishments, according to their valour or cowardice. The prevailing notion among them is, that after death the good shall visit their ancestors, who dwell in a delightful place beyond the Andes. They believe in certain invincible beings, the dispensers of good and evil, the rewarders of virtue, and the punishers of vice. As to their having no temples, this may possibly arise from their profound reverence of the Deity, who is not to be circumscribed by time or place, or worshipped in the mean houses erected by human labour, but under the glorious canopy of the heavens.

Nor is the opinion of their living without any regard to government more agreeable to truth; for even those writers who deny that they had any policy speak of their kings, chiefs, and generals, and even admit that there was a scale of subordination among them. If one man injured another, he was obliged to make him satisfaction in kind if possible, and no people on earth display more hospitality and civility to strangers, which is acknowledged by the Portuguese writers themselves, even while they are endeavouring to stigmatize those generous people with the odious appellation of cannibals.

The rites observed at funerals is a farther proof of their belief of a future state. The friends and relations of the deceased set up a lamentable howl, praising alternately the beauty, virtue, strength, and talents of their departed relation, crying out in the most melancholy voice, that they shall never see him more till they dance with him beyond the mountains. When these lamentations had lasted for the space of six hours, preparation was made for burying of the corpse in a fitting posture, and a dome erected over it by way of vault: here they deposited meat and drink, his arms, and whatever was useful to him when alive. As to the master of the family, his tomb was usually in the middle of his own house, and his monument was generally adorned with the most beautiful feathers and other ornaments.

Such, according to the most authentic relations, were the ancient Brasilians, and such, with very little variation, are the modern race, where the manners of the Portuguese and those of the negroes have not mingled with their original customs.

In short, the native Brasilians are at present a tractable and ingenious people, ready to learn any art or science the Portuguese will teach them, and take nothing so kindly of the priests as their instructing their children, which has given them an opportunity of making many converts;

converts; those who live under the Portuguese generally conform to their customs in eating, drinking, and cloathing, and few of these go naked.

S E C T. IV.

Of the Government, Forces, and Trade of Brasil.

THE government of Brasil is in the Vice-roy, who, as we have already observed, resides at St. Salvador. He has two councils, one for criminal, the other for civil affairs, in both which he presides: but to the infinite prejudice of the settlement, all the delay, chicanery, and multiplied expences incident to the worst part of the law, and practised by the most corrupted lawyers, flourish here; at the same time that justice is so relaxed, that the greatest crimes are often suffered to pass with impunity.

The Portuguese in Brasil are sufficient to maintain the dominion of that country against any other power; they have a good number of European regular troops; the militia too is regulated, among whom there are some bodies of Indians and free negroes. On the other hand, the Portuguese, Creoles, Mestizes, Negroes, and Brasilians, are now in a manner one people, their religion the same, and their blood intermixed by marriages; and therefore, however they may disagree among themselves while they have no enemy to contend with, they would infallibly unite against all the rest of the world. This is an advantage which both the Spaniards, Portuguese, and the French have over the English in America; for they always make the natives and negroes where they have any power, of their own religion; and these, in a short time, discover as much zeal for their superstition as the Portuguese themselves, who would never bear that any people who bore the name of heretics should plant themselves among them; nor is the circumstance of marriage and alliance inconsiderable: these lay strong obligations upon all people to unite against strangers, and this the English do not enough consider, when they prohibit their people matching with the natives or negroes. Instead of this we treat the latter with greater cruelty than those nations who are least distinguished for their humanity. Hence they generally remain in a separate interest, and instead of serving their masters faithfully, are ever conspiring to cut their throats, or to escape out of their hands.

The trade of Portugal is carried on upon the same exclusive plan observed by the other European nations with the American colonies, and resembles the Spanish method in not sending out single ships, as the convenience of the several places, and the judgment of the European merchants, may direct; but by annual fleets, which sail at stated times from Portugal, and compose three flotas, bound to as many parts in Brasil, namely, to Fernambuca in the northern part, to Rio Janeiro at the southern extremity, and to the bay of All Saints in the middle, where is the capital, of which we have given a description, and there all the fleets rendezvous on their return to Portugal.

The trade of Brasil is very great, and increases every year; which is the less surprising as the Portuguese have opportunities of supplying themselves with slaves for their several works at a much cheaper rate than any other European power that has settlements in America; they being the only European nation that has established colonies in Africa; and these being very considerable, both for their extent and the number of their inhabitants, they have of course advantages in that trade which no other nation can have, and every year draw from thence into Brasil between forty and fifty thousand negroes; and for this the situation of Brasil is very convenient, it being nearer to Africa than any other part of America. Hence it is principally that Brasil is the richest, most flourishing, and growing establishment in all America. The sugar exported from thence is very great, and it is finer than what any of ours, the French, or Spanish sugar plantations send us. Their tobacco is also remarkably good, though not raised in such large quantities as in our American colonies. The northern and southern parts of Brasil abound with horned cattle; these are hunted for

their hides, of which no less than twenty thousand are annually sent into Europe.

A considerable part of the gold brought from Brasil is coined in America: thus, that coined at Rio Janeiro bears an R, and that which is struck at St. Salvador, or the Bay, is marked with a B. Of the diamonds, there is supposed to be returned to Europe the value of one hundred and thirty thousand pounds. This, with the sugar, which is principally the cargo of the Fernambuca fleet, the tobacco, the hides, the valuable drugs for medicines and manufactures, may give some idea of the importance of this trade, not only to Portugal, but to all the trading powers of Europe.

The chief commodities the European ships carry thither are not the fifteenth part of the produce of Portugal; they consist of the woollen goods of all kinds of England, France, and Holland; the linens and laces of Holland, France, and Germany; the silk of France and Italy; silk and thread stockings, hats, lead, tin, pewter, iron, copper, and all sorts of utensils wrought in these metals from England; as well as flour, salt fish, beef, and cheese. They have oil from Spain: wine, with some fruit, is nearly all they are supplied with from Portugal.

Though the profits in this trade are great, few Portuguese merchants trade upon their own stock; they are generally credited by the foreign merchants, whose commodities they sell, especially by the English. In short, though in Portugal as well as in Spain all trade with their plantations is strictly forbidden to strangers, yet, like all other regulations that contradict the very intention for which they were made, they are little attended to. The Portuguese is, indeed, only the trustee and factor; but his fidelity is equal to that of the Spanish merchant, and that has scarce even been shaken by any public or private cause. This is extremely surprizing in the Portuguese, who in all other respects are far from being remarkable for their integrity, and is a striking instance how far a custom originally built upon a few examples, and a consequent reputation built upon that, will be able to affect in succession men of very different natural characters and morals.

England is at present most interested in the trade of Portugal, both for home consumption, and what they want for the use of the Brasils; and deserves to be most favoured, as well from the services the English have always done that crown, and from the stipulations of treaties, as from the consideration that no other people consumes so much of the produce of Portugal. However, the French have become very dangerous rivals to us in this, as in many other branches of trade.

S E C T. V.

ST. CATHARINE'S.

Its Situation, Extent, Face of the Country, Vegetables, Animals, and Climate.

BEFORE we take leave of Brasil, we shall take notice of St. Catharine's, the principal island on the coast of the southern part of this country. It is no where above six miles in breadth, though about twenty-seven in length, extending from the twenty-seventh degree thirty-five minutes south latitude to the twenty-eighth, and lying in the forty-ninth degree forty-five minutes west longitude from London.

Though it is of a considerable height, it is scarce perceivable at ten leagues distance, it being then observed under the continent of Brasil, the other mountains there rising exceeding high; but on a nearer approach it is easily distinguished, and may be known by a number of small islands lying at each end, and scattered along the east side of it. The harbour is defended by several forts.

The soil is truly luxuriant, spontaneously producing fruit of many kinds, and the ground is covered with one continued forest of trees of a perpetual verdure, which from the exuberance of the mould are so entangled with briars, thorns, and underwood, as to form a thicket absolutely impenetrable, except by some narrow paths which the inhabitants have made for their own convenience. These, with some spots cleared for plantations

along the shore facing the continent, seem the only uncovered parts of the island. The woods are extremely fragrant from the many aromatic trees and shrubs with which they abound; and the fruits and vegetables of all climates thrive here, almost without culture, and are to be procured in great plenty; so that here is no want of oranges, lemons, citrons, pine-apples, peaches, apricots, melons, and plantains; there are also abundance of onions and potatoes.

The flesh provisions are however much inferior to the vegetables; there are indeed to be purchased small wild cattle, somewhat like buffaloes; but these are very indifferent food, their flesh being of a loose contexture, and generally of a disagreeable flavour, owing perhaps to the wild calabash on which they feed. There are also great plenty of pheasants, but they are far inferior in taste to those we have in England. The other provisions are monkeys, parrots, and fish of various sorts, which abound in the harbour, are extremely good, and easily caught.

The water both on the inland and the opposite continent is excellent, and preserves at sea as well as that of the Thames, for after it has been in the cask a day or two, it purges itself, stinks most intolerably, and is soon covered with a green scum, which in a few days subsides to the bottom, leaving the water as clear as crystal, and perfectly sweet.

These are the advantages of the island; but it has several inconveniencies attending it, particularly with respect to the climate; for the woods and hills which surround the harbour, prevent a free circulation of air; and the vigorous vegetation which constantly takes place there, furnishes such a prodigious quantity of vapour, that all the night, and a great part of the morning, a thick fog covers the whole country, and continues till either the sun gathers strength to dissipate it, or it is dispersed by a brisk sea breeze. This renders the place close and humid. Strangers are here also much pestered with a multitude of musketos, which are all day extremely troublesome, and at sun set, when they retire, they are succeeded by an infinite number of sand-flies, which though scarce perceivable to the naked eye, make a great buzzing, and wherever they bite, raise a small bump in the flesh, which is soon attended with a painful itching, like that arising from the bite of an English harvest bug. This island is subject to a governor appointed by the king of Portugal, and has a garrison of soldiers for its defence.

SECT. VI.

A concise History of Brasil.

BRASIL is said to have been first discovered by Americus Vesputio, a Florentine, who had the good fortune to be honoured with giving his name to the immense continent some time before found out by Columbus. This was in the year 1498, but he then sailed no farther than to the fifth degree of south latitude. Afterwards, being employed by the king of Portugal, he sailed again to Brasil, and extended his discoveries to the fifty-second degree of south latitude; and the same year his Portuguese majesty sending a fleet to the East Indies under the admiral Peter Alvarez Capralio, he standing out to sea to avoid the calms upon the coast of Africa, fell in with the continent of South America, and landing in the seventeenth degree of south latitude gave the country the name of Santa Cruz, which, as we have already said, it soon after lost, and obtained the name of Brasil. The admiral sent one of his ships back to Portugal with an account of this discovery, the richness of the country, and its agreeable situation; and with the rest continued his voyage to India. His majesty, pleased with the account, resolved to send a colony thither, and the first settlement was made; but this was performed in a very improper manner, for it was only by banishing thither a number of criminals of all kinds. This introduced an evil disposition into the first principles of the colony, and made the settlement extremely difficult, from the disorders they introduced, and the offence they gave to the original in-

habitants. This settlement likewise met with some interruption from the court of Spain, who considered the country as within their dominions. However, the affair was at length accommodated by a treaty, in which it was agreed, that the Portuguese should possess all the country lying between the river of the Amazons and the river Plate.

Their right being thus confirmed, the Portuguese pursued the settlement with great vigour: considerable grants were made to those who were inclined to become adventurers; and many of the nobility of Portugal procured an interest in a country that promised such great advantages. The natives were in most parts subdued, and the improvement of the colony advanced apace. In a little time the crown became attentive to so valuable an acquisition; the government was new modelled, many exorbitant grants recalled, and every thing settled on so advantageous a footing, that all the sea-coasts for upwards of two thousand miles were in some measure settled, to the great benefit of the mother country. The Portuguese conquests on the coast of Africa greatly forwarded this settlement, by the number of negroes it afforded the settlers for their works; and this was the first introduction of negroes into America.

But in the very meridian of the prosperity of the Portuguese, when they were in possession of a most extensive empire, and a flourishing trade in Africa, Arabia, India, the islands of Asia, and one of the most valuable parts of America, they were struck by one of those blows which instantly decides the fate of kingdoms. Don Sebastian, one of their greatest princes, lost his life in an expedition against the Moors, and by that event the Portuguese lost their liberty, Portugal being absorbed in the Spanish dominions.

Soon after the same yoke which galled the necks of the Portuguese, becoming insupportable to the inhabitants of the Netherlands, seven provinces shook it off; and not satisfied with forming themselves into an independent state, and supporting their independency by a successful defensive war, with amazing ardour pursued the Spaniards into the remotest recesses of their extensive territories, and grew rich, powerful, and terrible by the spoils of their former ancestors. They particularly attacked the possessions of the Portuguese, took almost all their fortresses in the East Indies, and then turned their arms upon Brasil, unprotected by the Spaniards, and betrayed by the cowardice of the governor of the principal city. They would have conquered the whole island, had not Don Michael de Texeira, the archbishop, who was descended from one of the noblest families in Portugal, believed that in such an emergency the danger of the country superseded the common obligations of his profession: he took arms, and at the head of the monks, and a few scattered troops, put a stop to the conquests of the Dutch, making a gallant stand till succours arrived, and then resigned the commission, with which the public necessity and his own courage had armed him, into the hands of a person appointed by authority. By this stand he saved seven of the captainships out of fourteen into which Brasil is divided, the rest falling into the hands of the Dutch, who conquered and kept them with the utmost bravery and conduct.

To the brave count Maurice of Nassau the Dutch owed several of these conquests, the establishment of their colonies, and the advantageous peace by which they were secured to them. But as it is natural for a mercantile people to be desirous of sudden profit, and as this colony was not under the immediate government of the states, but subject to the Dutch West India company, they, from principles narrowed by avarice and mean sentiments, could not bear the present profits of the colony should be sacrificed to its future security. The prince kept up more troops and erected more fortresses than they were willing to allow him, and therefore treated him in such a manner as obliged him to resign.

The schemes of the company now took place; several persons were sent over who were to have the management of the colony, and who by their parsimony were to reimburse the company the sums the colony had cost. The chief of the illustrious persons who were the successors of the great count Maurice of Nassau, one of the ablest,

ablest, bravest, and most worthy men of that family, so famous for producing heroes, were Mr. Hamel, a merchant of Amsterdam; Mr. de Bassis, a goldsmith of Harlem; and Mr. Bullestraet, a carpenter of Middleburg; all men of good sense and great fidelity to the company: but unfortunately for the republic, as well as their masters, they understood trade better than the art of government. They sent over to Holland the produce of those lands which count Maurice had assigned for maintaining the fortifications, which in the mean time ran to ruin. They gave licences upon very easy terms to the soldiers to return home, which lessened the expence of the army. The charge of a court was retrenched, the debts of the company exacted with the utmost rigour and severity, their gains now increased cent. per cent. and in their opinion every thing was in a most flourishing state. But in a short

time all these fine appearances ended in the total loss of the country, and the entire ruin of the West India company. The hearts of the subjects were lost by their penurious way of dealing, the severity of their proceedings, and their rigorous exactions; those of the Portuguese who had been long settled in the country, and had submitted to the Dutch government, were now treated with very little ceremony: they therefore purchased fire-arms and ammunition of the government, and as they paid a very high price, they obtained whatever they wanted; joined the Portuguese who came from Europe to their assistance; by degrees recovered all the towns the Hollanders were in possession of, and in 1654 drove them entirely out of the country; since which time it has continued in the possession of the crown of Portugal.

C H A P. VIII.

Of the SPANISH AMERICAN Dominions.

S E C T. I.

Of the Isle of C U B A.

Its Situation, Extent, Face of the Country, Climate, Soil, Vegetables, and Animals; with a particular Description of the Havanna, the Manners and Customs of the People, and the History of the Island.

OUR desire to place the American dominions of each of the several European powers in one view, made it necessary to leave the West India Islands, to which we now return, and shall give as perfect, and at the same time as concise an account of them as we are able.

The island of Cuba is seated between the twentieth degree north latitude and the tropic of Cancer, and between the seventy-fourth and eighty-fifth degree fifteen minutes west longitude; it extends six hundred and sixty miles in length, from Cape St. Antonio on the west to Cape Maize on the east, but is very narrow in proportion, it being generally from thirty to forty miles in breadth. It is seated twenty-five leagues to the north of Jamaica, sixty miles to the west of Hispaniola, and a hundred miles to the south of Cape Florida, commanding the entrance of the gulphs of Mexico and Florida, and of the windward passage.

The natives had given it the name of Cuba before it was discovered by Columbus, who at first called it Juanna, from Don John, and afterwards Ferdinandino, from king Ferdinand V. who was king of Spain when this island was discovered; but it soon after recovered its American name of Cuba, which it still retains.

A ridge of mountains run almost through the island from east to west, in which are mines of copper, which furnish the Spanish plantations with the metal for all their brass guns; and gold dust being found in the sands of the rivers, it is conjectured that there are veins of gold, if not of silver, in the mountains. These mountains are shaded with trees, but the land near the shore is generally a plain champaign country. Abundance of rivulets run from the north and south sides of these eminences, but none of them are large, for they fall into the sea after a very short course. No place in the world has better harbours, the chief of which are the Havanna on the north west, which is one of the finest and most commodious havens in America; and that of St. Jago, which is at the bottom of a large bay, at the east end of the island.

The rainy season is in the months of July and August, when the sun is vertical, and consequently the weather would be extremely hot was the sun not clouded, and the air refreshed by the torrents of rain which then fall. The fairest season is when the sun is farthest from them, and

then the morning is much the hottest part of the day, for towards noon the sea breeze begins to blow pretty briskly, and thus continues till the evening. The trade wind in these seas blows from the north east. At the full and change of the moon, from October to April, they have brisk north or north west winds, which in December and January frequently become storms, though this is usually called the fair season.

This island is said to have in general the best soil, for so large a country, of any in America, and to produce all the commodities known in our American islands, particularly ginger, long pepper, and other spices, cassia fistula, mastic, and aloes. Here are large cedars and other odoriferous trees, oaks, pines, palm-trees, plenty of large vines, and fine cotton trees. There are two sorts of fruit here, called camitor and guanavana; the first resembles a China orange, and grows on a tree which has a leaf green on one side, and of a cinnamon colour on the other. The other is in the form of a heart, green without, and with some thorny prickles within: it has also some stones, and a tart juice. Their other fruits are plantanes, bananas, guavas, lemons, &c. here are also many large walks of cocoas. The country produces tobacco and sugar, said to be the best in the West Indies, though in no great quantity for want of hands to cultivate the canes, but their sugar works have both water mills and horse mills.

The black cattle formerly brought hither by the Spaniards, have multiplied to such an extraordinary degree, that numbers have run wild in the woods, and for want of people to eat the flesh, many fine fat beasts are killed purely for their hides, and left to rot on the ground. However, a great deal of flesh is cut into pieces, and dried in the sun, in order to serve for ships provisions. There are here also horses, mules, sheep, hogs and wild boars, wild and tame fowl, parrots, and partridges with blue heads; the shores abound with sea fowl, particularly with a sort of cranes that are white when young, but of several colours when old. Here are likewise large turtle, and there is no place where the seas and rivers abound more with alligators. The fish are chiefly barbel and shads.

This island is far from being improved as it might; for here, says our author, are more churches than plantations, more priests than planters, and more lazy bigots than labourers. To this it is owing, that this large island, with a luxuriant soil, capable of producing abundance of food, and which is perhaps easier procured and obtained here than in any other part of the world, here being forests which, besides the cattle just mentioned, afford plenty of venison; yet does not produce for exportation, including even their hides and tallow, their sugar,

sugar, tobacco, and snuff, near the value of our little island of Antigua.

Here are many considerable towns, but though St. Jago still retains the name of the capital, it is greatly inferior to the Havannah, which is by far the finest city in the island.

The Havannah is seated on the north west coast of the island, in the twenty-third degree twelve minutes north latitude, and in the eighty-second degree thirteen minutes west longitude. It was built by Diego de Velasquez, who landed here in the beginning of the sixteenth century with three hundred Spaniards, and with the assistance of Bartholomew de las Casas conquered Cuba. The last gentleman, after turning a Dominican friar, was made bishop of Chiapa, in New Spain, and distinguished himself greatly by his zeal in the cause of humanity; and from him we have the history of the Spanish cruelties, both here and in other parts of the West Indies. Its fort is said to be the most frequented, as well as the best in all the islands, and one of the finest in the world; it being so large, that a thousand sail of ships may commodiously ride in it in the utmost safety, without either anchor or cable, no wind being able to hurt them; and is so deep, that the largest vessels anchor at a small distance from the shore. The entrance, which has no bar to obstruct it, is by a channel about three quarters of a mile in length, but so narrow, that only one ship can go in at a time. The harbour into which it leads at the north west corner, is a long square lying north and south; the other three corners forming three creeks or bays.

This city stands in the most fertile part of the island, on the west side of the harbour, in a delightful plain that extends along the shore, and backwards it is washed by two branches of the river Lagida. The city is of an oval form, and begins about a quarter of a mile from the mouth of the harbour. The buildings, which are of stone, are very handsome, but not lofty, and the streets are narrow, but clean. Here are eleven churches and monasteries, two handsome hospitals, and a fine square in the middle of the town, encompassed with uniform buildings. The churches which are magnificent, are richly adorned, the lamps, candlesticks, and ornaments for the altars, being of gold and silver. Some silver lamps of most curious workmanship, are so large as to weigh two hundred marks, each mark being half a pound. The church of the Recollects has twelve beautiful chapels, and in their monastery are cells for fifty fathers. St. Clare's church has seven altars, all adorned with plate, and the nunnery contains a hundred women and servants. The church of the Augustines has thirteen altars, and that of St. John de Dieu nine altars, with a hospital for soldiers, that has a revenue of twelve thousand pieces of eight.

The city on the land side is encompassed with a wall defended by bastions, and a castle on the side towards the harbour; at the harbour's mouth are also two other strong castles to defend its entrance: the strongest of these has lines, which extend to the castle first mentioned, and is called the Moro fort: it is built on a rock at the foot of two hills, in which is cut a deep ditch, filled with sea water. The walls are of a triangular form, with three large bastions planted with forty heavy cannon. From this castle runs a line mounted with twelve prodigious long pieces of cannon, lying level with the water, each carrying a ball of thirty-six pounds, and these are by way of eminence called the twelve apostles. At the point between this castle and the sea is a tower, with a round lanthorn at the top, where a man continually watches to see what ships are approaching, of which he gives notice by putting out as many flags as there are ships. The second of the castles at the harbour's mouth is called the Puntal, and stands on a plain ground on the side of the entrance, opposite to the former. It is a regular fortification, with four good bastions well planted with cannon. The third fort, which was that first mentioned, is called El Fuerte, or, The Fort, by way of eminence: it is a small but strong work towards the end of the narrow channel, with four regular bastions, and another platform mounted with about sixty large heavy brass cannon. Besides these three forts there are two others, each of twelve guns, which stand on the shore four or five miles from the port. That to the east is called Coxemar, and

that to the west Bariavans. These forts have in the whole one hundred and twenty guns.

This city is of more importance to the Spaniards than any other in America, it being the place of rendezvous for all their fleets in their return from that quarter of the world to Spain; and from its lying at the mouth of the gulf of Florida, through which they are all obliged to pass, it has been called by the Spaniards, the key of the West Indies. Here rides the navy of the king of Spain; and here meet in September the merchant ships from several Spanish ports, both of the continent and islands, to the number of fifty or sixty sail, to take in provisions and water, in order to return to Spain in a body. Within the city is a continual fair till their departure, which is generally before the end of the month, when proclamation is made, forbidding any that belong to the fleet to stay in the town on pain of death, and upon firing a warning gun, they all go on board.

The inhabitants are generally more familiar than at La Vera Cruz, and the women in particular have more liberty, but do not go abroad without their veils. Many of them speak French, and dress after the French mode, some of that nation having settled there since Spain fell to the house of Bourbon. The diet most in use are hogs and turtle, with which all the ships complete their store of provisions. The pork is esteemed very nourishing, and contrary to that of other countries is binding. They cut the flesh of the turtle into long slices, and strewing salt over them, dry them in the wind. The wine here is pretty cheap, but provisions are in general dear, especially wheat bread, which is frequently sold at a penny an ounce, particularly when the galleons are here; this is ascribed to the want of wheat, which does not thrive here, and therefore all they have is imported from abroad. The inhabitants, however, in general make use of bread made of the cassava root. While the fleets are here, a fowl sells for a noble, and fruit and other things in proportion, so that a man can scarce live for two pieces of eight a day.

The other principal towns in the island are Santa Cruz, which is seated sixty-three miles to the east of the Havannah, on the same coast, and has a very good harbour. Porto del Principe, on the same coast, stands about three hundred miles south east of the Havannah; it was formerly a rich town, and was taken by the Buccaneers, after a stout resistance. Near it are some springs of bitumen.

St. Jago is seated in the twentieth degree two minutes north latitude, and in the seventy-fifth degree forty-seven minutes west longitude, at the bottom of a spacious bay, on the south east side of the island, about six miles from the sea. The entrance to the bay is narrow, and within it are small islands, which shelter it from storms, and form a commodious harbour. It is a bishop's see, and has a cathedral; it had once also a good trade, which is now removed to the Havannah, and though the city has jurisdiction over half the island, it has dwindled almost to nothing.

Though this island was discovered in 1492, it was not completely conquered till the year 1511. The natives were treated with all the cruelty that the united passions of savage bigotry, superstition, and avarice could invent; and it is said that some millions of them were cut off, and that at last orders were sent from the court of Spain to exterminate the few remains of its original inhabitants, which was accordingly executed with barbarous punctuality; so that the history of Cuba is no other than a relation of the most horrible massacres, which were industriously concealed by the Spaniards; for these monsters finding gold upon the island, concluded that it must come from concealed mines, and therefore tortured vast numbers of the natives, to make them discover where these mines lay; and it is said, that in the single year when the governor Velasquez arrived on the island, no fewer than six hundred thousand of the natives were put to death.

The houses of the Havannah were at first of no better materials than wood, and that town was so inconsiderable in 1536, that it was taken by the crew of a French pirate ship, who obliged the inhabitants to pay seven hundred ducats to save it from being burnt. The very day

day after the pirates departure three Spanish ships from Mexico arrived at the Havanna, and having unloaded their cargoes, sailed in pursuit of the pirate ship; but such was the cowardice of the Spanish officers, that the pirate took all their three ships, and returning to the Havanna obliged the inhabitants to pay them seven hundred ducats more.

To prevent the like accidents for the future, the inhabitants of the Havanna built their houses of stone, and ran up a fort at the mouth of the harbour: but as the town was still open on the land side, the English cruizers paid it several unwelcome visits, and more than once drove the Spanish inhabitants into the woods, while they plundered the place. During the war between Henry II. of France with Spain, a Dieppe ship, with no more than ninety men, plundered St. Jago, and afterwards attacked the Havanna; but the Spaniards had been so often used to those visits, that they had retired to the woods; so that the French found no inhabitants there. After remaining for some time in the town, searching in vain for plunder, two Spaniards came to them, seemingly to treat of the ransom of the town, but in reality to observe their numbers. The French demanded six thousand ducats for ransom-money, which the two deputies pretended was more than the inhabitants could raise, and took their leave. Upon their return to their countrymen, the majority came to a resolution to surprize the French sword in hand, and accordingly a hundred and fifty of them came, under cover of the night, to cut them off while asleep; but the French, after losing four of their number, stood to their arms, and soon put the Spaniards to flight. After this, by daubing the windows and doors of the houses with pitch and tar, of which they found great plenty, they set fire to the town, and afterwards pulled down the walls and the fort. In the year 1669 the English Buccaneers under captain Morgan took the city of Havanna, and would have kept it could they have had the king of England's protection.

In July 1741, admiral Vernon and general Wentworth landed at Walthenam harbour in the south-east part of the island, with a squadron of ships, made an encampment, and erected a fort on the shore, to which they gave the name of Cumberland harbour and fort. They continued there till almost the end of November following, when the sickness of the men obliged them to abandon the island.

The importance of the Havanna to the Spaniards was never thoroughly understood till after the succession of the house of Bourbon to the throne of Spain, and then nothing was wanting that could contribute to render it impregnable.

When the amazing successes of Great Britain in the late war united the three branches of the house of Bourbon, France, Spain, and Naples, in what was called the Family Compact, the mistakes of the former plans of war against Spain were observed, and it was resolved to begin the operations by the attack of the Havanna. This momentous plan depending so entirely upon military knowledge, his majesty referred, in a great measure, the execution of it to his uncle, the late duke of Cumberland, whose long experience in the army undoubtedly rendered him the best judge of the abilities of the officers who were to be employed in the execution of it. The chief command was given to the earl of Albemarle, the disciple of his royal highness in the art of war. Admiral Pocock, who had acquitted himself so much to the honour and interest of his country in the East Indies, had the command of the fleet, and Sir James Douglas was ordered to reinforce him with his squadron from Martinico.

The main fleet sailed on the fifth of March 1761, and was joined by Sir James Douglas with his reinforcement on the twenty-seventh of May off the north-west point of Hispaniola; the whole armament then consisting of nineteen ships of the line, eighteen smaller ships of war, and about a hundred and fifty transports, with ten thousand regular troops on board, which were to be joined about the time the operations were to commence by four thousand troops more, who were ordered from North America. The admiral, pressed by time, resolved to run along the northern shore of the island, through the old

streights of Bahama, which form a narrow passage, bounded on each side by dangerous sands and shoals about nine hundred miles in length. This the approach of the hurricane season rendered in some measure necessary, and the admiral having procured from lord Anson an excellent chart of those streights, conducted their passage with such success, that they got clear of all danger by the fifth of June.

Fourteen Spanish men of war, besides smaller ships, were then lying in the basin of the harbour of Havanna. The admiral, with twelve sail of the line, bore away to block them up, and to make a diversion on one side, while the landing was effected on the other, between the two forts, Barcarans and Coxemar, the first of which was taken possession of by the Mercury man of war, and the other by the Dragon; their garrison, which consisted of armed peasants and negroes, flying into the woods. Mean while the earl of Albemarle, favoured by the fire of the Dragon, passed the Coxamar river, and the army lay under arms along the shore.

On the eighth of June lord Albemarle marched to Guanamacoa, about six miles from the landing-place, and saw six thousand of the enemy, drawn up very advantageously, as if they intended to dispute his passage to that village, but they were soon dispersed; the next day his lordship formed the army into two bodies; one commanded by general Elliot lay towards the south-east of the harbour, extending considerably into the country, in order to cover the siege, and secure the foraging parties sent out for provisions. The other was commanded by general Keppel, and was employed in the attack of Moro castle, while colonel Howe was posted with a detachment to cut off the communication between the town and the country, and keep the enemy's attention divided. The hardships the English army sustained in carrying on the siege of the Moro castle, were inexpressible: the earth was every where so thin, that it was with great difficulty they could cover themselves in their approaches. There was no spring or river near them; it was necessary to bring water from a great distance, and so precarious and scanty was this supply, that they were obliged to have it brought from their ships: roads for communication were to be cut through thick woods; the artillery were to be drawn a vast way over a rough rocky shore, and several of the men dropped down dead with heat, thirst, and fatigue. In short, the siege of Moro castle was carried on with the utmost difficulty; and the fire continued with equal fury on both sides. To give the greater effect to the batteries, the Dragon, Marlborough, and Cambridge, laid their broadsides against the north east part of the Moro, and a most dreadful cannonading ensued for seven hours, both from the forts and the sea; but the situation and strength of the castle gave it great advantages over the ships, which were terribly shattered and obliged to sheer off. The enemy in the fort, who kept up a communication with the town, had landed two detachments of grenadiers of five hundred men each, with a great number of negroes and mulattoes, to attack the works of the English on the right and left; but they were defeated with the loss of above two hundred men, and a great number wounded. At length the batteries from the army had displaced many of the enemy's guns; but when it was thought that a speedy period would be put to the immense labours of the besiegers, the grand battery took fire, and with it was consumed the labour of six hundred men for seventeen days.

Sickness, the badness of provisions, and the scarcity of water, with the heat of the climate, had at length killed or rendered useless two-thirds of the army, and the seamen were in very little better condition, while the growing distempers of the season, and the exposed situation of the ships, threatened destruction both to the land and sea forces. After inexpressible toil the besiegers batteries again took fire, and they had now nothing to trust to but the arrival of their reinforcements from North America, because whatever losses the Spaniards sustained in the day time, were repaired in the night. At length the arrival of the Jamaica fleet inspired the troops with fresh hopes. On the twenty-second of July, a vigorous sally of fifteen hundred men, divided into three parties, was

made

made from the town, but they were repulsed with the loss of four hundred men, while that of the besiegers did not exceed fifty men. The ditch which secured the castle was cut in the rock about seventy feet deep, and forty wide, and though the enemy sent two boats and a floating battery out of the harbour, to fire grape-shot and small arms into the ditch where the miners were at work, they were not only repulsed, but a mine was sprung, which threw a part of the wall into the ditch, and left a breach, which though small, the troops were ordered to storm. The garrison of Spaniards within the castle was still considerable; but the soldiers mounting the breach, entered the fort with such amazing intrepidity, that the Spaniards, who had been regularly drawn up to resist them, lost all the spirit they had before exerted. Four hundred of them were cut to pieces, or perished in the water; four hundred threw down their arms, and received quarters. The marquis de Gonzales, the second in command, was killed while endeavouring to stop the shameful flight of his men: Don Lewis de Velasco, the governor, with about a hundred of the garrison, bravely defended their colours till he was killed, to the extreme regret of his generous conquerors. The Spaniards then directed their fire against Moro castle, now in the possession of the English. New batteries were erected by the besiegers, who battered both the Puntal and the town from forty-three pieces of cannon and eight mortars, with such success, that flags of truce appeared in all quarters of the Havannah, and a messenger was sent to the British camp to settle the capitulation, which was signed on the fourteenth of August, by which the men of war in the harbour, as well as the forts and the town, were delivered up to the English. And thus, says our author, a prophecy which had been long current with the Spaniards in those parts was fulfilled, namely, that the English should one day walk as masters through the streets of the Havannah. However, this important conquest was restored to Spain in the nineteenth article of the definitive treaty of 1763.

SECT. II.

Of PORTO RICO.

Its Name, Situation, Extent, Face of the Country, Climate, Soil, Vegetables, and Animals. A Description of the City of Porto Rico, and a concise history of the Island.

THE next island belonging to Spain, is that of Hispaniola, but as the most valuable part of it belongs to the French, we have placed it among the American islands subject to France. We now therefore come to Porto Rico, the last of the great Antilles that remains to be described.

This island, which was discovered by Columbus in 1493, received from him the name of St. John; but the chief town being afterwards built upon a harbour called Rico or Rich, as is supposed from its excellence, the whole island has since obtained the name of Porto Rico. It is situated between the eighteenth degree and forty minutes north latitude, and between the sixty-fifth and sixty-seventh degree west longitude, lying about eighteen leagues from the north east point of Hispaniola, extending one hundred and fifty miles from east to west, and between forty and fifty in breadth.

The soil is beautifully diversified with woods, vallies, and plains, and is extremely fertile. It abounds with fine meadows, and a ridge of mountains runs through the island from east to west. The north part, which is more barren than the south, has been represented by travellers as having mines of quicksilver, tin, and lead, with some of gold and silver; but there are none of the latter worked at present. It is well watered with springs and rivers, and there are reckoned no less than twenty-three that fall into the sea on the north or south side.

The rains which usually render the season unhealthy, generally fall in June, July, and August, which would otherwise be extremely hot, the sun being vertical, and

the wind is at south east, while at other times it is at north east. From eight in the morning till four in the afternoon they have a sea breeze, but from six in the morning till this refreshing gale springs up, the air is very hot; but the most sultry part of the day is at five in the afternoon, and the coolest from three in the morning till six.

The soil produces a long coarse grass, on which the cattle feed, but the inhabitants never make it into hay. It bears good ship timber, and variety of fruit trees, particularly cocoas, pine-apples, mammees, guavas, papaws, bananas, plantanes, palms, musk-melons, oranges, limes, pomegranates, citrons, grapes, plums, figs, Jamaica pepper, speckled wood, cassia fistula, the sensitive plant, and the bastard cinnamon, together with rice and Indian corn; but they make most of their bread of the cassava root. The common liquor here, besides water, is made of malasses and spices mixed together; but the better sort drink a liquor made of spices alone, and all the wine is brought from abroad.

The island is well stocked with wild cattle, which were originally of Spanish breed, with goats, hogs, and sheep. Their pork is excellent, as is also the flesh of their kids; but their mutton is poor dry food. Here are great flocks of parrots, wood-pigeons, and other wild and tame fowl, with all manner of European poultry, and plenty of fish.

The inhabitants are said not to exceed ten thousand. This island might, however, be rendered one of the most flourishing of all the Spanish colonies, if it was not for the mischief to which it is too liable from great droughts, hurricanes, and the descent of privateers, by which all the sea-ports have been frequently ruined. The principal commodities exported from hence are sugar, ginger, hides, cotton thread, raw cotton, cassia, mastic, &c. They have also great quantities of salt, and make considerable profit of their oranges, lemons, and sweetmeats. The inhabitants have many good vessels, in which they trade to various parts of America.

The city of Porto Rico is seated on the north side of the island, in a peninsula which joins to the continent by a causeway in the eighteenth degree twenty minutes north latitude, and the sixty-fifth degree thirty-five minutes west longitude. It is well-built, populous, and both the seat of the governor and the see of a bishop. The cathedral has a monastery belonging to it; but the heat of the climate renders it inconvenient to make use of glass-windows, and their canvas and wooden lattices disfigure their buildings. The city is defended by a citadel and a castle, and is the center of the contraband trade usually carried on by the English and French with the subjects of the king of Spain, notwithstanding the severity of the laws, and the extraordinary precautions taken to prevent it; hence it is large, and better inhabited than most of the Spanish cities in America.

When this island was taken by the Spaniards, it is said the natives amounted to no less than six hundred thousand, and had the character of a brave gallant people; but the Spaniards, by the advantage they had over them in the art of war, with much difficulty reduced them, and have since by degrees quite extirpated them. After which no more gold was to be found on the island; though the natives had a great deal of it, and on that account were murdered, that the Spaniards might have it all to themselves.

In 1595 Sir Francis Drake burnt the ships in the harbour of Porto Rico, and three years after the town was reduced by the earl of Cumberland, who fitted out a fleet at his own expence, in which were two regiments of queen Elizabeth's troops. He conquered the town with great difficulty, and had thoughts of keeping it; but losing four hundred of his men, who died of the bloody flux in a month's time, he abandoned it, after demolishing the forts, and carried off eighty pieces of brass cannon and a great quantity of plate. In 1615 it was taken and plundered by the Dutch; but they could not take the castle, which is now in a better condition than ever, as are also the other forts.

SECT.

S E C T. III.

Of the Islands of TRINIDAD and MARGARETTA.

Their Situation, Extent, and Produce; with some Observations on the Conduct of the Spaniards with respect to their West India Islands, and the Continent.

THERE are several other smaller islands belonging to Spain in this sea, particularly Trinidad, or Trinidad, which is seated in the tenth degree thirty-eight minutes north latitude, and in the sixtieth degree twenty-seven minutes west longitude, forming one side of the straits of Paria, or Bocca de Drago, and New Andalusia, in Terra Firma. It is about sixty-two miles in length, and forty-five in breadth. The soil is fruitful, producing sugar, fine tobacco, Indian corn, variety of fruit, and some cotton trees. It was taken by Sir Walter Raleigh in 1595, and by the French in 1676, who plundered the island and extorted money from the inhabitants.

About five degrees to the westward of Trinidad is Margarett, which is seated near the northern coast of New Andalusia, from which it is separated by a straight twenty-four miles broad. It is fifteen leagues in length, six in breadth, and, as it is always verdant, affords a very agreeable prospect. The island is very fertile, it abounding with pastures, maize, and fruit; and has many groves. A great number of boats were formerly employed here in fishing for pearls; but this fishery is much declined, if not discontinued.

There are several other small islands near the last of little consequence, at least to the Spaniards, who seem to have paid but small attention to the cultivation of the larger and more valuable, and we do not find any thing relating to them worthy the observation of the reader. We shall therefore conclude this section, and our account of the Spanish West India islands, with some observations on the conduct of the Spaniards, with regard to their settlement of them.

The Spaniards, by a series of the most inhuman and impolitic barbarities, having exterminated the original inhabitants of Cuba, Hispaniola, and Porto Rico, have left them comparatively so many deserts, and deprived themselves of a thousand advantages they might have enjoyed by an equitable trade with the natives. The commerce between the islands and the Spanish continent is carried on by the Barvento fleet, consisting of six ships of good force and burthen, who annually make the tour of Cuba, Hispaniola, Porto Rico, and the coast of Terra Firma, not only to carry on the commerce between them, but to clear the sea of pirates and illicit traders; and now and then a register ship from Spain is bound to one or other of them. The Spaniards have hitherto seemed to keep possession of them, rather to prevent any other nation growing too powerful in those seas, than from the profit they expected to derive from them: for it is certain, that should any other nations obtain the possession of all these islands, the trade of the American continent, and perhaps the continent itself, would be entirely at their mercy. The Spaniards have, however, lately taken some steps towards the better settlement of Porto Rico;

and are beginning to open the American trade to some other towns in Spain besides Cadiz. They have made a difference in point of duty between their own manufactures and those of foreigners; and are opening their eyes to the true interest of their country.

“Hitherto, says an ingenious author, the tide of wealth that constantly flowed from America into Spain ran through that kingdom like a hasty torrent, which, far from enriching the country, hurried away with it all the wealth it found in its passage. No country in Europe has received such vast treasures as Spain. In no country in Europe is seen so little money: for from the time that the Indies fell into the hands of Spain, the affairs of that monarchy have been constantly going backward. In America their settlements were carried on conformably to that genius, and to those maxims which prevailed in their government in Europe. No means of retaining their conquests but by extirpating the people; no schemes for the advancement of trade; no attempts at the reformation of abuses, which became venerable in proportion to the mischiefs they had suffered by them: in government, tyranny; in religion, bigotry; in trade, monopoly.

“When the Spaniards found, to their ambition, which was boundless, that they had joined a treasure which was inexhaustible, they imagined there was nothing too vast for them to compass. They embraced a thousand projects at once; many of them noble ones in theory; but to be executed with different instruments in different parts of the world, and all at a vast expence of blood and treasure. The wars, which were the result of these schemes, and the Indies, which were to support them, were a continual drain, which carried off their people, and destroyed all industry in those who remained. The treasure which flowed in every year from the New World, found them in debt to every part of the Old; for to the rest of their revenues they had forgot to add that, which is a great revenue itself, and the great support of all the others, œconomy. On the contrary, an ill order in their finances at home, and a devouring usury abroad, swallowed up all their treasure, whilst they multiplied the occasions for it. With the best scheming heads in Europe, they were every where outrivalled; with brave and well-disciplined troops, they were almost always defeated; with the greatest treasures, they were in want; and their armies were ill provided, and ill paid. Their friends exhausted them by trade; their enemies by plunder. They saw new states arise out of the fragments of their dominions; and new maritime powers start up from the wrecks of their navy. In short, they provoked, troubled, and enriched all Europe; and at last desisted through mere want of strength. They were inactive, but not quiet; and they were enervated as much by their laziness, during this reserve, as they had been weakened before by their ill-judged activity. At present the politicks of Spain, with regard to America, seem to be to preserve South America, and particularly the navigation of the South Seas as much as possible to themselves; to destroy effectually the contraband trade, and to encourage the export of their own manufactures.”

C H A P. IX.

Of the SPANISH Dominions on the Continent of AMERICA; and first of NEW MEXICO, CALIFORNIA, and MEXICO, or NEW SPAIN.

S E C T. I.

Of the Spanish Dominions on the American Continent in general : their Situation, Extent, Climates, and Produce : with some Reflections on the Conduct of the Spaniards with respect to Population, and the Manner in which Spain became impoverished by the Acquisition of Gold and Silver.

WE now come to the continent of Spanish America, which is of an amazing extent, it reaching from the thirty-fourth degree of north to the fifty-third degree of south latitude ; extending from Cape Sebastian, the most northern point of California, to the straits of Magellan, a space of between six and seven thousand miles, the whole coast of which is on one side entirely Spanish ; but on the other is Brasil, and a comparatively inconsiderable French and Dutch settlement. A great part indeed of this country is possessed by the natives, and some places lie desolate ; but Spain claims the dominion of the whole : however, it must be confessed, that only a very small part of it is really cultivated by the Spaniards.

The climate in so great an extent of country must differ according to the latitude, and other circumstances ; and thus the general opinion, that the Spanish American dominions are unhealthy, is, like many other general propositions, at the same time both true and false. Those colonies within or near the tropics are in many places exceeding hot, while others are remarkably cool ; some where the climate is exceeding hot are both healthy and pleasant, while others have an almost pestilential air. Several of the provinces in New Spain and Peru are blessed with almost every advantage, and no country affords more delightful spots than are to be found in New Mexico in the north, Buenos Ayres in the south, and several other countries on both sides the Line in the temperate zones. Where the lands have never been cleared, where the soil is marshy and swampish, where periodical deluges of rain pour down from the heavens, we may easily believe the climate must be unhealthy, and all these meet in some of the Spanish dominions in America.

The soil differs no less than the climate : some countries consist of the most beautiful lawns, pastures, fields, and meadows, watered with fine streams, shaded with groves, and variegated with hills and valleys ; while others only present to the eye dreary deserts, dreadful rocks, and mountains of a stupendous height, vast forests, and the most tremendous scenes of wild, rude, and uncultivated nature. Several of the Spanish plantations are wonderfully rich and fruitful, abounding in corn, the most beautiful pastures, trees that afford fruit, shade, and ornament, odoriferous shrubs, medicinal plants, woods, and roots, with flowers delightful to the senses ; in short, almost every thing that nature or art produces, in any quarter of the globe, may here be found growing spontaneously, or raised by labour, in its greatest perfection. In the bosom of the earth have been found immense treasures of gold and silver, and in short, this extensive territory also produces emeralds, pearls, rich drugs, dyeing woods, tobacco, ginger, coffee, cotton, and sweetmeats : and for the convenience of navigation, it is furnished with the noblest rivers in the world.

If we take a view of the country with respect to its inhabitants, we shall find the reason why these colonies have proved of little service to Spain. The impolitic expulsion of the Moors proved an irreparable blow to that monarchy ; and the colonization of America increased

the evil. Yet though Spain was almost depopulated by the constant migration of her people to the continent of America and the West India islands, still the number was very inadequate to the purpose of rendering the plantation populous and flourishing, especially as the cruelty of the first conquerors had almost extirpated the natural inhabitants. When America was first reduced, it was thought necessary to establish great numbers of ecclesiastics in the country, for the instruction of the natives in the Christian religion ; and these have since multiplied to such a degree, as to have the most pernicious effect upon population. Every province is filled with monasteries, nunneries, and persons condemned by superstition to celibacy, and doomed by the tyranny of the church to be denied the gratification of the most natural passion. The spirit of avarice and oppression which reigns among all the officers of the crown, who are generally chosen out of families of distinction of broken fortunes, sensibly affects the state by prejudicing the revenues, discouraging industry, and extinguishing public spirit. But what is of still more importance is, that the fondness the Spaniards have shewn for gold and silver, has been equally prejudicial to the colonies, and to the mother country, since it has not only prevented those commodities and manufactures which in themselves would prove more valuable than the richest mines of gold and silver, but has diffused such narrow and sordid principles through the minds of the people, as are visibly productive of the most fatal effects.

The justly celebrated baron de Montesquieu, in his admirable work, intitled, *The Spirit of Laws*, after observing that from the time in which the Spaniards discovered the gold and silver of America, Spain has been incessantly declining, adds,

“ Gold and silver are either a fictitious, or a representative wealth. The representative signs of wealth are extremely durable, and in their own nature but little subject to decay. But the more they are multiplied, the more they lose their value, because the fewer are the things they represent.

“ The Spaniards, after the conquest of Mexico and Peru, abandoned their natural riches in pursuit of a representative wealth, which daily degraded itself. Gold and silver were extremely scarce in Europe, and Spain becoming suddenly mistress of a prodigious quantity of those metals, conceived hopes to which she never before aspired. The wealth found in the conquered countries, great as it was, did not, however, equal that of their mines. The Indians concealed a part ; and besides, these people, who made no other use of gold and silver than to give magnificence to the temples of their gods, and to the palaces of their kings, sought not for it with an avarice like ours. In short, they had not the secret of drawing the metals from every mine, but only from those in which the separation might be made by fire.

“ However, it was not long before the specie of Europe was doubled ; this appeared from the price of commodities ; which was every where doubled.

“ The Spaniards raked into the mines, scooped out mountains, invented machines to draw out water, to break the ore, and separate it ; and, as they sported with the lives of the Indians, they forced them to labour without mercy. As the specie of Europe soon doubled, the profit of Spain diminished in the same proportion ; and they had every year the same quantity of metal, which was become by one half less precious.

“ In

“ In double the time the specie still doubled, and the profit diminished another half.

“ It diminished even more than one half: let us see in what manner.

“ To extract the gold from the mines, to give it the requisite preparations, and to import it into Europe, must be attended with some certain expence; I will suppose this to be as one to sixty-four. When the specie was once doubled, and consequently became one half less precious, the expence was as two to sixty-four. Thus the galleons, which brought to Spain the same quantity of gold, brought a thing which was really of less value by one half, though the expences attending it had been one half higher.

“ If we proceed doubling and doubling, we shall find in this progression, the cause of the impotency of the wealth of Spain.”

S E C T. II.

Of NEW MEXICO.

Its Situation, Extent, Climate, Rivers, Face of the Country, and Produce. A concise Account of its Government, and of its Indian Inhabitants.

THE province of New Mexico will not admit of our being very explicit in our account of it, since its boundaries are by no means ascertained, and the far greatest part of it is still in the hands of the natives, who have the happiness still to enjoy that invaluable blessing their liberty. It is however supposed to extend between the twenty-eighth and thirty-eighth degree of north latitude. On the north it is bounded by very high mountains, and a country utterly unknown, and never pervaded by Europeans. On the east it has the spacious country of Louisiana; on the west the Californian lake, and the river Colorado; while on the south it is bounded by the province of Mexico Proper.

As it lies in the midst of the temperate zone, it enjoys a very pleasant climate. The summers, indeed, are very warm, and the winters pretty sharp; but then the former are neither stifling nor unhealthy, nor the latter intensely cold, or deluged with floods of heavy rain, but the air is clear and salubrious. Thus each season is what is very desirable, and extremely agreeable to an European constitution.

This country is finely watered with rivers and rivulets, though few of these are large or navigable. The Rio Solado and the Rio del Norte alone deserve notice; the last flowing the whole length of the country, and then making a sweep eastward, runs through the province of New Leon, and discharges itself into the gulf of Mexico. There are also several smaller rivers that fall into the Mexican sea, and some bays, ports, and creeks, on that coast, which might easily be converted into excellent harbours, had the Spaniards any share of that diligence and commercial spirit which animates the other maritime powers of Europe.

The land is beautifully interspersed with rising grounds and fertile plains, covered with trees, some of which are fit for timber, and others produce various kinds of fruit. Here are said to be found gold and silver, turquoises, emeralds, and other precious stones. Here are all kinds of wild and tame cattle, especially cows, with a prodigious variety of fowl; and the rivers are abundantly stored with the most delicious fish. In short, it is affirmed to be one of the pleasanter, richest, and most plentiful countries in America, or in any other part of the world.

New Mexico is divided by some geographers into fifteen provinces, and by many of the Spanish writers into eighteen, of which they give us the names.

Santa Fe, the capital, is a handsome well built town, seated near the source of the Rio del Norte, in the thirty-sixth degree forty minutes north latitude, and in the one hundred and first degree fifteen minutes west longitude from London. It is regularly built, and is the see of a bishop, suffragan to that of Mexico, and the seat of the governor of the country, who enjoys his post five years. This governor is enjoined to maintain a constant force of six hundred horse, half of which number, says our author, is

feldom kept up, their pay going into the governor's pocket, which alone would make a considerable salary, no less than four hundred and fifty pieces of eight being allowed for the annual support of every soldier.

The natives are easy, generous, and pacific, yet extremely formidable on account of the dexterity with which they handle their bows and arrows. They are better provided for their defence than any other inhabitants of the new world. When the Spaniards first entered the country, they found the natives well clothed, their lands cultivated; their villages neat, and their towns built of stone, in which they shewed some knowledge in architecture not drawn from the rules of art, but the convenience dictated by nature. Their flocks of cattle were numerous, and they seemed to live in a very comfortable manner. We are told, that they were so skilful in shooting, that at a considerable distance, they would discharge an arrow so true, as to shake the grain out of a ripe ear of Indian corn without breaking it. They were great lovers of mules flesh, and upon that account frequently seized the mules of the Spanish travellers, leaving their chests of silver upon the road, because they set no value upon that metal. They worshipped the sun and moon, but discovered a greater readiness to embrace the doctrines of Christianity than any other of the American nations, expressing no other dislike to it, but a fear that it would oblige them to part with their freedom, to which they are extremely attached. Their princes were little more than the leaders of their armies, elected at the pleasure of the people, for their wisdom or valour.

The Spanish writers say, that New Mexico is inhabited by a great variety of different nations, intirely unconnected with each other; but the principal are the Apaches, the several tribes of whom are distinguished by their towns and settlements. They are a brave, warlike, resolute people, fond of liberty, and the inveterate enemies of tyranny and oppression, of which the Spaniards had fatal experience towards the close of the last century, when they took arms and ravaged the country planted by the Spaniards. At length they were rather appeased than subdued, and ever since have remained the allies, but not the subjects of Spain. This is all the account we are able to give of the present state of New Mexico, from authors that deserve any credit. The Spaniards have been very sparing in their accounts of this country, which is probably owing either to their indolence or caution. However, they have probably but few towns here, and an inconsiderable part of the country is cultivated, compared with its extent.

S E C T. III.

Of CALIFORNIA.

Its Situation, Extent, Climate, Face of the Country, Vegetables, and Animals. With an Account of the Manners and Customs of the Natives.

CALIFORNIA, the most northern part of the Spanish dominions on the continent of America, towards the Pacific ocean, received the name of New Albion, from Sir Francis Drake, who took possession of it in the name of queen Elizabeth. It is also called by some writers, Islas Carabiras. This province was for a long time considered as an island, but is now found to be a peninsula in the Pacific ocean, issuing from the north coast of America, and extending from Cape Sebastian, in the forty-third degree thirty minutes north latitude, to the south east, where it is terminated by St. Lucar, in the twenty-second degree thirty-two minutes north latitude, the whole peninsula being eight hundred miles in length.

It is divided from Mexico by a gulf, in which are many islands. The peninsula is very unequal in breadth; towards the north it is near two hundred miles wide, but at the southern extremity it tapers away, and is scarcely fifty miles over.

Though it lies for the most part in the temperate zone, the coast is very hot in summer, but the inland part is more temperate. In winter it is very cold, but healthy.

However, in so extensive a country there must be great variations, both of soil and climate; and Califor-

nia has not only some of the most beautiful lawns, but has many of the most inhospitable deserts in the universe. The lands to the westward of the river Colorado are level and fruitful, interspersed with delightful woods, cool refreshing springs and rivulets, and the most enchanting pastures and meadows. Upon the whole, though California, on a general view, appears rather rough, craggy, and unpromising, yet we are assured, that with due culture it furnishes every necessary of life.

California produces large quantities of timber fit for ship building; and among the shrubs is one called pitahaya, which is said to be peculiar to California; its branches are finely fluted, and rise vertically from the stem, so as to form a very beautiful top. The shrub bears no leaves, the fruit growing on the boughs, without shade or cover. It resembles a horse chestnut, but contains a pulp, which has some resemblance to that of a fig. In some it is white, in others yellow, and sometimes red, but always exquisitely delicious; it being a rich sweet, tempered with a grateful acid. This peninsula has also most of the fruits to be found in other parts of America; and what is pretty extraordinary, there is here a species of manna, supposed to fall with the dew, and to become inspissated on the leaves of the trees. Father Pinolo says, that without the whiteness of refined sugar, it has all the sweetness. Botanists are now agreed, that this manna is a juice exuding from the tree, though the natives firmly believe that it drops down from heaven.

California has likewise all sorts of domestic animals that are commonly used in Spain and Mexico, as horses, mules, asses, oxen, sheep, hogs, goats; and all other quadrupeds imported, thrive and increase in this country. Among the native animals is one called taye, which is of the size of a young heifer, and greatly resembles it in its shape; but the head is like that of a deer, and the horns, which are thick and curved, resemble those of a ram. The hoof of this animal is large, round, and cloven; the skin spotted, but the hair thinner, and the tail sharper than that of a deer. The flesh is greatly esteemed.

Father Torquemado describes an animal something like a buffalo, of the size of a steer, and nearly of the figure of a stag: its hoofs are cloven, like those of an ox: its neck is long; on its forehead are horns, branched like those of a stag, and its hair is a quarter of a yard long. The tail is a yard in length, and half a yard in breadth.

With respect to the feathered race, besides the birds produced in other parts of America, there are said to be many peculiar to this country; but we have no description of any of these, the natural history of California being yet in its infancy. It is only mentioned, that the coast is plentifully stocked with peacocks, bustards, geese, cranes, vultures, gulls larger than geese, cormorants, mews, quails, nightingales, larks, linnets, and most of the birds found in other parts of the world.

Insects swarm here, as in most other warm countries; but they are neither so numerous nor so troublesome, on account of the dryness of the soil and climate.

Turtles are caught in the utmost plenty on the coast, and the multitude and variety of fish with which the gulf of California and the Pacific ocean are supplied, is almost incredible. Salmon, turbot, barbel, skate, mackarel, pilchard, thornback, bonetos, soles, and all the rest of the finny kind are caught here with very little trouble, together with pearl oysters, fine eating oysters, lobsters, and a variety of other excellent shell-fish. On the coast of the Pacific ocean is a small shell-fish, which is perhaps the most beautiful in the world; its lustre surpassing that of the finest pearl, and darting its ray through a transparent varnish of an elegant vivid blue.

California is inhabited by several Indian nations, who are in general handsome, genteel, strong, vigorous, and robust; of a healthy countenance, but very swarthy; but the paint with which they daub themselves, and their making holes in their ears and nostrils, are great disadvantages to their appearance in the eyes of an European, though deemed a great beauty in their own. They say that their ancestors came from the north, which might be reasonably inferred from their situation, California being surrounded by the sea, except on the north, where

it joins the continent. They particularly mention the cause of their coming thither, alledging, that it arose from a quarrel at a banquet, at which the chiefs of all the nations were present. This was followed by a bloody battle, when the defeated party fled to the south, to establish settlements in a distant country, where they might at least avoid servitude and oppression. They are acquainted with no divisions or possessions. On the first arrival of the missionaries, they were divided into tribes, which acknowledged no chief who had a right to tribute, homage, or external ceremonies. Every father was the prince of his own family, but the authority of parents over their children ceased as soon as they were able to provide for themselves. Yet, in each tribe were two or more persons who gave orders for gathering the productions of the earth, directed the fisheries, and in case of a rupture with any neighbouring clan, headed the forces. This dignity was not acquired by blood, descent, or seniority: he who was the most brave, expert, and eloquent, was promoted to the command; but his authority was limited by those who submitted to his directions. This occasional leader conducted them to the forests and sea coasts, in quest of food; he sent and received messages to and from the neighbouring nations; he gave the earliest notice of any impending danger; he spirited up the clan to revenge injuries; he directed the execution; and he headed the people in their wars. In all other particulars, every one was master of his own liberty.

Their houses consist of wretched huts, built near the few streams, wells, or ponds, found in the country. As they are under the necessity of frequent migrations in search of food, they easily shift their residence, it requiring only the labour of a few hours to build a little habitation fitted for all their purposes; and it is usual with them, in the severity of winter, to live in subterraneous caverns.

With respect to their dress, it consists of a girdle, with a cloth round their waists, and a few ornaments about their hair, as strings of pearls, which abound on the coast, and interweaving their locks with beautiful feathers. Some wear fillets of neat net-work. Their arms are likewise frequently adorned with net-work, or strings of pearls, in the form of bracelets. The Indians of the north wear their hair short, and instead of strings of pearl, decorate the head with a splendid kind of tiara, made of mother of pearl, detached from the shell by a flint, and finely polished on both sides. Though many of the women go as naked as the men, yet they shew great regard to that decency, so necessary to the security of virtue. They generally, indeed, wear a kind of petticoat, made of palm-leaves; and all carefully conceal those parts which decency teaches them to hide. A love of ornament prevails among the women more than the men.

Their greatest ingenuity appears in their fishing-nets, which are made with admirable skill, of various colours, and such diversity of texture and workmanship, as cannot be described. Father Toraval says he can affirm, that of all the nets he ever saw in Europe and Mexico, none are comparable to these, either in the mixture of the colour, or the strength and workmanship, in which they represent a great variety of figures. The nets are woven by the men, but the women spin and prepare the materials from plants, and a coarse sort of thread made from the palm. Some of them adorn the head and neck with these nets; they are likewise used for holding fruit, and the vegetable productions of the earth, as well as for catching fish.

They have a high festival at the gathering in of the fruits of the earth, when they resign themselves to feasting, dancing, and mirth. Whole nights are then spent in jollity; they are even said to act a kind of comedies, and to be very skilful in mimicry. Their dances are particularly extolled, and are said to be of various kinds; their performers acquit themselves with agility and gracefulness, representing the different motions of war, fishing, hunting, marrying, and whatever is of most importance among them, by gesticulation and dumb shew.

The Jesuits, who have given a description of this country, have introduced so many absurd and ridiculous circumstances, that it is, perhaps, impossible to distinguish truth from fiction, in the account they give of the religion and customs of these people.

After all that has been said of this extensive country, it can hardly, with any propriety, be said to be subject to Spain. The Jesuit missionaries have indeed endeavoured to propagate the Romish religion, and a number of them have settled in the country, but at present a little Spanish town, near the Cape of St. Lucar, is the only place that can be strictly called subject to Spain, and that is made no other use of than as a place of refreshment for the Manilla ship, and its being the head residence of the missionaries.

S E C T. IV.

Of MEXICO, or NEW SPAIN.

Its Situation, Extent, Climate, Soil, and Minerals, particularly Gold and Silver; its Vegetables, Beasts, Birds, Insects, and Fishes.

MEXICO, or New Spain, the first valuable acquisition of the Spaniards on the continent of America, extends from the seventh degree thirty minutes to the thirtieth degree forty minutes: it is bounded on the south-east by the isthmus of Darien, and on the north-west by New Mexico; it is washed by the gulph of Mexico and the North sea on the east, and on the south and west by the Pacific ocean, or South sea. This country stretches along the Pacific ocean above two thousand miles, and the coast towards the Atlantic ocean cannot extend less than sixteen hundred; but the breadth is very unequal, for to the north-west it is supposed to be between six and seven hundred miles over, while towards the south-east the breadth cannot much exceed sixty miles.

As the greatest part of Mexico lies within the Torrid Zone, the air is excessively hot; but the heat is qualified with refreshing showers in the hottest months, and with land and sea breezes, which blow alternately; in some parts the vapours rising from a great number of lakes and rivers cool the air, and render it mild, soft, and pleasant. The greatest heats are during the months of February, March, and April, when the sun is seldom obscured by clouds, and the waters are so dried up, that in many places it is difficult to procure any. The rainy season begins towards the close of April, and continues till the month of September, and is always preceded by tempests of thunder and lightning, which increase till the month of June, at which time the rains fall as if a second deluge was to ensue.

On the eastern coast, where the land is low, marshy, and constantly flooded in the rainy season, it is extremely unhealthy; the coast is far from being pleasant, it being for the most part encumbered with almost impenetrable woods of mango trees, of a bare and disagreeable aspect, and which extend a considerable way into the water. The inland country, indeed, assumes a more agreeable aspect, and the air is more temperate; here the tropical fruits grow in great abundance; the land is agreeably variegated, and the soil extremely fertile. On the western side the land is not so low as on the eastern, is much better in quality, and abounds with plantations.

The Spaniards probably chose to leave the eastern coast in its present state of rudeness and desolation, judging that a rugged and unwholesome frontier is a better defence against an European army than fortifications and armies, that are maintained at a vast expence; or the strength of the inhabitants, rendered by the climate effeminate and pusillanimous, and kept so by policy. Indeed it would be next to impossible to make any considerable establishment on that coast, that could effectually answer the purposes of any power in Europe, without struggling with the greatest difficulties; and as for a sudden invasion, the nature of the country itself is a good fortification. In general few countries under the same aspect of the heavens enjoy more of the benefits of nature, and the

necessaries of life; but, like all the tropical countries, it is more abundant in fruit than in corn.

In almost all the accounts of New Spain, we are told that mines of gold and silver are found in most of its provinces. It is said that there are no fewer than a thousand different mines of silver, but gold only in the province of Veragua and New Granada; though the latter is indeed in Terra Firma, but is considered as a province of Mexico, from its being under the jurisdiction of the same viceroy. Gold is found either in grains, at the bottom of running streams, or in mines. Acosta affirms, that he has seen grains of pure gold that weighed two pounds, though in general they seldom exceed a twentieth part of that weight. The gold in the mines runs in veins through a hard stone, and it requires a great deal of labour and expence to separate it, especially as it is generally incorporated with silver or copper. Both the mines of gold and silver are usually found in barren rocks, mountains, and such places as are entirely unfit for pasture and tillage; as if nature had wisely ordained that a fertile soil, fit for producing every thing necessary to the life of man, should not be rendered useless by searching for those metals, which frequently turn to its prejudice. Some of the mines are of an extraordinary depth; particularly that of Pachuca, which is above three hundred yards deep, and above a thousand negroes are continually employed in it. From the mine called the Trinidad no less than forty millions of pieces of eight were drawn into the royal treasury, free of all expences, in the space of ten years.

Whoever discovers a mine of gold or silver is at liberty to work it, paying the king, and limiting himself within sixty yards round the place upon which he has fixed. Beyond this space another person may open a mine, leaving five yards between, to serve for a partition. All the gold and silver, either dug or found in grains, ought to be entered in the royal exchequer; and it is said that, though great quantities are concealed, no less than two millions of silver marks, each weighing eight ounces, are annually entered, out of which they coin seven hundred thousand marks into pieces of eight, half pieces of eight, quarter pieces, royals, and half royals; the value of the latter being about three-pence sterling.

We cannot here forbear extracting some observations from an ingenious work we have often quoted, entitled, *An Account of the European settlements in America.* "Of the plenty of gold and silver which the mines of Mexico afford, great things have been said, and with justice; as this, with the other Spanish colonies in America, in a manner furnish the whole world with silver, and bears a great proportion in gold to the whole of what the world produces. A late very judicious collector of voyages says, that the revenues of Mexico can hardly fall short of twenty-four millions of our money. He founds this upon a return made by the bishops of their tenths, which, without doubt, were not over-rated; and that these amounted to one million and a half sterling; that these are about a fourth of the revenues of the clergy; and that the estates of the clergy are about the fourth part of the whole revenues of the king, which at this rate amount to twenty-four millions English. He takes another method of computing the wealth of this province, which is by the fifth paid to the king of the gold and silver dug out of the mines. This he observes, in the year 1730, amounted to one million of marks in silver, each mark equivalent to eight ounces; so that if we compute this silver at five shillings per ounce, then the inhabitants receive from their mines ten millions in money. For my part, I neither distrust the candor or good sense of this writer; but I can hardly avoid thinking he must be misinformed in the accounts upon which he has built his calculation. If New Spain draws from her silver and gold mines ten millions annually, Peru, even since the decline of the mines of Potosi, has scarce ever been thought less rich in silver than Mexico, and must therefore be rated at the same proportion, and allowed to yield ten millions more annually. New Mexico abounds likewise in very rich silver mines; but that we may not exceed, we will allow for this province but two millions, which, allowing

“ing for the large produce of New Spain, is certainly
 “not above the proportion. Chili has, indeed, no in-
 “considerable mines of silver, but then those of gold are
 “by far the richest in the world; and taking the com-
 “parative wealth of this province with the others, it
 “cannot be less than two millions; if we add to it what
 “is produced in Terra Firma; so that the gold and silver
 “raised in the Spanish colonies cannot be estimated at
 “less than twenty-four millions yearly.”

Mexico has also quarries of jasper, porphyry, and beautiful marble; and here also are found pearls, emeralds, and turquoises.

No country abounds more with grain, delicious fruit, roots, and vegetables of every kind, many of which are peculiar to the country, or at least to America. The woods on the tops and declivities of mountains consist either of fine forests or delightful groves of large trees of various kinds, unencumbered with brush-wood; so that a traveller may pass through them on horseback without any inconvenience. Among the most curious species of woods in this country are the cedar, bloodwood, maho, of which the natives make ropes and cables, lightwood, and other trees; of the fruit-trees and shrubs are the cabbage, cacao, or chocolate nut, the vanilla, plantains, capadillo, avogato-peaer, mammee, mammee-sapota, the prickly-pear, bibby, tamarind, and locust tree; the calabash, gourds of a prodigious size, grapes, and many others. To these may be added the grenadillo de China creeping plant, and the mayhey, which furnishes the natives with thread for linen and cordage, and also with a balsam and liquor, which when fermented is as pleasant and strong as wine.

Trees are all the year in leaf, blossom, or fruit; and every month presents the mingled appearance of spring, summer, and autumn.

Besides maize, or Indian corn, the native grain of Mexico, the Spaniards have cultivated wheat, barley, peas, beans, and other corn, which, with roots and vegetables, are now found growing in every province. Rice grows abundantly, and flourishes, on account of the long wet seasons.

Among the valuable commodities of New Spain are the following drugs: copal, anime, tacamahaca, caranna, liquid amber, oil of amber, balsam of Peru, which is found in Mexico, as well as in that country from which it takes its name, guyaiacum, the root mechoacan, China root, and sarsaparilla; all which are known in the shops of our apothecaries, and are of great use in a variety of distempers. The other commodities of New Spain are cotton, sugar, cochineal, chocolate, feathers, honey, balsams, dying woods, salt, tallow, hides, tobacco, ginger, amber, pearls, precious stones, gold, and silver.

A considerable quantity of sugar is raised in this country, so that there are more sugar-mills than in any part of Spanish America; but all the sugar is used in the country, and particularly in the monasteries, in chocolate, sweetmeats, preserves, and confectionary wares. There is also a great home-trade in goods manufactured of cotton. They have the best indigo in the world, and the trade in that and cochineal is managed entirely by the merchants of Mexico and Carthagena, who export them to Europe. In the province of Guaxaca and Guatemala they raise the best and greatest quantity of silk of any country in New Spain; but it is here only prepared for the needle. Cotton here is very good, and in great plenty: it is manufactured largely, for as it is light wear, suitable to the climate, and all other clothing being extravagantly dear, it is generally worn by the common people; the woollens and linens of Europe being rather luxuries worn only by persons of some rank.

The number of their horned cattle is in a manner infinite; many of them run wild, and a very considerable trade is carried on in their hides and tallow. Sheep are numerous in Mexico, but it does not appear that wool is an article of any consideration in their trade; and it is not probable that it is of a good kind, as it is scarce ever found useful between the tropics, where it is coarse, short, and hairy, except only in Peru, which enjoys a climate different from that of all other countries. Swine are equally numerous, and their lard is much in request all over the country, where it is used instead of butter.

Besides the beasts already mentioned, which they have in common with us, they have several kinds of red and fallow deer, hares, rabbits, squirrels, foxes, otters, wild-cats, pole-cats, porcupines, jackalls, monkies, the pecaree, the warree, the guano, the sloth, the armadillo, the racoon, and ounce.

The pecaree is a little, black, short-legged animal, that has some resemblance to a hog. These herd together in great droves; and, what is most remarkable, the navel is said to grow upon its back; and if it be not cut off as soon as the pecaree is killed, it instantly corrupts the whole carcase, which is otherwise very good food.

The warree is less than the pecaree, which it nearly resembles, only its navel is in the usual place. The skin is thick, and covered with hair, that looks like a coarse fur. Both the pecaree and warree are so wild and fierce, that they will engage either man or beast. The Indians hunt them down with their dogs, and then shoot or kill them with spears.

The guano is shaped like a lizard; the body is as big as a man's leg, but grows tapering towards the end of its tail, which is very small. They have four short feet with claws, are of various colours, as of a dark and light brown, of a dark and light green, some of them yellow, and others speckled. They live in water as well as upon the land, and both their flesh and eggs are very good food.

The sloth is about the size of a large spaniel, has a round head, small eyes, and very sharp teeth and claws: he feeds on the leaves of trees, and frequently kills them, not leaving a single leaf on the tree he visits; but he is so many days in getting down one tree, and climbing another, that though he be fat when he comes down, he grows lean before he can get to the top of the next tree. He receives his name from the slowness of his motions, for he is said to be several minutes in moving one of his legs three inches, nor will blows make him mend his pace, for he seems insensible of stripes, and can neither be frightened nor provoked.

Here is an animal called a quash, which is bigger than a cat; its head resembles that of a fox, with short ears and a long nose: the legs are short, and it runs up trees like a cat; the body is covered with a fine yellow hair, and the flesh is very good meat. The young ones may be tamed, and are as diverting as a monkey.

The monkeys of Campeachy are very ugly; they are much larger than a hare, and have tails two feet and a half long; the body and upper part of the tail are covered with a coarse, long, black hair. They keep together twenty or thirty in a company, rambling over the woods, leaping from tree to tree, and if they meet with a single person, he is in danger of being torn to pieces by them; at least they chatter and make a terrible noise; some throw things at him, while others scatter their water and dung about his ears: they hang themselves by the tail on the boughs, and seem to threaten him all the way he passes; but where two or three people are together they usually scamper away.

With respect to the feathered race, we find in Mexico tame poultry, turkies, pigeons, parrots, parakeets, macaws, quams, curasoes, cockricoes, bill-birds, humming-birds, black-birds, eagles, vultures, pelicans, cormorants, batts, and a multitude of others.

The macaw is shaped much like a parrot, but is twice as large; the feathers of the body are of several bright and lively colours, particularly red, blue, and green: it has a bushy tail, with two or three long straggling feathers, red or blue; the pinions of the wings of some of them are red, and of others blue; and their beaks yellow: they make a great noise in the morning, resembling a hoarse human voice: they will imitate not only the voices of the Indians, but their way of singing, and also mimic the noise of almost any bird or animal; and may be taught to talk. The natives tame them, and, when they are used to their houses, suffer them to fly to the woods in the day-time, among those that are wild, and they return in the evening to the house or plantation they belong to. There are great plenty of these birds in Mexico; and they are not only extremely beautiful and entertaining, but their flesh, though black and pretty tough, is well tasted.

The

The quam is a wild land-fowl of the size of a hen-turkey, which it resembles in its bill; the feathers are of a dun colour, the tail is short, and darker than the rest of the feathers. It feeds upon berries and other fruit, and the flesh is very good food.

The curasoe is larger than the quam, but much of the same shape: the cock has a crown of black or yellow feathers on his head, with red loose flesh on his neck like a turkey-cock; but the hen has neither. They have a big gross voice, which the natives think melodious. The flesh is tolerably good, but the bones so noxious that the natives bury them, and will not suffer a dog to eat them.

The cockricoes are of the colour of a partridge, but somewhat less, and their legs longer. They delight in creeks and watery places; are remarkable for their calling one another morning and evening, and are esteemed delicious food.

They have two sorts of pheasants; the one of a dark colour, with black wings and tail, which they call gritones; and the other, much larger, called royal, from a tuft which appears like a crown upon its head. The batts of this country are as large as pigeons.

In all hot countries there are abundance of poisonous and troublesome reptiles and insects, as snakes, scorpions, centipees, spiders, toads, ants, and muskettoes.

Among the various kinds of serpents is a yellow snake, as big as the small of a man's leg, and six or seven feet long. This is a lazy animal, that takes little pains to hunt for its prey, but lies concealed, and surprizes the lizards, guanoes, and other small animals passing by. There is also a green snake, about the thickness of a small cane, and four or five feet in length: these lie among bushes and trees, full of leaves, and prey chiefly on small birds. Here is also a dun-coloured snake about two feet long, that frequents houses, and kills mice and other vermin, and is so harmless that no body endeavours to kill it. There are many other snakes, and particularly the rattle-snake, of which we have already given a very particular account.

The locust is an insect that brings destruction wherever it comes, and is most found in hot countries, where they sometimes appear in such clouds as to hide the sun, and darken the brightest day. They are much like the grasshopper, but larger, and have wings. While Mr. Gage was in Mexico, a cloud of these insects visited that part of the country where he resided, lighting upon the trees and standing corn; and in one night devoured both the fruit and leaves of the trees, and consumed the corn in every field where they fell. The high-ways were covered with them, and neither the plantations of sugar or indigo escaped. Upon the approach of this winged army, all people were commanded out into the fields, with trumpets, brass pans, kettles, and every thing that would make a noise, to frighten them away.

On the coasts and the banks of the rivers are caught alligators, several sorts of turtle, with oysters and muscles of a prodigious size, lobsters, crabs, and shrimps. Among the other fish are the paracoad, which is about three feet and a half in length, and it is said will attack a man in the water. It is a firm well tasted fish, but some of them have been found unwholesome food.

The gar-fish resembles the former, but is less, and has a long sharp bone in its snout, like a sword-fish; only the sword-fish's bone is flat, and indented like a saw, while that of the gar-fish resembles a spear, it being round, smooth, sharp at the end, and about a foot long. These fish swim very swift, frequently leaping out of the water, and skimming, as it were, just above the surface, for twenty or thirty yards; then wetting their fins, spring forward again, darting themselves with such force, that they will strike their long spear through the sides of a canoe, or the body of a man, if they meet with him in the water. These are esteemed well tasted, wholesome food.

Mullets and snooks are very plentiful; as are also Spanish mackerel, which resemble those of Europe, but are above a yard in length, and nine or ten inches round. Here are also the old-wife, the cavally, the turpom, and several other kinds of fish. In the lakes and rivers are pike and carp, with plenty of others that are excellent food.

S E C T. V.

Of the three Audiences of Mexico, with whatever is most remarkable in each, including a Description of the Cities and Trade of Mexico, Acapulco, Los Angeles, La Vera Cruz, and Guatimala.

IN order to give a more distinct idea of this extensive country, it will be necessary to describe it under its three grand divisions, called audiences, Guadalajara, Mexico Proper, and Guatimala, all of which are under the government of the same viceroy, and are subdivided into several provinces.

Guadalajara, also called Galicia, is bounded on the north by New Mexico, on the east and south by the audience of Mexico, and on the west it is washed by the South sea and the gulph of California; containing a space of eight hundred miles in length, and above five hundred in breadth. It is divided into seven provinces, and being the most temperate division of the empire, is generally pleasant and healthy. These provinces are Guadalajara Proper, Zacatecas, New Biscay, Cinaloa, Culiacan, Chametlan, and Xalisco.

The capital, called Guadalajara, is the seat of the royal courts of judicature, a bishop's see, and is pleasantly seated on the north banks of the river Bareinja. It has several churches, besides the cathedral, with some monasteries and nunneries. This audience is celebrated for the richness of the silver mines and its fertility. In each of the provinces are several towns, and that of Cinaloa is rendered extremely picturesque, by a number of beautiful cascades falling in streams down the mountains. In this audience is the lake of Chapala, which is said to be forty leagues in compass.

The audience of Mexico is beyond comparison the most valuable of the Spanish dominions north of the equator. On the east it is bounded by the gulph of Mexico, on the south-east by the audience of Guatimala, on the south-west by the South sea, and on the north-west by the audience of Guadalajara. It extends about six hundred miles in length, and in some places near as much in breadth; yet it is only about sixty leagues in breadth from sea to sea across the province of Guaxaca.

This audience, in rich commodities, gold, silver, and precious stones, far surpasses all the rest of the empire, as it likewise does in its spacious extensive vallies, the fertility of its arable lands, pasturage, and variety of fruits. The great lakes, rivers, and sea-ports, with which it abounds, not only furnish the inhabitants with plenty of excellent fish, but give them great advantages in trade, both foreign and domestic. It is divided into nine provinces, namely, Mexico Proper, Mechoacan, Panuco, Tlascala, Guaxaca, Tabasco, Yucatan, Chiapa, and Soconusco.

The province of Mexico Proper, which greatly exceeds the rest, contains the capital, which is of the same name, and is seated in the lake of Mexico, on the east side of a valley, at the foot of a range of hills, in the twentieth degree north latitude, and the hundred and first degree ten minutes west longitude, about a hundred and seventy miles west of the gulph of Mexico, and a hundred and ninety north of Acapulco. This is the capital of the kingdom, the residence of the viceroy, the seat of the first audience or chamber of justice, and the see of an archbishop. This is thought to be the most regular-built city in the world. It is a perfect square, each side extending half a league, and consequently the whole is about two leagues, or six miles in circumference. There is a great square in the middle of it, from whence the streets run in direct lines, either north and south, or east and west, crossing each other at right angles; so that the length and breadth of the city may be discerned at the corner of every street. There are five entrances into it, but it has neither gates, walls, nor artillery. The houses are built very strong of brick and stone, but not very high, on account of its being subject to earthquakes, and great part of the town standing upon a morass, this occasions the foundations of some of them to sink; but what is still worse, it is subject to inundations from the streams which flow down from the mountains into the lake, so that it is often in danger of being overflowed,

overflowed, and indeed many of the houses and inhabitants have been actually swept away by floods, though they have been at a vast expence in making canals, dykes, and sluices to carry off the water; so that it has often been debated, whether they should not abandon the city, and build another upon better ground. All the buildings are convenient, and the public edifices magnificent. Here are twenty-nine cathedrals and churches, and twenty-two monasteries and nunneries, of the wealth of which we may form some judgment from the revenue of the grand cathedral, which amounts to near eighty thousand pounds sterling a year, out of which the archbishop has fifteen thousand pounds, besides vast sums that arise by perquisites. The cathedral is a magnificent pile, built in the form of a cross, which, with the cloisters and dwellings of the clergy adjoining to it, take up a large space of ground in the city, and was sixty years in building, at the expence of above two millions of pieces of eight. The paintings, gilding, and carving are extremely fine, and it contains abundance of beautiful altars and chapels on each side; the high altar, which stands in the middle of the choir, cost fifty thousand pieces of eight. The image of the Virgin Mary is of massy silver, adorned with rubies and pearls to the value of thirty thousand pieces of eight, and is once a year carried in procession, when a number of maids draw lots for three hundred pieces of eight for their marriage portions. The chalice for the ordinary service is worth eleven thousand, being of gold, chased, and set with rubies. The host is here carried to the sick persons not on foot, as in other countries, but in a coach drawn by four of the finest mules that can be had from Europe.

The great square, or market, in the middle of the city is extremely magnificent, and has piazzas on one side, under which are some of the richest shops in the world; and on another stands the magnificent palace of the viceroy, the principal front of which faces the square, and is not inferior to the palace at Naples.

The palace of the marquis de Valle, as it is called, is one of the noblest pieces of architecture any where to be met with. It is built on the very spot where formerly stood the palace of Motezuma, and takes up nearly the same space.

Besides the churches and monasteries there are several hospitals richly endowed; among the rest is one for young maids who are left orphans; these are handsomely maintained while they live single, and are allowed five hundred pieces of eight when they marry. There is another hospital erected for those who have venereal complaints, which has a revenue of thirty-six thousand pieces of eight per annum; and a third for sick priests.

The several trades have their respective streets: a very spacious one that runs from the square belongs to the goldsmiths, and has the shops furnished with such a variety of utensils and ornaments of gold, silver, and jewels, as is not to be paralleled in any city in the world, particularly with gilt plate in services and sets, and with vast quantities of rubies, emeralds, and pearls. The street of St. Austin, where the mercers expose their rich silks to sale, has a very grand and beautiful appearance. The street called Tacuba, where the tradesmen who deal in brass, steel, and iron reside, is very long and spacious. But Eagle-street, which is inhabited by the nobility, gentry, and great lawyers, is said to excel all the rest in magnificence.

The city is supplied with fresh water from a hill at three miles distance, to which an aqueduct supported on arches extends from the city.

There is a pleasant park well planted and adorned with fountains, and other water-works, whither the quality of both sexes and the gay part of the town resort every evening, some in coaches, and others on horseback; and here the young cavaliers endeavour to recommend themselves to the ladies by feats of activity and horsemanship. Several hundreds of coaches are frequently seen here, with numerous retinues of black slaves. It is said that the negro girls who run by the coaches of the ladies wear bracelets of gold, pearl necklaces, and jewels in their ears; while the black foot-boys are covered with lace and embroidery.

Though this city is no sea-port, nor has a communication with the sea by any navigable river, it has a prodigious commerce, and is itself the center of all the trade carried on between America and Spain on the one hand, and between America and the East Indies on the other; for here the principal merchants reside; here the greatest part of the business is negociated, and the goods that pass from Acapulco to La Vera Cruz, or from La Vera Cruz to Acapulco, for the use of the Philippines, and in a great measure for the use of Peru and Lima, all pass through this city, and employ an incredible number of horses and mules in the carriage. Hither all the gold and silver comes to be coined; here the king's fifth is deposited, and here is wrought all that immense quantity of utensils and ornaments in plate which is every year sent into Europe.

One of the principal diversions of the citizens is fishing in boats upon the lake, whither they carry wine and cold provisions to regale themselves with upon the water. This lake, on the west side of which Mexico is situated, is about fifteen miles in length from north to south, but the breadth is very unequal; however, in the broadest part it is something more than twelve miles, and the north end of it is scarce so broad. To the north of this lake are three others that have a communication with it by canals, and on the south are two other lakes, divided from it only by a causeway.

The neighbourhood of Mexico is rendered extremely pleasant by the numerous palaces, country seats, monasteries, and villages either on the islands in the lakes, or on the banks of the several lakes within view of the city, to which the citizens resort in boats, when they are disposed to retire from the hurry of the town.

It cannot be exactly ascertained what number of people are in the city; it is certainly very considerable, and is by many computed at seventy or eighty thousand. The bulk of the people are blacks and mulattoes, there having been abundance of black slaves brought hither, who have obtained their freedom and married with the natives, and their descendants are very numerous. There is also a strange mixture of Spanish and Indian blood. The pure Spaniards, and those descended from Spanish ancestors on both sides are a very small number, both here and in the other towns of Mexico.

The port nearest to this city is Acapulco, which is also in the province of Mexico Proper, and is a celebrated port on the South sea, in the seventeenth degree north latitude, and the hundred and second degree of west longitude, upwards of two hundred miles distant from the capital. It has one of the deepest, securest, and most commodious harbours in the South sea, and indeed almost the only good one upon the western coast of New Spain. The entrance of the harbour is defended by a castle of tolerable strength; but the town itself is ill built, and makes but a miserable figure except at the time of the fair, when it entirely changes its appearance, and becomes one of the most considerable marts in the world. About the month of December the great galleon, which makes the whole communication between America and the Philippines, after a voyage of five months, arrives here, loaded with all the rich commodities of the East; nutmegs, mace, cloves, pepper, cinnamon, china, Japan wares, calicoes plain and painted, chints, silks, muslins of all sorts, precious stones, and rich drugs. At the same time the annual ship from Lima arrives, and is computed to bring not less than two millions of pieces of eight in silver, besides quicksilver, cacao, drugs, and other valuable commodities, to be laid out in the purchase of East India goods. Several other ships from different parts of Chili and Peru meet upon the same occasion; and, besides the traffic for the Philippine commodities, this causes a very large dealing for every thing those countries have to exchange with one another, as well as for the purchase of all sorts of European goods. The fair sometimes lasts for thirty days. The goods are no sooner disposed of than the galleon prepares to set out on her voyage to the Philippines, with her returns chiefly in silver, but with some European goods and American commodities.

When this fair is over the town is comparatively deserted; however, it remains during the whole year the most

considerable port in Mexico, from whence what exceeds their own consumption is sent by land-carriage to La Vera Cruz to pass over to Terra Firma, to the islands, and a small quantity even to Spain.

In the province of Tlascala, or Los Angeles, which is said to be the best peopled by Indians of any in Mexico, is the city of Puebla de los Angeles, or the city of Angeles, which is seated in a fine valley on the banks of the river Zacatula, in the nineteenth degree of north latitude, twenty-five leagues to the eastward of Mexico. The buildings are principally of stone, and, like the other Spanish towns, has a beautiful square in the middle, from whence run the principal streets in a direct line, which are crossed by others at right angles. On one side of the square is the cathedral, which has a magnificent front, while the other three sides have handsome uniform piazzas, under which are the shops of the principal tradesmen. There are here many beautiful and magnificent parochial and conventual churches; with several rich monasteries and nunneries. The city is the see of a bishop suffragan to the archbishop of Mexico, and some judgment may perhaps be formed of the wealth of the inhabitants from the revenue of the bishop and chapter; the former has eighty thousand pieces of eight per annum, and there are two hundred thousand more annually paid to the canons and officers of the church. The people of this city in general are exceeding wealthy, though the laity in this part of the world cannot pretend to vie with the clergy either in estates or influence.

In the province of Tlascala is also the city of La Vera Cruz, which is seated in the gulph of Mexico, in the nineteenth degree ten minutes north latitude, about two hundred miles south-east of Mexico. It is situated in a barren sandy plain, but is considerable on account of its excellent harbour, which is naturally defended by rocks: but on one side the town is exposed to clouds of dry sand, and on the other to the putrid exhalations of bogs and marshes, which impregnate the air with the most pernicious vapours. The town extends from east to west, but is not more than half a league in circumference. The walls are of little use, the sands being in many places level with the tops of them; but the castle and forts are so situated, as to be a defence to the ships in the harbour. The town is very poor, most of the houses being no better than thatched cottages, inhabited by fishermen; but the Spanish garrison consists of a troop of sixty horse and two companies of foot. From this port the wealth of Mexico is poured out upon the Old World, and from this port they receive the numberless luxuries and necessities that the Old World yields them in return. The annual fleet from Cadiz, called the flota, arrives about the latter end of November, and then vast multitudes resort to La Vera Cruz from all parts, living in little huts or tents while the fleet remains there; their valuable merchandize being deposited in ware-houses built for that purpose. The fleet stays there during the winter, and upon its departure all the people of substance retire on account of their health.

This fleet, which sails only from Cadiz, consists of about fourteen or fifteen large merchant ships from four hundred to a thousand tons burthen, under the convoy of three or four men of war. They are loaded with almost every sort of goods which Europe produces for exportation; all sorts of linens, woollens, silks, velvets, laces, cutlery, glass, watches, clocks, quicksilver, wrought iron, horse-furniture, shoes, stockings, books, pictures, military stores, wine, and fruit; so that all the trading parts of Europe are highly interested in the cargo of the fleet. Spain sends out little more than the wine and fruit, and this with the freight and commissions to the merchants, and the duty to the king, are almost all the advantages that kingdom derives from her commerce with the Indies. The ware-houses of La Vera Cruz are constantly full of European goods and commodities, and its trade may be reputed nearly equal to all the commerce of Spanish America, though it is chiefly confined to the time the flota stays there.

The province of Tabasco, which is washed on the north by the bay of Campeachy, is the place where logwood principally grows; the land near the coast is generally so flat and low, that it rains nine months every year, and,

according to Dampier, remains under water six or seven months, during which the logwood-cutters usually work up to the knees in mud and water in felling the trees, and can scarce find a dry spot to build their huts on. On the coast are almost impenetrable thickets of mangroves and bamboos; but farther up the country are fine savannahs and gentle rising hills, adorned with variety of fruit-trees, and the banks of the river Tabasco are shaded with large trees, particularly cabbage trees a hundred feet high.

The province of Yucatan is a peninsula seated in the gulph of Mexico, between the bays of Campeachy and Honduras, and is generally flat low land, with scarce any hills, unless on the western part. It is thinly inhabited, for the air is excessive hot, and the lands near the coast frequently under water. Its chief produce is logwood, cotton, and salt. The only Spanish town in this extensive coast is Campeachy, seated on the west side of the peninsula facing the sea, and has a fine appearance, it being built of stone, and encompassed with a good wall; with a strong citadel mounted with several pieces of heavy cannon placed at one end for its defence.

The audience of Guatemala forms a very fine country, capable of great improvements. It is bounded on the north-west by that of Mexico; on the north-east by the North sea; on the south-east by the province of Darien, or Terra Firma; and on the south-west by the South sea; thus enjoying every advantage of situation with respect to commerce. It is about a thousand miles in length from the north-west to the south-east, but scarce half so broad in any part, and in some not a hundred miles in breadth: it is subdivided into the six following provinces: Guatemala Proper, Vera Paz, Honduras, Nicaragua, Costa Rica, and Veragua; the two last provinces are, however, placed by the learned Don Antonio de Ulloa within Terra Firma.

This province is mountainous, filled with volcanoes that have dreadful fiery eruptions, and subject to earthquakes. It has, however, rich and fertile vallies that abound with corn, and pastures that feed an incredible number of cattle; with rich drugs for dying, some silver mines, and sugar plantations. Great quantities of bees-wax are also exported out of this province.

St. Jago de Guatemala, formerly the capital of the audience, and one of the finest cities in New Spain, was destroyed in 1541 by a dreadful earthquake and a neighbouring volcano. Never appeared a more terrible and awful scene: the day preceding it a prodigious noise was heard from a volcano seated in the mountain above the city, which was succeeded in the night by a furious explosion, as if the mountain, says our author, had discharged all her bowels. This mountain has two tops, from one of which issued fire, and from the other a torrent of water, which swept all before it, and carried off the houses and inhabitants. The horror of this scene was heightened by one of the most dreadful earthquakes ever felt in any part of the globe; and a hundred and twenty thousand Spaniards and natives lost their lives.

New Guatemala, the present capital of the audience and province, the residence of the president and royal courts, the see of a bishop, the seat of an university, and the center of the trade of these parts, is situated in a beautiful plain at a good distance from the fatal volcano; yet all their precautions cannot secure it against the dreadful earthquakes so frequent in this country. It is nevertheless well built and inhabited; the cathedral and parish-churches are exceeding rich, and here are two very fine monasteries, a nursery, and an hospital. The citizens trade largely, not only with all the provinces of Mexico, but even with Peru.

S E C T. VI.

Of the different Ranks of People among the present Mexicans; with the Manners, Customs, and Government of the Spaniards and Creoles.

MEXICO is at present inhabited by a mixed people, consisting of the native Indians, the Spaniards, and the negroes; and the descendants of these are divided and distinguished

distinguished by various names; as the unmixed descendants of the Spaniards, who are called Creoli, or Creoles; the Mestizes, or issue of the Spaniards by the native Indians; the Mestiches, or the issue of such issue; the Terceroons dez Indies, or the children of the last married to Spaniards; and the Quarteroons dez Indies, who are their descendants, and are allowed the same privileges as true Spaniards. The issue of an European and negro is called a mulatto; besides which there is a mixed breed of negroes and Indians, which is generally deemed the lowest rank of the people.

The whites are either born in Spain, or Creoles: the native Spaniards are mostly in offices and in trade, and have the same characters and manners with the Spaniards of Europe; the same gravity of behaviour, the same natural sagacity, the same indolence, and a still greater share of pride and stateliness; for they here consider their being natives of Old Spain as a very honourable distinction, and are, in return, looked upon by the Creoles with no small share of hatred and envy. The latter have little of that firmness and patience which distinguishes the native Spaniard. They are destitute of courage, weak, and effeminate. Living in an enervating heat, surfeited with wealth, and spending their whole time in loitering and inactive pleasures, they have nothing bold and manly, to fit them for making a figure in active life, and very few have any taste for the satisfactions of a learned retirement. They are luxurious without either variety or elegance, fond of show and parade, temperate at their tables and in their cups, and merely from constitution and idleness make their whole business amour and intrigue, which they carry on in the old Spanish taste, by doing and saying extravagant things, by bad music, worse poetry, and excessive expences. The ladies are little celebrated for their chastity or domestic virtues; but exert all their genius and abilities in combating the restraints which are laid upon them.

It is allowed by the most judicious authors that the priests, monks, and nuns of all orders are upwards of one fifth of all the white people; but the clergy being here generally too ignorant to instruct by preaching, and too debauched in their manners to reform by their example, the people are little better for their numbers, wealth, or influence. Many of them are said to be only adventurers from Old Spain, who without the least regard to their character or their vows, direct all their studies to raise a sudden fortune, by abusing the ignorance and extreme credulity of the people. Much attention is paid to mere mechanical methods of devotion. Moral duties are seldom mentioned. An extreme veneration for saints is strongly inculcated, and forms the general subject of their sermons, which are rather designed to raise a stupid admiration of their miracles, than an imitation of the sanctity of their lives. However, it must be acknowledged, that there are some of the clergy who practise the duties of their station, and are distinguished by their learning and the purity of their manners; but these are very few.

As to the laity, it is said there is not a more bigotted, or a lewder people upon earth: a present to the church wipes off the odium and the punishment of the greatest crimes. The principal way in which they are instructed in religion, is by theatrical entertainments in their churches. There is scarce any part of the Gospel, but is the subject of a play, which the lowest of the people are here taught to act: one personates our Saviour, another Pilate, a third Herod, and so on: as their churches are exquisitely fine, so is their music, both vocal and instrumental. The clergy collect the most harmonious voices, and have them taught to sing not only anthems, but merry songs; and in their cloisters are masques, dances, and all the entertainments in which the laity indulge themselves; and yet the people have their seasons for penance and mortification, particularly in Lent, when they not only keep a rigorous fast, but in their processions lash themselves unmercifully. This is the exercise of the holy week before Easter, and in case of an earthquake, famine, or other general calamity, they endeavour by these austerities, to appease the wrath of heaven.

The civil government, administered by tribunals called audiences, consists of a certain number of judges divided into different chambers, which have a greater resem-

blance to the parliaments in France, than to our courts of justice. The viceroy himself presides at the head of the chief of these chambers, when he sees fit. His employment is one of the greatest the king of Spain has in his gift, and his is perhaps the richest government entrusted to any subject in the world. All employments here are held by none but native Spaniards, and by them only for a limited time, which must not exceed three years. Jealousy and avarice in this, as well as in every thing else that has a relation to the Indies, influences all public regulations; and every officer, from the highest to the lowest, has the avidity which a new and lucrative post inspires; ravenous because his time is short; he oppresses the people, and defrauds his sovereign; another succeeds him with the same dispositions; and no man takes care to establish any thing useful in his office, knowing that his successor will trample upon every regulation that is not subservient to his own interest.

There are some troops kept in Mexico, and a good revenue appropriated for their maintenance, and for the support of the fortifications; but the soldiers are few, ill-clothed, ill-paid, and worse disciplined. Thus the military keep pace with the civil and ecclesiastical administration, and the whole form one regular scene of rapaciousness, pride, arrogance, and oppression.

S E C T. VII.

Of the Persons, Dress, Manners, Customs, Houses, Food, and Festivals of the Mexicans, particularly of those who are detached from the Spaniards, and still enjoy their Liberty.

THE original Mexicans, like the other Americans, are in general tall, clean, well proportioned, and handsome, active, nimble, and remarkably swift of foot. They are of a deep olive complexion; their eyes large, lively, and sparkling; the face round, and the features usually agreeable. They wear their hair, either flowing loose, cut short, or twisted and plaited on the head. Some nations within the limits of this vast country, differ widely from the general appearance and manners of the rest; a few deem flat noses the greatest ornament, and early flatten those of their infants, to produce that beauty on their faces; while others mould their thin tender skulls into a conical or pyramidical form, by means of compression. Many of the Mexicans disfigure themselves with paint, or rather daubing, and represent on the body the figures of various birds and beasts; or, in time of war, paint their faces red, to give them a warlike and bloody appearance: they also anoint their bodies with oil or fat, to prevent their being bit by muskettoes, to preserve the skin against the intense heat of the sun, and to render their joints supple and pliant.

The people are however in general clothed, though in a very different manner from the Spaniards; but in the province of Veragua, it is said there is a nation where the men cloath nothing besides the penis, which the vulgar are contented with wrapping in a leaf, while the great inclose it in a case of gold or silver, of a conical form, adorned with jewels, letting the scrotum fall under it, in full view. This circumstance, improbable as it appears, is mentioned by several authors; but with what degree of truth, we will not pretend to determine; yet it is said that even these people, on festivals and other solemn occasions, have a white or black cotton garment like a ploughman's frock, that reaches down to their heels; and if an European gives them a shirt or any other cloathing, they immediately put it on, and reckon themselves very fine.

In general the Indians are fond of pendants, bracelets, and necklaces. The men wear a thin plate of gold or silver hanging over their upper lip, of an oval figure, in the form of a crescent, the points of which gently pinch the bridle of the nose, and fasten it on; the middle is about the thickness of a guinea, and it grows gradually thinner towards the edges. The women, instead of a plate, wear a ring, which goes through the bridle of the nose, and by its weight sometimes draws down it to the mouth. These strange kinds of ornaments they have of various sizes; the larger sort they lay aside at their entertainments, and the smaller do not hinder their eating. Their great men likewise wear two gold plates of the

shape of a heart, a span long at each ear, fastened to it by a gold ring, which stretches the ear to an immoderate size. They also wear a kind of coronet or bandage of gold or silver about the head eight or ten inches broad, and indented on the upper side; others have only a bandage of cane painted red stuck round with beautiful feathers, standing upright, and most of the Indians of both sexes wear strings of beads, teeth, shells, and other toys, hanging from the neck down to the breast.

Those Indians who live in the Spanish towns wear a short waistcoat and wide breeches, with a short cloak of various colours, resembling the Spanish dress; but their legs are bare, and only a few cover their feet with sandals. The women wear a short jacket of cotton or linen, over which flows a loose robe, or a straight petticoat, and sometimes both. There are, however, such varieties in dress, depending upon custom and fancy, that it would be endless to enter upon particulars.

With respect to the genius, temper, and manners of the Mexicans, they seem to be greatly degenerated since their being conquered by the Spaniards. They were once ingenious, hospitable, civilized, and generous; except in the article of human sacrifices; but now those who live among the Spaniards are said to be cowardly, treacherous, and stupid. The buildings, images, paintings, carvings, cotton cloths, manufactured feathers formed into beautiful pictures, and many other pieces of art, evince the genius of the ancient Mexicans; and the loss of these is a demonstration of the decline of that genius. Indeed the cause is not difficult to be assigned; their temples and images, on which they had lavished all the powers of art, being destroyed, themselves reduced to a state of servitude, and constrained to labour in the mines, to gratify the avarice of their new masters; it is no wonder they were effectually discouraged from cultivating talents, that could only turn to their destruction, and gain them stripes instead of rewards. Besides, the introduction of European arts, manufactures, and the implements of mechanics, made the Indians despise the inferiority of their own, all knowledge of which they soon forgot, without being able to acquire any degree of skill in the other, to the drudgery and lower branches of which they were confined. To what purposes then should an Indian labour to improve talents that can only serve to render his bondage more irksome? or why should he strive to accumulate that wealth, of which he knows he shall be stripped by his arbitrary master?

Those Indians who have preserved their freedom in the mountains and some other parts of the country are still a brave, generous, and humane people, entirely untainted with the sordid vices and corrupt manners of the inhabitants of the Spanish cities and towns. They spend their time in hunting, fishing, and field exercises; cultivate but little soil, sow and plant what is just sufficient to answer the purposes of nature, and allow nothing for the gratification of appetites founded on luxury.

The business of planting is performed by the women, after the men have cleared the ground. The females likewise execute all the domestic offices, spin, weave, and dress cotton and linen cloths for their own or their husbands apparel. They are obedient and respectful to their husbands, who return a mutual affection. This is at least the picture given us by English and French travellers, though the Spaniards, perhaps to palliate their own conduct, speak less favourably of them.

These Indians live in thatched cottages, and observe little regularity in their towns; their houses neither standing contiguous, nor in any order, but are dispersed here and there, only they have one common guard-house, or fort, seated on an eminence, to which they resort on the approach of an enemy, or when they assemble in council. They never lay any deep foundations, but set up small posts seven or eight feet high, two or three feet asunder, and closing up the intervals cover them with clay. They make the roof like that of an ordinary barn, and usually cover it with palmetto leaves. The building is about twenty-four feet long, and twelve broad; the hearth is in the middle, and they have a hole over it, to let out the smoke: they have only the ground-floor, and use no partitions, so that the whole house forms but one room. Instead of beds they use hammocks, which are hung from

the principal beam, and blocks of wood are their only seats and tables. Their furniture consists of earthen vessels, with calabashes of an uncommon size to hold their liquor; and their arms, bows, arrows, lances, darts, and quivers, with their tools, are hung as ornaments round the cottage.

Their guard-house is about a hundred and thirty feet long, and twenty-five broad; the walls nine or ten feet high, and the ridge of the roof about twenty feet in height, and thatched with palmetto leaves: they have narrow loop holes on the sides, from whence they can repulse an enemy with their arrows; they are seated, as hath been observed, on an eminence; and the ground is cleared of wood and shrubs for a good space round, that an enemy may find no shelter from their arrows, or any place to lie concealed. They have strong doors to defend the entrance; but the Spaniards easily burn them down by shooting flaming arrows into the palmetto leaves, which answer the purpose of thatch.

We shall now treat of the diet, exercises, festivals, and diversions of those Indians who still enjoy their liberties. Their principal food is either Indian corn parched and ground into flour, and made into thin cakes, or fruit, roots, wild hogs, deer, &c. and sometimes fish. They frequently go a-hunting in companies a week or a fortnight together, every man carrying with him his bow and arrows, a spear, a hatchet, and a long knife. Each man also takes a dog or two with him to beat for game. Some women also go with them to carry their provisions of roasted plantains, yams, potatoes, baskets of parched Indian corn, and a few utensils. The beasts they hunt are chiefly the pecaree and warree, a sort of wild hogs, of which we have given a description. They also meet with a variety of fowls. They lodge at night wherever they happen to be at sun-set, contriving to be near some river. They hang up their hammocks between the trees, and have scarce any other covering but a plantane leaf. They begin their hunting again at sun-rising the next morning. Their game, just mentioned, are not swift of foot, and usually go together in droves of two or three hundred; but they sometimes hunt a whole day without meeting any. When the beast is tired with the pursuit, or wounded, he will stand at bay with the dogs, till the master comes up and shoots him; he then strikes his spear into the creature to let out the blood, embowels him, and cutting him in two pieces carries them on a stick laid across his shoulder to a place where the women are appointed to wait: here they cut off the head of the animal, quarter and flea it; what they intend to preserve they barbecue by laying it upon a wooden grate, under which is a fire of wood coals, which is kept up till the meat is as dry as a chip; and these pieces will keep a great while. When they have much game, the men assist the women in carrying it home; and when their stock of provisions is almost spent, they go out again to look for more.

Whether their flesh be dried, or fresh killed, they cut it into small pieces, which they put into a kind of pipkin, adding some roots, green plantanes, or other fruit, with a great deal of pepper, stewing them together in water seven or eight hours, and not suffering them to boil, which reduces all the ingredients into a kind of pulp; they then pour it into an earthen dish, or calabash, and setting it upon a wooden block that serves them for a table, sit round it on lesser blocks, all having a calabash of water standing by their side on the ground, into which they frequently dip their fingers while they are eating. They have seldom more than one set meal in a day, but they eat plantanes and other fruit raw or roasted almost all the day.

There is scarce any flesh, fish, or fowl, but what the natives of Mexico eat either stewed or broiled on the coals: it does not appear that they use either knives, forks, or spoons, but fill their mouths with their hands, and tear the broiled flesh off the bones with their teeth; but those who are among the Spaniards conform to their customs, and every thing they eat is high seasoned with pepper. Chocolate serves both for meat and drink in almost every province of Mexico, both among the free and those called the civilized Indians, if they can obtain it; but it is so much used by the Spaniards, and such quantities are

exported to Europe, that it is pretty scarce among the free Indians.

They have a great variety of liquors; the most ordinary drink is water, with the flour of Indian corn infused in it, and drank off presently. This serves to keep them alive on a march, when they can get no other provisions. They have a liquor named mislaw, of which they have two sorts; one made of plantanes fresh gathered, and the other of plantanes dried; the first they roast, and, peeling off the rind, mash them in a bowl of water till they are dissolved, and then drink the mixture; the other is made of cakes of plantanes dried over a slow fire: this they carry with them on journies, and drink it dissolved in water. As their pine-apples are one of their most delicious fruits, an infusion of these they are very fond of; and indeed they make an infusion of almost all manner of fruits, adding honey to them at their entertainments: but the country affords no wine, for grapes will not ripen kindly in the rainy season, and the heats at other times render the liquor sour; for this reason scarce any country between the tropics affords good wine.

The Indians scarce undertake any business of consequence without an entertainment. If they propose entering into a war, either with the Spaniards or any Indian nation, their chiefs are summoned to a consultation, and eat and drink plentifully before they enter on their debates. A hunting-match, which usually lasts some weeks, is also preceded by hard drinking. At weddings and other joyful occasions they have their feasts, where they continue drinking two or three days, till all the liquor is spent; and as they are very quarrelsome in their liquor, the master of the house always secures their arms before they begin to be merry; for they never go without them, if it be but to the next door. They usually get so drunk as to be unable to stand, and having slept till they have become sober, return home.

The men drink to one another at meals, but never to the women, who always stand by and wait upon their husbands, while they are eating and drinking, serving them with liquor; even when at home the wife does not eat till the husband has done; but the females feast among themselves, when they are as merry as the men, and as little afraid of drinking to excess; they, however, take care to keep sober till their husbands are recovered, and indeed no sooner perceive them in liquor, than they take

them up and put them into hammocks. Both sexes are also fond of smoking tobacco.

Their principal exercises, or rather employments, as hath been intimated, are hunting, shooting, and fishing; which they perform in order to provide for their families. Every man breeds up his son to these exercises, at which they are so dexterous when children, that it is said a boy of eight years of age will split a cane set up at twenty yards distance, with an arrow discharged from his bow, and kill a bird flying. But the most expert of all the Indians of Mexico are the Mosquito Indians, who dwell in the province of Honduras. They are tall, well made, strong and nimble, long visaged, have a stern look, are hard favoured, and have lank black hair. These people, who inhabit the sea-shore and the banks of rivers, are bred to throw the lance, harpoon, and dart; draw the bow from their infancy, and they will turn aside any missile weapons thrown at them with a small cane no bigger than a gun-stick. Their principal employment is striking fish, particularly the manatee and turtle. The English privateers, when they cruize on the Mexican coast, have usually one or two of these Mosquito men to strike the fish, and they will take enough to maintain a ship's crew of a hundred men. When they serve the English they learn the use of the gun, and become exceeding good marksmen; they are also extremely daring in fight, and never give back while supported by the party that entertains them.

But to return to the Indians in general, who have their dances and music, if it may be called by that name, such as wooden drums, and a kind of pipe made of a cane or reed, but very disagreeable to an European ear; for they love every thing that makes a noise, how disagreeable soever be the sound: they will also hum over something like a tune when they dance, but it does not appear that they have any thing like songs or ballads. They dance thirty or forty in a circle, stretching out their hands, and laying them on each others shoulders; stamp, jump, and use the most antic gestures for several hours together, till they are heartily weary. Sometimes one or two of the company step out of the ring, to divert the rest by shewing tricks and feats of activity, throwing up their lances, catching them again, bending backwards, and springing forwards with great agility.

CHAP. X.

OF TERRA FIRMA, or NEW CASTILE.

SECT. I.

The Situation, Extent, and Divisions of Terra Firma; with a particular Description of the Situation, Extent, Rivers, Face of the Country, and Climate of Terra Firma Proper; and of the Towns of Porto Bello and Panama: likewise an Account of the Pearl Fishery near the last City; and of a Scots Settlement on the Coast of Darien.

THE province of Terra Firma, or New Castile, is a very extensive country, it being bounded on the north and east by the North sea; on the south by part of Guiana and the country of the Amazons; and on the west by the South sea, where the isthmus of Darien also divides it from Mexico. Its greatest length from the South sea to the mouth of the river Oroonoko is upwards of thirteen hundred miles, and its greatest breadth is about seven hundred and fifty; but in other places it is much pent in by the river Oroonoko, so that it is not above half that breadth, and towards the mouth of that river not above a hundred and eighty miles. It extends almost from the equator to the twelfth degree thirty minutes north latitude, and from the sixty-second to the eighty-third degree of west longitude.

Terra Firma is divided into the following districts, or governments: the isthmus of Darien, or Terra Firma Proper, Carthagena, Santa Martha, Rio de la Hacha, Venezuela, New Granada, New Andalusia, and the province of Popayan.

The most northern of these is the country lying between the gulph of Darien and Mexico, along the coast of the South and North sea, particularly distinguished by the name of the isthmus of Darien, and by some writers called the isthmus of Panama. It divides North and South America, extending between the eighth and tenth degree north latitude, and between the seventy-eighth and eighty-seventh degree west longitude, in the form of a crescent, round the bay of Panama for about three hundred miles in length, and sixty in breadth, from the North sea to the Pacific ocean. It is bounded on the east by the river and gulph of Darien, which separates it from Carthagena; on the south by Popayan and the Pacific ocean, or South sea; and on the west by the same ocean and Veragua.

The land has almost every where an equal surface, and is distinguished by hills and valleys of great variety for height, depth, and extent. The valleys are generally watered with rivers, brooks, and perennial springs, some

some of which fall into the North and others into the South sea: most of them rise from a chain of higher hills than the rest that extend the length of the isthmus, in a manner parallel to the shore, and is in most parts nearest the North sea, from which it is seldom above ten or fifteen miles distant. On the north side of this main ridge, which is a continuation of the Andes, there are either no hills at all, or only gentle declivities. This side of the country is every where so covered with woods, that it is all one continued forest: nor is the main ridge itself carried on every where with a continued top; but is rather a range of distinct hills, and accordingly has frequent large valleys disjoining the several eminences that compose its length; and some of them are even so deep as to admit a passage for rivers.

Some of the rivers that water the country are pretty large, though few of them are navigable. On the north coast they are for the most part small; for as they generally rise from the main ridge, which lies near that shore, they have but a short course. The Darien, from which the isthmus is supposed to take its name, is indeed a very large river, but its depth at the entrance is not answerable to the wideness of its mouth. The river Chagre is pretty considerable; for though it rises from the same ridge, it has a long bending course from the south and east part of the isthmus. The river Conception is also considerable: these three fall into the North sea. Into the South sea fall the Santa Maria, the Congo, and the Cheapo.

In the river Chagre are bred a great number of alligators; and all the forests and woods near it are full of wild beasts, especially different kinds of monkeys, of various colours, as black, brown, and reddish; there is also the same diversity in their size, some being a yard long, others half a yard, and others scarce a foot. The flesh of all these different kinds is highly valued by the negroes, especially that of the red; but however delicate the meat may be, says the learned Don Antonio Ulloa, the sight of them is enough to make the appetite abhor them; for when dead they are scalded, in order to take off the hair, whence the skin is contracted by the heat; and when thoroughly cleaned looks perfectly white, and greatly resembles a child of about two or three years of age when crying: yet the scarcity of food in many parts of America renders their flesh valuable; and not only the negroes, but the Creoles, and the Europeans themselves, make no scruple of eating it.

But to return, nothing can excel the prospects which the rivers of this country exhibit. The most fertile imagination of a painter can never equal the magnificence of the rural landscapes drawn by the pencil of nature. The groves, which shade the plains, and extend their branches to the rivers; the various dimensions of the trees that cover the eminences; the texture of their leaves; the figure of their fruits, and the various colours they exhibit, form a most delightful scene, that is greatly heightened by the infinite variety of creatures with which it is diversified. The different species of monkeys skipping in troops from tree to tree, hanging from the branches; and in other places, six, eight, or more of them, linked together, in order to pass a river, with the dams carrying their young on their shoulders, throwing themselves into odd gestures, and making a thousand grimaces, will perhaps appear fictitious to those who have not actually seen it; but if the birds are considered, our reason for admiration will be greatly augmented. These, from their great abundance, seem to have had their origin on the banks of the rivers, while the beauty and variety of their various plumage conspire to charm the eye. Here are all the various kinds of parrots, parroquets, cotores, the tulcan, the gallinazo, the wild and royal peacock, the turtle dove, the heron, and many others.

The weather is much the same here as in other places of the torrid zone, inclining rather to the wet extreme. The rains begin in April or May, and are very violent during the months of June, July, and August: it is then very hot, whenever the sun breaks out of a cloud, there being no breezes to fan and cool the air, it is all a glowing heat. About September the rains begin to abate, but it is November or December, and perhaps the beginning of January, before they are quite gone; so that

the rainy weather lasts two-thirds of the year. They first come, like our sudden April showers, one in a day; at length a shower falls almost every hour, frequently accompanied with violent thunder and lightning; during which the air has often a faint sulphureous smell, where pent up among the woods. After this variable weather there will be, for about a month or six weeks, a settled continued rain of several days and nights, without thunder and lightning, but extremely vehement, considering the length: yet at certain intervals, even in the wettest part of the season, are intermixed several fair days, with only tornadoes or thunder showers, and that sometimes for a week together. These thunder showers usually cause a sensible wind by the clouds pressing the atmosphere, which is very refreshing from its moderating the heat; but as it shakes the trees of the forest, their dropping is as troublesome as the rain itself. When the shower is over, you hear a great way together the croaking of frogs and toads, and the humming of muskettoes, which chiefly infest the low swampy grounds near the rivers. The floods caused by the heavy rains often beat down the trees; so that they frequently bar up the rivers till they are cleared by another flood.

The soil of the inland part of the country is generally very good, and for the most part consists of black fruitful mould. The hills are every where fertile to the top, though more fruitful nearer the bottom; but even the tops of the main ridge are covered with very flourishing trees. Indeed the soil seems capable of producing all the vegetables proper to the climate; yet the trees on the tops and sides of the hills in the inland country are very different from those in the sea. The woods on the hills forming a large forest of timber trees, or a delightful grove of trees of several kinds, are very tall, with little or no underwood, and placed at such a distance from each other, that a horse may gallop among them a great way, and easily avoid them: their tops are generally very large and spreading, and it is probably their shade and dropping which hinder any thing else growing in the rich ground among them; for in the open savannas, or where the ground is cleared by industry, there is great plenty of smaller vegetables. On the sea-coast, where the soil is frequently swampy drowned land, especially near the mouths of rivers, the trees are not tall, but shrubby; consisting of mangroves, brambles, bamboos, &c. not growing in the manner of groves, but in a continued thicket.

The trees on the isthmus are many of them the same as those in Mexico, and they have also many of the same animals.

The principal towns in this province are Porto-Bello and Panama.

The town of St. Philip de Porto-Bello is situated in the ninth degree thirty-four minutes thirty-five seconds, north latitude, and in the eighty-second degree five minutes, west longitude, from London; and stands on the declivity of a mountain that surrounds the whole harbour. Most of the houses are built of wood; but in some the first story is of stone, and the rest of timber; but they amount only to about one hundred and thirty: most of them are however large and spacious. It consists of one principal street, extending along the strand, with others smaller crossing it, and running from the declivity of the mountain to the shore. There are also some lanes in the same direction with the principal street, where the ground admits of it. Here are two large squares, one opposite to the custom-house, which is of stone, adjoining to the quay; the other faces the great church, which is also of stone, large, and decently ornamented. Here are also two other churches, one called Nuestra Señora de la Merced, with a convent of the same order; but both the church and convent are mean and ruinous; the other is St. Juan de Dios, which is a small building, in no better condition than the former.

At the east end of the town is a quarter called Guinea, where the negroes of both sexes, whether slaves or free, have their habitations. This quarter is much crowded when the galleons are here. The mulattoes and other poor families also remove either to Guinea, or to cottages erected near it, or built upon the occasion. Great numbers of artificers from Panama, who flock to Porto-Bello

to work at their respective businesses, likewise lodge in this quarter for cheapness. Towards the sea is a large tract between the town and Gloria-castle, where barracks are erected, and are principally filled with ships crews, who keep stalls of sweet-meats and other eatables brought from Spain: but at the conclusion of the fair the ships put to sea, and all these buildings are taken down; after which the town returns to its former tranquillity.

The name of this port signifying Fine Port, or Harbour, indicates its being commodious for all ships; and though its entrance is very wide, it is well defended by Fort St. Philip. On the south-side of the harbour, opposite to the anchoring place, is a large castle, called Saint Jago de la Gloria, to the east of which, at the distance of two hundred yards, begins the town, having before it a point of land projecting into the harbour, on which stood a small fort, called St. Jerom. All these were demolished by admiral Vernon, in 1739, with only six ships under his command. Among the mountains, which surround the whole harbour, is one at its utmost extremity, remarkable for its superior height. Its top is always covered with clouds, of a density and darkness seldom seen in those of this atmosphere: when these thicken, increase in blackness, and sink below their usual station, it is a sure sign of a tempest; while on the other hand, their clearness and ascent as certainly indicate the approach of fair weather. These changes, however, are very frequent and sudden.

The town is under the jurisdiction of a governor, who has the title of lieutenant general; he is always a gentleman of the army, and has under him the commanders of the forts that command the harbour. To these his jurisdiction is limited, the neighbouring country being full of mountains covered with impenetrable forests.

The inclemency of the climate of Porto-Bello is exceeding great: the heat is excessive, it being augmented by the situation of the town, which is surrounded with high mountains, without any interval to admit refreshing winds. The trees on these mountains stand so thick as to intercept the rays of the sun, and consequently prevent their drying the earth under their branches: hence arise copious exhalations, which form large clouds that fall in violent torrents of rain; but this is no sooner over, than the sun breaks forth afresh, shining with his former splendor; but has scarce dried the surface of the ground not covered by the trees, than the sun is again concealed, and fresh showers fall. These torrents of rain, which, by their suddenness and impetuosity, seem to threaten a second deluge, are accompanied with such dreadful tempests of thunder and lightning, as must daunt even the most resolute stranger; and this dreadful noise is prolonged by the echoes from the caverns of the mountains, and the howlings and shrieks of the many kinds of monkeys which dwell in their forests: but what is still worse, the air is so unhealthy, that the galleons, or other European ships, which stay here any time, seldom leave it without burying half, or, at least, one third of their men: hence it has been termed the grave of the Spaniards. It is universally asserted in that town, that the animals from other climates, on their being brought from Porto-Bello, cease to propagate their species; thus hens brought from Panama, or Carthagena, immediately on their arrival, lay no more eggs. The horned cattle sent from Panama, after being here a short time, lose their flesh so as not to be eatable, though there is plenty of pasture; and it is certain that horses and asses never breed here.

The number of inhabitants from the inclemency of the climate is very inconsiderable, and the greatest part of these are negroes and mulattoes, there being scarce thirty white families; for none stay at Porto-Bello but those whose employments oblige them to it, as the governor, the commanders of the forts, the civil officers of the crown, with the officers and soldiers of the garrisons.

Provisions are scarce, and consequently dear, particularly during the stay of the galleons and the fair, when there is a necessity for a supply from Carthagena and Panama. From the former are brought maize, rice, cassava bread, hogs, poultry, and roots; and from the latter cattle. The only thing in plenty here is fish, of which there is a great variety, and very good. The adjacent

country also abounds in sugar-canes, and they make sugar, molasses, and rum.

Snakes are extremely numerous, and the toads innumerable, swarming not only in damp and marshy places, as in other countries, but even in the streets, courts of houses, and all open places in general. Thus, when it has rained in the night, the streets and squares in the morning seem paved with them; so that you cannot step without treading on them, which is sometimes productive of troublesome bites; for besides their poison, they are so large that their teeth are severely felt. They are generally about six inches long, and nothing can be imagined more dismal than their croakings, during the night, in all parts of the town, the woods, and caverns in the mountains.

As the forests almost border on the houses, the tygers often enter the streets during the night, carrying off fowls, dogs, and other domestic animals, and sometimes even boys have fallen a prey to them. Besides the snares usually laid for them, the negroes and mulattoes who fell wood in the forests of the mountains are very dexterous in encountering them, and some even seek them in their retreats. Their arms are only a lance, two or three yards long, made of a very strong wood, with the point hardened in the fire, and a large scymetar. Thus armed, they stay till he flies at their left arm, which holds the lance, and is wrapped up in a short cloak of baize. Sometimes the tyger seems to decline the combat, but his antagonist provokes him with a slight touch of the lance, which he no sooner feels than he grasps it with one of his paws, and with the other strikes at the arm which holds it: upon this, the person nimbly aims a blow with his scymetar, which he kept concealed in the other hand, and hamstringing the creature, which immediately draws back enraged; but returning to the charge, receives another such stroke, by which he is deprived of his most dangerous weapons, and rendered incapable of moving: after which the person kills him at his leisure; and stripping off the skin, cuts off the head, with the fore and hind feet, and returns to the town with the trophies of his victory.

To return to Porto-Bello, which though so thinly inhabited, on account of its noxious air, becomes on the arrival of the galleons one of the most populous places in all South-America; for its situation on the isthmus, between the North and South Sea, the goodness of its harbour, and its small distance from Panama, have given it the preference, for the rendezvous of the joint commerce of Spain and Peru.

The inhabitants of Carthagena no sooner receive advice that the Peru fleet has unloaded at Panama, than the galleons set sail for Porto-Bello, where the concourse of people is immediately so great, as to raise the rent of a middling chamber with a closet, during the fair, to a thousand crowns, and some large houses are let for that season for four, five, or six thousand crowns.

No sooner are the ships moored in the harbour than a tent is erected in the square, with the sails of the ships, for receiving their cargo, and thither the bales are drawn on sledges by the crew of every ship. While the seamen and European traders are thus employed, the land is covered with droves of mules from Panama, each drove consisting of above a hundred, loaded with chests of gold and silver, on account of the merchants of Peru. Some unload them at the exchange, and others in the middle of the square; yet amidst the hurry and confusion of such crowds, no theft, loss, or disturbance is ever known. He who has seen this place during the solitary time when it was poor, and a perpetual silence reigned every where, while every place wore a melancholy aspect, must be filled with astonishment at the sudden change, to see the bustling multitudes, every house crowded, the square and streets encumbered with bales, and with chests of gold and silver, with the harbour full of ships and smaller vessels; and, in short, this abandoned town become the staple of the riches of the Old and New World.

After the ships are unloaded, and both the merchants of Peru and the president of Panama arrived, the fair comes under deliberation, and the deputies of the several parties repair on board the commodore of the galleons, where, in the presence of the commodore and the president of Panama, the former as patron of the Europeans, and the latter

latter of the Peruvians, the prices of the several kinds of merchandize are settled, and all preliminaries being adjusted in three or four meetings, the contracts are signed and made public, that every one may conform to them in the sale of his effects. Thus all fraud is precluded. The purchases and sales, with the exchange of money, are transacted by brokers, both from Spain and Peru. After this every one begins to dispose of his goods; the Spanish brokers embarking their chests of money, and those of Peru sending away the goods they have purchased in vessels called chatas, and bongos, up the river Chagre, and thus the fair of Porto-Bello ends.

With respect to the history of this town, few places have been more unfortunate: in 1595 it was taken and ransomed by Sir Francis Drake: in 1601 it was surprised by captain Parker: in 1699 it was taken by captain Morgan: in 1678, by captain Croxon; and in 1739, by admiral Vernon.

Panama, the most important place in the province, is built on the coast of the South Sea, in the eighth degree fifty-seven minutes forty-eight seconds, north latitude. But with regard to its longitude, there are various opinions, none of the astronomers were for a long time able, from the observations made on the spot, to ascertain it; so that it was doubtful whether it lies to the east or west of Porto-Bello; but Don Antonio de Ulloa has with great care determined the dispute, and proved that it stands thirty minutes west of Porto-Bello. The houses in general are of stone, but are only one story high; however, from the symmetry of the windows, they make a handsome appearance. Without the city walls is an open suburb, larger than the city itself, and the houses of the same materials and construction. The decorations of the private houses are elegant, but not costly, and though there are here no persons of such immense fortunes as in some other cities in America, yet it is not destitute of wealthy inhabitants, and all of them have a sufficiency.

This city had the misfortune, in the year 1670, to be sacked and burned by John Morgan, an English buccaneer, who had before taken Porto-Bello and Maracaybo, and retiring to the islands, every where published his design of going to Panama; upon which he was joined by many adventurers. He first sailed to the river Chagre, where he landed some of his men, and battered the castle with his ships; but when he began to think it adviseable to retreat, on account of the great number of his men killed and wounded by the fort, an extraordinary accident gave him success. An arrow shot from the bow of an Indian, lodged in the eye of one of Morgan's companions; who being rendered desperate with the pain, with a remarkable firmness and presence of mind, plucked the arrow from the wound, and wrapping one of its ends in cotton or tow, put it into his musket, which was ready loaded, and discharged it into the fort, where the roofs of the houses were of thatch, and the sides of wood. The arrow fell on one of the roofs, and immediately set it on fire, which was not at first observed by the besieged, who were busy in defending the place; but the smoke and flames soon informed them that the fort and magazine of powder were on the point of destruction. Such an unexpected accident filled them with terror and confusion; and every soldier, being eager to save himself, abandoned the works, in order to escape the double danger, of being either burnt or blown up. The commandant, however, resolving to do all in his power, still defended the fort, with sixteen or twenty soldiers, till he was slain; and Morgan obtained the fort, which was soon laid in ashes.

Having surmounted this difficulty, he, with great part of his men, sailed up the river in boats, leaving the ships at anchor; and having landed, marched towards Panama, and on the Sabana, a spacious plain before the city, had several skirmishes, in which Morgan always gained the advantage; so that he made himself master of the city; but found it almost forsaken; the inhabitants on seeing their men defeated, having retired into the woods. He now plundered it at his leisure; and after staying some days, agreed for a large ransom, to leave it without damaging the buildings; but after the payment of the money, the city was set on fire by accident; a misfortune that rendered it absolutely necessary to rebuild it, on which it

was removed to its present situation, which is about a league and a half from the former, and much more convenient.

In this city is a tribunal, or royal audience, in which the governor of Panama resides; and to this employment is annexed the post of captain-general of Terra Firma. The city has a court of inquisition, a cathedral, and a chapter, consisting of a bishop, and a number of prebendaries. The cathedral and convents are of stone; the latter are those of the Dominicans, Franciscans, Augustines, and fathers of Mercy; a college of Jesuits, a nunnery of the order of St. Clara, and an hospital of St. Juan de Dios.

The harbour is formed in the road by the shelter of several islands, where the ships lie very safe. At the bottom of the sea are a great number of pearls, and the oysters in which they are found are remarkably delicious. This kind of fishery is of great advantage to the inhabitants of all the islands; and of this fishery we shall give a particular description in treating of the trade of Panama.

The inhabitants are parsimonious, designing, insidious, and stop at nothing when profit is in view. The same selfishness and parsimony reigns equally among the women, who when they go abroad begin to imitate the dress of those of Peru, which consists only of a gown and petticoats nearly resembling those worn in Spain; but at home, on visits, and some particular ceremonies, their shift is the only cloathing from the waist upwards. The sleeves are very long, broad, and quite open at the wrist; and these, like the bosom, are adorned with very fine lace, the chief pride of the ladies of Panama. They wear girdles and five or six chaplets of beads about their necks, some set in gold, some of coral mixed with small pieces of gold, and others less costly; but all of different sizes; besides these, they have one, two, or more gold chains, from which hang some relics. Round their arms they wear bracelets of gold and tombac; also strings of pearls, corals, and bugles. Their petticoat reaches only from their waist to the calf of their legs, and from thence to a little above their ankle, a broad lace hangs from their under petticoat.

The land in the neighbouring country is left entirely to nature, nor does the least vestiges remain of its being formerly cultivated; whence the inhabitants are under the necessity of being supplied with every thing, either from the coast of Peru, or distant places in its own jurisdiction; and the ships of Peru are continually employed in exporting goods and provisions from that country, as the coasting barks are in bringing the produce of the several places in its jurisdiction; whence Panama is plentifully furnished with the best wheat, maize, cattle, and poultry, and the inhabitants are not so meagre and pale as those who live at Carthagena and Porto-Bello.

From what has been said of the commerce of Porto-Bello in the time of the galleons, an idea may be formed of that of Panama on the same occasion; this city being the first where the treasure from Peru is landed, and likewise the staple for the goods brought up the river Chagre. This commerce is of the greatest advantage to the inhabitants, both with regard to their letting their houses, the freight of vessels, the hire of mules and negroes. The city, during the absence of the armada, is never without a great number of strangers, it being the thoroughfare for all going to the ports of Peru in the South Sea, as also for any coming from thence to Spain; to which must be added the continual trade carried on by the Peruvian ships, which bring variety of goods; as meal of different sorts, wine, brandy, sugar, olives, oil, tallow, leather, and the like. The ships from Guayaquil bring cacao, and quinquina, or Jesuit's bark. The coasting barks, which make frequent trips from the adjacent ports, supply the city with hogs, poultry, hung-beef, hog's-lard, plantains, roots, and other food. The dearth of provisions in the city, and its district, occasioned by the great distance from whence they are brought, is amply compensated by the multitude and value of the pearls found in the oysters of its gulf, particularly those near the islands Del Rey, Tabaga, and others, amounting in the whole to forty-three in number, forming a small archipelago. At present they are found in such plenty, that there are few persons of substance near Panama who do not employ a

part of their slaves in this fishery, which is performed in the following manner:

The owners of negroes employ such as are both expert swimmers, and are capable of holding their breath a long time: these they send to the islands, where they have huts built for their lodgings, and boats that hold eight, ten, or twenty negroes, under the command of an officer. In these boats they go to such parts as are known to produce pearls, where the depth of the water does not exceed twelve or fifteen fathoms. Here they come to an anchor, and the negroes having a rope fastened round their bodies, and the other end to the side of the boat, they carry with them a small weight to accelerate their sinking. On reaching the bottom, they take up an oyster, which they put under their left arm, a second they hold in their left hand, and a third in their right; with these three oysters, and frequently another in their mouth, they rise to take breath, and put them in a bag. When they have rested themselves some time, and recovered their breath, they perform a second diving; and thus continue till they have completed their task, or their strength fails. Each of these divers is obliged to deliver daily to his master, a certain fixed number of pearls; so that when they have the proper number of oysters in their bag, they begin to open them, and deliver the pearls to the officer, till they have completed the number required; and if the pearl be but formed, it is sufficient, without any regard to its being small; and the remainder, however large or beautiful, are the negro's own property, the master not having the least claim to them, the slaves being allowed to sell them to whom they please, though they are generally purchased at a very small price by the master. The negroes cannot however every day make up their number, and therefore are obliged to supply the deficiency.

Besides the fatigue of this fishery, from the oysters strongly adhering to the rocks, they are in no small danger from several kinds of fish, which either seize on them, or crush them by their weight against the bottom. The fishery on the whole coast is obnoxious to the same dangers; but these fish are much more frequent where such riches abound. The tintoreras, and taburones, which are of an enormous size, feed on the bodies of these unfortunate fishermen; and the mantas or quilts press them to death. It wraps its fins round a man or any other animal that comes within its reach, and immediately deprives it of life by this pressure. This fish, though of a prodigious size, in shape resembles a thorn-back.

Every negro carries with him a sharp knife to defend himself against these fishes, and if one of them offers to assault him, he attempts to strike it, on which the fish instantly retires. The officers keep a watchful eye on these voracious animals, and on discovering them, shake the rope fastened to the negro's body to put him on his guard; and many upon seeing the diver in danger, have thrown themselves into the water, and dived down to his assistance: but too often all their dexterity and precaution are incapable of preventing the diver being devoured, or his losing a leg or an arm; and though several schemes have been tried to prevent these melancholy accidents, they have hitherto failed of success.

The pearls of these fisheries are generally of a good water, and some remarkable for their shape and size. A few of them are sent to Europe, but the greatest part are carried to Lima, where the demand for them is very great, they being not only universally worn there by persons of rank, but from thence they are sent into the inland parts of Peru.

Before we take leave of the Isthmus, we ought not to omit observing, that near the north-west point of the gulph of Darien, a settlement was attempted by the Scots in 1699, who built a fortress, which they named New Edinburgh, and denominated the surrounding country New Caledonia. Several English and Hamburg merchants engaged deeply in the adventure, and they were not only assisted by an act of the Scots parliament, but by letters patent from king William III. The territory of which the adventurers took possession, was governed by eight Indian chiefs, then at war with the Spaniards, who joyfully received the Scots, in hopes of being able, by their assistance, to expel their enemies.

For some time the new colony flourished extremely, but their good fortune soon raised the jealousy of the English East India company, and the complaints of the court of Madrid. The former represented this as an infringement of their charter, and the latter as a violation of the treaty subsisting between Spain and Great Britain. Unhappily the English parliament interposed, and addressed his majesty to vacate the charter granted to the Scots company. But though the Scots defended their rights with all the arguments of reason and justice, the influence of their adversaries was too powerful, and all measures were taken to ruin the infant settlement. The Hamburgers were prevailed on to withdraw their subscriptions; the merchants of London were even threatened with the ministerial displeasure; and orders were sent to the English plantations to deny the colonists provisions and assistance. In short, such was the power of faction and private interest, that the nation was robbed of the benefit of one of the most useful establishments ever projected, the advantages of which must have fully appeared whenever a rupture happened between England and Spain; for while the isthmus continued in the possession of the colony, the Spanish treasures must either have been detained in America, or have fallen into the hands of the English.

SECT. II.

Of CARTHAGENA.

The Situation, Extent, Face of the Country, Vegetables, and Animals of that Government: its Climate, and the Diseases of the Inhabitants: a particular Description of the City of Carthagena, its Trade, and Revenues; with the Manners and Customs of the Inhabitants.

THE government of Carthagena has the river of Santa Martha on the east, which parts it from the province of that name; it has Popayan on the south; the river and gulph of Darien on the west; and the North sea on the north-west and north.

The country consists of hills and valleys, covered with thick forests and groves. It is impossible to view without admiration the rich and perpetual verdure of the woods and plants it naturally produces: but of these advantages the natives make little use, their innate sloth and indolence not allowing them to cultivate the gifts of nature, which here seem to be dealt out to them with a lavish hand.

Though Carthagena has not the convenience of being furnished by its soil with the different kinds of European vegetables, it is in no want of others that are far from being contemptible, and of which the inhabitants eat with pleasure: and though the Europeans at first seem to dislike their ordinary food, they soon become so well accustomed to it, as to forget that of their own country. Thus, though the constant moisture and heat of this climate will not admit of the cultivation of wheat, barley, and other European grain, it produces excellent maize and rice in such abundance, that a bushel of maize usually produces an hundred. From this grain they make the bollo, or bread used in this country; and also use it in feeding hogs and fattening poultry. The method of making it is to soak the maize, and afterwards bruise it between two stones; it is then put into large bins filled with water, where, by rubbing and shifting it from one vessel to another, they clear it from its husk, and afterwards grind it into a paste, and wrapping it up in plantain leaves boil it in water, and use it as bread; but in twenty-four hours time it becomes tough, and has a disagreeable taste. In families of distinction the bollo is kneaded with milk, which greatly improves it. They also make of the flour of maize several kinds of pastry, and a variety of foods equally palatable and wholesome. They have likewise cassava bread, which is common among the negroes.

Wheat bread is not uncommon at the city of Carthagena; but as the flour comes from Spain, it is too dear for the common people, and is only used by the Europeans settled at Carthagena and a few Creoles, and by these

these only with their chocolate and conserves. At all other meals they by custom prefer bollo to wheat bread.

In this country the interwoven branches of the trees form a shelter impenetrable both to heat and light. The trees are not only large and lofty, but of an admirable variety, and entirely different from those of Europe. The principal of these for dimensions, are the acajou, the cedar, the maria, and the balsam tree. Of the first are made the vessels used for fishing, and for the coast and river trade within the jurisdiction of this government; and the wood is compact, fragrant, and beautiful. The cedar is of two kinds, white and reddish; but the last is most esteemed. The maria and the balsam tree, besides the usefulness of their timber, distil those admirable balsams called maria oil, and balsam of Tolu, so called from a village, in the neighbourhood of which it is found in the greatest plenty, and of a peculiar excellence.

Besides these trees here are also the tamarind, the medlar, the sapote, the papah, the cassia, the palm, and the manchineel. The palm trees, rising with their tufted heads above the branches of the others, form a grand perspective on the mountains: these are of several kinds, and palm wine is extracted from them all, by boring a hole in the trunk, in which is placed a tap, with a vessel under it, to receive the liquor. Guaiacum and ebony trees are equally common, and their hardness nearly approaches to that of iron.

Here are also many cotton trees, some planted and cultivated, and these are the best; others spontaneously produced. The cotton of both is spun and made into several sorts of stuffs, which are worn by the negroes and the country Indians.

The cacao tree also grows in great plenty on the banks of the river Magdalena, and in other situations, which the tree delights in; but those in the jurisdiction of Carthagea greatly excel what are to be found in other parts, both in the size and the goodness of the fruit. The chocolate made of it is little known in Spain; for as it is more esteemed than that of other countries, the greatest part of it is consumed there, or sent to other parts of America.

There are here a vast number of delicious fruits that evidently display the exuberance of the soil, some resembling those of Spain, and others peculiar to the country. Those of the same kind with the Spanish fruits are melons, water-melons, grapes, oranges, medlars, and dates. The grapes are not equal to those of Spain; but the medlars as far exceed them. With regard to the rest there is little difference.

Among those peculiar to the country, the preference doubtless belongs to the pine-apple; hence its beauty, smell, and taste have acquired it the denomination of queen of fruits. Many of the others have been mentioned already, and here are also plantations of sugar-canes.

We shall now proceed to the animals, some of which are tame, and contribute to the use and pleasure of the inhabitants; others are wild, and of such different kinds and qualities, as display in a surprising manner the wonderful variety of the works formed by the Author of nature. The quadrupeds and reptiles frequent the dry and desert places, and are distinguished by the prodigious variety of spots upon their skins; while the vivid plumage of the feathered race glows with exquisite beauty, and the brilliant scales of one class of reptiles conceal the most active poisons. The only tame animals are horned cattle and hogs, of which there are the greatest plenty. Though the beef is not absolutely bad, it cannot be said to be palatable; for the constant heat of the climate renders the beef lean, and deprives it of that succulency it would otherwise acquire; but the pork is delicate, and exceeds any in Europe. There are here wild boars, deer, rabbits, and tygers; the last make great havock not only among the cattle, but among the human species: their skin is very beautiful, and some are as large as small horses.

Here are also leopards, foxes, armadillos, squirrels, and many others, besides innumerable kinds of monkeys, some remarkable for their size, and others for their colour. The fox's artifice in defending itself against dogs, or other animals, by whom it is pursued, by voiding its urine on its own tail, and sprinkling it on them, here effectually

answers its intention, the smell being so fetid, that the dogs are greatly disordered by it, by which means the fox escapes. Indeed the stench is so great, that it may be smelt a quarter of a league from the place, and very often for half an hour after. What is here called the fox is little bigger than a large cat, but delicately shaped, and has a very fine skin of a cinnamon colour; the tail is not very bushy, but the hair is spongy, and forms a bunch proper for this method of defence.

The birds seen in this hot climate are so very numerous, that it is impossible to give a full idea of the beauty and brilliancy of their various plumage; but the cries and croakings of some disturb the pleasure that would arise from the warblings of others. Here we see an instance of the equity observed by nature in distributing her favours, the plumage of those birds being the most beautiful whose noise is the most offensive; while on the other hand, those whose appearance has nothing remarkable, excel in the sweetness of their notes. This is particularly evident in the guacamayo, the beauty and lustre of whose colours are absolutely inimitable by painting, and yet nothing can make a more shrill and disagreeable sound.

The most extraordinary of all the birds seems to be the tulcan, or preacher. It is about the size of a common pigeon, but its legs much larger; its tail is short, and its plumage of a dark colour; but spotted with yellow, purple, blue, and other colours, that have a beautiful effect on the dark ground. Its head greatly exceeds all proportion with respect to its body; but it would not otherwise be able to support its bill, which is at least six or eight inches from the root to the point: the lower mandible closes with the upper through the whole length, and both diminish insensibly to the end, when it suddenly bends, and terminates in a strong sharp point. The tongue is formed like a feather, and, as well as the inside of its mouth, is of a deep red. The bill is variegated with all the bright colours that adorn the plumage of other birds: at the base, and also at the convexity, it is generally of a light yellow, forming a kind of ribbon, half an inch in breadth. The rest is of a fine deep purple, except two streaks near the root of a rich scarlet. The name of preacher has been given to this bird from its custom of perching on the top of a tree above his companions while they are asleep, and making a noise like ill-articulated sounds, moving its head to the right and left, in order to keep off the birds of prey from seizing on the others. They are easily rendered so tame as to run about the house, and come when called. Their usual food is fruit; but the tame eat other things, and in general whatever is given them.

Another extraordinary bird is the gallinazo, which is about the size of a pea-hen; but the head and neck somewhat larger. From the crop to the base of the bill, instead of feathers, it has a wrinkled glandulous rough skin, covered with small warts and tubercles. Its feathers are black, which is also the colour of the skin: its bill is well proportioned, strong, and a little crooked. These birds are so numerous and tame in the city of Carthagea, that it is not uncommon to see the ridges of the houses covered with them. They are also of great service on account of their cleaning the city from all kinds of filth, greedily devouring any dead animal, and any thing most offensive. They have so quick a scent, that they will smell a dead body at the distance of ten or twelve miles, and never quit it till they have entirely reduced it to a skeleton. The multiplicity of these birds found in such hot climates is of the utmost consequence, as otherwise the putrefaction caused by the excessive heat would render the air insupportable to human life. At their first rising they fly heavily, but soon after dart out of sight. Though their legs are strong and well proportioned, they hop along on the ground in a very awkward manner. They have the toes forward turning inwards, and one in the inside turned a little backwards; so that the feet interfering occasions their hopping and walking in the above manner. Each toe has long and thick claws.

There is another species of these birds, somewhat larger than the former, but only to be found in the country. In some of these the head and part of the neck are red, in some white, and in others a mixture of both these colours,

lours. At a small distance from the crop they have a ruff of white feathers; and are equally fierce and carnivorous with the former: these are called the kings of the gallinazos; probably because the number of them is but small; and it is observed, that when one of these birds has fastened on a dead beast, none of the others approach, till he has first eaten the eyes, which is generally the part he begins with first; and is gone to another place, when they all flock to the prey.

Batts are very common all over this government; but Carthagenas is infested with such an infinite number of them, that after sun-set, when they begin to fly, they may, without exaggeration, be said to cover the streets like clouds. They are the most dexterous bleeders both of men and cattle; for the inhabitants being obliged, by the excessive heats, to leave the windows of their chambers open, the batts get in, and if they find a person asleep with the foot bare, they insinuate their tooth into a vein, with all the art of a most expert surgeon, sucking the blood till they are satiated, after which it flows out of the orifice to the great danger of the person's life. The reason why the puncture is not felt, is attributed to the gentle and refreshing agitation of the air by the batt's wings, throwing the person into a deeper sleep, and thus preventing his feeling the slight puncture. This also happens to horses, mules, and asses; but beasts of a thicker skin are not so much exposed to it. This account, which is extracted from the learned Don Antonio de Ulloa, is confirmed by M. Condamine, who observes, that there are some of a monstrous size; and that they have entirely destroyed at Borja, and other places, all the black cattle which the missionaries had introduced there.

The great number of reptiles and insects is not only an inconvenience to the inhabitants, but they are even very dangerous. The most common of the snakes, and at the same time the most poisonous, are the coral-snakes, the rattle-snakes, and the willow-snakes. The first, which are generally between four and five feet in length, and an inch in diameter, make a very beautiful appearance, their skin being variegated with a vivid crimson, green, and yellow. The head is long and flat, like a viper. Each mandible is furnished with a row of pointed teeth, through which, during the bite, they insinuate the poison. The person bit swells to such a degree, that the blood gushes out through all the organs of sense, and even the coats of the veins at the extremities of the fingers burst.

The willow-snake resembles in colour and form a stick of that tree, and as they frequently hang from the boughs, really seem to be a part of it, till a too near approach unhappily discovers the mistake. Though their poison is less active than that of the others, it is mortal, unless a remedy be speedily applied.

Scolopendra not only swarm in this country, but are of a monstrous size, and are the more dangerous from their breeding in the houses: they are generally a yard in length, and some a yard and a quarter, with about five inches in breadth. The back and sides are covered with hard scales of a musk colour tinged with red; but so articulated as not in the least to impede their motion, and yet so strong as to defend them against any blow; so that you can only kill them by striking them on the head. They are very nimble, and their bite, without timely application, proves mortal.

Scorpions are not less common, and of different kinds, as black, red, musk colour, and some yellow.

The soldier-snail, of which we have already given a description, is here also dangerous, for the gripe which it gives with its two claws is attended with the same symptoms as the sting of a scorpion.

There are here an infinite number of butterflies, which, though they differ in their figure, colours, and decorations, it is difficult to determine which are the most beautiful. But whatever pleasure there be in seeing of these, it is far from equalling the pain which arises from the numberless muskettoes, of which there are large clouds of four different sorts, all of them extremely troublesome.

The climate of Carthagenas is excessive hot. From the month of May to the end of November is the season

they call winter, there being a continual succession of thunder and tempests, the clouds precipitating the rain with such impetuosity, that the streets of the capital have the appearance of rivers, and the country of an ocean. The inhabitants make use of this opportunity of filling their cisterns, this being the only sweet water they can procure. From the middle of December to the end of April the rains cease, and the weather becomes agreeable, the heat being something abated by the north-east winds. This season they call summer; besides which there is another called the little summer of St. John, as about the festival of that saint the rains are intermitted, and refreshing gales begin to blow, and continue about a month.

The almost invariable continuance of the great heats, without any sensible difference between night and day, occasions such profuse perspiration, that the wan and livid complexion of the inhabitants would make a stranger suspect their being just recovered from some terrible distemper. In all their motions there is something relax and sluggish; it even affects their speech, which is soft and slow, and their words generally broken: yet, notwithstanding these appearances of sickness and debility, they enjoy a good state of health. Strangers from Europe generally retain their strength and ruddy complexion about three or four months; but afterwards they are no longer to be distinguished by their countenances from the old inhabitants.

The singularity of the climate is probably the cause of the singularity of several diseases which here afflict mankind: some of these attack only the Europeans newly landed, and others are common to the inhabitants. The first kind carry off a multitude of people, and extremely thin the crews of European ships, but seldom lasts above three or four days. They are caused in some persons by cold, and in others by indigestion, which soon bring on the black vomit, which very few recover. Some, when the vomit attacks them, are seized with such a delirium, that, were they not tied down, they would tear themselves to pieces, and expire in the midst of the most terrible phrensy.

The inhabitants throughout the whole extent of the government of Carthagenas are very subject to the leprosy; and, in order to put a stop to the contagion of this distemper, there is without the capital an hospital called San Lazaro, in which all persons of both sexes labouring under this distemper are confined, without any distinction of age or rank; and if any refuse to go, they are forcibly carried thither. But from thence the distemper is suffered to spread; for their allowance being too small for their subsistence, those who have no other support are permitted to beg in the city, and from their intercourse with those in health, the number of lepers never decreases. The hospital resembles a little town. Every person at his entering it, where he is to continue during life, builds a cottage, in which he lives in the same manner as before in his own house, none going out unless to ask alms. The ground on which the hospital stands is encompassed by a wall, and has only one gate, which is always carefully guarded. They live a long time under this distemper, and as it greatly increases the natural desire of coition, to avoid the disorders that would result from this, which is almost impossible to be controuled, they are allowed to marry.

The itch and herpes are equally frequent among such Europeans as are not seasoned to the climate; and if neglected in the beginning, it is dangerous to attempt a cure.

A more singular and remarkable distemper, though less common, is the culebrilla, or little snake, which is perhaps a tumor caused by malignant humours settled longitudinally between the membrane of the skin, and daily increasing in length, till it surrounds the part affected, which is usually the arm, thigh, or leg. The external indications of it are a round inflamed tumor, a quarter of an inch thick, attended with pain, but not vehement, and a numbness of the part, which often ends in a mortification. The natives, who firmly believe it to be a small snake, are very skilful in removing it. They first examine where the head is, as they call it, to which they apply

apply a small suppurative plaster, and gently foment the whole tumor with oil. The next day the skin under the plaster is found divided, and through the orifice appears a kind of white fibre, about the size of coarse sewing thread, which they carefully fasten to a thread of silk, and wind the other end of it about a card, rolled up like a cylinder. After this they repeat the fomentation with oil, and the following day continue to wind about the cylindric card the part of this small fibre that appears in sight, and in this manner proceed till the whole is extracted, and the patient entirely cured. During this operation their chief care is not to break the culebrilla, because, say they, it would then cause a humour to spread through the body, and produce a great quantity of such little snakes, as they will have them to be, whence the cure would become extremely difficult.

The city of Carthagena is situated in the tenth degree twenty-five minutes forty-eight seconds north latitude, and in the seventy-seventh degree twelve minutes west longitude, three hundred and twenty miles south of Port Royal in Jamaica, on a sandy plain, which forms a narrow passage on the south-west to a part called Tierra Bomba, as far as Bocca Chica. The fortifications both of the city and suburbs are constructed in the modern manner, and lined with free-stone. The garrison, in time of peace, consists of ten companies of regulars, each containing seventy-seven men, including the officers, besides several companies of militia. The city and suburbs are well laid out, the streets being straight, broad, uniform, and well paved. The houses are built of stone, except a few of brick, but chiefly consist of only one story above the ground-floor; however, the apartments are well contrived. All the houses have balconies and lattices of wood, it being more durable in this climate than iron, which is soon corroded and destroyed by the moisture and acrimonious quality of the nitrous air, from whence, and the smoaky colour of the walls, the outside of the buildings make but an indifferent appearance. There are here a cathedral, a church dedicated to the Trinity, and a chapel of ease. The orders that have convents are those of St. Francis in the suburbs, St. Augustine, St. Dominic, La Merced, that of the Jacobines, and the Recollects, a college of Jesuits, and an hospital of San Juan de Dios. The nunneries are those of St. Clara and St. Teresa. The churches and convents are sufficiently capacious, but not much ornamented in the inside.

Carthagena, together with its suburbs, is equal to a city of the third rank in Europe. It is well peopled; but most of the inhabitants are descended from the Indians. The governor resides in the city; it has also a bishop, whose spiritual jurisdiction is of the same extent as that of the military and civil government: there is also a court of inquisition. Besides these tribunals, there is a secular magistracy, consisting of regidores, from whom every year are chosen two alcaldes, who are generally persons of great distinction; and likewise a treasury, in which all the taxes and money belonging to the king are received.

The bay is one of the best not only on the coast, but in all the known parts of the country. It extends two leagues and a half from north to south, has a sufficient depth of water, with good anchorage, and is so smooth that the ships are no more agitated than on a river. However, the many shallows at its entrance make the assistance of a good pilot necessary. The tides in this bay are very irregular, which is the case with almost the whole coast: it being often seen to flow a whole day, and afterwards ebb away in four or five hours; yet the greatest alteration observed in its depth is two feet, or two feet and a half. The bay abounds with a great variety of wholesome palatable fish, and a multitude of large turtle; but it is greatly infested with sharks, which are extremely dangerous to seamen, as they immediately seize every person they discover in the water, and sometimes even venture to attack them in their boats.

In this bay the galleons from Spain wait for the arrival of the Peru fleet at Panama, and on the first advice of this sail away to Porto Bello. It is the first place in America at which the galleons are allowed to touch, and thus it enjoys the first-fruits of commerce by the public sales made there. The sales, though not attended with

the same formalities as those of Porto Bello, are very considerable: for the traders of the inland provinces of Quito, Popayan, and Santa Fe, lay out great sums for several sorts of goods, and those species of provisions that are most wanted in their respective countries. The traders bring gold and silver in specie, ingots, and dust; as also emeralds; for besides the silver mines worked at Santa Fe, which are very numerous, there are others which yield the finest emeralds. The fair of Carthagena occasions a great quantity of shops to be opened, and filled with all kinds of merchandize. This is a time of universal profit; to some by letting lodgings and shops; to others by the increase of their respective trades; and to others by the labour of their negro slaves, whose pay during this busy time is proportionably increased; and it is not uncommon for slaves, out of their savings, after paying their masters, and providing themselves with necessities, to purchase their freedom. This commercial tumult lasts only while the galleons continue in the bay; for they are no sooner gone than silence and tranquility resume their former place; for, with regard to the trade carried on with the other governments, it is not very considerable.

The inhabitants of this city may be divided into different tribes, who derive their origin from a coalition of whites, negroes, and Indians. The Europeans are not numerous; most of them, after acquiring a competent fortune, either return to Spain, or remove into the inland provinces, in order to increase it. The Europeans and Creoles settled at Carthagena carry on the whole trade of the place, while the other inhabitants are indigent, and reduced to have recourse to hard labour for their subsistence. The dress of the whites, both men and women, differs but little from that worn in Spain; for persons in high posts have habits of the same form as in Europe, but with this difference, that they are all very light, the waistcoats and breeches being of fine linen, and the coat of some other thin stuff. Neckcloths are very uncommon, the neck of the shirt being adorned with large gold buttons, which generally hang loose. On their heads they generally wear a cap of fine linen, and others go entirely bare-headed. Fans are worn by the men: these are made of a kind of palm, in the form of a crescent, with a stick of the same wood in the middle.

The Spanish women wear a kind of petticoat made of thin silk, without any lining, and on their body a very thin white waistcoat; but even this is only worn in what they call winter, it being insupportable in summer. They, however, always conceal their breasts. When they go abroad they wear a mantelet, and on the days of precept go to the mass at three in the morning, and return before the violent heat of the day, which begins with the dawn.

Those women who are not perfectly of the white class wear over the above petticoat one of taffety, of any colour they please, except black; this is pinked all over, to shew the other they wear under it. On the head is a cap of fine white linen covered with lace, in the shape of a mitre, well starched, and terminating forwards in a point. They never appear abroad without this and a mantelet on their shoulders. The ladies and other native whites use this as their undress: instead of shoes they wear, both within and without doors, a small kind of slippers. In the house their whole exercise consists in sitting in their hammocks, and swinging themselves for air. In these they pass the greatest part of the day, and men as well as women often sleep in them, without regarding the inconvenience of being unable to lie at full length.

Both sexes possess a great deal of wit and penetration, with a genius proper to excel in all kinds of mechanic arts. This is particularly conspicuous in those who apply themselves to literature, who at a tender age shew a judgment which in other climates is attained only by a long series of years. This happy disposition continues till they are between twenty and thirty years old, after which they generally decline as fast as they rose; and frequently before they arrive at that age, when they should begin to reap the advantage of their studies, indolence checks their progress, and they forsake the sciences, leaving the surprising effects of their capacity imperfect. This is doubtless owing to the want of proper objects for exercising

exercising their talents; and the small hopes of being preferred to any post answerable to the pains they have taken. However, there are often seen here persons of extensive talents, both in the speculative and practical sciences, who retain them in all their vigour to a very advanced age.

Charity is a virtue, in which the inhabitants of Cartagena remarkably excel; and did they not exert it in the most generous manner towards the Europeans who come thither to seek their fortune, they would often perish with sickness and poverty.

The houses of persons of wealth and distinction are served with great delicacies; most of the dishes are dressed in the manner of the country, and some of them are so agreeable, that foreigners are no less pleased with them than the natives. One of their favourite dishes is the *ajiaco*, there being scarcely a genteel family without it. This is composed of pork fried, birds of several kinds, plantains, maize, paste, and several other things highly seasoned with pimento.

The inhabitants of any figure generally make two meals a day, besides a slight repast. Their breakfast is usually composed of some fried dish, pastry of maize-flour, followed by chocolate. Their dinner consists of a much greater variety; but at night they have only a slight regale of some sweetmeats and chocolate. Some families indeed affect the European custom of having regular suppers, though they are generally looked upon at Cartagena as detrimental to health.

The use of brandy is so common, that the most sober people never omit drinking a glass of it at about eleven o'clock in the morning, alleging that it strengthens the stomach, weakened by the constant perspiration, and creates an appetite. Chocolate is so common that there is not a negro slave but constantly allows himself a regale of it after breakfast, and the negro women sell it ready made about the streets at the rate of a quarter of a real, or about five farthings a dish. This, however, is mixed with maize flour; but that used by people in good circumstances is neat and worked as in Spain. This they also constantly drink an hour after dinner, but never without eating something with it. They also make great use of sweetmeats and honey, never drinking a glass of water without previously eating some sweetmeats.

The passion for smoking is no less universal: the ladies and other white women smoke only in their houses; but the women of the other casts, and the men in general, regard neither time nor place. This custom the ladies learn from their childhood, probably from their nurses, who are negro slaves; and it is so common among persons of rank, that those who come from Europe learn it, if they intend to make any considerable stay in the country.

The natives are fond of balls, which in houses of distinction are conducted in a very regular manner. They open with Spanish dances, and are succeeded by those of the country, which are not without spirit and gracefulness. These are accompanied with singing, and the parties seldom break up before day-light: but the balls of the populace are intermixed with indecent gestures, and a continual round of drinking, which frequently produces quarrels.

Their burials and mournings are also something singular, and in these they endeavour to display their grandeur. If the deceased be a person of rank, his body is placed on a pompous catafalco erected in the principal apartment of the house, amidst the blaze of tapers. The corpse lies there twenty-four hours, or longer, during which it is visited by the acquaintance of the family, and the lower class of women, who come to lament the deceased. These women, who are generally dressed in black, come in the evening, or during the night, into the apartment where the corpse lies, and throwing themselves on their knees, rise and extend their arms to embrace it; then in a doleful tone, mixed with horrid cries, they begin their lamentations, which always conclude with the name of the deceased. Afterwards they begin in the same disagreeable tone his history, rehearsing all his good and bad qualities, not even omitting his amours, till at length, quite spent, they withdraw to a corner of the apartment stored with wine and brandy, on which they never fail plentifully to regale themselves. No

sooner are these departed from the body, than others succeed, till the women have taken their turn. The same is afterwards repeated by the servants, slaves, and acquaintance of the family, which continues without intermission during the remainder of the night. The funeral is also accompanied with the like noisy lamentations, and even after the corpse is deposited in the grave the mourning is continued in the house for nine days; during which time the mourners never stir from the apartment, where they receive the compliments of condolance, and in the night are attended by their relations and intimate friends.

Before we conclude this article, it will be proper to give a concise account of the hostilities this city has suffered from foreigners, by whom it has been frequently attacked, taken, and plundered. The first invasion was made in 1544, soon after its establishment by certain French invaders, conducted by a Corsican pilot. In 1585 it was taken and almost destroyed by Sir Francis Drake, the scourge of the new Spanish settlements. M. de Pointis came before it in 1597 with a squadron of privateers, under the protection of the French king; and, after obliging the fort of Bocca Chica to surrender, whereby the entrance of the bay was laid open, he landed his men, and besieged Fort Lazaro, the taking of which was followed by the surrender of the city; but the capitulation was no security against the rage of avarice, which had consigned it to pillage. This conquest has been attributed to a private correspondence between the governor and Pointis; and what increases the suspicion is, that he embarked on board the French squadron, at his departure, taking with him all his treasures and effects, none of which had suffered by the general calamity. In 1741 it sustained a long siege from the English under admiral Vernon; but they were obliged to retire after they had made themselves masters of most of the forts and harbours, which was principally owing, besides the strength of the place, to the great mortality among the troops, and the differences that arose between the admiral and general.

SECT. III.

A concise Account of the Government of Santa Martha, Rio de la Hacha, Venezuela, New Andalusia, and New Granada; their Situation, Extent, Climates, Produce, and principal Towns.

THE government of Santa Martha is bounded on the east by Rio de la Hacha, on the south by New Granada, on the west by Cartagena, and on the north by the North sea; extending about a hundred and forty miles from east to west, and about two hundred from north to south.

The country is extremely mountainous, and some of these mountains, especially that called Santa Martha, is said to be higher than the pike of Teneriffe. From hence result considerable advantages to the inhabitants, the air being cooler and more wholesome than in some other parts of America near the equator. The air, however, is extremely sultry by the sea-coast; yet the mountains in the interior country are covered with snow, and the cold so intense, that while the people in one place are scorched with the sun-beams, others at sixty miles distance are shivering with the rigours of the season. It rains very much in the months of September and October in that part of the country which lies towards the sea-coast; but there is little rain in the other months, because the east and north winds which blow there disperse and drive away the clouds. The valleys of this country are exceeding fruitful, and produce oranges, lemons, pine-apples, grapes, and many other fruits. The country abounds in rich gold mines, and in the mountains are found sapphires, emeralds, jasper, and marble most beautifully veined. At a league and a half's distance from the city of Santa Martha are salt-ponds, where they get very good salt, which is exported into the neighbouring provinces.

The city of Santa Martha, which gives name to the province, is situated on a branch of the Rio Grande near the

the mountains of Santa Martha, in the eleventh degree thirty-four minutes north latitude. Formerly the city was flourishing and populous; but is much decayed since the Spanish fleets no longer touch there. The inhabitants amount to about three thousand souls, including all degrees: it is honoured with the residence of the governor of the province, and is the see of a bishop, suffragan to the metropolitan of New Granada. The houses are built with canes, and covered with palmeto leaves; and some with pantiles. This town has frequently suffered by hostile fleets; for in 1525 it was entirely ruined by Sir Francis Drake, and the next year was plundered by Sir Anthony Shirley; in 1630 it was taken by the Dutch, and was afterwards frequently pillaged by the Buccaneers.

On the east side of the Rio Grande, about twenty miles from the capital, is seated the town of Baranca del Malambo, a place of consequence on account of the brisk trade carried on by the inhabitants. The merchandize of New Granada is brought down hither in boats, and conveyed to the bay about forty miles below the town, or else directly to Santa Martha by a branch of the Rio Grande.

On the southern frontier of Santa Martha is seated the little province of Rio de la Hacha, in the form of a peninsula, between the gulph of Venezuela on the east and a bay of the North sea to the westward. The country is pleasant, tolerably healthy, and exceeding fertile. The rains are not so violent as in Santa Martha, though there are frequent tornadoes and thunder showers. In the middle of the province are some mines of jasper and chalcodony, and on the coast a very rich pearl-fishery, in which the Indians are chiefly employed, and, notwithstanding the vigilance of the Spaniards, reap the chief profits. The inhabitants of the open country still enjoy the blessing of liberty, and form a numerous, resolute, and brave nation.

Rio de la Hacha, the capital, which gives name to the province, and takes its own from the river, at the mouth of which it is situated, was formerly called Nuestra Señora de los Remedios, and stands in the eleventh degree six minutes north latitude, about a hundred and twenty miles from the city of Santa Martha, and contains only about a hundred houses. The town was formerly rich, but it was so often taken by the Buccaneers, that in 1682 the Spaniards abandoned it, but were afterwards induced to return, and defend it by building strong fortifications.

Venezuela, the next province, is bounded on the east by New Andalusia, on the south by New Granada, on the west by Rio de la Hacha, and on the north by the North sea, and includes the district of Caraccas; extending, according to some authors, four hundred miles along the coast of the North sea, and near three hundred into the interior country. The climate is moderately temperate, and the soil so rich and fertile as to produce two harvests every year, and to feed great herds of black cattle and flocks of sheep. The famous lake of Maracaibo, which is eighty leagues in compass, adds equally to the beauty and convenience of the province; but though the water of the lake and the rivulets which flow from it are drank, yet they are brackish and unwholesome, and the natives are in great want of fresh water. The inhabitants of this province are said to exceed a hundred thousand, including Spaniards, mulattoes, and negroes.

Venezuela, or Cora, the capital of the province, is seated on the north-east part of the peninsula, on the banks of the North sea, and lies in about the tenth degree forty minutes north latitude. It is the residence of the governor, the seat of the courts of justice, and the see of a bishop; but is neither remarkable for its commerce, its opulence, or buildings: its situation alone in the midst of the waters engages attention, and from hence it is that it has been called Venezuela, or Little Venice.

The town of Maracaibo, though inferior in dignity to the former, is more elegant, pleasant, and wealthy. It fronts the lake of the same name, and has a great number of splendid buildings, adorned with balconies that command a prospect of the lake at a great distance. The inhabitants are reckoned to exceed four thousand, eight

hundred of whom are said to be capable of bearing arms. Here is a governor dependent on the governor of the province, and it contains a large parish-church, four convents, and an hospital. Small vessels are continually trading to this place with the merchandize and manufactures of all the towns contiguous to the great lake; particularly with cacao, or chocolate, indigo, sugar, tobacco, and green hides. Maracaibo is also a celebrated port for ship-building, for which it is very convenient.

With respect to the country of Caraccas, it extends as far as Cape Blanco; but the coast is rocky and mountainous: it is, however, interspersed with small fertile valleys, which are subject, at certain seasons of the year, to dry north-west winds; but is in general blessed with a clear air, and a wholesome climate. A very extensive illicit trade is carried on with this coast by the English and Dutch, notwithstanding all the vigilance of the Spaniards, who have scouts perpetually employed, and breast-works raised in all the valleys.

Caraccas, the chief town in the district, is situated in the tenth degree ten minutes north latitude, at a considerable distance from the sea. It is said to be large, wealthy, populous, and extremely difficult of access, on account of the steep and craggy hills, over which an enemy must march to it.

Porto Cavallo is a sea-port town on this coast, which was unsuccessfully attacked in the late war by admiral Knowles.

New Andalusia is allowed to be a pretty large province, the boundaries of which are not exactly known. However, it has a part of Guiana and New Granada on the south, also part of New Granada and Venezuela on the west, the North sea on the north, and the river Oroonoko on the east; including the districts of Camana and Paria, it extends, according to the most reasonable limits, five hundred miles from north to south, and about two hundred and seventy from east to west. The interior country is woody and mountainous, variegated with fine valleys, that yield corn and pasturage. The produce of the country chiefly consists in sugar, tobacco, medicinal roots, gums, dying drugs, Brasil wood, and some valuable timber. To these may be added pearls, for which the Spaniards fish along the coast.

Cumana, or Comana, the capital of New Andalusia, to which it sometimes gives its name, stands in the ninth degree fifty-five minutes north latitude, and in the sixty-fifth degree thirty minutes west longitude from London, about nine miles from the North sea. It was built by the Spaniards in the year 1520, and is defended by a strong castle, capable of making a vigorous defence, as appeared in the year 1670, when it was assailed by the Buccaneers, who were repulsed with great slaughter.

New Granada, sometimes called Santa Fe, and Castella del Oro, is bounded on the north by Santa Martha, Rio de la Hacha, and Venezuela; on the east also by Venezuela; on the south by Peru; and on the west by Popayan. The whole country is supposed to include a space of three hundred and thirty-six miles in length, and near as much in breadth.

Though it lies between the first and ninth degree of north latitude, the climate is remarkably temperate; so that several writers affirm, that their equality of day and night is undisturbed by any variety of seasons; but, upon a strict examination, this does not appear to be strictly true, there being in reality two summers and two winters. The country is beautifully variegated with hills and valleys covered with verdure. The mountains contain gold, silver, and emeralds; and the valleys are enriched with all the necessaries of life, as corn, cattle, roots, and fruit: they produce likewise great quantities of guaiacum, gums, balms, drugs of various kinds, and other valuable articles of commerce.

The capital of the kingdom, as it is called, is the city of Santa Fe de Bogata, seated on the banks of the lake Gatavita. It is the residence of the royal audience, and of an archbishop, who has for his suffragans the bishops of Carthagena, Santa Martha, and Popayan. The city is large, populous, opulent, well built, and adorned with magnificent palaces and fine houses; but as we can meet with no particular description of it for less than a century past,

past, we may reasonably conclude that it is much changed since that time. There are, besides the capital, Tunia, Marida, Trinidada, and Truxillo.

S E C T. IV.

Of the Government of POPAYAN.

Its Situation, Extent, Divisions, Climate, Soil, and Produce; with a particular Description of the Plant called Cuca and the Mopa-mopa, the dreadful Insect named the Coya, and the Manner of obtaining Gold from the Mines. A Description of the City of Popayan, and its Government.

WE now come to the government of Popayan, which is bounded on the north by the government of Carthagena; on the east by the kingdom of New Granada; on the south by Peru; and on the west its ancient boundary was the South sea; but it has since been contracted by the new government of Choco; so that only a part of it reaches to the sea. Its extent is not precisely determined; but it is from east to west about eighty leagues, and little less from north to south. This government is divided into two jurisdictions, of which that on the north and east belong to Santa Fe, or New Granada, while all those parts which lie towards the south and west are reckoned in the province of Quito.

The climate varies according to the situation of places, some being more cold than hot, others the reverse, and some throughout the whole year enjoy a continual spring, particularly Popayan the capital. The same may be said of the soil, which produces in great abundance the corn and fruit proper to its situation, and the farmers breed great numbers of horned cattle and sheep. The jurisdiction of Popayan is, however, subject to dreadful tempests of thunder, lightning, and earthquakes.

Among the plants of the country of Popayan grows the cuca, an herb so esteemed by the Indians in some provinces of Peru, that they would part with any kind of provisions, the most valuable metals, gems, or any thing else, rather than want it. It grows on a weak stem, which for support twists itself round another stronger vegetable: its leaf is about an inch and a half or two inches in length, and extremely smooth. The Indians make use of it for chewing, mixing it with a kind of chalk or whitish earth, called mambi. They put into their mouth a few leaves of cuca, and a proper quantity of mambi, and chewing them together, at first spit out the saliva, but afterwards swallow it; thus moving it from one side of the mouth to the other, till its substance is quite drained, when it is thrown away and immediately replaced by fresh leaves. This herb is so nutritive and invigorating, that they labour whole days without any thing else, and on the want of it find a decay in their strength. It also preserves the teeth sound, and fortifies the stomach. Great quantities of this herb are cultivated by the Indians in the southern provinces of Peru, and it makes no small article of trade; a vast deal of it is in particular carried to the mine towns, that the owners of the mines may furnish the Indians with it, who otherwise could not be brought to work, or would not have strength to go through it. This plant is the same with the betel of the East Indies, and it is used there in the same manner: the Eastern nations, as the reader has already seen, are excessively fond of their betel; and the Indians of Peru and Popayan are no less so of their cuca.

In the most southern districts of Popayan are certain trees which yield a resin called mopa-mopa, of which is made a varnish, which is not only exquisitely beautiful, but will bear boiling water, and even acids. The method of applying it is to dissolve some of the resin in one's mouth, and then wet the pencil with it; afterwards it is dipped in the colour which is to be laid on, and when dried has all the lustre of the Chinese lac; but with this superior quality, that it never wears off nor becomes moist, though rubbed with spittle. The cabinets, tables, and other furniture made by the Indians of this country are carried to Quito, where they are highly valued.

In the valleys of Neyba, and others within this jurisdiction, is an insect extremely remarkable for the venom

it contains. Its common name is coya, or coyba: it is shaped like a spider; but is much less than a bug. Its colour is of a fiery red, and, like the spider, is generally found in the corners of walls and among the herbage. Its venom is so extremely malignant, that on squeezing the insect, if any of it happens to fall on the skin, either of man or beast, it immediately penetrates into the flesh, and causes large tumours that are soon succeeded by death. The only remedy hitherto known is on the first appearance of a swelling to singe the party all over the body with a flame of straw, or the long grass growing in those plains. In order to this the Indians of that country lay hold of the patient, some by the feet and others by the hands, and with great dexterity perform the operation; after which the person is thought to be out of danger. However, though this insect is so very noxious, yet squeezing it between the palms of the hands is attended with no consequence, the callous preventing the vermin reaching the blood: accordingly the Indian mulattoes squeeze them between the palms of their hands to gratify the curiosity of the passengers; but should a person of a delicate hand make that trial, the effect would doubtless be the same as on any other part of the body.

The people who travel along these valleys, where they are so much in danger from these coyas, are warned by the Indians who attend them, that if they feel any thing stinging or crawling on their neck or face, to be careful not to scratch the part, nor even so much as lift up their hand to it, the coya being of so delicate a texture, that it would immediately burst: and as there is no danger while they do not eject the humour in them, the person acquaints some of the company with what he feels, and points to the place, where if it be a coya, the other blows it away. The beasts who are incapable of such warning, are by instinct taught a precaution against the danger; for before they offer to touch the herbage with their lips, they blow on it with all their force, in order to disperse any of these pernicious vermin; and when their smell acquaints them that they are near a nest of coyas, they immediately leap, and run to some other part. Thus they secure themselves from the venom of these insects, though sometimes a mule, after all his blowing, has been known to take in some with his pasture, on which after swelling to a frightful degree, it expires on the spot.

Every part of the jurisdiction of Popayan abounds in mines of gold, great numbers of which are still worked, and new mines are daily discovered. In the gold mines in these parts the gold is not incorporated with stone or other heterogeneous bodies; but is found dispersed and mixed with the earth and gravel, as sands are found mingled with earths of different species. Thus the whole difficulty consists in separating the grains of gold from the earth, which is easily done by running conduits of water.

The manner of extracting the gold throughout the whole jurisdiction of Popayan, is to dig out the earth of the mine, and lay it in a reservoir made for that purpose; and when this is filled, water is conveyed into it through a conduit. They then stir the whole, which soon turns to mud, and the lightest parts are conveyed away through another conduit, which serves as a drain, and this is continued till only the most ponderous parts, as little stones, sand, and gold remain at the bottom. They then go into the reservoir with wooden buckets made for that purpose, in which they take up the sediment, then moving them circularly and uniformly, and changing the water, the less ponderous parts are separated, and at last the gold remains at the bottom of the bucket clear from all mixture. It is generally found in grains as small as those of sand, though sometimes what are called seeds, are found among it of different sizes; but generally they run small. The water issuing from the first reservoir is stopped in another a little beneath it, and there undergoes a like operation, in order to secure any small particles of gold, which from their extreme minuteness might be carried off by the current of the water being mixed with the earth, and other substances. And lastly, this water is passed into a third reservoir; but the savings here are generally

generally inconsiderable. The labourers are negro slaves; some of whom are employed in washing, while others bring earth; so that the washers are kept in continual employment. The fineness of this gold is generally of twenty-two carats, sometimes more, even to twenty-three, and it is seldom below twenty-one.

The city of Popayan, one of the most ancient in these parts, stands in a large plain, which on the north side affords an uninterrupted prospect of the country. It is situated in the second degree twenty-eight minutes north latitude, on the east side of a mountain of a middling height called M, from its resembling that letter, and being covered with a variety of trees, affords an agreeable prospect. The city is of a middling size, with broad, straight, and level streets, which, though not every where paved, are equally convenient. The foot-path near the houses being paved in all parts, and the middle of the streets being composed of hard small gravel, they are never dirty in rainy weather, nor dusty in dry. The houses are built with unburnt bricks; those of note have one story, and the others only a ground-floor. The church was erected into a cathedral in the year 1547, and is the only parish-church in the city. Here are likewise convents of Franciscans, Dominicans, and Augustines, with a college of Jesuits, all of which have churches; and in the latter is a grammar-school. Here are also two nunneries. From the mountain of M issues a river, which by running through the city, besides other conveniences, carries away all its soil. Two bridges are erected over it, one of wood, and the other of stone; and its waters have a particular medicinal virtue. In this mountain is also a spring of very fine water; but it not being sufficient to supply the whole city, it is conveyed to the nunneries and the houses of people of rank.

A little above a league to the north of Popayan runs the river Cauca, which is very large and deep, its current rapid, and subject to dangerous swellings in the months of June, July, and August.

The inhabitants of Popayan, where the negroes are bound, are chiefly descended from the marriages of the whites and negroes, so that the number of Indians here are in general very few. This government, however, has many large villages of them, and it is only in the capital and other Spanish towns that they are so greatly outnumbered by the negroes. The inhabitants of Popayan are computed at between twenty and twenty-five thousand, and among these are many Spanish families. While other towns see their inhabitants daily decreasing, Popayan constantly increases; for the many gold mines worked all over its jurisdiction afford employment to the indigent, and consequently occasion a great resort of people to these parts. The city of Popayan is the constant residence of the governor, whose office being merely civil, it is not necessary, as in many other places, that he should be acquainted with military affairs: however, within the jurisdiction of his government all civil, political, and military affairs are under his direction. He is also the chief magistrate of the city, besides whom are two alcaldes annually chosen, and a proper number of regidores. Here is a chamber of finances, into which are paid the several branches of the royal revenue, as the tribute of the Indians, the duty on goods, the fifth of the metals, and the like. The ecclesiastical chapter is composed of the bishop, whose annual revenue amounts to six hundred thousand dollars; the dean, who has five hundred; the archdeacon, chanter, rector, and treasurer, who have each four hundred. This see is a suffragan of the archbishop of Santa Fe de Bogota. As Popayan lies within the jurisdiction of the inquisition of Carthagená, it has a commissary from thence. Here is also another of the croisade; but the authority of these judges does not extend beyond the diocese, which is far less than the extent of the government, a considerable part of it being under the jurisdiction of the archbishop of Quito.

CH A P. XI.

Of PERU, including QUITO, LIMA, and LOS CHARCOS.

S E C T. I.

Of QUITO.

The Situation and Extent of Peru in general, and of Quito in particular. Of the Climate, Diseases, Soil, and Produce of the latter; with a Description of some of the most remarkable Fruits; as also of the City of Quito, the Manners and Customs of the Inhabitants, and their Trade.

THE great empire of Peru is bounded on the north by Popayan, last described, on the east by the Andes, on the south by Chili, and on the west by the Pacific ocean; extending between the equator and the twenty-fifth degree ten minutes south latitude, and between the sixtieth and eighty-first degree of west longitude, that is about eighteen hundred miles in length, and its greatest breadth does not much exceed three hundred and ninety.

This country is divided into three grand divisions, Quito, Lima, or Los Reyes, and Los Charcos. As to its climate, mines, soil, and produce, they differ greatly in different parts of the country; we shall therefore treat of these in describing its several districts.

The extensive province of Quito is bounded on the north by Popayan, and includes a part of that government, and also by Santa Fe de Bogota; on the south by the governments of Piura and Chachapoyas; on the east it extends over the whole government of Maynas and the river of the Amazons to the meridian of demarkation, which divides the Spanish from the Portuguese

dominions; and on the west it is bounded by the South sea; extending, according to Antonio de Ulloa, six hundred leagues in length, and about two hundred in its greatest breadth; but this greatly exceeds the computation of all other of the great geographers. He, however, observes, that it must be owned a great part of those vast dominions are either inhabited by nations of savage Indians, or have not hitherto been sufficiently peopled by the Spaniards, if indeed they have been thoroughly known; and that all the parts that can properly be said to be peopled, and actually subject to the Spanish government, are those intercepted by the two Cordilleras of the Andes, which in comparison to the extent of the country may be termed a street, or lane, fifteen leagues, or sometimes more, from east to west, which is the distance intercepted between the two Cordilleras: but to this must be added several detached governments, separated by very extensive tracts, inhabited by free Indians.

In order to form a right judgment of the happy temperature of the air of Quito, it is necessary to correct our ideas of the heat in latitudes close to the equator; for experience here shews, that in this respect the climate of Quito differs from all others, since in the center of the torrid zone, or rather under the equinoctial, the heat is not only very tolerable, but even in some places the cold is painful; while others enjoy all the advantages of a perpetual spring, the fields being constantly covered with verdure, and enamelled with flowers of the most lively colours. The mildness of the climate, free from the extremes of heat and cold, and the constant equality of

the day and night, render this country, which from its situation might be thought to be parched by the constant heat of the sun, and scarcely inhabited, both pleasant and fertile; for nature has here scattered her blessings with so liberal a hand, that this country in several respects surpasses those of the temperate zones, where the vicissitudes of winter and summer, and the change from heat to cold, cause the extremes of both to be more sensibly felt. However, in different parts of the country the air is very different; in one part are mountains of a stupendous height and magnitude, with their summits covered with snow. The plains are temperate, the valleys hot, and, according to the high or low situation of the country, are found all the variety of gradations of temperature possible to be conceived between the extremes of heat and cold.

Quito, the capital, is so happily situated, that neither the heat nor cold is troublesome, though both may be felt in its neighbourhood; and what renders this equality more delightful is, that it is constant throughout the whole year, the difference between the seasons being scarce perceptible. Indeed the mornings are cool, the remainder of the day warm, and the nights of an agreeable temperature. These being almost the only variations, the inhabitants make no difference in their dress during the whole year; for though some wear silks or light stuffs, at the same time that others are dressed in substantial cloth, the former are as little incommoded by the cold, as the latter are by heat.

The winds, which are healthy, blow continually, for the most part from north to south; but never with any violence, though they sometimes shift their quarters, but without any regard to the season of the year; and were it not for some inconveniences to which this country is subject, it might be considered as the most happy spot on the earth: but when on the other hand these disagreeable circumstances are considered, all its beauties are buried in obscurity; for here are dreadful and amazing tempests of thunder and lightning, and the inhabitants, in the midst of their security, are often surprized by destructive earthquakes. The weather, during the whole morning till one or two in the afternoon, is generally extremely delightful; a bright sun and a clear and serene sky are commonly seen; but then the vapours begin to rise, the whole atmosphere is covered with black clouds, which bring on such dreadful tempests of thunder and lightning, that all the neighbouring mountains tremble, and the city frequently feels their dreadful effects. Soon the clouds discharge themselves in such impetuous torrents of rain, that the streets appear like rivers, and the squares, though situated on a slope, like lakes. This generally continues till sun-set, when the weather clears up, and nature again puts on the beautiful appearance of the morning. Sometimes indeed the rains continue all night, and they have been known to last three or four days or more successively. On the other hand, this general course of the weather has its exceptions, three, four, six, or even eight fine days succeeding each other.

The distinction of winter and summer consists in a very minute difference: the interval between the month of September and those of April, May, or June is here called the winter season, and the other months compose the summer. In the former season the rain chiefly prevails, and in the latter the inhabitants frequently enjoy whole days of fine weather; but whenever the rains are discontinued for above a fortnight, the inhabitants are in the utmost consternation, and public prayers are offered up for their return. On the other hand, when they continue a short time without intermission, the like fears prevail, and the churches are again crowded with supplicants for obtaining fine weather; for a long drought produces dangerous diseases, and a continual rain, without intervals of sun-shine, destroys the fruits of the earth.

It is probably owing to some unknown quality of the air that the city of Quito is entirely free from muskettoes and other insects of that kind, which in hot countries render life almost a burthen. They are not even known to the inhabitants, and even a flea is seldom seen here, nor are the people molested with venomous reptiles. The only troublesome insect here is the nigua, or pique, a very small insect shaped like a flea, but hardly visible to

the sight. They live among the dust, and insinuate themselves into the legs, the soles of the feet, or toes, and pierce the skin with such subtlety that there is no being aware of them, till they have made their way into the skin, and taken up their lodging between that and the membrane of the flesh, where sucking the blood they form a nidus covered with a white and fine tegument, resembling a flat pearl, where it deposits its eggs, and as the number of these increases the nidus enlarges. There is an absolute necessity of extracting it, for otherwise it would burst of itself, and thus scatter an infinite number of small nits, which becoming niguas would in a manner undermine the whole foot. These cause extreme pain, especially during the operation of extracting them; for sometimes they penetrate even to the bone. These insects are very common at Carthagena, and many other places, as well as here.

Though the plague is unknown here, and in every other part of America; they have other diseases that have many symptoms of it, as malignant spotted fevers and pleurifies, which, when they prevail, sweep away prodigious numbers. Another disease here is called vicho, or mal del valle, which is a kind of gangrene in the rectum, and to which persons afflicted with the flux are most liable. The venereal disease is so common, that few persons are free from it, and its commonness effaces the disgrace with which it is attended in other countries. During the continuance of the north and north-east winds, which are the coldest, the inhabitants are afflicted with painful catarrhs. Canine madness is entirely unknown in America; but there is here a disease that in some respects resembles it, and in others the small-pox; this disease few or none escape, but having once had it, are never more afflicted with it. The symptoms are convulsions in every part of the body, a continual endeavour to bite, a delirium, and vomiting blood. Those whose constitutions are unable to support the conflicts of this distemper, perish; but this is equally common throughout all South America.

The fertility of the soil is incredible, for the fruits and beauties of the several seasons are seen here at the same time, and the curious European observes with a pleasing admiration, that while some herbs of the field are fading, others of the same kind are springing up; while some flowers lose their beauty, others blow to continue the enamelled prospect: thus, when the fruits of the trees have attained their maturity, and the leaves begin to change their colours, fresh leaves blossom, and fruit are seen in their proper gradations in size and ripeness on the same tree. The same incessant fertility is conspicuous in the corn, both reaping and sowing being carried on at the same time. That corn which had been lately sown is coming up, that which has been longer sown is in ear, and the more advanced is perfectly ripe; so that the declivities of the neighbouring hills exhibit all the beauties of the four seasons in one single view. Though all this is generally seen, yet there is a settled time for the grand harvest: but sometimes the most favourable season for sowing in one place is a month or two after that of another, though their distance does not exceed three or four leagues. Thus in different spots, and sometimes in one and the same, sowing and reaping are performed throughout the whole year, the forwardness or retardment naturally arising from the different situations, as mountains, rising grounds, plains, and valleys; and the temperature being different in each; the best times for performing the several operations of husbandry must also differ.

The only article of food of which there is here any scarcity is pulse; but this deficiency is supplied by roots. The principal of these are the camates, arucachas, yucas, ocas, and papas. The three former are the natives of hot countries, and cultivated in the plantations of sugar-canes, and in the spots called valleys and yungas, the former signifying here plains in a bottom, and the latter on the sides of the Cordilleras; but both in a hot exposure. In these are produced plantanes, guincos, Guinea pepper, granadillas, and others natural to warm climates. The cold parts produce pears, peaches, apricots, nectarines, melons, water-melons, quaitambos, and aurimelos. The parts which can neither be denominated hot nor cold produce frutillas, or Peruvian strawberries. The succulent

succulent fruits which require a warm climate are likewise here in great plenty throughout the whole year, as China and Seville oranges, lemons, citrons, limes, cidras, and toronjas. These trees are full of blossoms and fruit all the year round, equally with those that are natives of the climate, and abundantly supply the tables of the inhabitants.

We shall now give a particular account of some of the most remarkable of these fruits.

The chirimoya is universally allowed to be one of the most delicious fruits in the world. Its dimensions are various, it being from one to five inches in diameter. Its figure is imperfectly round, flattened towards the stalk, where it forms a kind of navel; but all the other parts are nearly circular. It is covered with a thin soft shell, which adheres so closely to the pulp, as not to be separated from it without a knife. The outward coat is green, variegated with prominent veins, forming all over it a kind of network. The pulp is white, and contains a large quantity of juice resembling honey, of a sweet taste, mixed with a gentle acid of a most exquisite flavour. The seeds are formed in several parts of the pulp, and are somewhat flat. The tree is high and tufted, the stem large and round, but with some inequalities full of elliptic leaves, terminating in a point. The blossom differs little from the colour of the leaves, which is a darkish green; and though far from being beautiful, is remarkable for its incomparable fragrance, and are therefore so much admired by the ladies, that they purchase them at any price.

The granadilla in its shape resembles a hen's egg, but is larger. The outside of the shell is smooth, glossy, and of a faint carnation colour, and the inside white and soft. The shell contains a viscous liquid substance full of very small and delicate grains, less hard than those of the pomegranate. This medullary substance is separated from the shell by a fine and transparent membrane. This fruit has a delightful sweetness blended with acidity, very cordial and refreshing, and so wholesome that there is no danger of indulging one's appetite.

The last of the fruits we shall mention is the frutilla, or Peruvian strawberry, which is very different from that of Europe in size; for though they are here generally not above an inch in length, they are much larger in other parts of Peru; but their taste, though juicy, and not unpalatable, is not equal to those in Europe.

The city of Quito is seated in thirteen minutes thirty-three seconds south latitude, on the eastern skirts of the west Cordillera of the Andes, thirty-five leagues west of the coast of the South sea. The city is built on the acclivity of the mountain of Pichincha, which rises far above the clouds, and surrounded by others of a middling height, among a number of breaches or clefts, some of which are of a considerable depth, and run quite through the city, so that great part of the buildings stand upon arches: this renders the streets irregular and extremely uneven. Near the city are two spacious plains, one on the south three leagues in length, and the other on the north about two leagues in extent; and both being interspersed with seats and cultivated land, greatly add to the prospect of the city, they being continually covered with a lively verdure enamelled with flowers. This scene is beautifully diversified with a multitude of cattle feeding on the eminences. These two plains contract as they approach the city, and at their junction form a neck of land covered with those eminences on which part of Quito stands. It may perhaps appear strange, that, notwithstanding two such beautiful and extensive plains are so near, the city should be placed in so inconvenient a situation; but the first founders were fond of building it on the spot where stood the ancient capital of the Indians. It was formerly in much greater repute than it is at present, for the inhabitants now daily decrease, and whole streets of Indian huts are entirely forsaken.

The principal square is spacious, well built, and furnished with some very magnificent buildings. On one side of the square stands the cathedral, and opposite to it is the episcopal palace; the third side is taken up by the town-house; the fourth by the palace of the audience; and in the center is an elegant fountain: but the square is rather disfigured than adorned by the palace of the au-

dience, the greatest part of it being suffered to run to ruin, and only a few halls and offices taken care of. Four streets terminating at the angles of the square are straight, broad, and handsome; but at the distance of three or four hundred yards from the square begin the troublesome declivities, which deprive the inhabitants of the use of coaches or any other wheel-carriages.

Except the four streets above-mentioned, all the rest are crooked, and destitute both of order and symmetry. Some of them are crossed by breaches, and the houses stand on the sides of their winding, coarse, and irregular projections. Some parts are situated at the bottom of these breaches, and others on their summits. The principal streets are paved; but those which are not are almost impassable after rain.

Besides the chief square there are two others, both very spacious, with several others that are smaller. In these the greatest part of the convents are situated, and thence make a very handsome appearance, their fronts being adorned with all the embellishments of architecture, particularly the Franciscan convent, which is built of freestone, and from the disposition of the parts, and the elegant taste of the whole, is said to be equal to the most admired buildings in Europe. The principal houses are very large, and some of them have spacious and well contrived apartments, though none are above one story in height, which is seldom without a balcony towards the street; but their doors and windows are very low and narrow. They are built with unburnt brick, cemented by a mortar of uncommon hardness, that was in use among the ancient Indians.

The city is divided into seven parishes, including the cathedral, which, besides the richness of its furniture, is splendidly adorned with tapestry and other costly decorations; but others of the parish-churches are mean; tho' the chapel del Sagrario is very large, built wholly of stone, and its architecture executed in an elegant taste.

The convents of monks are those of the Augustines, Dominicans, and the fathers of Mercy, who are the heads of provinces: besides these there is another of Franciscan Recollects, another of Dominicans, and another of the fathers of Mercy; a college of Jesuits, and two colleges for seculars, in one of which is an university under the patronage of St. Gregory. Here are also several nunneries, as that of the Conception, the orders of St. Clare, St. Catharine, and two of bare-footed Theresians. The college of Jesuits, as well as all the convents of monks, are very large, well built, and splendid; and the churches belonging to them magnificently decorated, especially on solemn festivals, when the vast quantities of wrought plate, rich hangings, and costly ornaments exposed to public view, are really amazing; and the nunneries, though they do not exhibit such riches, exceed them in the elegance and delicacy with which they are adorned. Here is also an hospital under the care of the order of Our Lady of Bethlehem.

The cathedral chapter consists of the bishop, whose annual revenue amounts to twenty-four thousand dollars; a dean, who has two thousand five hundred; an archdeacon, chanter, treasurer, and a doctoral, who have two thousand a year each; three canons, who have fifteen hundred each; four prebends, who have six hundred each; and two demi-prebends, each of whom has four hundred and twenty. In this cathedral the festivals of Corpus Christi and the Conception of Our Lady are celebrated with amazing magnificence; but the singular pomp in the procession of the host in the former ought not to be omitted. All the houses of the streets through which it passes are adorned with rich hangings, and superb triumphal arches are erected, with altars at stated distances that rise higher than the houses, on which, as on the triumphal arches, are piled up such immense quantities of wrought plate and jewels, disposed in such an elegant manner, as render the whole even more pleasing than the astonishing quantity of riches. All the persons in public offices march in magnificent dresses, and a number of Indians in rich habits, with bells on their legs and playing on the tabor and pipe, attend the ceremony with their dances.

With respect to the courts held at Quito, the principal is that of the royal audience, which consists of the president,

dent, who is governor of the province, with regard to law affairs; four auditors, who are at the same time civil and criminal judges; a royal fiscal, who, besides the causes brought before the audience, takes cognizance of every thing relating to the revenue; and an officer stiled the protector of the Indians, who solicits for them, and when they are injured pleads in their defence.

The next is the treasury, the chief officers of which are an accomptant, a treasurer, and a royal fiscal.

The tribunal of the Croisade, which has a commissary, who is generally some dignitary of the church, and a treasurer.

Here is also a treasury for the effects of persons deceased; an institution established all over the Indies, for receiving the goods of those whose lawful heirs were in Spain, in order to secure them from those accidents to which they might be liable in private hands.

Here is likewise a commissary of the inquisition, with an alguazil-major and familiars, appointed by the inquisition at Lima.

The corporation consists of a corregidor, two ordinary alcaldes, chosen annually, and regidores. These superintend the election of the alcaldes, which is attended with no small disturbance, the people being divided into two parties, the Creoles and Europeans.

This city is very populous, and has among its inhabitants some families of high rank and distinction, descended either from the original conquerors, or persons who at different times came from Spain invested with some lucrative post. The number of great families is however but small.

The commonalty may be divided into four classes, the Spaniards, Mestizos, Indians, and Negroes, with their progeny; but the last are not near so numerous in proportion to the rest, as in other parts.

The Creoles are well made, of a proper stature, and of a lively and agreeable countenance. The Mestizos are also in general well made, often taller than the ordinary size, very robust, and have an agreeable air. The Indians, both men and women, are commonly low, though strong and well proportioned; but more natural defects are to be found among them than in any of the rest. Some are remarkably short, some idiots, dumb, or blind. Their hair is generally thick and long, which they wear loose on their shoulders; but the Indian women plait theirs behind with a ribbon, and cut that before a little above the eye-brows, from one ear to the other. The greatest disgrace that can be offered to an Indian of either sex is to cut off their hair; for whatever corporal punishment their masters think proper to inflict on them, they bear with patience; but this affront they never forgive; and accordingly the government has interposed and limited this punishment to the most enormous crimes. Its colour is generally a deep black: but it is lank, harsh, and as coarse as that of a horse. On the contrary, the Mestizos, in order to distinguish themselves from the Indians, cut off their hair; but the women do not imitate them.

The country is observed to abound more in women than in men, which is the more remarkable as those causes which induce men to leave their country, as travelling, commerce, and war, naturally bring over more men from Europe than women. But there are many families in which there are a number of daughters, without one son among them. The women enjoy a more vigorous state of health, which may be owing in some measure to the climate, and more particularly to the early intemperance and voluptuousness of the other sex.

The whites may be considered as one sixth part of the inhabitants, and the Mestizos, who are the descendants of the Spaniards and Indians, may be reckoned a third. The next class is the Indians, who form about another third, and the others who are descended from these are about one sixth. These, according to the most authentic accounts, amount to between fifty and sixty thousand persons of all ages, sexes, and ranks. The Spaniards it is natural to think are the most eminent for riches, rank, and power; yet it must be owned that many of them are, in proportion, the most poor, miserable, and distressed; for whatever be their circumstances, they disdain to apply themselves to any mechanic business, considering it as a disgrace to that quality they so highly value themselves

upon, which consists in their not being black, brown, or of a copper colour. The Mestizos readily apply themselves to arts and trades; but chuse those of the greatest repute, as painting, sculpture, and the like, in which they particularly excel. Some of them have acquired great reputation; and some of the works of one of these Mestizos have been carried even to Rome, where they were honoured with the unanimous applause of the virtuosi: and what renders their exquisite performances still more admirable, is their wanting the tools that might be thought necessary to perform them with any tolerable degree of accuracy: but they are excessively indolent and slothful. The Indians, who are generally shoemakers, bricklayers, weavers, and the like, are not more industrious. Of these the most active and tractable are the barbers and phlebotomists, who equal the most expert hands in Europe. The shoemakers, on the other hand, are so slothful, that you have frequently no other way left to procure the shoes you have bespoke, than to purchase the materials, and lock up the Indian till they are finished. This is chiefly owing to the custom of paying for the work before it is done; for when the Indian has got the money, he spends it all in chicha, a kind of ale made of maize, and is never sober while it lasts, and he is afterwards unwilling to work for what he has spent.

With respect to the dress of the inhabitants, the Spaniards, who wear a black cloak, have under it a long coat with a close sleeve open at the side; and along the seams of the body, as well as those of the sleeves, are button holes, and two rows of buttons for ornament. In every other particular, people of fortune affect great magnificence, wearing the finest cloths or silk stuffs, and very often gold and silver tissues.

The ladies of the first rank wear on the upper parts of the body a shift, on which is a loose jacket laced; and over all a piece of baize. Every part of their dress is as it were covered with lace; and on days of ceremony, they wear the richest stuffs, with a profusion of ornaments. Their hair is generally made up in tresses, which they form into a kind of cross on the nape of the neck, tying a rich ribbon twice round their heads, and forming the ends into a rose at their temples. Those roses are intermixed with diamonds and flowers, and have a very pleasing effect. When they go to church they sometimes wear a full petticoat; but the most usual dress on these occasions is the veil.

The Mestizos in general wear a blue cloth, manufactured in this country; but though the lowest class of Spaniards are very ambitious of distinguishing themselves from them, either by the colour or fashion of the cloaths, there appears but little difference between them.

The Mestizo women affect to dress in the same manner as the Spanish, though they cannot equal the ladies in the richness of their stuffs. The meaner sort wear no shoes; but, like the men of the same rank, go barefooted.

The dress of the Indians consists of white cotton drawers, which hang down to the calf of the leg, where they are loose, and edged with a lace suitable to the stuff. The use of a shirt is supplied by a black cotton frock, made in the form of a sack, with three openings at the bottom, one in the middle for the head, and others at the corners for the arms; and thus covers their naked bodies down to the knees. Over this is a serge cloak, with a hole in the middle for putting the head through, and a hat made by the natives. This is their general dress, which they never lay aside, even while they sleep; and they have no additional cloathing for their legs or feet. The Indians who have acquired some fortune, particularly the barbers and phlebotomists, distinguish themselves from their countrymen by the fineness of their drawers; and by wearing a shirt, which, though without sleeves, has a lace four or five fingers in breadth, fastened round like a kind of ruff or band. They are fond of silver or gold buckles to their shoes, though they wear no stockings; and instead of a mean serge cloak, wear one of fine cloth, which is often adorned with gold or silver lace.

There are two kinds of dresses worn by the Indian women, made in the same plain manner with those worn by the men in general, the whole consisting of a short petticoat and a veil of American baize. But the dress of the lowest

lowest class of Indian women is only a bag of the same make and stuff as that of the men, which they fasten on their shoulders with two large pins: it reaches down to the calf of the leg, and is fastened round the waist with a kind of girdle. Instead of a veil, they wear about the neck a piece of the same coarse stuff, dyed black; but their arms and legs are naked. The caciqueesses, or Indian women, who are married to the alcaldes-majors, governors, and others, distinguish themselves by wearing a petticoat of baize adorned with ribbons, over which they have a sort of black mantle, open on one side, plaited from top to bottom, and generally fastened round the waist with a girdle. Instead of the veil worn by the common Indian women, they have one much fuller plaited and hanging down from the back part of the head almost to the bottom of the petticoat. This they fasten before with a large silver bodkin. Their head-dress is a piece of fine linen, curiously plaited, with the end hanging down behind, and they never appear abroad without their shoes.

The youth of family are here instructed in philosophy and divinity; and some study the civil law, which they generally follow with reluctance. In these sciences they shew a great deal of judgment and vivacity, but are very deficient in historical and political knowledge, as well as in other sciences. The only employment of persons of rank, who are not ecclesiastics, is visiting their estates, where they reside during the time of harvest; but few of them apply themselves to commerce, permitting that lucrative branch to be possessed entirely by the Europeans. However, a few Creoles and Mestizos keep shops in the city.

The women of rank have a graceful carriage, and an amiable temper; qualities which are indeed common to the whole sex in this part of America. Their children are always educated under their own eyes, though little to their advantage, their extreme fondness preventing their seeing those vices which so often bring youth to ruin and infamy; they frequently endeavour to hide the vices of the son from the father; and when he discovers them, interpose passionately in defence of their favourite, in order to prevent his being corrected.

The want of proper employments, and the great neglect of education in the common people, occasion their balls and entertainments, of which they are extremely fond, to be conducted in the most licentious manner; but persons of rank and character are never seen at these meetings.

The people have dishes unknown in Europe; but are particularly fond of cheese; and have also excellent butter in the neighbourhood of Quito. Sweetmeats are more admired here than in any other country, which necessarily occasions a great consumption of honey and sugar. One method of indulging this appetite is to squeeze the juice out of the sugar-canes, let it settle, and curdle it; out of this curd they make small cakes, called raspaduras, which are so highly valued by the lower class, that with a slice of it, and another of bread and cheese, they make as hearty a meal as the rich with all their variety of dishes.

Rum is commonly drank here by persons of all ranks; but their favourite liquor is brandy. The disorders arising from the excessive use of spirituous liquors are chiefly seen among the Mestizos; and the lower class of women, both among the Creoles and Mestizos, are also extremely addicted to the same species of debauchery.

Another liquor much used in this country is mate, which is made of an herb, known in all these parts of America by the name of paraguay, as being the produce of that country. Some of it is put into a calabash tipped with silver, called here mate, with sugar and some cold water. After it has continued thus some time, the calabash is filled with boiling water, and they drink the liquor through a pipe fixed in the calabash. In this manner the vessel is filled several times with water, and fresh supplies of sugar, till more of the herb is wanting. It is also usual to squeeze into the liquor a small quantity of the juice of lemons or Seville oranges, mixed with some perfumes from odoriferous flowers. This is their usual drink in the morning fasting, and many use it also at their evening regale. The manner of drinking it appears very indelicate, the whole company drinking suc-

cessively through the same pipe, it being carried several times round the company till all are satisfied. This among the Creoles is the highest enjoyment; so that when they travel they never fail to carry with them a sufficient quantity of it, and till they have taken their dose of mate they never eat.

The vice of gaming is here carried to an extravagant height, persons of rank and opulence have led the way, and their inferiors have almost universally followed their example, to the ruin of many families, some losing their stocks in trade, others the very cloaths from their backs, and afterwards those belonging to their wives, which they hazard with the hopes of by that means recovering their own.

The common people, the Indians, and even the domestics, are greatly addicted to stealing. The Mestizos, though arrant cowards, do not want audacity in this way; for though they will not venture to attack any one in the street, it is a common practice to snatch off a person's hat, and immediately seek their safety in flight. Trifling as this acquisition may seem, it is sometimes of considerable value; the hats worn by persons of rank, and even by the wealthy citizens when dressed, being of white beaver, worth fifteen or twenty dollars, besides the hatband of gold or silver lace fastened with a gold buckle, set with diamonds or emeralds. However, robberies on the high-way are seldom heard of.

In Quito, and in all the towns and villages of its province, different dialects are spoken, Spanish being no less common than the Inga, the language of the country. The Creoles use the latter as much as the former, but both are considerably adulterated by borrowed words and expressions. The first language generally spoken by children is the Inga; for the nurses being Indians, many of them do not understand a word of Spanish, and thus they afterwards learn a jargon composed of both languages.

The sumptuous manner of performing the last offices of the dead demonstrates how far the power of habit is capable of prevailing over reason and prudence; for their ostentation is so great in this particular, that many families of credit are ruined by preposterously endeavouring to excel others; and the people here may be said to toil and scheme to lay up wealth to enable their successors to lavish honours upon a body insensible of all pageantry.

With respect to the commerce of the province of Quito, the persons who are the chief conductors of it are the Europeans settled here, and others coming occasionally. The latter purchase the country goods, and sell those of Europe. The manufactures of this province are only cottons, some white and striped baize and cloths, which meet with a good market at Lima, for supplying the inward provinces of Peru. The returns are made partly in silver, and partly in fringes made of gold and silver thread, with wine, brandy, oil, copper, tin, lead, and quicksilver. On the arrival of the galleons at Cartagena these traders resort thither to purchase European goods, which, at their return, they consign to their correspondents all over the province. The coasts of New Spain supply this province with indigo, of which there is a very large consumption at the manufactories, blue being universally the colour which this people affect in their apparel. They also import, by way of Guayaquil, iron and steel both from Europe and the coast of Guatemala.

S E C T. II.

Of the several Jurisdictions in the Province of Quito; a Description of the Town of San Miguel de Ibarra, with the Manner of catching wild Asses; and a particular Account of the Cochineal Insect.

THE province of Quito is divided into nine jurisdictions, which, beginning at the north, are San Miguel de Ibarra, Otabalo, the city of Quito, Latacunga, Rio Bamba, Chimbo, or Guaranda, Guayaquil, Cuenca, and Loja, of which we shall only describe what appears most worthy of notice.

The town of San Miguel de Ibarra is seated at the extremity of an extensive plain, at a small distance from a chain of mountains, and between two rivers, which give the plain a perpetual verdure. It is of a middling size, with straight broad streets, and most of the houses of stone or unburnt brick, and all tiled. It is surrounded with suburbs inhabited by the Indians, whose cottages make a mean appearance; but the houses in the town are neat and uniform, though they have only a ground-floor, except those in the square, which have one story. The parish-church is a large and elegant structure well ornamented. The town has convents of Franciscans, Dominicans, and the fathers of Mercy, with a college of Jesuits, and a nunnery of the order of the Conception. The inhabitants are computed at ten or twelve thousand souls.

In this jurisdiction sugar-canes ripen pretty early, and yet may at any time be committed to the mill, there being no necessity for cutting them at any precise time, they retaining all their goodness even when suffered to stand two or three months after they are ripe; so that they are cut every quarter, and the mills kept at work during the whole year.

Within the district of the village of Mira in this jurisdiction are a great number of wild asses, which increase very fast, and are not easily caught. The owners of the grounds where they breed allow all persons, on paying a small acknowledgment, to take as many as they can, in proportion to the number of days they employ in the sport. The manner in which they are caught is as follows: several persons go on horseback, attended by Indians on foot, and on their arrival at a proper place form a circle in order to drive them into some valley, where, riding at full speed, they throw a halter, the end of which is formed into a noose, over their heads; for these creatures, on finding themselves enclosed, make furious efforts to escape, and if only one forces his way through, they all follow with irresistible impetuosity: but the hunters having caught them in the noose, throw them down, secure their legs, and leave them till the hunting is over, when, in order to bring them away, they pair them with tame beasts; but this is not easily performed, they being so fierce as often to hurt the persons who undertake to manage them. They have all the swiftness of horses, and neither steep ascents nor declivities retard them in their career; and when attacked they defend themselves with their mouth and heels with such activity, that without slackening their pace they often maim their pursuers: yet after carrying the first load their celerity leaves them, their dangerous ferocity is lost, and they soon contract the stupid look and dullness peculiar to the rest of their species. It is also observable, that they will not permit any horse to live among them; and if one happens to stray into the places where they feed, they all fall upon him and, without giving him the liberty of flying from them, bite and kick him till they leave him dead on the spot. They are very troublesome neighbours, for whenever one or two of them begins to bray, they are answered in the same vociferous manner by all within the reach of the sound, which is greatly increased and prolonged by the repercussions of the valleys and cliffs of the mountains.

In the jurisdiction of Loja is produced that famous specific for intermitting fevers known by the name of quinquina, or the Jesuits bark. The tree which produces it is about seven yards high, and the body and branches of a proportionable thickness. The Indians, in order to take off the cortex, cut down the tree, bark it, and dry the quinquina. Though there are here large forests of this tree, there is a sensible diminution of them, occasioned by the Indians not sowing the seed, those growing spontaneously being by no means equal in number to those cut down.

The jurisdiction of Loja has also a very great advantage from breeding the cochineal insect, which is reckoned of equal goodness with that of Oaxaca in New Spain: but the inhabitants are so far from applying themselves to this business so effectually as to supply the demands of trade, that they breed no more than they imagine will be sufficient for the dyers in that and the neighbouring jurisdiction of Cuenca. To this elegant and lasting

colour it is probably owing, that the carpets of Loja and the baize of Cuenca are preferred to all others.

The cochineal insect is bred on a plant called by the name of nopal, or the Indian fig tree, in Latin *opuntia maxima*. The method of planting it is by making rows of holes about half a yard deep, and about two yards distant from each other. In each of these holes is placed one or two leaves of the nopal in a flat position, and then covered with earth. This leaf soon shoots up into a single stem, which, during its growth, divides into several branches, and these successively produce fresh leaves, the largest being nearest the stem, which is full of knots, as are also the branches, and from these the leaves have their origin. The plant seldom exceeds three yards in height, its blossom is small, of a bright red, and in the shape of a bud, from the center of which proceeds the fruit. When the fig is ripe the outward skin becomes white; but the pulp is so fully impregnated with a deep red, that it tinges the urine of those who eat it; yet few fruits are more pleasant and wholesome. The cochineal was formerly imagined to be a fruit or seed of some particular plant; but it is now known to be insects which breed and are nourished on these trees, where they place their eggs among the leaves. The juice of the plant, which is their sole nourishment, is converted into their substance, which is thus rendered of a beautiful crimson colour. When the insects are at their full growth they are gathered, and put into earthen pots; but great care is necessary to prevent their getting out, as in that case great numbers would be lost. When they have been confined some time in these pots, they are killed and put in bags. The Indians have three methods of killing them, one by fire, another by the rays of the sun, and a third by hot water; and to these are owing the several gradations of the colour. The method of killing them by fire is to put them on shovels into an oven moderately heated, the fine quality of the cochineal depending on its not being over dried at the time of killing the insects. However, the best method of destroying this valuable creature seems to be by the rays of the sun. It is remarkable that this insect does not in any visible manner injure the plant, but extracts its nourishment from the most succulent juice which it sucks by means of its proboscis through the fine teguments of the leaves.

S E C T. III.

Of the Governments of Quixos, Macas, and Jaen de Bracamoros; their Situation, Climate, Extent, and Produce.

BESIDES the jurisdictions we have mentioned, there are five governments in the province of Quito; one of which is included in part of the province of Popayan, already described; we shall begin with those of Quixos, Macas, and Jaen de Bracamoros.

The two former are seated on the east side of the cordillera of the Andes. Quixos, which lies on the north, joins to the jurisdiction of Popayan, to the eastward it extends to a river named Aguarico, and on the westward it reaches to a part of the cordilleras of the Andes. The towns are here very small, and unworthy of a particular description: the principal are the cities of Archidona and Avila, whose inhabitants are obliged to be constantly on their guard against the free Indians, by whom they are surrounded, who frequently commit depredations among their houses and plantations. They compose different nations, and are so dispersed all over the country, that every village is under continual apprehensions from those that live in its neighbourhood.

The air of this country is hot and very moist, the rains are almost continual, and the country is covered with thick woods, in which are some trees of a prodigious magnitude. In the south and west part of Quixos is the cinnamon tree, a great quantity of which is cut for use in the province of Quito; but the cinnamon is inferior to that of the East Indies.

The government of Macas is bounded on the east by the government of Maynas, on the southward by that of Bracamoros, and on the westward by the east cordillera

of the Andes. The nearness of Macas to those mountains causes a sensible difference in the climate; for tho' it be also a woody country, the diversity between the two most distant seasons of the year is manifest. Thus winter begins here in April, and lasts till September; the atmosphere is then clear, the sky serene, and the earth clothed with its various beauties.

The country is very fruitful in corn; but one of the chief employments of the country people is the culture of tobacco, which, being of an excellent kind, is exported in rolls all over Peru. Sugar-canes and cotton also thrive well; but the dread of the free Indians, who have often ravaged the country, discourages them from planting more than is just sufficient for present use; they being here in the same unhappy situation as the people of Quixos, the villages having in their neighbourhood bands of Indians, who, when they imagine them to be farthest off, suddenly assault them.

Among the infinite variety of trees in this country, one of the most remarkable is the storax, the gum of which is of a most exquisite fragrance; but is scarce, the trees growing in places at some distance from the villages, and it is dangerous going to them, on account of the hatred of the free Indians to all the Spaniards, and who lie in wait for them. The same may be said with respect to some mines of ultra marine, from which very little is brought, on account of the danger, though a finer colour cannot be imagined. This territory also produces cinnamon trees, which some, who are allowed to be extremely well versed in natural history, maintain to be of a superior quality to that of the isle of Ceylon. It visibly differs from that of Quixos; but is supposed to owe its superior excellence to the trees being more fully exposed to the rays of the sun, they not being here intercepted by the foliage of any other trees. Great quantities of copal are brought from Macas, and also wild wax; but the latter is of little value.

The government, which on the south limits the jurisdiction of the audience of Quito, and follows next to Macas, is that of Jaen de Bracamoros, whose inhabitants amount to about three or four thousand, who are for the most part Mestizos, with some Indians, and but very few Spaniards.

The climate is like that of Quixos, only the rains are neither so lasting nor so violent. The soil is very fruitful in all the grain and products agreeable to the climate, and the country full of wild trees, particularly the cacao, which is produced in the greatest abundance; but though it is equal to that cultivated in plantations, it is of little use, for want of consumption; and the carriage to any distant parts would be attended with such expence as would prejudice the sale. Thus the fruit rots on the trees, or is eaten by monkeys or other animals. There are here produced vast quantities of tobacco, the inhabitants being chiefly employed in its cultivation. It is prepared by steeping it in hot mead, or decoctions of fragrant herbs, in order to improve its flavour; and being made into rolls, is sent all over Peru, and the kingdom of Chili. The country also produces a great deal of cotton, and a prodigious number of mules. In the three governments just mentioned are a great many wild beasts, which have been already described in treating of countries of a like climate; but besides these are bastard lions, bears, and the danta, an animal of the size of a bullock, and very swift; its colour is generally white, and its skin very much valued for making buff leather. It is remarkable, that in the middle of its head is a horn bending inward. These three kinds of wild beasts are unknown in the other countries of the torrid zone, and their being known here, is owing to the proximity of this government to the cordilleras of the Andes; for in those mountains they breed in a cold climate adapted to their nature, and from thence sometimes come down into this country.

Among the reptiles is the maca, a snake that has a shining spotted skin, like that of the tiger; but entirely covered with scales. It makes a most frightful appearance, its head being greatly larger than might be expected from the thickness of its body, and has two rows of teeth and fangs, like those of a large dog. The free Indians, to express their intrepidity, and to give them a more ter-

rible appearance, paint on their targets the figure of this snake; the bite of which is incurable, and wherever it has seized, it never lets go its hold.

S E C T. IV.

Of GUAYAQUIL.

Its Situation, Extent, and Climate; the prodigious Number of Muskettoes, and Rats, and the Diseases it occasions. Among its Produce are particularly described its Canes, the Vijahua, and Bejuco; and among the Animals is a large Account of the Alligator. The City of Guayaquil described, with the Manners and Customs of the Inhabitants.

WE shall now describe the territory of Guayaquil, the last we have to mention in the government of Quito. It begins at Cape Passado, in the twenty-first degree south latitude, about thirty miles to the north of the bay of Manta. From this Cape it extends along the coast, including the isle of Puna, to the town of Machala, on the coast of Tumbez, where it is terminated by the jurisdiction of Piura; from whence it runs eastward, and is bounded by that of Cuenca; then turning northward, along the western skirts of the Andes, it terminates on the jurisdiction of Bamba and Chimbo; extending about sixty leagues from north to south, and forty or forty-five from east to west. The whole country is one continued plain, and in winter is entirely overflowed. It is divided into seven lieutenancies, for each of which the corregidor appoints a lieutenant, who must be confirmed by the audience of Quito.

The rainy season sets in during the month of December, sometimes at the beginning, sometimes in the middle, and in others not till the end of that month, and lasts till April or May. During this season the elements, the insects and vermin, seem joined in a league to incommode the human race. The heat is extreme, and the rains continue day and night, accompanied with frequent and dreadful tempests of thunder and lightning; the river of Guayaquil, and all those that fall into it, overflow their banks, and people are pestered with innumerable swarms of insects and vermin.

The snakes, vipers, scorpions, and scolopendra in this season, find methods of getting into the houses, to the destruction of many of the inhabitants; though they are not free from them the rest of the year, yet at this time they are far more numerous and active; so that it is necessary to examine carefully the beds, for fear they should conceal themselves in them. To avoid being tortured by the muskettoes, all persons, even the Indians and negro slaves, are obliged to have curtains to their beds: those used by the lower class of people are made of cotton, and others use white linen. Indeed the inhabitants are no where so greatly incommoded with volatile insects, as at the town of Guayaquil, where it is impossible to keep a candle burning, except in a lantern, above three or four minutes, numberless insects flying into the flame, and extinguishing it; and any person who is obliged to be near any light, is soon driven away by the infinite numbers that fill his eyes, ears, and nostrils. "These insects," says Don Antonio Ulloa, were almost insupportable to us during the short clear intervals of some nights, which we spent in making observations on the heavenly bodies. Their stings were attended with great tortures, and more than once obliged us to abandon our observations, being unable either to see or to breathe for their multitudes."

Another very great inconvenience attending the houses here, is the number of rats, every building being so infested with them, that in the evening they quit their holes, and make such a noise in running along the ceiling, and in clambering up and down the sides of the rooms and testers of the beds, as to disturb those who are not accustomed to them, and they are so little afraid of the human species, that if a candle be set down, without being in a lantern, they instantly carry it off; but as this might be attended with dreadful consequences, they are seldom put to the trial, though they take advantage of the least neglect. All these inconveniences, which seem

insupportable to strangers, and sufficient to render the country uninhabited, has little effect on the natives, who have been used to them from their infancy, and are more affected with cold on the mountains, which is scarce felt by the Europeans, than all these disagreeable circumstances.

The dry season is the least troublesome, as then both the number and activity of these vermin are diminished; the heat is then abated by the south-west and west south-west breezes, which constantly begin at noon, and continue to refresh the earth till five or six in the morning of the following day. The sky is then always serene and bright, and the gentlest showers are rarely known; but the capital advantage is the remarkable salubrity of the air in that season. The natives of the neighbouring mountains, who are inured to a cooler climate, cannot endure the air of Guayaquil, it having a natural tendency to debilitate them, and by an intemperate use of its delicious fruits, they throw themselves into intermitting fevers: these are common at Guayaquil during the winter season, and are here particularly painful and dangerous. The black vomit is also dangerous in this country. The natives are likewise very subject to cataracts and other diseases of the eye, which often cause a total blindness.

Among the vegetable productions, we shall mention the canes, the vijahua, and the bejuco.

The canes are remarkable both for their length, their thickness, and the water contained in their tubes. Their usual length is between twelve and sixteen yards, and though there is some difference in their size, the largest do not exceed six inches in diameter. The wood or side of the tube is about six lines in thickness, so that when the cane is opened, it is made to form a board near a foot and a half in breadth, and hence it is not strange that houses should be built of them. From the time of their first appearance, till they attain their full perfection, many of the tubes contain a quantity of water, and what is very remarkable, at full moon, they are either quite or very nearly full, and with the decrease of the moon the water ebbs. During the decrease it appears turbid, and at the full is as clear as crystal. The water is not found in all the joints, one having water, and others not, alternately. This water is said to be an excellent preservative against the ill consequence of bruises, and is therefore drank by those who come from the mountains, where such accidents are in a manner unavoidable.

The canes being cut, are left to dry, whence they acquire such a degree of strength, as to serve either for rafters, beams, flooring, or even masts for vessels, called balzas. Ships which load with cacao are also ceiled with them, to preserve the timbers from the great heat of that fruit. They also serve as poles for litters, and for an infinite number of other uses.

The vijahua is a leaf generally five feet in length, and two and a half in breadth; growing wild, without any stem. The principal rib in the middle is near half an inch broad; but all the other parts are perfectly soft and smooth. The under-side is green, and the upper white, covered with a fine white viscid down. It is commonly used for covering houses; and serves for packing up salt, fish, and other goods, sent to the mountains, to secure them from the rain.

The bejuco is a kind of woody cordage, of which there are two sorts; one of which grows from the earth, and twines round the trees; the other strikes its root into certain trees, and from thence derives its nourishment. Both kinds, after growing to a great height, incline again to the earth, on which they creep, till they meet with another tree, to the top of which they climb as before, and then again renew their inclination towards the earth, and thus form a labyrinth of ligatures. Some are even seen extended, like a cord, from the top of one tree to another. They are so extraordinary flexible, that no bending or twisting can break them. The slenderest of them are between a quarter and half an inch in diameter; but the most common size is a little above half an inch: indeed there are others much thicker; but those are of little or no use, on account of the hardness, contracted in their long growth. They are chiefly used for lashing, tying, or fastening different things together; and by twist-

ing several of them in the manner of ropes, they make cables and hawsers for balzas, and small vessels; and are found by experience to last a long time in the water.

Here are thick forests of various kinds of large trees differing in foliage, the disposition of their branches, and the size of their trunks. In the level part of this woody extent are a great number of quadrupeds and birds, and among the latter are wild peacocks, bustards, pheasants, and some others, which are here so numerous, that did they not always rest on the tops of the trees, where, from their enormous height, or their being covered with leaves, they are secured from danger, a traveller with a good fowling-piece might at any time procure himself an elegant repast. These forests are, however, terribly infested with snakes. Among the monkeys is one species so very large, that when standing on their hind legs, they are little less than six feet high. They are black and in every respect very ugly, but are easily tamed.

The river Guayaquil abounds in fish of various kinds; but their increase is greatly hindered by the prodigious number of alligators, amphibious animals that live both in the rivers and adjacent plains, though they are seldom known to go far from the banks of the river. When tired with fishing, they leave the water to bask themselves in the sun, and then appear rather like rotten wood thrown ashore by the current, than living creatures; but upon perceiving any vessel near them, they immediately throw themselves into the water. They are the largest animals of the lizard kind; some of them here are of so monstrous a size, as to exceed fifteen feet in length. The head is long, turning up at the nose like the snout of a hog, and furnished with two rows of strong pointed teeth. During the time they lie basking on the shore, they keep their huge mouths wide open, till filled with muskettos, flies, and other insects, when, suddenly shutting their jaws, they swallow their prey. They generally avoid a man, and on the approach of any one, plunge into the water. The whole body of the alligator is covered with scales, impenetrable to a musket ball, unless it happens to hit him in the belly, which is the only part vulnerable. This is an oviparous animal.

The female makes a large hole in the sand near the brink of a river, and in it deposits her eggs, which are almost as large as those of an ostrich, and as white as those of a hen; but much more solid. She generally lays about a hundred, continuing in the same place till they are all deposited, which is about a day or two. She not only covers them with sand, but, the better to conceal them, rolls herself over them, even to a considerable distance, and then returns to the water, till natural instinct informs her, that it is time to deliver her young from their confinement. When she comes to the spot, she is followed by the male; she then tears up the sand, and begins breaking the eggs, with such care, that scarce a single one is injured, and a whole swarm of little alligators are seen crawling about. She then takes them on her neck and back, to remove them into the water; but the watchful gallinazos seize this opportunity to deprive her of some; and even the male alligator, which indeed comes for no other purpose, devours what he can, till the female has reached the water with the few remaining; and then all that fall from her back, and do not swim, she herself eats, whence of this formidable brood happily no more than four or five escape.

The gallinazos, which we have described in treating of Carthagena, contribute greatly to prevent the increase of the alligators, they being extremely fond of their eggs, in finding which they make use of extraordinary address. These birds often make it their sole business to watch the females during the dry season, when they lay their eggs, the sides of the river not being then covered with water. The gallinazo conceals itself among the branches of some tree, where it silently watches the female alligator, till she has laid her eggs and retires; but she is no sooner under the water, than the gallinazo darts down on the repository, and with its beak, claws, and wings, tears up the sand, and devours the eggs, leaving only the shells. This banquet would richly reward its long patience, did not a multitude of gallinazos from all parts join the fortunate discoverer, and share in the spoil. These eggs, when

when fresh, are also eat by the mulattoes. Thus Providence diminishes the number of those destructive animals, which would soon increase so fast, that neither the river nor the neighbouring fields would be sufficient to contain them; for as it is, their numbers can hardly be imagined.

The alligators are not wanting in address in catching the fish, which is their principal food: eight or ten, as it were by agreement, draw up at the mouth of a river or creek, while others go a considerable distance up the river, and chase the fish downwards, by which none of any bigness escape them. The alligators being unable to eat under water, on seizing a fish, raise their head above the surface, and thus devour them; and, after satisfying their appetite, retire to rest on the banks. When they cannot find fish, they betake themselves to the meadows on the banks of the river, and devour colts and calves. This is done in the night, that they may surprise them in their sleep; and it is observed, that those alligators that have once tasted flesh, become so fond of it, as never to feed upon fish, but in cases of necessity. There are indeed many melancholy instances of their devouring the human species, especially children who are out of doors in the dark; and these voracious animals having once seized them in their mouths, make sure of their prey, against that assistance which the cries of the victim constantly bring, by hastening into the water, where they immediately drown it, and then rising to the surface devour it at leisure. The boatmen, by inconsiderately sleeping with one of their arms or legs over the side of a boat, have been seized by these animals, and the whole body drawn into the water. Those alligators who have once feasted on human flesh, are known to be the most dangerous, and entertain an insatiable desire of repeating the same delicious repast.

The inhabitants of the places where they abound, are very industrious in destroying them. Their usual method is by a piece of hard wood, sharpened at both ends, and baited with the lungs of some animal; this they fasten to a thong, the end of which is secured on the shore. The alligator, on seeing the lungs floating on the water, snaps at the bait, and both points of the wood entering his jaws, he is dragged on shore with his mouth wide open: he then endeavours violently to rescue himself, while the Indians bait him, knowing the greatest damage he could do them is to throw down such as, for want of care or agility, do not keep out of his reach.

We shall now describe the city of Guayaquil, which is seated on the west bank of the river of the same name, in the second degree eleven minutes twenty-one seconds of south latitude. The old city is built on the side of a mountain, and the new at the distance of several hundred yards; and, for preserving a communication between them, a bridge of timber has been erected of about six hundred yards in length. The city is of considerable extent, it stretching along the bank of the river from the lower part of the old town to the upper part of the new, near a mile and a half; but it is not of a proportionable breadth, every person being fond of having a house near the river; both on account of the refreshing winds, which in the rainy season are more eagerly coveted, as they are then very rare, and for the amusements the river affords. The houses of both towns are built of wood, and many of them covered with tiles, though the greatest part of those in the old town are only thatched. They are, however, large and handsome, and have one story above the ground-floor. In the front are shops of all kinds, and before them are generally spacious porticos, which, during the rainy seasons, are the only places where you can walk, the streets being utterly impassable. As a precaution against fire the kitchens stand twelve or fifteen paces from the houses, to which they are joined by a long open gallery resembling a bridge; but so slightly built, that it is instantly demolished on the least appearance of fire in the kitchen, by which means the house is preserved. Persons of rank and fortune live in the upper apartments, and the ground-floor is let to strangers who come to trade, or pass through the city with their goods.

The ground on which the new city is built, and the savannahs in its neighbourhood, are not to be travelled over, either on foot or on horseback, during the rainy

season; for it is not only of a spongy chalk, but is every where so level, that there is no declivity for carrying off the water, whence on the first rain it becomes one general slough. In that season the streets of the city are crossed by very large planks, but these soon becoming slippery, occasion frequent falls into the water, which at the return of the dry season is soon exhaled, and all the country rendered sufficiently dry for travelling.

The city is defended by three forts, two on the river, and one behind it, all built after the modern method of fortification. These forts are built of large pieces of a very hard wood, which retains its solidity either under the water or in the mud. All the churches and convents are likewise of wood, except that of St. Domingo in the old town, which is of stone; the great solidity of the ground in that part being sufficient to support heavy buildings. Here is a parish-church, and also a convent belonging to the Augustines, and another to the Franciscans, with a college of Jesuits; but the monks are not very numerous on account of the smallness of their revenues. Here is also an hospital.

The city and its jurisdiction are under a corregidor, who is nominated by the king, and holds his office during five years. Though he is subordinate to the president and audience of Quito, he appoints the deputies in the several departments under his jurisdiction; and the police and civil government are under ordinary alcaldes and regidores. The revenue is under the management of a treasurer and an accomptant, who receive the tributes of the Indians, the duties on imports and exports, and the taxes on the commodities either consumed in the city or carried through it. The ecclesiastical government is lodged in the bishop of Quito's vicar, who is generally priest of the town.

Guayaquil contains as many inhabitants in proportion to its extent as any Spanish city in America; the continual resort of strangers greatly increase the number, which is computed at twenty thousand. The inhabitants capable of bearing arms are divided into companies of militia according to their rank and complexion, and are commanded by officers chosen by themselves, the corregidor being commander in chief.

Though the heat is here equal to that of Panama or Carthagena, all the natives, except those born from a mixture of blood, are fresh-coloured, and are esteemed the handsomest people not only in the province of Quito, but in all Peru. It is remarkable that the natives, notwithstanding the heat of the climate, are not tawny, and that though the Spaniards have not naturally so fair a complexion as the northern nations, their children born here of Spanish women are very fair; a phenomenon which has yet never been fully accounted for. To these advantages it must be added, that the inhabitants are greatly distinguished by their elegance and politeness.

In this city necessity has introduced several kinds of bread, to supply the want of wheat; and the most usual is unripe plantanes cut into slices, roasted, and served up as bread, to which this is even preferred by the Europeans themselves, the wheat-bread being here badly made, and this is far from being unpalatable.

In the dry season good water is very scarce at Guayaquil, there being none at a less distance than four or five leagues up the river. In dressing their food they commonly use beef-suet instead of butter, but it has the smell and taste of tallow, which renders their dishes extremely nauseous to strangers; and, what is little better, they are all seasoned with Guinea pepper, which they think the finest ingredient in the world for giving a relish to their food, and use it in such quantities as to make the mouth in a flame.

The inhabitants of Guayaquil affect great splendor in their entertainments. The first course consists of different kinds of sweetmeats, the second of high-seasoned ragouts, and thus they continue to serve up alternately a succession of sweet and high seasoned dishes. The common drink on these occasions is brandy, cordials, and wine, of all which they drink freely during the entertainment; but the Europeans generally prefer wine. The custom of drinking punch obtains greatly among persons of distinction, who generally drink a glass of it at eleven, and another in the evening; it not only allaying the thirst,

thirst, but correcting the water, which, besides the disagreeable taste communicated to it by the heat, produces excessive perspiration; and this custom so prevails, that even the ladies punctually observe it.

With respect to the commerce of Guayaquil, it may be divided into two parts, one consisting of the products and manufactures of its jurisdiction, and the other transitory; its port being the place where the goods from the provinces of Peru and Terra Firma consigned to the mountains are landed; and, on the other hand, those from the mountains designed for these provinces are brought hither, and shipped for their respective ports.

Cacao, one of its principal products, is chiefly exported to Panama, New Spain, and Peru. Timber, which is esteemed the second article, is chiefly sent to Callao. These branches of trade are of great advantage to Guayaquil, from the prodigious quantities exported; and the trade of salt is not inferior to either, though the principal markets to which it is sent are only the inland towns in the province of Quito. To these may be added cotton, rice, and fish, both salted and dried, horned cattle, mules and colts, tobacco, wax, Guinea pepper, and Ceibo wool, which is the produce of a very high tufted tree.

The goods imported hither from Peru in return for the above-mentioned commodities, are wine, brandy, oil, and dried fruits. From Quito it receives baize, flour, bacon, hams, cheese, and other goods; from Panama European goods purchased at the fairs; from Mexico iron found in that country, but much inferior to that of Europe, naptha, tar, and cordage.

SECT. V.

Of the Customs and Manners of the Indians throughout the Audience of Quito.

THE disposition of the Indians in the province of Quito is extremely remarkable, and they appear to have no resemblance to the people found there by those who first discovered the country. They at present possess a tranquillity not to be disturbed either by fortunate or unfortunate events. In their mean apparel they are as contented as a prince clothed in the most splendid robes. They shew the same disregard to riches, and even the authority and grandeur within their reach is so little the object of their ambition, that to all appearance it seems to be the same to an Indian, whether he be created an alcalde, or obliged to perform the office of a common executioner. Among them a reciprocal esteem is neither increased nor diminished by such circumstances: the same moderation appears in their food, and they enjoy their simple diet with the same complacency as others do their well furnished tables. Nothing can move them to alter their minds, it being common for them to decline a little act of service, though offered a very considerable reward. Fear cannot stimulate, respect induce, or punishment compel them. They are indeed proof against every attempt to rouse them from their natural indolence, in which they seem to look down with contempt on the wisest of mortals.

They are in general remarkably slow. Thus in weaving carpets, curtains, quilts, and other stuffs, being unacquainted with any better method, in forming the woof they have the patience every time to count the threads one by one; so that two or three years are requisite to finish a single piece. Their sloth is so great, that scarcely any thing can induce them to work. Whatever therefore is necessary to be done is left to the Indian women, who are much more active; they spin and make the half shirts and drawers which form the only apparel of their husbands; they cook the provisions, grind barley, and brew the beer called chicha; while the husband sits squatting on his hams, the usual posture of the Indians, looking at his busy wife. The only domestic service they do, is to plough their little spot of land, which is sowed by the wife. When they are once settled in the above posture, no reward can induce them to stir; so that if a traveller has lost his way, and happens to come to one of their

cottages, they charge their wives to say that they are not at home. Should the passenger alight and enter the cottage, the Indian would still be safe; for having no light but what comes through a hole in the door, he could not be discovered; and should the stranger even see the Indian, neither entreaties nor rewards would prevail on him to stir a step with him.

In order that they may perform the works appointed by their masters, and for which they are paid, it is to little purpose to shew them their task; the master must have his eye continually upon them, for he no sooner turns his back than they leave off working. They are lively only in parties of pleasure, rejoicings, entertainments, and especially dancing; but in all these the liquor must circulate briskly, and they continue drinking till they are entirely deprived both of sense and motion. Their propensity to intemperance is so great, that the cacique and the alcalde never fail to be of the company at all entertainments, and drink like the rest till quite overcome by the chicha.

It is remarkable that the Indian women, whether maids or married, and Indian young men before they are of an age to contract matrimony, are never guilty of this vice; it being a maxim among them, that drunkenness is the privilege of none but masters of families, who, when they are unable to take care of themselves, have others to take care of them.

When they celebrate any solemnity, the person who gives the entertainment invites all his acquaintance, providing for each a jug of chicha, containing two gallons. In the court of the house, if it be a large town, or before the cottage, if in a village, a table is placed, and covered with a carpet only used on such festivals; and upon it is placed a slight repast. The women present the chicha to their husbands in calabashes, till their spirits are raised; then one plays on a pipe and tabor, while others dance. Some of the best voices among the Indian women sing songs in their own languages, and those who do not dance squat down in the usual posture till it comes to their turn. When tired with intemperance they all lie down together, without minding whether they be near the wife of another, or their own sister or daughter. These festivities sometimes continue three or four days, till the priest coming among them, throws away all the chicha, and disperses the Indians, lest they should procure more.

Their funerals are likewise solemnized with excessive drinking. The house is filled with jugs of chicha, for the solace of the mourners and other visitors; the latter even go out into the streets, and invite all of their nation who happen to pass by, to come in and drink to the honour of the deceased. This ceremony lasts four or five days, and sometimes more, strong liquor being their supreme enjoyment.

Though they are so addicted to intemperance, they cannot be charged with gaming. They seem to have no inclination for play, nor have above one kind, and that is of great antiquity. This game they call pafa, or a hundred, as he who first gets that number wins. They play with two instruments, one a spread eagle of wood, with ten holes on each side, and pegs to set up the game: the other is a die of bone cut with seven faces, one of which has a particular mark, and is called guayro. Five of the others tell according to their number, and the last is a blank. In playing they toss up the die, and the marks on the upper surface are so many gained; but the guayro goes for ten, and the like number is lost if the blank side appears. This game is peculiar to the Indians; but is little used, except at their revels.

The habitations of these Indians, like those of others we have described, consist only of a little cottage, in the middle of which is their fire-place. Here both they and the animals they breed live promiscuously. They have a particular fondness for dogs, and are never without three or four, a hog or two, and a few poultry. These, with some earthen-ware, as pots and jugs, with the cotton which their wives spin, constitute the whole inventory of their effects, except two or three sheep skins which serve them for beds. Though the Indian women breed fowl and other domestic animals in their cottages, they

never

never eat them, and even conceive such a fondness for them, that they will neither kill them with their own hands nor sell them : so that if a stranger, who is obliged to pass the night in one of their cottages, offers ever so much money for a fowl, they refuse to part with it ; and he finds himself under the necessity of killing the fowl himself, at which his landlady shrieks, dissolves in tears, and wrings her hands ; till at last, seeing there is no remedy for what is passed, she wipes her eyes, and quietly takes what the traveller offers her.

Many in their journeys take their whole family with them. The cottages are in the mean time shut up, and there being no valuable furniture to lose, a string or thong of leather serves for a lock. If their journey is to last for several days, they take their animals to the cottage of some neighbour or acquaintance : if otherwise their dogs are left guardians of the whole, and discharge their trust with such care, that they will fly at any one, except their masters, who offers to come to the cottage. It is observable that dogs bred by the Spaniards and Mestizos have such a hatred to the Indians, that if one of them approaches a house where he is not very well known, they fall upon him, and, if not called off, tear him to pieces ; for they know them at a distance by their scent : on the other hand, the dogs of Indian breed are animated with the same rage against the Spaniards and Mestizos, whom they likewise smell at a distance.

The Indians in the audience of Quito act contrary to all other nations in their marriages ; for they never make choice of a woman who has not been first known by others, which they consider as a certain sign of her having something pleasing in her. After a young man has asked the object of his affections of her father, and obtained his consent, they immediately begin to live together as man and wife, and assist the father-in-law in cultivating the land. At the end of three or four months, and frequently of a year, he leaves his bride without any ceremony ; and perhaps expostulates with his father-in-law for endeavouring to deceive him, by imposing upon him his daughter, whom no body else had thought worthy of making his bedfellow. But if nothing of this happens, after passing three or four months in this commerce, which they call *amanarse*, or to habituate oneself, they then marry. This custom is still very common, though the whole body of the clergy have used all their endeavours to put a stop to it. Accordingly they always absolve them of that sin, before they give them the nuptial benediction.

Their intrepidity shews itself upon many occasions, particularly in the alacrity and resolution with which they halter a bull at full speed, and with the same dexterity and courage they hunt the bears ; for a single Indian, with only a horse and his noose, never fails of getting the better of all the cunning and rage of this furious animal. This noose is made of cow-hide, so thin as not to be seized by the beast's paw, and at the same time strong enough not to be broke by the struggles of the bear. On their perceiving this animal they directly make towards him, whilst he rears himself up in order to seize the horse. But the Indian, being advanced within a proper distance, throws the noose about the creature's neck, and twisting the other end two or three times round the saddle, he then with surprizing celerity claps spurs to his horse, and the bear, unable to keep pace with the horse, and struggling to get free, is choaked. This achievement is looked upon as an admirable piece of courage and dexterity ; and is commonly practised in the province of Alausi, near the eastern Cordillera, where these creatures abound.

A great part of the rusticity in the minds of the Indians must be imputed to a want of culture ; for they who in some parts have enjoyed that advantage, are found to have as good rational faculties as other men ; and if they have not all the politeness of civilized nations, they at least think properly. All the Indians brought up to handicraft trades in cities and large towns are far more acute and sensible than those who have spent their lives in little villages, and many of these distinguish themselves by their genius and abilities.

S E C T. VI.

Of the CORDILLERAS of the ANDES.

The most remarkable of them with respect to their Height and Volcanoes : their Climate : a remarkable Phenomenon : the Animals found upon the Andes ; with a particular Description of the Condor : the Bridges over the Rivers in the Andes ; and the Roads over the Mountains.

WE now come to the most remarkable mountains and deserts in the Cordilleras of the Andes, near the countries last described. It has been observed, that the dependences of the jurisdictions of Quito are seated between the two Cordilleras of the Andes, and that the air is more or less cold, and the ground barren, according to the height of the mountains. These barren tracts are called deserts ; for, though all the Cordilleras are dry, some are much more so than others ; and the continual snows and frosts render some parts of them without a single plant, and consequently uninhabitable by man or beast.

Some of these mountains, which appear as if founded on others, rise to a most astonishing height, and reaching far above the clouds, are here in the midst of the torrid zone covered with perpetual snow. From barometrical experiments made on the mountain Cotopaxi, it appears that its summit is elevated six thousand two hundred and fifty-two yards above the surface of the sea, something above three geographical miles, which greatly exceeds the height of any other mountain in the known world.

Cotopaxi became a volcano at the time of the Spaniards first arrival in this country. A new eruption happened in 1743, which had been for some days preceded by a continual rumbling in its bowels : after which an aperture was made in its summit, as also three others near the middle of its declivity, at that period buried under prodigious masses of snow. The ignited substances ejected on that occasion, mixed with a considerable quantity of snow and ice, melting amidst the flames, were carried down with such amazing rapidity, that in an instant the plain from Callo to Latacunga was overflowed ; and, besides its bearing down the houses of the poor inhabitants, great numbers of people lost their lives. The river of Latacunga was the canal of this dreadful flood, till being too small for receiving the prodigious current, it overflowed the adjacent country, carried away all the buildings within its reach, and rendered the land near the town of the same name like a vast lake. The inhabitants retired to a spot of higher ground behind their town ; those parts of which that stood within the limits of the current were entirely destroyed. During three days the volcano ejected cinders, while torrents of melted ice and snow poured down its sides. The fire lasted several days longer, and was accompanied with terrible roarings of the wind, rushing through the mouths of the volcano. At last all was quiet, and neither smoke nor fire were to be seen. However, in May 1744, the flames forced a passage through several other parts on the sides of the mountain ; so that in clear nights the flames, being reflected by the transparent ice, formed a very grand and beautiful illumination. But on the thirteenth of November following it ejected such prodigious quantities of fire and ignited substances, that an inundation equal to the former soon ensued, and the inhabitants of the town of Latacunga for some time gave themselves over for lost.

The most southern mountain of the Cordilleras is that of Mecas, or Sangay, which is of a prodigious height, and the far greatest part of it covered with snow ; yet from its summit issues a continual fire, attended with explosions which are plainly heard at forty leagues distance. The country adjacent to this volcano is entirely barren, it being covered with cinders ejected from its mouth. In this mountain rises the river Sangay, which being joined by the Upano forms the Payra, a large river which discharges itself into the Marañon.

In order to convey an idea of the climate on the top of these mountains, we shall give some account of that which prevailed

prevailed on Pichincha, when Don George Juan and Don Antonio de Ulloa were stationed there in order to make their proper observations in relation to the figure of the earth, whence a judgment may be formed of the rest; the inclemency of the weather being in proportion to the height of the mountains.

Pichincha, though famous for its great height, is twelve hundred and seventy-eight yards lower than the perpendicular height of Cotopaxi, and was formerly a volcano, but the mouth on one of its sides is now covered with sand and calcined matter; so that at present neither smoke or fire issues from it. Our learned author found the cold on the top of this mountain extremely intense, the wind violent, and they were frequently involved in so thick a fog, or, in other words, a cloud, that an object at six or eight paces distance was scarcely discernible. The air grew clear by the clouds moving nearer to the surface of the earth, and on all sides surrounded the mountain to a vast distance, representing the sea with their rock standing like an island in the center. When this happened, they heard the dreadful noise of the tempests that discharged themselves on Quito, and the neighbouring country. They saw the lightning issue from the clouds, and heard the thunder roll far beneath them. While the lower parts were involved in tempests of thunder and rain, they enjoyed a delightful serenity; the wind was abated, the sky clear, and the enlivening rays of the sun moderated the severity of the cold. But when the clouds rose their thickness rendered respiration difficult; snow and hail fell continually, and the wind returned with all its violence; so that it was impossible entirely to overcome the fear of being, together with their hut, blown down the precipice, on whose edge it was built, or of being buried in it by the daily accumulations of ice and snow. Their fears were likewise increased by the fall of enormous fragments of rocks. Though the smallest crevice visible in their hut was stopped, the wind was so piercing, that it penetrated through; and though it was small, crowded with inhabitants, and had several lamps constantly burning, the cold was so great, that every one of them was obliged to have a chafing-dish of coals, and several men were constantly employed every morning to remove the snow which fell in the night. By the asperities of such a climate their feet were swelled, and so tender, that walking was attended with extreme pain, their hands covered with chilblains, and their lips so swelled and chapt, that every motion in speaking drew blood.

"There is in all this range of mountains, as far as I have travelled, says M. Bouguer, who was engaged in the same expedition as the gentlemen last mentioned, a constant inferior boundary, beyond which the snow never melts; this boundary, in the midst of the torrid zone, I found to be two thousand four hundred and thirty-four fathoms above the level of the South sea. The snow indeed falls much lower, but then it is subject to be melted the very same day; whereas above that it preserves itself,

"The gather'd winter of a thousand years."

Before we conclude this article, it will be proper to mention a phenomenon of a very extraordinary nature, which, according to the author just mentioned, appears almost every day on the top of these mountains; and though it is doubtless as ancient as the world, it was perhaps never mentioned before. The first time our authors observed it was, when they were on the top of Pambamorea, a mountain less high than Pichincha. A cloud, in which they were involved at break of day, dissipating, they saw the rising-sun extremely splendid, and the cloud passed on the other side opposite to the sun, where it appeared very thin, and was about twenty yards distant from the place where they were standing, when they saw in it, as in a looking-glass, the image of each of them; and what appeared still more extraordinary, the head was adorned with a glory like what is seen round the heads of saints in pictures, each head being as it were the center of three concentric irises, of very lively colours, and each with the same varieties as a rainbow, the red being outward; the last or most external colours of one touched the first of the following; and from some distance from them all was

a fourth arch, entirely white. These were perpendicular to the horizon; and as the person moved, the phenomenon moved also. But what was most remarkable, though there were six or seven persons, each could see none but his own shadow, because the cloud had an uneven surface. The diameter of the arches gradually altered with the ascent of the sun above the horizon, and the phenomenon itself, after continuing a long time, insensibly vanished. Don Antonio Ulloa gives a particular description of this phenomenon, and M. Bouguer, after describing it, says, "This was a kind of apotheosis to each spectator; and I cannot forbear mentioning again, that each enjoyed the secret pleasure of seeing himself adorned with all these crowns, without perceiving those of his neighbour's. I must observe, however, that this phenomenon doth not appear unless the aqueous particles of the cloud are frozen."

In those parts of the mountains that are not so high as to expose them to an eternal frost, there grows a kind of rush, and several other plants, with a few trees of one or two species, which are too barren to admit of cultivation.

Though the severity of the air on these deserts is so great, that all animals cannot live upon them, yet they afford many deer, which feed on the straw or rushes peculiar to those parts; and some of them are to be met with on the highest mountains, where the cold is intolerable to the human species. Among the rushes are also bred a great number of rabbits, and some foxes.

The only birds known in those rigorous places are partridges, which are something different from those of Europe, and nearly resemble the quail, with condors and hummers.

The condor, which is the largest bird in these parts, resembles in its colours and appearance the gallinazo, already described, and sometimes soars from the highest mountains so as to be almost out of sight. From its being seldom seen in low places, a subtle air seems to agree best with it; though some that have been tamed when young live in the villages and plantations. They are extremely carnivorous, and are frequently known to seize and fly away with lambs that feed on the heaths upon the sides of the mountains. Our author confirms this by his own observation; for seeing on a hill, adjoining to one on which he stood, a flock of sheep in great confusion, he perceived a condor flying upwards from it, with a lamb in its claws. When at some height he dropped it; but following it took it up, and let it fall a second time; and then winged its way out of sight, for fear of the Indians, who, at the cry of the boys and barkings of the dogs, were running towards the place.

In some deserts this bird is more common, and as it preys on the flocks, the Indians are not wanting in their endeavours to catch it. One of these ways is killing an old cow, or some other beast, and rubbing the flesh with the juice of some potent herbs, which they afterwards carry away, otherwise the bird would not touch the flesh; and farther, to take off the smell, bury the flesh till it becomes putrid, and then expose it; when the condors, allured by the smell of the carcase, hasten and feed on it greedily, till the herbs operating, they become senseless and incapable of motion; when the Indians, seizing this opportunity, destroy them. They likewise catch them with springs laid near some flesh; but such is the strength of this bird, that with a stroke of its wing it sometimes knocks down the man who approaches it. Their wing also serves them as a shield, by which they ward off blows, without receiving any visible hurt.

From most of these mountains flow rivers, which when too deep to be forded, bridges are made at the most frequented places. Of these there are two kinds, besides those of stone, which are very few. The most common are of wood, and the rest of bejucos, the plant we have described as used for all the purposes of ropes. With regard to the first, they choose a place where the river is very narrow, and has on each side high rocks. These only consist of four long beams laid over the precipice, forming a path about a yard and a half in breadth, just sufficient for a man to pass over on horseback; and custom

has

has rendered these so familiar, that the people pass them without any apprehensions.

The bridges of bejucos are only used where the breadth of the river will not admit of beams being laid across. In their construction several bejucos are twisted together, in order to form a large cable of the length required. Six of these are drawn from one side of the river to the other, two of which are considerably higher than the other four, and serve for rails. Across the latter are wattled cross sticks of bejucos, and the whole resembles a fishing-net, or Indian hammock stretched from one side of the river to the other. As the meshes of this net are very large, and the foot would be in danger of slipping through, they take care to strew reeds at the bottom, which serve for a floor. The reader will easily conceive, says our author, that the mere weight of this kind of basket machine, and much more the weight of a man passing over, must cause it to make a prodigious bend; and if it be considered that the passenger, when he is in the midst of his course, especially if there be a wind, is exposed to vast swingings from side to side, a bridge of this sort, sometimes more than ninety feet long, must at first sight be extremely frightful; yet the Indians pass over it running, though loaded with the baggage and pack-saddles of the mules, and laugh to see the Europeans hesitate in venturing. Most of these bridges are only for men and women, the mules swimming over the rivers; for their loading being taken off they are driven into the water near half a league above the bridge, that they may reach the opposite shore near it, they being carried so far by the rapidity of the stream.

Some rivers, instead of a bejuco bridge, are passed by means of a tarabita, a single rope made of bejucos, or thongs cut from the hide of an ox, and consisting of several strands, about six or eight inches in thickness. This rope is extended from one side of the river to the other, and fastened on each bank to strong posts. On one side it is fastened to a wheel, that it may be straightened or slackened to the degree required. From the tarabita hangs a kind of leathern hammock, capable of holding a man, suspended by a clue at each end. A rope is also fastened and extended to the sides of the river, for drawing the hammock to the side intended, which with a push at its first setting off sends it quickly to the other side. This not only serves to carry over persons and loads, but also the beasts themselves, where the rapidity of the stream, and the prodigious stones continually carried along by it, render it impracticable for them to swim over.

For carrying over the mules two tarabitas are necessary, one for each side of the river, and the ropes are much thicker and slacker. On this rope is only one clue, which is of wood, and by this the beast is suspended, he being secured with girths round the belly and neck. When this is performed the creature is shoved off, and immediately landed on the opposite side. Those that are accustomed to be conveyed over in this manner never make the least motion, but even come of themselves to have the girths fastened round them; yet it is with great difficulty they are at first brought to suffer this to be done, and when they find themselves suspended they kick and sling during their short passage.

The roads over some of these mountains are not the least of those extraordinary particulars relating to them. In many places the road is so narrow that the mules have scarce room to set their feet, and in others is a continued series of precipices. Besides, these roads are full of holes near three quarters of a yard deep, in which the mules put their fore and hind feet, so that sometimes they draw their bellies and the rider's legs along the ground. Indeed these holes serve as steps, without which the precipices would be in a great measure impassable; but should he happen to put his foot between two of these holes, or not place it right, the rider falls, and, if on the side of the precipice, inevitably perishes.

But the manner of descending seems still more dangerous. On one side are frequently steep eminences, and on the other frightful abysses; and as they generally follow the direction of the mountain, the road, instead of being on a level, forms steep eminences and declivities. The mules are sensible of the caution requisite in these

descents, for coming to the top of an eminence they stop, and having placed their fore-feet close together, place their hinder feet a little forwards, as if going to lie down. Having in this attitude taken a survey of the road, they slide down with the swiftness of a meteor. All the rider has to do is to keep himself fast in the saddle, for the least motion is sufficient to disorder the equilibrium of the mule, in which case they both unavoidably perish. His address here is extremely wonderful; for in this rapid motion, when he seems to have lost all government of himself, he follows exactly the different windings of the road, as if he had accurately settled in his mind the road he was to follow, and taken every precaution for his safety. But the longest practice of travelling these roads cannot entirely free the mules from a kind of dread, on their arriving on the top of a steep declivity; for they not only attentively view the road, but tremble and snort at the danger. If the rider inadvertently endeavours to spur them on, they continue immovable; and it is really wonderful to consider how, after having overcome the first emotions of their fear, they stretch out their fore-legs, that by preserving a proper equilibrium they may not fall, yet make with their body that gentle inclination necessary to follow the several windings of the road, and afterwards their address in stopping themselves at the end of their impetuous career.

SECT. VII.

Of the Audience of LIMA.

Its Situation, Extent, and Climate, particularly near the Capital, where the Rain, Snow, Hail, Thunder, and Lightning are unknown; but is subject to Earthquakes, some of which are described. Of the Soil and Produce. A particular Description of the City of Lima; with the Dress, Manners, Customs, and Trade of the Inhabitants.

THE next division of Peru is the audience of Lima, which is bounded on the north by Quito, on the east by the Cordillera of the Andes, on the south by the audience of Los Charcas, and on the west by the Pacific ocean, it being about seven hundred and seventy miles in length from north to south, but of an unequal breadth.

Nothing can be imagined more various than the climate and soil of this country, which in some places is exceeding hot, in others insupportably cold, and in the city of Lima, where it never rains, is always temperate. The seasons vary within the compass of a few miles, and in certain parts of the audience all the vicissitudes of weather are experienced in twenty-four hours. What is most singular is, that no rains fall or rivers flow on the sea-coasts, though they are supplied by thick fogs and dark clouds, that never condense into showers. This phenomenon has exercised the thoughts of many naturalists.

Spring begins towards the close of the year, that is towards the end of November or the beginning of December, when the vapours which fill the atmosphere during the winter subside, and the sun to the great joy of the inhabitants again appears, and the country now begins to revive, which during the absence of his rays had continued in a state of languor. This is succeeded by summer, which though hot, from the perpendicular direction of the sun's rays, is far from being insupportable, the heat, which indeed would otherwise be excessive, being moderated by the south winds, which always blow at this season, though with no great force. Winter begins at the latter end of June or the beginning of July, and continues till November or December, when the south winds begin to blow stronger, and bring the cold with them, not indeed equal to that in countries where ice and snow are known; but so keen that the light dresses are laid by, and cloth or other warm stuffs worn. During the winter the earth is covered with so thick a fog, as totally to intercept the rays of the sun, and the winds, by blowing under the shelter of this fog, retain the particles they contracted in the frozen zone. In this season only the vapours dissolve into a very small dew, which every where equally moistens the earth, by which means all the hills, which during the other parts of the year offer

offer nothing to the sight but rocks and wastes, are clothed with verdure and enamelled with flowers of the most beautiful colours. These dews never fall in such quantities as to damage the roads, or incommode the traveller; a very thin stuff will not soon be wet through; but the continuance of the mists during the whole winter, without being exhaled by the sun, render the most barren spots of this part of the country fertile.

Lima is as free from tempests as from rain; so that those of the inhabitants who have neither visited the mountains, nor travelled into other parts, are absolute strangers to thunder and lightning, and are therefore extremely terrified when they first hear the former or see the latter. But it is very remarkable, that what is here entirely unknown should be so common thirty leagues to the east of Lima, it being no farther to the mountains, where violent rains and tempests of thunder and lightning are as frequent as at Quito.

But though the capital is freed from the terror of these tempests, it is subject to what is much more dreadful. The earthquakes happen here so frequently, that the inhabitants are under continual apprehensions of being, from their suddenness and violence, buried in the ruins of their own houses: yet these earthquakes, though so sudden, have their presages, one of the principal of which is a rumbling noise in the bowels of the earth about a minute before the shocks are felt, that seems to pervade all the adjacent subterraneous parts. This is followed by dismal howlings of the dogs, which seem to perceive the approaching danger. The beasts of burthen passing the streets stop, and by a natural instinct spread open their legs, the better to secure themselves from falling. On these portents the terrified inhabitants fly from their houses into the streets with such precipitation, that if it happens in the night, they appear quite naked; fear and the urgency of the danger at once banishing all sense of decency. Thus the streets exhibit such odd and singular figures, as might afford matter of diversion, were it possible to be diverted in so terrible a moment. This sudden concourse is accompanied with the cries of children waked out of their sleep, blended with the lamentations of the women, whose agonizing prayers to the saints increase the common fear and confusion. The men are also too much affected to refrain from giving vent to their terror; so that the whole city exhibits a dreadful scene of consternation and horror.

The earthquakes that have happened at the capital are very numerous. The first since the establishment of the Spaniards was in 1582; but the damage was much less considerable than in some of the succeeding: for six years after Lima was again visited by another earthquake so dreadful, that it is still solemnly commemorated every year. In 1609 happened another, which overturned many houses. On the twenty-seventh of November, 1630, such prodigious damage was done in the city by an earthquake, that, in acknowledgement of its not having been entirely demolished, a festival on that day is annually celebrated. Twenty-four years after, on the third of November, the most stately edifices in the city, and a great number of houses, were destroyed by an earthquake; but the inhabitants retiring, few of them perished. Another dreadful one happened in 1678; but one of the most terrible was on the twenty-eighth of October, 1687. It began at four in the morning, with the destruction of many of the finest public buildings and houses, in which a great number of the inhabitants perished; but this was little more than a presage of what followed; for two hours after the shock returned with such impetuous concussions, that all was laid in ruins, and the inhabitants began to think themselves happy in being only spectators of the general devastation, and the loss of all their property. During this second shock the sea retiring considerably, and then returning in mountainous waves, entirely overwhelmed Callao and the adjacent country, together with the miserable inhabitants. From that time six earthquakes happened at Lima before that of 1746. This last was on the twenty-eighth of October at half an hour after ten at night, when the concussions began with such violence, that in little more than three minutes the greatest part, if not all the buildings in the whole city were

destroyed, burying under their ruins those inhabitants who had not made sufficient haste into the streets and squares, the only places of safety. At length the horrible effects of this first shock ceased; but the tranquillity was of short duration, the concussions swiftly succeeding each other. The fort of Callao also sunk into ruins; but what it suffered from the earthquake in its buildings was inconsiderable when compared to the dreadful catastrophe which followed; for the sea, as is usual on such occasions, receding to a considerable distance, returned in mountainous waves, foaming with the violence of the agitation, and suddenly turned Callao and the neighbouring country into a sea. This, however, was not perfectly performed by the first swell of the waves; for the sea retiring farther, returned still with greater impetuosity, and covered both the walls and other buildings of the place; so that what even had escaped the first, was now totally overwhelmed by those terrible mountainous waves. Twenty-three ships and vessels, great and small, were then in the harbour, nineteen of which were sunk, and the other four, among which was a frigate named *St. Fermin*, carried by the force of the waves to a considerable distance up the country. This terrible inundation extended to other parts on the coast, and several towns underwent the same fate as the city of Lima, where the number of persons who perished in the ruin of that city within two days after the earthquake began amounted, according to the bodies found, to thirteen hundred, besides the maimed and wounded, many of which lived only a short time in torture.

Though it might naturally be expected that a country where rain is seldom or never known must be entirely barren, yet the country of Lima enjoys great fertility, it producing all kinds of grain and a prodigious variety of fruit; but here industry and art supply that moisture which the clouds withhold. The ancient yncas of Peru caused small canals to be formed, in order to conduct the waters of the rivers to every part of this country, and render large fields capable of producing grain. The Spaniards finding these useful works ready executed to their hands, took care to keep them in order, and by these are watered spacious fields of barley, large meadows, plantations, vineyards, and gardens, all yielding uncommon plenty. Lima differs from Quito, where the fruits of the earth have no determined season; for here the harvest is gathered in, and the trees drop their leaves in the proper season. The blossoms have also their respective times of blowing; so that this country resembles those of the temperate zones.

The fields in the neighbourhood of Lima are chiefly sown with clover, on which feed an inconceivable number of mules and horses. The other parts of the country are taken up with plantations, among which those of the sugar-cane yield an excellent kind of sugar. The olive plantations appear like thick forests, for besides the height, magnitude, and fullness of leaves of these trees, they are never pruned, by which means their branches become so interwoven, that the light cannot penetrate through their foliage. They produce an uncommon plenty of the finest olives, which are either committed to the press for oil, or pickled, they being particularly adapted to the latter, on account of their beauty, largeness, and flavour; and their oil is much preferable to that of Spain. All the fields and plantations are cultivated by negro slaves purchased for that purpose.

The country contiguous to the city of Lima is covered with gardens that produce all the herbs and fruits known in Spain, besides those common to America, all which flourish here in an uncommon degree. The city likewise enjoys another singular advantage, the whole year being as it were summer, with regard to the plenty and freshness of the fruit, from the seasons of the year varying alternately in the district called Valles and the mountains; for when fruit-time is over in Valles, it begins on the skirts of the mountains; and the distance from Lima not exceeding twenty-five or thirty leagues, they are brought thither, and by this means the city is constantly supplied with fruit, except a few, as grapes, melons, and water-melons, which requiring a hot climate do not come to perfection in the mountains. The grapes at Lima are of

various kinds, and among them one species called the Italian, are very large and delicious. The vines extend themselves on the surface of the earth, which is either stony or full of sand. These vines are pruned and watered at proper times, and without any other care thrive remarkably.

Besides the orchards, fields, and gardens, with which the country is delightfully variegated, there are other parts where nature spontaneously furnishes beautiful prospects for the inhabitants, and plenty of excellent food for their cattle, particularly the hills of St. Christopher and Amancaes, whose perpetual verdure, diversified in spring with elegant flowers, seems to invite the neighbouring inhabitants to a nearer enjoyment of the beauties it presents at a distance to their view. The parts in the neighbourhood of the city, to the extent of six or eight leagues, offer the like entertainment, and accordingly many families resort thither for change of air and rural amusements.

After giving this account of the climate and produce of this country, it ought not to be omitted, that though the summer here is pretty warm, yet venomous creatures are unknown, and the same may be said of the territory called Valles, though here are some ports, as Tumbes and Piura, where the heat is almost as great as that of Guayaquil. This singularity can therefore proceed from no other cause than the natural drought of the climate.

We shall now give a description of the city of Lima, also called Los Reyes, or the city of the Kings, as it appeared before the dreadful calamity in 1746. It is seated in the spacious and delightful valley of Rimac, in the twelfth degree two minutes thirty-one seconds south latitude, and in the seventy sixth degree west longitude, in one of the most advantageous situations that can be imagined; for being in the center of that spacious valley, it commands the whole without any difficulty. The river Rimac washes the walls of the city, and when not increased by the torrents from the mountains, is easily forded; but as it is at other times deep and rapid, a very elegant and spacious stone bridge was built over it, having at one end a very fine grate, which formed the entrance into the city, and led to the grand square, which was very large and finely ornamented, having in the center a fountain, in which was a statue of Fame in bronze, ejecting water through her trumpet, and through the mouths of eight lions surrounding the statue. The east side of the square contains the cathedral and archiepiscopal palace, fronted with free-stone, and adorned with columns and pilasters. On the north side was the viceroy's palace, in which were the several courts of justice, the offices of the revenue, and the state prison. On the west side of the square, facing the cathedral, were the council-house and the city prison. The south side was filled with private houses, which, like the others in the city, had only one story; but the fronts being of stone, their uniformity, porticos, and elegance, were great embellishments to the square.

The city was of a triangular form; the base, extending along the banks of the river, was about two miles in length, and its greatest breadth from north to south, from the bridge to the opposite angle, a thousand and eighty fathoms. It was surrounded with a brick wall, flanked with thirty-four bastions; but without platforms and embrasures, and had seven gates and three posterns.

On the opposite side of the river was a suburb called St. Lazaro, all the streets of which were broad, and ran parallel from north to south and from east to west, forming squares of houses a hundred and fifty yards in front. The streets were paved, and along them ran streams of water conducted from the river, a little above the city; and, being arched over, contributed to its cleanliness. The houses were commodious, and made a good appearance; but were for the most part low, that they might bear the shock of earthquakes; the principal parts were of wood mortised into the rafters of the roof, and the walls lined both within and without with wild cane or osiers. These last were plastered over with clay and white-washed; but the fronts were painted in imitation of free-stone. They had cornices and porticos also painted of a stone-colour. The roofs were flat, and covered only so far as was necessary to keep out the wind and intercept the rays of the sun, a slender covering, but suf-

ficient in a country where there was no danger of rain. Within the walls were many fruit and kitchen-gardens, and most of the principal houses had pleasure-gardens behind them.

The city had five parish-churches, and two chapels of ease, with a parish of Indians under the care of Jesuits. The convents were very numerous, there being four of Dominicans, three of Franciscans, three of the order of St. Augustine, three belonging to the order of Mercy, and the Jesuits had six colleges. There were likewise a monastery of the order of St. Benedict, a convent called Nuestra Señora de la Buena Muerte, and a convent of St. Francis de Paula; with fourteen nunneries, twelve hospitals, an orphan house, and other public buildings.

All the churches, both conventual and parochial, and also the chapels, were large; they were built partly of stone, and adorned with paintings and other decorations of great value, particularly the cathedral and the churches of the Jesuits, the fathers of Mercy, St. Dominic, St. Francis, and that of St. Augustine, were so splendid as to surpass description. The riches and pomp of the city, especially on solemn festivals, were astonishing. The altars, from the very bases to the borders of the paintings, were covered with massy silver wrought into various ornaments. The walls of the churches were hung with velvet, or tapestry of equal value, adorned with gold and silver fringes, all which in this country are remarkably dear, and on these were suspended pieces of plate in various figures. If the eye was directed from the pillars, walls, and ceiling to the lower part of the church, it was equally dazzled with glittering objects, among which were candlesticks of massy silver, six or seven feet high, placed in two rows along the nave of the church, embossed tables of the same metal, and in the intervals between them pedestals, on which stood statues of angels. Such immense riches were bestowed on the body of the church; but those immediately used in divine worship, as the sacred vessels, the chalices, ostensoriums, &c. were much more valuable, since an emulation between the several churches subsisted, each endeavouring to procure the most valuable. In these the gold was covered with diamonds, pearls, rubies, and sapphires, so as to dazzle the eyes of the spectators. The gold and silver stuffs, fringes, laces, &c. for vestments and other decorations were always the richest and most valuable of those brought over by the register ships, and every thing employed in ornamenting the churches was the richest of the kind possible to be procured.

The principal convents were very large, with convenient and many apartments. The roofs of many of the churches were arched; the frontispieces and principal gates had a majestic appearance, and the columns, friezes, statues, and cornices were of wood finely carved, and not to be distinguished from stone. The churches were decorated with small cupolas; the towers were of stone from the foundation to the height of about eight or ten feet, and from thence to the roof of brick; but the remainder of wood, painted of a free-stone colour, terminating in a statue of the saint to which the church was dedicated, and these were hung with very tunable bells.

Thus splendid was the city of Lima before the last dreadful earthquake, in which every building was levelled with the ground; and how far they have recovered from that dreadful calamity it is impossible to determine, since the authors who have best described that country wrote at the time of its destruction, and no later pen has given us any account how far they have recovered their former splendor.

The university made a stately appearance, and had a large square, encompassed by a handsome piazza. There the genius of the people is cultivated in that species of divine and human knowledge in repute in Old Spain. The Aristotelian and old school philosophy still maintain their ground; so that the inhabitants are much more indebted to the kind gifts of nature for any extraordinary exertions of genius, than to culture and education; and their little progress in useful learning appears to be owing rather to the want of proper instruction than of talents.

The viceroy of Lima usually resides in that city; his government is triennial; he enjoys all the pomp and pre-

prerogatives of royalty, and is absolute in all affairs, whether military, civil, criminal, or relating to the revenue. Under him are officers and tribunals for executing the several departments of government, and he fills up all vacant posts. For the security of his person he has a body of guards of a hundred and sixty horse, under the command of a captain and lieutenant, all in a blue uniform richly laced with silver: a body of fifty halberdiers who do duty in the rooms leading to the royal audience-chamber, who have waistcoats of crimson velvet, with a broad gold lace: besides these, there is another guard within the palace, consisting of a detachment from the garrison at Callao. All these are occasionally employed in executing the viceroy's orders, and enforcing the decrees of the tribunals, after their having received his assent. The viceroy, besides assisting at the courts of justice, and the councils relating to the finances and war, gives daily audience to all ranks of people; for which purpose the palace is furnished with three very grand and spacious rooms; in the first of which he receives deputations from the Indians and different casts: in the second he gives audience to the Spaniards; and in the third receives all those ladies who desire a private audience.

The viceroy has an annual salary of seven thousand one hundred and sixty-seven pounds sterling, besides his lawful perquisites, which amount to three times that sum. It is said that he can raise a hundred and twenty thousand horse and foot within his jurisdiction; but it is acknowledged that he cannot arm a fifth part of the number. The garrison of Lima is composed of militia, fourteen companies of which entirely consist of Spanish infantry, seven companies of the corporation of commerce, eight companies of Indians, and six companies of mulattoes, with ten troops of Spanish horse, all forming a body of forty thousand able-bodied but ill-disciplined troops.

The forms of government are conducted with the greatest regularity, and while every thing appears to be managed with the most scrupulous justice, it flows entirely from the pleasure of the court. The affairs relative to the cabinet are dispatched by a secretary of state, with an assistant; and from this office orders are received for passports, which must be obtained from every corregidor within his jurisdiction. The secretary, with the viceroy's approbation, fills all juridical employments for the term of two years.

Causes relating to equity are tried in the court called Audiencia, from the decrees of which there is no appeal to the council of the Indies, except in cases of the most notorious injustice. This tribunal, which is the supreme court at Lima, is composed of eight auditors, and a fiscal for civil affairs. It is held in the viceroy's palace, in three different saloons, the deliberations being held in one, and the causes tried either publicly or privately in the two others.

The next is a chamber of accounts, which consists of a commissioner, five chief accountants, and two doctors, with inferior officers belonging to each class. Here the corregidores entrusted with the public revenue pass their accounts, and here also the distribution and management of the royal revenue are regulated.

Within the palace is also the royal treasury, under the direction of an accountant and agent, who superintend his majesty's revenue within the jurisdiction of the audience of Lima.

The magistracy consists of regidores, or aldermen, *alfarez real*, or sheriffs, two *alcaldes*, or royal judges; all of whom are noblemen of the first distinction. These have the direction of the police, and the ordinary administration of justice. The jurisdiction of the corregidor here only extends to the Indians.

One of the most useful institutions, when justly administered, is the court for the effects of deceased persons, which takes charge of all the goods of people dying intestate, and inspects the conduct of those intrusted with the effects of other persons. It consists of a judge, a counsellor, and an accountant.

The next is the board of trade and commerce, composed of a president and two consuls, who preside over every thing relating to trade, decide all commercial dis-

putes, and are governed by the same rules as the consuls at Cadiz and Bilbao.

The tribunal of the inquisition is composed of two inquisitors and a fiscal, who, like the subordinate officers, are nominated by the inquisitor-general, and in cases of a vacancy filled by the supreme council of the inquisition. This court is only adapted to inspire horror, and gain universal detestation.

The inhabitants of Lima are composed of Spaniards, negroes, Indians, *Mestizos*, and other casts proceeding from the mixture of all three. The Spanish families are very numerous; Lima, according to the lowest computation, containing sixteen or eighteen thousand whites. Among these are reckoned a third or fourth part of the most distinguished nobility of Peru, in which number are included no less than forty-five counts and marquises. The number of knights belonging to the several military orders is also very considerable. Besides these there are twenty-four gentlemen of large estates; but without titles, one of whom traces his descent from the ancient *yncas* of Peru, and to this family the kings of Spain have been pleased to grant several distinguished honours and privileges.

Those who make the greatest figure have a multitude of slaves and other domestics, and keep coaches; while others are content with having a chaise, and these are so common that no family of any substance is without one. Indeed they are no where more necessary, for the numberless droves of mules continually passing through Lima, cover the streets with their dung, which being soon dried by the sun and wind, turns to a nauseous dust scarce supportable to those who walk on foot. These chaises which are drawn by a mule, and guided by a driver, have only two wheels, with two seats opposite to each other; so that on occasion they will hold four persons; but though they are very slight and airy, yet on account of the gildings and other decorations, sometimes cost eight hundred or a thousand crowns. The number of them is said to amount to five or six thousand.

Commerce is so far from being considered as a disgrace at Lima, that the greatest fortunes have been raised by it; and those who have not a sufficient estate, are here despised, if through indolence or neglect they have not recourse to it for improving their fortunes; for a royal proclamation has removed all the prejudices of the Spaniards against trade, by wisely declaring, that commerce in the Indies should not exclude from nobility or the military orders.

The negroes, mulattoes, and their descendants, form the principal part of the inhabitants, and of these are most of the mechanics; though here the Europeans also follow the same employments; for gain being here the universal passion, the inhabitants pursue it by means of any trade, none of which are here despised as at Quito, on account of their being followed by mulattoes.

The third and last class of inhabitants are the Indians and *Mestizos*, who are few in proportion to the largeness of the city, and the multitude of the second class. They are chiefly employed in agriculture, in making earthen ware, and bringing all kinds of provisions to market; the domestic services being chiefly performed by negroes and mulattoes.

The dress of the men in general differs but little from that worn in Spain; nor is there much distinction between the several classes; for here every one is allowed to wear whatever he can purchase: so that it is not uncommon to see a mulatto, or any other mechanic, dressed in a rich tissue. They are all fond of fine cloaths; and vanity and ostentation being under no restraint, they are extremely lavish in this article: but the dress of the men is greatly exceeded by that of the women, who in the choice of their laces carry their taste to a prodigious excess; nor is this confined to persons of quality; but has spread through all ranks, except the lowest class of negroes. These laces must be all made in Flanders, no woman of rank condescending to look on any other.

The dress of the ladies consists of a pair of shoes, stockings, a shift, a dimity-petticoat, an open petticoat, and a jacket, which in summer is of linen, and in winter of a beautiful stuff. To this some add a mantelet, that the former

former may hang loose. From the under-petticoat, which reaches no lower than the calf of the leg; hangs a border of very fine lace, through which the ends of the garters are discovered, embroidered with gold or silver, and sometimes set with pearls. The upper petticoat, which is of velvet, or some rich stuff, is fringed all round, and adorned all over with fringe, lace, or embroidery. The shift sleeves, which are a yard and a half in length, and two in width, when worn for ornament, are covered with lace in such a manner as to render the whole truly elegant. Over the shift is worn the jacket, the sleeves of which are excessively large, of a circular figure, and consist of rows of lace, or slips of cambric with lace disposed between each. The body of the jacket is tied on the shoulders with ribbons fastened to the back of the stays, and its round sleeves, being tucked up to the shoulders, form, with those of the shift, what may be termed four wings. If the jacket be not buttoned or clasped before, it is fastened on their shoulders. In summer they have a kind of veil of the finest cambric or lawn, richly laced; but in winter the veil worn in their houses is of baize, which, when they go abroad full dressed, is adorned like the sleeves. Over the petticoat is an apron of the same stuff as the sleeves of the jacket, hanging down to the bottom of it. In short, so expensive are they, that the marriage shift alone frequently costs a thousand crowns, and sometimes more.

The women value themselves extremely on the size of their feet, a small foot being esteemed one of their chief beauties; and therefore from their infancy they are accustomed to wear straight shoes, that their feet may not be suffered to grow beyond their proper size: some of them do not exceed five inches and a half, or six inches in length. Their shoes have little or no sole, one piece serving both for that and the upper leather, and are of an equal breadth and roundness at the toe and heel, so as to form a long figure of eight; but the foot not complying with this figure, brings it to a more natural shape. These shoes are always fastened with diamond buckles, or something very brilliant in proportion to the ability of the wearer; but these are worn less for use than for ornament; for they are made in such a manner, that they never loosen of themselves, nor do the buckles prevent their being taken off. They are also fond of white silk stockings, which are made extremely thin, the better to shew the shape of the leg, the greatest part of which is exposed to view.

The reader will conceive a still higher idea of their magnificence, when he is informed of the ornaments with which they are adorned in their visits, and upon public occasions. Their hair, which is naturally black, and capable of reaching below the waist, they dispose in a very graceful manner. They tie it up behind in six braided locks, through which is inserted a gold bodkin, a little bent, with a cluster of diamonds at each end, and on this the locks are suspended, so as just to touch the shoulders. On the front and upper-part of the head, they wear diamond egrets, and the hair is formed into little curls hanging from the fore-head to the middle of the ear, with a large black patch of velvet on each temple. Their earrings are of brilliants, intermixed with tufts of black silk covered with pearls; and besides their necklaces, they also wear about their neck rosaries, the beads of which are of pearls, either separate or set in clusters, to the size of a large filbert.

Besides their diamond rings, necklaces, girdles, and bracelets, all very curious, both with regard to water and size, many ladies wear a round jewel enriched with diamonds suspended from their girdle, and much more superb than their other ornaments. In short, a lady thus covered with lace, instead of linen, and glittering from head to foot with jewels, is supposed to be dressed at the expence of no less than thirty or forty thousand crowns; yet the small value they seem to set upon them, by wearing them in the most careless manner upon all occasions, is really surprising, since by this means they bring upon themselves fresh expences in repairing the old or purchasing new jewels, especially pearls, which are liable to be damaged.

The women of Lima are generally of a middling stature, handsome, genteel, and have a remarkable lustre and

dignity in their eyes. Their personal charms are said to be heightened by those of the mind; for they have clear and comprehensive intellects, an easiness of behaviour so well tempered, that while it invites love, it commands respect: the charms of their conversation are beyond expression; their ideas just, and their manners inimitably graceful. But they are so excessively fond of perfumes, that they always carry ambergrise about them; and not content with the natural fragrantcy of flowers, of which they are also extremely fond, they scatter perfumes even on their nosegays. The most beautiful flowers they place in their hair, and others which are most valuable for their odour, they stick in their sleeves. Hence the effluvia issuing from these ladies, it may be easily imagined, reach to no inconsiderable distance.

The lower class of women, even to the very negroes, endeavour, according to their abilities, to imitate their superiors, not only in the fashion of the dress, but in its richness. Their linen is always starched to a great degree, in order to display the costly patterns of their laces, and they give themselves the pain of pinching up their feet in little shoes, in order to imitate the ladies in the smallness of their feet. Their next care, which is indeed much more commendable, is cleanliness, which is seen in the uncommon neatness of their houses.

They are naturally gay, sprightly, and jocular, without levity; remarkably fond of music; so that even among the lowest you are entertained with agreeable songs; for they have in general good voices. They are very fond of balls, where they distinguish themselves by the gracefulness and agility of their motions.

The manners and dispositions of the nobility correspond with their rank and fortune; they are extremely courteous to strangers, who are charmed with their probity, their politeness, candour and magnificence. Though the natives of an inferior rank have too great a share of pride, they do not want docility; they instantly shew their reluctance to a command given with haughtiness; but when delivered with mildness and affability, are equally obsequious and submissive. They are charmed with gentleness of manners, and a few instances of kindness make a lasting impression on their minds; but the mulattoes, being less civilized, are haughty, turbulent, and quarrelsome.

The distempers most common at Lima, are malignant, intermitting, and catarrhus fevers, pleurisies, constipations, and convulsions. These last are divided into two kinds, common or partial, and malignant. They both come when nature is struggling in the crisis of some acute distemper; but those afflicted with the former often recover, tho' the greater part die on the third or fourth day; while those who have the misfortune of being attacked by the latter, sink under it in two or three days. Both are attended with insupportable pains; so that the groaning patient cannot be moved without inconceivable tortures, even from one side to the other. The throat is so contracted, that nothing can be conveyed into the stomach. The jaws are also sometimes so closely shut that it is impossible to open them. Thus the miserable patient lies without motion, and tortured in every part of his body. The malignant or arched spasm is even in the first stage so violent as to cause a contraction of the nerves of the vertebræ, from the brain downwards, which with all the muscles become more and more constricted all over the body, till it is drawn backward in the form of an arch, and all the joints dislocated.

The women of Lima are subject to a cancer in the matrix, which is extremely painful, very contagious, and almost incurable. Slow and hectic fevers also greatly prevail here, and the venereal disease is as common as in any other part of Spanish America, few being entirely free from it.

We shall now consider the commerce of Lima, which is the general emporium of trade of every kind, the center of the products and manufactures of other provinces, together with those of Europe imported by the galleons, and the staple of the whole kingdom. All the wealth of the southern provinces pours into this capital, and is discharged into the fleet, which sails with the galleons from Callao to Panama. At the head of this commerce is the tribunal del Consulado, already described, which appoints

commissaries to reside in the other cities of its dependence all over Peru. When commodities arrive at Lima, the merchants remit to their correspondents such goods as have been bespoke, reserving the rest in ware-houses, to dispose of on their own account to the traders who then resort to Lima. The produce of the sales in the interior country is sent to Lima in bars of silver, and a kind of amalgama of mercury and silver dust, which is coined in the mint of this city. The remittances sent to Lima during the interval between the flotillas, are expended in the manufactures of the country, great quantities of which come from the province of Quito, and the consumption is very large; they being worn by all the lower class of people, who cannot afford to purchase European stuffs. Lima has also its particular trade with the kingdoms both of North and South America. The most considerable commodity imported from the former is snuff, brought from the Havanna to Mexico, from thence transported to Lima, and diffused by the merchants of this city all over the province of Peru. Those who deal in this merchandize never engage in any other branch of commerce, except in the sale of perfumes, porcelain, ambergrise, and musk. From New Spain, Lima receives tar, naptha, indigo, and iron; from Terra Firma is imported leaf tobacco, which is greatly used by putting a small roll in the mouth called a *limpian*, both by the gentlemen and ladies, as well as by the vulgar; from Terra Firma are also imported pearls, and a few other articles. The timber used in building houses, ships, and boats, is brought from Guayaquil, together with cacao. The coasts of Nasca and Pisco send to Lima raisins, olives, wine, brandy, and oil; and the kingdom of Chili flour, wheat, dried fruits, wine, lard, leather, cordage, and some gold. Copper and tin are brought from Coquimbo; and from the mountains of Caxamarca and Chacapoyas, are brought a sort of canvas made of cotton for sails, &c. From the southern provinces are sent Vicuna wool for making hats, and some stuffs of a peculiar fineness; and lastly from Paraguay is sent the herb called by that name, of which there is an amazing consumption.

Thus this city is the emporium to which people resort from all quarters, and trade is in a constant circulation. The inhabitants of Lima are even said to have a natural disposition for commerce, and the city may be considered as an academy to which great numbers resort to perfect themselves in the various arts of trade. They penetrate into the designs of the seller, and artfully draw the purchaser into their own views. They have besides a remarkable talent of persuasion, at the same time that they are incapable of being persuaded. They affect to flight what they are most desirous of purchasing, and by that means frequently make very advantageous bargains, which none can obtain from them. However, notwithstanding these mean finesses in buying and selling, for which they are particularly distinguished, none are more punctual in performing their contracts.

S E C T. VIII.

Of the other principal Towns in the Audience of Lima, namely, Callao, Truxillo, Guamanga, Cusco, and Arequipa.

CALLAO is the port of Lima, from which it is five miles distance, and extends along the sea-coast on a low flat point of land. The Spaniards have no harbour equal to this in the South-sea, for beauty, security, and convenience; for the largest vessels may lie with perfect safety in the road, the water being extremely deep, and the port sheltered from the winds by the island of St. Laurence, which also breaks the surges rolling from the south-west. The town from the sea makes a tolerable figure, it having several public edifices; and besides the churches there are five monasteries, though according to some authors the inhabitants do not exceed four or five hundred. The government has expended large sums of money in giving this important harbour all the advantages of strength that it was thought art could bestow. Hence that town is considered in Spain as almost impregnable, though in fact both the garrison and fortifications are very inconsiderable. The latter consisted of an inclosure on the

land side, flanked by ten bastions, and several redans and plain bastions on the edge of the sea, with four strong batteries to command the port and road; but these being in a manner demolished in the last great earthquake, have never since been thoroughly repaired, the money appropriated by the government having been expended in other purposes, more agreeable to the viceroy of Peru. It is also reported, that his Catholic majesty is annually charged with large sums for the garrison, fortifications, and the men of war supposed to lie in the harbour; yet such is the integrity of the royal offices there, that the soldiers are hardly sufficient to mount guard; the walls are in many places in ruins, and the ships could not be fitted for sea in the space of several months.

A judgment may be formed of the importance of this harbour from what has been said of the commerce of Lima chiefly carried on by this channel. Two flotas annually sail from hence, one for Arica, the other from Panama; the former about the close of February, which having received the silver sent from Potosi, returns in March. In the beginning of May the flota sails from Panama with all the treasures of Potosi, the wealth of Chili brought by the Valparaiso fleet, and the royal revenues and merchandize brought from the most distant parts of Peru and Los Charcas. Besides these fleets there annually sail from hence two ships from Acapulco, freighted with gold and silver, and the commodities they bring back are lodged in the magazines here, and retailed to all the southern provinces of America.

This town and the city of Lima are the principal places in the archbishopric of that name. The audience of Lima is also divided into four bishoprics, Truxillo, Guamanga, Cusco, and Arequipa.

The diocese of Truxillo lies to the north of the archiepiscopal diocese of Lima, and, like all the others, is divided into several jurisdictions.

The city of Truxillo is seated in the eighth degree six minutes three seconds, south latitude, in a pleasant situation, though in a sandy soil. It is surrounded by a brick wall; and its circuit intitles it to be classed among the cities of the third order: it is situated about half a league from the sea; and six miles to the northward of it is the port of Guanchaco, the channel of its maritime commerce. The houses, which are mostly built of brick, make a handsome appearance, they being adorned with stately porticos and balconies; but are low on account of the frequent earthquakes, few having so much as one story. It is the residence of a bishop, who has a chapter, consisting of a dean, an arch-deacon, a chanter, four canons, and two prebendaries. Here is also an office of revenue with convents of several orders, a college of Jesuits, an hospital of the lady of Bethlehem, and two nunneries.

The inhabitants consist of Spaniards, Indians, and all the other casts. Among the former are several rich and distinguished families, all in general civil, friendly, and regular in their conduct. The women in their dress and customs follow nearly those of Lima. A great number of chaises are seen here; for as the sandy soil renders walking very troublesome, there are few families of any credit without one.

The valley in which Truxillo is seated is extremely fruitful, abounding with sugar-canes, maize, fruit, and plants proper for the kitchen, with vine-yards and olive-yards. The parts of the country nearest the mountains produce wheat, barley, and other grain, whence the inhabitants not only enjoy plenty of all kinds of provisions, but export considerable quantities, especially of wheat and sugar to Panama. This remarkable fertility has been improved so as to embellish the country. The city is surrounded by several groves and delightful walks of trees; the gardens are also well cultivated, and make a beautiful appearance.

The city of Guamanga, the capital of the second diocese, in the audience of Lima, is situated on the declivity of some mountains not remarkable for their height, which extending southward inclose a spacious plain to the eastward of the city, watered by a small stream. Guamanga has at least twenty noble families, who live in the center of the town in spacious houses of a considerable height, built partly of stone, and accommodated with

with extensive gardens and orchards. The cathedral is very splendid, and its chapter consists of a dean, an archdeacon, a chanter, two canons, and a penitentiary. It has a seminary for the service of the church, under the title of St. Christopher. Here are two parish-churches, one for the Spaniards, and one for the Indians, with four chapels. The city has also an university, with professors of philosophy, divinity, and law; and enjoys equal privileges with that of Lima, they being both royal foundations. Within the walls of the city are the convents of St. Dominic, St. Francis, the fathers of Mercy, St. Augustine, St. Juan de Dios, a college of Jesuits, and an hospital of St. Francis de Paula. The nunneries are of the orders of St. Clare, the Carmelites, and a religious sisterhood.

The large Indian suburbs round the city add greatly to its extent; and the houses, though low, are chiefly of stone.

In this diocese is a rich quicksilver mine, from which the inhabitants of a neighbouring town procure their whole subsistence, the coldness of the air in that place checking the growth of all kinds of grain and fruit; so that they are obliged to purchase them from their neighbours. The quicksilver mines wrought here supply all the silver mines of Peru with that necessary mineral, and, notwithstanding the prodigious quantities already extracted, no diminution is perceived.

Cusco is the most ancient city in Peru, it being of the same date with the empire of the yncas, and was founded by them as the capital of the empire. It stands in a very uneven situation on the sides of the mountains, there being no other near it more convenient. On a mountain contiguous to the north part of the city are the ruins of a famous fort built by the yncas, from whence it appears that their design was to inclose the whole mountain with a prodigious wall of such construction, as to render its ascent absolutely impracticable to an enemy, in order to prevent all approach to the city. This wall was entirely of free-stone and strongly built, some of the stones being of a prodigious magnitude.

The city of Cusco is nearly equal to that of Lima. The north and west sides are surrounded by the mountain of the Fortrefs, and on the south it borders on a plain in which are several beautiful walks. Most of the houses are of stone, covered with tiles of a lively red, that gives the houses an elegant appearance. The apartments are very spacious, and as the inhabitants are famous for their elegant taste, they are finely decorated, the mouldings of all the doors being gilt, and the other ornaments and furniture very splendid.

The cathedral nearly resembles that of Lima, though it is much smaller; it is built entirely of stone, and the architecture is even thought to exceed it. Here are also eight other parishes, with a convent of Dominicans, the principal walls of which were formerly those of the temple of the Sun, and the high altar stands in the very place where was once an image of gold of that imaginary deity. There is also a convent of Franciscans, which is the head of that order in this province. The convents of St. Augustine and the fathers of Mercy are likewise the principal of their respective orders. The Jesuits have also a college here. The convent of St. Juan de Dios, and that of the Bethlehemites, which are both very large, contain hospitals for the sick; the latter is particularly appropriated to the Indians, who are used there with great care and tenderness.

The government of the city consists of a corregidor placed at the head of the magistrates, who are the chief nobility; and out of these are annually chosen two ordinary alcaldes.

Here are three colleges: in the first, called St. Anthony, is a seminary for the service of the cathedral, in which are taught Latin, the sciences, and divinity: the second is under the direction of the Jesuits, who instruct youths of fortune: the third, called St. Francis de Borja, belongs also to the Jesuits, and is founded for the education of the sons of Indian princes. The two former confer all degrees below that of doctor, and have been erected into universities. Here is also a court of inquisition, and another of the croisade,

In this bishopric are several mines of gold and silver, that are extremely rich.

The fourth diocese of the audience of Lima is Arequipa, which contains the city of the same name, one of the largest in all Peru. It is delightfully seated in a plain; the houses are well built of stone, and are generally lofty, commodious, finely decorated on the outside, and neatly furnished within. The temperature of the air is extremely agreeable, the cold being never excessive, nor the heat troublesome; so that the fields are always clothed with verdure, and enamelled with flowers as in a perpetual spring. The inhabitants enjoy an exemption from many diseases common in this part of America, which is supposed to be in a great measure owing to their care in keeping the streets clean, by means of canals which extend to a river that runs near the city, and by which all its filth is swept away. But these advantages are allayed by its being frequently exposed to dreadful earthquakes; for by these convulsions of nature it has been four times laid in ruins. The city is, however, very populous, and among its inhabitants are many noble families. A great number of them have settled here on account of the goodness of the air, the fertility of the soil, and the convenience of commerce at the port of Arante, at twenty leagues distance. The chapter, besides the bishop, consists of a dean, an archdeacon, a chanter, a rector, and treasurer, three canons, and two prebendaries: besides the sacristy, which is served by two priests for the Spaniards, the parish of Santa Martha is appropriated to the Indian inhabitants. Here are two Franciscan convents, one of Dominicans, another of Augustines, a monastery of the fathers of Mercy, a college of Jesuits, and a convent and hospital of St. Juan de Dios, with three nunneries, and a seminary for the service of the cathedral. The civil, political, and military government of the city is executed by a corregidor, who is placed at the head of the regidores, from whom are annually chosen two ordinary alcaldes. Here is likewise an office of the revenue under the direction of a treasurer and accomptant, with commissaries of the inquisition and croisades.

In this bishopric are several gold and silver mines, and in some parts are large vineyards, from which considerable quantities of wine and brandy are made. Among the other productions is Guinea pepper, in which the jurisdiction of Arica in this diocese carries on a very advantageous trade, the annual produce of these plantations bringing in no less than sixty thousand dollars per annum. The pods of this pepper are about a quarter of a yard in length, and when gathered are dried in the sun and packed up in bags of rushes, each bag containing an aroba, or a quarter of a hundred weight, and thus they are exported to all parts. Other places of this jurisdiction are famous for vast quantities of large and excellent olives, far exceeding the finest produced in Europe, they being nearly as big as a hen's egg.

S E C T. IX.

Of the Audience of LOS CHARCAS, or LA PLATA.

Its Situation, Extent, and Climate. A particular Account of the famous Mountain of Potosi, and of the Lumps of Silver found in the Province of Carangas: with a Description of the City of Plata.

THE audience of Charcas, the last division of Peru, is equal in extent to that of Lima; but many of its parts are not so well inhabited, some being full of vast deserts and impenetrable forests, while others have extensive plains intercepted by the stupendous height of the Cordilleras; so that it is inhabited only in those parts that are free from those inconveniencies. It is bounded on the north by the diocese of Cusco, and reaches southward to Buenos Ayres; on the eastward it extends to Brasil; and on the westward reaches to the South sea, particularly at Atacama. The remainder of the province borders on the kingdom of Chili.

The climate of this country is various; on the shore it is excessive hot, and the inland parts of the country are in some places extremely cold: the soil is, however, generally

nerally fruitful in the cultivated parts, particularly in the valleys between the mountains, where it is watered by several rivers. With respect to its produce, it is chiefly famous for its gold and silver.

This audience of Charcas is divided into the archbishopric of Plata, and five bishoprics. We shall begin with the former.

The famous mountain of Potosi is known all over the commercial world for the immense quantity of silver it has produced. The discovery of this amazing treasure happened in the year 1545, by a fortuitous accident. An Indian, by some called Hualpa, and by others Gualca, pursuing some wild goats up this mountain, and coming to a very steep-part, laid hold of a shrub in order to climb it with greater celerity; but the shrub being unable to support his weight, came up by the roots, and discovered a mass of fine silver; and at the same time he found some lumps of the same metal among the clods that adhered to the roots. This Indian, who lived at Porco, hastened home with these first-fruits of his discovery, washed the silver, and made use of it, repairing when his stock was near exhausted to his perpetual fund. At length an intimate friend of his, named Guanca, observing the happy change in his circumstances, longed to know the cause, and repeated his questions with such earnestness, that Gualca revealed the secret to him. For some time they retired in concert to the mountain for fresh supplies of silver, till Gualca refusing to discover his method of purifying the metal, Guanca revealed the whole secret to his master Villarroel, a Spaniard, who also lived at Porco; and on this information went, in April 1545, to view this fortunate breach in the mountain, and the mine was instantly worked with immense advantage.

The first mine was called the Discoverer, from its discovering other sources of riches, inclosed in the bowels of this mountain; for in a few days another was found equally rich, and called the Tin Mine: since that another has been discovered, and distinguished by the name of Rica, or rich, it surpassing all the rest. It was afterwards succeeded by one named the Mendieta. These are the principal mines of Potosi; but there are several smaller crossing the mountain on all sides.

On a report of these important discoveries people from all parts repaired to Potosi, particularly from the city of Plata, which is situated about seventy-five miles from the mountain; so that at present the town of Potosi is near six miles in circuit, and inhabited by many noble families, particularly those concerned in the mines. Though the air of the mountain is so extremely cold, as to render the adjacent country remarkably barren, it producing neither corn, fruit, nor herbs; yet the town is so plentifully supplied as to enjoy an abundance of every kind, and the trade for provisions is greater here than in any other place except Lima. Some provinces send the best of their corn and fruit, others their cattle, others their manufactures, and those who trade in European goods resort to Potosi as to a market, where there is a great demand, and no want of silver to give in exchange. A Spanish author declares, from very good authority, that before the year 1638 it appeared by the public accounts, that the produce of the silver amounted to three hundred ninety-five millions six hundred and nineteen thousand dollars; which, in ninety-three years, the time it had then been discovered, amounted to forty-one millions two hundred fifty-five thousand and forty-three dollars per annum. Hence an idea may be formed of the vast trade which has for many years been carried on in this town, and is still likely to continue for a long time, its whole trade consisting in the silver extracted from this mountain; and though some diminution has been perceived in its produce, it is still very considerable.

At a small distance from Potosi are the hot medicinal baths, called Don Diego, whither some resort for health, and others for diversion.

In the province of Carangas, which is remarkably cold, is a great number of silver mines, constantly worked; among which one called Turco is very remarkable for a sort of ore termed by miners machacado, the fibres of the silver forming an admirable intertexture with the stones in which they are contained. Mines of this kind are

generally the richest. Besides these there are others in this jurisdiction; for in the barren sandy deserts extending towards the coast of the South sea are found, by digging in the sand, detached lumps of silver unmixed with any ore or stone, but what adheres to some parts of the metal. The lumps are called papas, from their being taken out of the ground in the same manner as that root. These lumps of silver are of a different composition from those found in the mines, having all the appearance of melted silver. In them the silver forms a mass, and the surface is covered over with black terrene particles, that have all the marks of calcination; but few or none of them are mixed with the silver. The size and figure of these lumps are very different, some weighing about two marks, or sixteen ounces, and some above a hundred marks. These lumps of silver are found in different parts of the same ground, though not often near one another.

We shall now give a description of the city of Plata, which received its name from the silver mines in its neighbourhood. It stands in a small plain environed by eminences, that defend it from the winds. The temperature of the air in the dry season is very mild; nor is there any considerable difference throughout the year; but in the winter, or rather the rainy season, which begins in September and continues till March, tempests of thunder and lightning are very common, and the rains of long continuance; but, during all the other parts of the year, the atmosphere is bright and serene. The houses both in the great square and those adjoining to it have one story above the ground-floor, and are covered with tiles. They are large and convenient, and have delightful gardens planted with the fruits of Europe; but water is so scarce, that they have hardly enough to supply the necessary purposes of life, the little they have being fetched from several public fountains dispersed in different parts of the city. The inhabitants, who consist of Spaniards and Indians, are said to amount to about four thousand.

The cathedral is large and divided into three isles, and is finely adorned with paintings and gildings. Its chapter consists of a dean, an archdeacon, chanter, treasurer, and rector, five canons, four prebendaries, and four minor prebendaries. The archbishop and his chancellor constitute the ecclesiastical tribunal. The parish of the cathedral is served by two priests, one for the Spaniards, and the other for the Indians. At the end of the city is St. Sebastian's church, which is appropriated solely to the Indians living within its precinct, who are thought to be about three thousand. The convents are those of the Augustines, Dominicans, Franciscans, the fathers of Mercy, and a college of Jesuits, all spacious buildings, with splendid churches. Here is also a conventual hospital of St. Juan de Dios, the expences of which are defrayed by the king; with two nunneries, one of the order of St. Clare, and the other of St. Monica. The city of La Plata has also an university dedicated to St. Francis Xavier, the chairs of which are filled indifferently either by the secular clergy, or by laymen; but the rector is always a Jesuit. Here are also two other colleges, in which lectures are read: that of St. John is under the direction of the Jesuits; while the archbishop nominates to that of St. Christopher, which is a seminary.

The chief tribunal in Plata is that of the audience, whose president has the titles of governor and captain-general of the province, exclusive of the governments of Santa Cruz de la Sierra, Tucuman, Paraguay, and Buenos Ayres, which are independent, and in military affairs absolute. It has also a fiscal, a protector-fiscal of the Indians, and two supernumerary auditors. The magistracy, or corporation, as in all the other cities of this country, consist of regidores, who are persons of the first distinction, with the corregidor at their head; and from them are annually chosen two ordinary alcaldes for maintaining order and the police. Here is also a tribunal of croisade, with a commissary, subdelegate, and other officers; a court of inquisition subordinate to that of Lima; and an office for taking care of the effects of persons dying intestate.

Two leagues from Plata runs the river Cachimayo, which has on its banks several pleasant seats of the inhabitants; and about six leagues in the road leading to

Potosi

Potosi is the river Philcomayo, which is passed over by a large stone bridge. During some months in the year this river furnishes the city of Plata with great plenty of delicious fish: among these is one called the dorado, which generally weighs between twenty and twenty-five pounds. The other provisions, as bread, flesh, and fruits, are brought from the neighbouring provinces.

S E C T. X.

Of the Diocese of La Paz in the Audience of Plata. Its Climate and Produce; with a Description of the Lama, the Guanaco, and Vicuna, of the Lake of Titicaca, and the City of La Paz.

WE now come to the five dioceses in the audience of Plata, and shall begin with that of La Paz, which is divided into six jurisdictions. Great part of the country is exposed to a cold air; so that hard frosts, snow, and hail, are not uncommon; but the city of La Paz is secured from them by its happy situation. Other parts are also so well sheltered from the piercing air of the Andes, that they produce all the vegetables of a hot climate, as sugar-canes, cacao, and the like. In the mountainous parts are large woods of valuable timber, but infested with tygers, leopards, and bears: they have also a few deer, and a great number of cattle of the European kinds, which feed on the heaths; as do also guanacos, vicunas, and lamas.

It will be proper here to describe the last of these animals, and we shall begin with the lama, which in several particulars resembles the camel, as in the shape of its head, neck, and some other parts; but has no bunch on its back, and is much smaller, cloven-footed, and of a different colour; for though most of them are brown, some are black, others white, and others of different colours. Its pace resembles that of a camel, and its height is equal to that of an ass between one and two years old. The Indians and Spaniards use them as beasts of carriage, and they answer very well for any load under a hundred weight. Anciently the Indians used to eat their flesh, as they still do when they are past their labour, and say there is no difference between it and mutton, except its being something sweeter. It is a very docile animal, easily kept; its whole defence is ejecting from its nostrils a viscous matter, which is said to give the itch to any one on whom it falls; so that the Indians, who firmly believe this, are very cautious in provoking it.

The guanaco and the vicuna are but little different from the lama. The guanaco is larger, and its wool long and harsh; the vicuna, which is smaller than the lama, has shorter and finer wool, and is brown all over the body, except the belly, which is whitish. The last are of great service in the mines, carrying metals in such rugged roads, as would be impassable for any other beasts.

In the cordillera near the city is a mountain of remarkable height, called Illimani, which doubtless contains immense riches; for a crag of it being some years ago separated from it by a flash of lightning, and falling on a neighbouring mountain, such a quantity of gold was found in the fragments, that for some time that metal was sold at Paz at eight pieces of eight per ounce. But its summit being perpetually covered with ice and snow, no mine has been opened in the mountain.

In this diocese is the lake of Titicaca, which is somewhat of an oval figure, and about eighty leagues in circumference, and the water in some parts seventy or eighty fathoms deep. Ten or twelve large rivers, besides a great number of smaller streams, empty themselves into it. The water, though neither bitter nor brackish, is turbid, and its taste so nauseous, that it cannot be drank. It contains several islands, among which is one of a considerable size, on which the yncas erected a magnificent temple to the sun, the walls of which were covered with plates of gold and silver; but this immense mass of riches the Indians, on seeing the rapaciousness of the Spaniards on their conquering the country, are thought to have thrown into the lake, to prevent its falling into their hands.

The city of La Paz is of a middling size, and from its situation among the breaches of the Cordillera, the ground on which it stands is not only unequal, but also surrounded by mountains, without any other prospect than that of those mountains and the channel of the river. When this river is increased either by the rains or the melting of the snow on the mountains, its current forces along large masses of rocks with some grains of gold, which are found after the flood has subsided. Hence some idea may be formed of the riches inclosed in the bowels of these mountains, a remarkable proof of which appeared in the year 1730, when an Indian washing his feet in the river discovered so large a lump of gold, that the marquis de Castel Fuerte gave twelve thousand pieces of eight for it, and sent it as a present to the king of Spain.

The chapter of the cathedral consists of a dean, an archdeacon, a chanter, four canons and prebendaries. Here are also four parish-churches and monasteries of Augustines, Dominicans, Franciscans, fathers of Mercy, a college of Jesuits, and a convent and hospital of St. Juan de Dios, with a nunnery of the order of Conception, and another of Santa Terefa. The city is governed by a corregidor, under whom are regidores and ordinary alcaldes, as in the other towns.

S E C T. XI.

Of the Bishoprics of Santa Cruz de la Sierra and Tucuman, in the Province of Los Charcas: their Climate, Soil, Produce, and Inhabitants.

THE bishopric of Santa Cruz de la Sierra is a government and captain-generalship, and though its jurisdiction is of large extent, not many Spaniards are found in it; and its few towns are in general missions, comprehended under the name of missions of Paraguay.

The winter here is severe; it begins in May, and ends in August, during which the south wind blows for seven weeks, and the rains overflow great part of the country; but the summer is excessive hot.

The soil abounds with several kinds of fruit. Here is a species of palm tree, from the trunk of which they get a sort of meal that is very good food. Grapes, figs, and musk-melons, also thrive well here.

The city of Santa Cruz, the capital of this government, stands eighty or ninety leagues east of Plata, but is neither large nor well built, nor has any thing answerable to the name of a city. The houses are of stone covered with palm leaves: there is one church, which is the cathedral; its chapter consists only of a bishop, dean, and archdeacon; it having neither canons, prebendaries, nor other dignitaries.

The missions belonging to the Jesuits in the parts dependent on this bishopric are called Indios Chiquitos, or Little Indians, a name they received from the Spaniards, from the extreme smallness of the doors of their houses. Their country lies between Santa Cruz de la Sierra and the lake of Xarayes, from whence the river Paraguay has its rise, and being increased by the conflux of others, forms the famous river of Plata. About the close of the last century the Jesuits began preaching in this nation, and had such success, that in 1732 they had formed seven towns, each consisting of above six hundred families, and were then building others for assembling under their laws the great number of Indians they brought over to the Romish church.

The Indios Chiquitos are active and well made, and their courage has been frequently experienced by the Portuguese, who used to make incursions into their country, in order to carry off the inhabitants for slaves: but their valour has taught them to keep within their own limits. The arms of these Indians are poisoned arrows, muskets, and sabres. Though their language is different from that of the other nations of Paraguay, they have nearly the same customs. Near these is another nation of Indians, who have always strenuously refused to listen to the missionaries, who have been able to make very few converts among them.

The bishopric or government of Tucuman lies in the center of this part of America, beginning south of the

river Plata beyond the towns of Chicas, which furnish Indians for the mines of Potosi; on the east it borders on Paraguay and Buenos Ayres, reaching westward to the kingdom of Chili, and southward to the plains of Magellan.

The territories of this government are of such extent, that they reach above two hundred leagues from north to south, and in some parts little less than a hundred from east to west; but all the towns are small, and built without either order or symmetry. The principal part of the country is not habitable, either from the want of water, or the impenetrable forests with which it is covered; and the Spaniards are prevented from extending their settlements by the ravages of the free Indians, who take all opportunities to destroy them.

Those parts of the country that are watered by rivers are so fertile, as to produce corn and fruit sufficient for the consumption of the inhabitants. The woods abound in wild honey and wax, while the hot parts produce sugar and cotton; the last of which is manufactured in the country, and, with the woollen stuffs also wove by the inhabitants, form an advantageous branch of trade. But its great article consists in the mules bred in the luxuriant pastures of its valleys; inconceivable droves of these animals are sent to all parts of Peru, they being famous for exceeding all others in strength and docility.

S E C T. XII.

Of PARAGUAY.

Its Situation, Climate, and Produce; with a particular Account of the Missions of the Jesuits, and the Orders, Regulations, and Government of the Towns and Villages under their Authority.

THE fourth bishopric of the audience of Charcas is Paraguay, which lies to the east of Tucuman, and is bounded on the north by Santa Cruz de la Sierra, on the south by Buenos Ayres, and on the west by Brasil.

The air in general is moist and temperate, though in some places it is rather cold. The temperate parts abound with all kinds of provisions. Cotton is produced in great quantities; and the industrious, in the missions of the Jesuits, are very ingenious in weaving it into stuffs for exportation. It also abounds in tobacco, and in the valuable herb called Paraguay; with plenty of a variety of fruits, and rich pastures, in which are bred vast herds of cattle.

The only settlements in this government are the city of Assumption, Villa Rica, and some other towns, whose inhabitants are a mixture of Spaniards, Mestizos, and some Indians; but the greatest part are of the several casts. As the city Assumption is but small and irregular, it cannot be expected that Villa Rica and the other towns and villages should be better. The houses of the capital are indeed intermixed with gardens and plantations, but without any symmetry. It is, however, the residence of the governor of the province, who had formerly under his jurisdiction part of the towns which composed the mission of Paraguay; but a few years since they were separated from it, and annexed to the government of Buenos Ayres. In the city of Assumption is a cathedral, whose chapter, besides the bishop, consists of a dean, an arch-deacon, a treasurer, and two canons. The parishes of the city of Villa Rica, and of the other towns depending on this government, are served by the Franciscans; but in the missionary towns they are solely under the care of the Jesuits; and these composing most of the towns in this province, we shall treat particularly of them, in which we shall follow the account given by the learned and ingenious Antonio de Ulloa, and Muratori.

The missions of Paraguay, besides those in the province of that name, include a great many in Santa Cruz de la Sierra, Tucuman, and Buenos Ayres.

Soon after the city of Assumption was founded, a few Jesuits entering Paraguay, brought over to the Romish church about fifty Indian families, who soon induced many others to follow their example, on account of the peace and tranquillity they enjoyed under the direction of the fathers. They had long disdained to submit to the

arms of the Spaniards and Portuguese; but became willing converts to the religious tenets proposed by the Jesuits, who, in order to cultivate their minds and gain their affections, learned their language, and conformed to their manners; thus obtaining an entire ascendant over their affections, they established the most solid and real authority, a dominion over the mind.

They began with assembling them in towns, and forming them into societies, regulated by a very extraordinary system of civil policy. They engaged to protect them against the insolence of the Spanish soldiers and the tyranny of the governors, and actually kept their word with respect to the Portuguese, against whom they obtained leave from the court of Spain to arm the natives. The Portuguese, then only intent on the improvement of their colonies, in violation of the most sacred laws, did not, even after the conversion of these people, cease from making incursions, in order to carry off the young inhabitants as slaves for their plantations; so that it became absolutely necessary, in order to preserve these converts, to remove into Paraguay about twelve thousand of all ages, and a like number were brought from other places. The Jesuits set about disciplining the Paraguayans, taught them the use of fire-arms, and soon rendered them able to cope with their enemies, and, when they appeared, to drive them out of the country. The mildness of the Christian yoke, the exemption from taxes and marks of servitude, rendered them extremely attached to the fathers; and at present above three hundred and forty thousand families are subject to the Jesuits, living in obedience and an awe bordering upon adoration, yet procured without any violence or constraint.

The Paraguay missions are on all sides terminated by nations of idolaters, some of which, however, live in perfect harmony with them, while others make frequent incursions into the country; and among the latter the fathers chiefly employ their zeal, in order to bring them over to their religion and discipline; and having brought over a number of these to their principles, they conduct them to the Christian towns, where, after proper instructions, they are admitted to baptism.

There are about threescore parishes on the banks of the rivers Paraguay and Panama, at not above the distance of thirty miles from each other. In each of these is a Jesuit, who is supreme in all causes civil, military, and ecclesiastic; and may be regarded as a petty prince, who governs not only with the authority of a sovereign, but with the influence and reputation of an oracle. The important office of governor is, however, always filled by a person chosen by the Indians, with the approbation of the priest. The alcaldes are annually appointed by the regidores, and the governor jointly with them attends to the maintenance of good order and tranquillity among the inhabitants; but that these officers, who are seldom persons of distinguished abilities, may not abuse their authority, and either through interest or passion carry their revenge too far against the other Indians, they are not to proceed to punishment without previously acquainting the priest, that he may compare the offence with the sentence. The priest, on finding the person really guilty, delivers him up to be punished, which generally consists in imprisonment for a certain number of days, and sometimes fasting is added to it; but if the fault be very great, the delinquent is whipped, which is said to be the most severe punishment used among them. The execution of the sentence is preceded by a discourse made by the priest before the delinquent, in which he represents, with the greatest mildness, the nature and guilt of his crime, by which means he is brought to acknowledge the justice of the sentence, and to receive it rather as a paternal correction, than a rigorous punishment; and indeed they are said to have so high an opinion of the Jesuits, that they are more ready to blame themselves, than to think it possible for the priest to do wrong.

Every town has a particular armoury, in which are kept all the fire-arms, swords, and weapons used by the militia when they take the field, whether to repel the insults of the Portuguese, or any of the free Indians inhabiting their frontiers; and, that they may be dexterous in the management of them, they are exercised on the evening of every holiday in the market-places of the town.

All persons capable of bearing arms are also in every town divided into companies under their proper officers, who owe this distinction to their military qualifications. Their uniform is richly laced with gold or silver, according to their rank, and embroidered with a device of their towns. In these they always appear on holidays at the times of exercise. The governor, alcaldes, and regidores, have likewise very magnificent habits of ceremony, which they wear on solemn occasions.

Every town has a school for teaching reading, writing, dancing, and music; and whatever the natives undertake they generally make a great proficiency in; for the inclination and genius of every one is carefully consulted, before he is forwarded in any branch of science. In one of the courts of the house belonging to the priest of each town are work-houses for painters, sculptors, gilders, silver-smiths, lock-smiths, carpenters, weavers, watch-makers, and other mechanic arts and trades, where the Indians work for the benefit of the whole town, under the inspection of the priest's coadjutors; and boys are also instructed in the arts or trades to which they have the greatest inclination.

In each of the towns is a house in which women of ill fame are placed; it also serves for the retreat of married women who have no families, during the absence of their husbands. For the support of this house, and also of orphans, and those who by age or any other circumstance are disabled from earning a livelihood, two days in the week are set apart, in which the inhabitants of every village are obliged to sow and cultivate a piece of ground, called *Labor de la Comunidad*, the Labour of the Community, and the surplus of the produce is applied to procure furniture and decorations for the church, and to clothe the orphans, the aged and disabled. By this benevolent plan all distress is precluded, and the inhabitants provided with every necessary of life.

That the Indians may never want materials for work, it is one part of the priest's care to have always in readiness a stock of different kinds of tools, stuffs, and other goods; so that all who are in want repair to him, bringing, by way of exchange, wax, of which here are great quantities, and other products. The goods received in exchange are sent by the priest to the superior of the missions, and with the produce a fresh stock of goods is laid in. The priest likewise visits personally the Indian plantations, in which he is remarkably sedulous, in order to prevent the indulgence of that slothful disposition natural to the natives. He also attends at the slaughter-houses where cattle are daily killed, large herds of which are kept for the public use, and their flesh is distributed by the priests in lots proportioned to the number of persons in each family. In short, he visits the sick, to see that they are duly attended and provided with every thing necessary to their recovery.

The civil government of these towns seems admirably calculated to produce happiness; and the ecclesiastical appears no less extraordinary. The priest instructs the Indians in his district, and obliges them punctually to frequent Divine service on Sunday. The children repair every morning by break of day to the churches, where they take their places on opposite sides, according to their sex. There they recite alternately the morning prayer and Christian doctrine, till sun-rise, when mass is celebrated, at which all the inhabitants are obliged to attend, except they can give a sufficient reason for their absence. After mass all go to work, and in the evening the children assemble to be catechised, and the adults to pray. Marriages are, for the greater solemnity, celebrated on Sunday; high mass is then sung, and an exhortation to the married pair is pronounced from the pulpit; after which a list is called over to see who is absent, and penances are imposed on all trespasses committed in the parish. This regularity is said to produce an astonishing effect on the minds and morals of the Indians, who are punctual in their religious duties, faithful in their dealings, charitable to the distressed, humble, obedient, and industrious, beyond what could be reasonably expected from a people naturally indolent and slothful.

The parish-churches in Paraguay are capacious, rich, elegant, and splendidly furnished; gilding and painting attract the eye, and on every side strike the imagination;

all the utensils used in religious worship are of gold and silver, many of them curiously embossed and set with precious stones. Magnificent galleries are erected on one side the altar for the civil magistrates, and on the other for the military officers, and all the vulgar are seated with great order on seats round the area. Every church has its band of music, consisting of a great number of performers in vocal and instrumental music, and Divine service is celebrated in them with all the pomp of cathedrals. The same is observed in public processions, especially on that of Corpus Christi-day, at which the governor, alcaldes, and regidores assist in their habits of ceremony, and the militia in their uniforms; the rest of the people carry flambeaux: these processions are likewise accompanied with dancing, and the performers wear particular dresses, extremely rich, and adapted to the characters represented. In short, the whole is conducted with the utmost pomp and parade, and every thing relating to religion is contrived to strike the senses and captivate the imagination of the weak and superstitious.

The house or rather palace of the priest, who may be considered as a spiritual prince within his jurisdiction, is grand, spacious, and constructed in the form of a church, in order to strike his subjects with religious awe and reverence: it consists of different apartments, suited to the various offices of the priest, as a civil and ecclesiastical magistrate. Every morning after prayers is devoted to hearing the complaints and redressing the grievances of those who demand an audience. At noon he hears confessions and grants absolutions, in which he is extremely rigid and exact. In the afternoon he walks abroad, inspects the public and private affairs, and superintends the labour of his parishioners; while the evening is devoted to catechising and discoursing on moral and religious subjects.

The houses of the Indians are built with that symmetry and convenience, and so completely furnished, as to excel those of the Spaniards in many towns in this part of America. Most of them, however, have only mud walls; but some of them are of unburnt brick, and others of stone; yet in general are covered with tiles. All private houses are said to make gun-powder, that a sufficient quantity may not be wanting, either on any exigency, or for fire-works on holidays and anniversary rejoicings.

Such at least is the idea conveyed of the behaviour of the Jesuits here by Muratori and the learned Don Antonio Ulloa, who are undoubtedly the best writers on the subject. Indeed some have treated their characters with great severity, and they may justly be accused of ambition; but perhaps this passion was never directed to more noble and useful purposes than instructing the ignorant, promoting industry, and inspiring a love of order, with temperance, frugality, and every other virtue that can humanize the mind. It is not surprising if the excessive reverence paid here to the Jesuits fills them with pride, so natural to an elevated station. However, it is affirmed, but with what justice we will not pretend to determine, that they carry their authority to such an excess, as to cause even the magistrates to be corrected before them with stripes, and suffer persons of the highest distinction within their jurisdictions to kiss the hem of their garments as the greatest honour. It must, however, be added, that the utter abolition of all ideas of property, which is rendered useless by the general magazines and store-houses, doubtless contributes to the happiness of the people, since they are certain of never wanting, and are deprived of the very inclination of committing the numerous vices that spring from selfishness, avarice, and discontent. From this and other particulars one would imagine, that they had taken the general scheme of their government from Sir Thomas Moor's *Utopia*; yet the priests themselves possess large property, all manufactures are theirs, every natural commodity is brought to them, and the treasures annually remitted to the superior of the order plainly evince that zeal for religion is not the only motive of their forming these missions.

The missionary fathers will not permit any of the inhabitants of Peru, whether Spaniards, *Mestizos*, or even Indians, to come within their missions in Paraguay. This, their friends say, is not with a view of concealing their transactions from the world, but to prevent their Indians being

being corrupted by the example of others. They are said to be at present strangers to sedition, pride, malice, envy, and other passions so fatal to society; but were strangers admitted among them, their bad examples would soon teach them what at present they are happily ignorant of. The vigilance and jealousy which the fathers express in this particular has given birth to many unfavourable reports. If a stranger, in spite of all their precaution, should find his way into the country, he is immediately secured by the superior of the parish, a house assigned him, and every satisfaction is generously allowed him, except his liberty. If the father should permit him to see the town, it is always in his own company, and after notice has been given to the inhabitants to keep close in their houses, where they barricade themselves as if they dreaded the assault of a powerful enemy. As soon as an opportunity offers for his embarking at Buenos Ayres, the stranger is sent thither under a guard of Indians, who are entire strangers to every European language; whence it is impossible for them to communicate any thing with respect to the state of the country.

It ought not to be omitted, that, besides the provincial governments, there is a supreme council, composed of an annual meeting of all the fathers, who adjust the methods necessary to be executed for promoting the common concerns of the mission, for framing new laws, correcting or abolishing old ones, and adapting every thing to the present circumstances.

It has been already intimated, that the natives are trained up to the exercise of arms, and the military of Paraguay is at present so formidable as to raise the jealousy of Spain and Portugal, and is probably able to foil all the attempts of the Portuguese and Spaniards to reduce them to obedience. Every parish has its body of horse and foot, who are duly exercised every Sunday in the manual exercise and evolutions, in the same manner as the militia of Switzerland. This force is said to be divided into regiments, composed of six companies of fifty men each. The officers hold their commissions of the fathers, and are selected out of the body of the people for their valour, activity, and obedience. The cavalry is on much the same footing as the infantry, only the regiments are less numerous. It is even said, that the Jesuits can raise seventy or eighty thousand well disciplined troops, amazingly expert in the use of the firelock and bayonet, and that with their slings they can throw stones of four or five pounds weight with astonishing force, and such dexterity, as to hit the smallest mark at any proposed distance within the compass of their strength.

With respect to the trade of Paraguay, it consists of cotton stuffs, made in the country; of tobacco, a great deal of which is planted here; and of the herb called Paraguay, which alone would be sufficient to form a flourishing commerce. These goods are carried for sale to the cities of Santa Fe and Buenos Ayres, where the fathers have factors, who dispose of what is consigned to them from Paraguay, and lay out the money in such European goods as the towns are then in want of, in ornaments for the churches, and for the priests who officiate in them; but the greatest care is taken in deducting from what each town sends the amount of the tribute of its Indian inhabitants, which is immediately remitted to the officers of the revenue belonging to the crown of Spain.

SECT. XIII.

Of BUENOS AYRES, including PATAGONIA.

Its Situation and Produce; with a particular Account of the Manner of hunting the wild Cattle for their Hides, in order to take them alive; with a Description of the City of Nuestra Senora de la Buenos Ayres.

BUENOS Ayres, which is included by Ulloa within the jurisdiction of Los Charcas, and termed the fifth bishopric of that audience, received its name from the extraordinary salubrity of the air, and is extended to all that country from the eastern and southern coast of that part of America as far as Tucuman on the westward, on the north to Paraguay, and on the south to Terra Magellanica. This country is watered by the great river

La Plata. The distinctions between summer and winter are here very visible. In summer the excessive heats are mitigated by gentle breezes, which constantly begin at eight or nine in the morning, and in winter violent tempests of wind and rain are very frequent, accompanied with such dreadful thunder and lightning as fill the inhabitants, though used to them, with terror and consternation.

There is no place either in America or Europe where meat is better or cheaper; it is always fat and very palatable, and in such plenty, that it is said the hides of the beasts, which are most valuable, are all that is properly bought, the carcase being in a manner given in the bargain. The country to the west, north, and south of the city of Buenos Ayres lately abounded so greatly in cattle and horses, that the whole cost consisted in taking of them; and even then a horse was sold for a dollar, and the usual price for a beast chosen out of a herd of two or three hundred was only four rials. At present there is no scarcity; but they keep at a greater distance, and are more difficult to be caught, from the prodigious havoc made of them by the Spaniards and Portuguese, merely for the sake of their hides, the principal branch of the commerce of Buenos Ayres.

Though the Spaniards claim the whole country as far as the straits of Magellan, yet the southernmost part, usually distinguished by the name of Patagonia, is unpossessed by the Spaniards. This country is on the east side extremely remarkable for a peculiarity not to be paralleled in any other part of the known world; for though the whole territory to the northward of the river Plata is full of wood, and stored with immense quantities of large timber trees; yet to the southward of the river no trees of any kind are to be met with, except a few peach trees, first planted by the Spaniards in the neighbourhood of Buenos Ayres; so that on the whole eastern coast of Patagonia, extending near four hundred leagues in length, and reaching as far back as any discoveries have yet been made, no other wood has been found than a few insignificant shrubs.

The country, however, abounds with pasture; for the land appears in general to consist of a light, dry, gravelly soil, and produces great quantities of long coarse grass, which grows in tufts, interspersed with large barren spots of gravel between them. This grass feeds immense herds of cattle; for the Spaniards at Buenos Ayres having, soon after their first settling there, brought over a few black cattle from Europe, they have thriven prodigiously by the plenty of herbage they met with, and are now increased to that degree, and are extended so far into different parts of Patagonia, that they are not considered as private property; but many thousands have been annually slaughtered by the hunters, only for their hides and tallow.

The manner of killing these cattle being peculiar to this part of the world, deserves a particular description. The hunters being all mounted on horseback, both the Spaniards and Indians being excellent horsemen, arm themselves with a kind of spear, which at its end has its blade fixed a-crofs; with this instrument they ride at the beast, and the hunter who comes behind him hamstring him. As the beast after this operation soon falls, without being able to rise, they leave him and pursue others, whom they serve in the same manner. Sometimes a second party attend the hunters, to skin the cattle as they fall: but it is said, that at other times the hunters choose to let them languish in torment till the next day, from the opinion that the anguish the animal endures facilitates the separation of the skin from the carcase: and though their priests have loudly condemned this most barbarous practice, yet all their efforts to put an entire stop to it have hitherto proved ineffectual.

These cattle are slaughtered, as hath been already said, only for their hides and tallow, to which sometimes are added their tongues; but the rest of their flesh is left to putrify, or to be devoured by the birds and wild beasts. The greatest part of it falls to the wild dogs, of which there are immense numbers in that country. These are supposed to have been originally produced by Spanish dogs from the city of Buenos Ayres, who, allured by the great quantity of carrion, and the facility they had by that

mean s

means of subsisting, left their masters, and run wild among the cattle; for they are plainly of the breed of the European dogs, animals not originally found in America: but though these dogs are said to be some thousands in a company, they neither diminish nor prevent the increase of the cattle, not daring to attack the herds on account of the numbers which constantly feed together; but contenting themselves with the carrion left by the hunters.

As it is often necessary for the uses of agriculture, and for other purposes, to take the cattle alive, without wounding them, this is performed with admirable dexterity by throwing a thong of several fathoms in length, with a running noose at one end, over the horns of the beast, much in the same manner as we have already described in hunting the wild ass and other animals. Another hunter who follows the game, throws another noose about one of its hind legs, and as the other end is fastened to the saddle of the riders, this is no sooner done, than the horses, who are trained to the practice, turn different ways, by which means the beast is soon thrown down; the horses then stopping, keep their thongs upon the stretch, and the hunters alighting, secure the beast in such a manner, that they afterwards easily convey him to whatever place they please. They in like manner noose horses, and it is said even tigers.

The horses which were first brought from Spain, and are likewise prodigiously increased, run wild to a much greater distance than the black cattle; and though many of them are excellent, yet their number renders them of very little value, the best of them being often sold in the neighbouring settlements, where money is plenty, for not more than a dollar a-piece.

In all parts of this country are a good number of vicuñas or Peruvian sheep; but these, from their shyness and swiftness, are killed with difficulty. On the eastern coast are found immense quantities of seals, and a vast variety of sea-fowl, among which the most remarkable are the penguins, which in size and shape resemble a goose; but instead of wings have short stumps like fins, which are of no use to them except in the water; their bills are narrow, and they stand and walk in an erect posture.

The inhabitants of the eastern coast appear to be but few, and rarely more than two or three at a time have been seen by any ships that have touched there. However, towards Buenos Ayres they are sufficiently numerous, and frequently very troublesome to the Spaniards. These last exceed the southern Indians in activity and spirit, and seem in their manners to be nearly allied to those gallant Indians of Chili, who have long set the whole Spanish power at defiance, have often ravaged their country, and still remain independant.

The capital of this government is called Nuestra Señora de Buenos Ayres. It was founded in 1535, on the south side of the river Plata, close by a small river, in the thirty-fourth degree thirty four minutes thirty-eight seconds south latitude, and in the sixtieth degree five minutes west longitude from London. This city, which is built on a large plain, gently rising from the little river, is far from being small, it having at least three thousand houses inhabited by Spaniards and different casts. Like most towns seated on rivers, it is much longer than it is broad; but the streets are straight, and of a proper breadth. The principal square is very large, and built near the little river; the front answering to it being a castle, in which the governor constantly resides, and, with the other forts, has a garrison, with a thousand regular troops. The houses, which were formerly of mud thatched with straw, and very low, are now much improved, some being of chalk, and others of brick, with one story above the ground-floor, and most of them tiled. The cathedral is a spacious elegant structure, and is the parish-church for the greatest part of the inhabitants; the other at the farther end of the city being only for the Indians. The chapter consists of the bishop, dean, and two canons. There are also several convents, and a royal chapel in the castle, where the governor resides.

Within the government of Buenos Ayres are three other cities, named Santa Fe, Las Corrientes, and Monte Video. Santa Fe lies about ninety leagues north-west of Buenos Ayres, between the rivers Plata and Salado, which, after running through the country of Tucuman, joins the former. The city is but small and meanly built, which is in a great measure owing to the frequent insults the inhabitants have received from the free Indians in its neighbourhood, who have sometimes pillaged the city and the adjacent villages. It is, however, the channel of the commerce between Paraguay and Buenos Ayres. The city of Las Corrientes, which is seated on the eastern banks of the Plata, between it and the river Parana, is about a hundred leagues north of the city of Santa Fe; but is much inferior to it, and indeed has no marks of a city except the name. Monte Video, which was lately built, stands on the border of the bay from whence it derives its name, and, like the former, is of little consequence. Each of these cities has its particular regidor, as lieutenant of the governor, and its inhabitants, together with those of the neighbouring country, are formed into a militia, which on any appearance of an invasion from the Indians, assemble in order to repel their attacks, in which they have been frequently successful.

C H A P. XII.

Of CHILI, the Islands of TERRA DEL FUEGO, JUAN FERNANDES, &c.

S E C T. I.

Of C H I L I.

Its Situation, Extent, Climate, and Produce: the Number of its Inhabitants, and the Manners and Customs of the free Indians.

THE kingdom of Chili is very extensive, but its limits are not exactly ascertained; some confine it within the Spanish jurisdiction, others extend it from the twenty-sixth to the forty-seventh degree of south latitude, and there are even some who include within its limits Terra del Fuego and the very extremity of Cape Horn. We shall, however, upon the best authority confine the name of Chili to that tract of land between the twenty-sixth and forty-fifth degree of south latitude, and between the forty-seventh and fifty-fourth degree of west longitude.

Agreeable to which limits it is bounded by Peru on the north, by the province of La Plata on the east, by Patagonia or Terra Magellanica on the south, and by the South sea or Pacific ocean on the west; containing a space of between twelve and thirteen hundred miles in length, and about half as much in breadth, if we include the vast plains of Chicuito, which lie on the opposite side of the lofty ridge of the Andes, which are here of a stupendous height. The country indeed strictly called Chili lies between this chain of mountains on the South sea, including only a space of about ninety miles in breadth.

The seasons here are almost opposite to those in the northern hemisphere; but the face of the country is beautiful, and the climate wholesome. Here is felt heat and cold in the different seasons. On the east the country is screened by the Andes; while from the west the

air is cooled by the most refreshing sea-breezes: yet in some parts the piercing winds which in winter blow from the mountains are exceeding sharp. However, this country may in general be esteemed one of the most agreeable climates in South America. In winter a light coat of snow falls upon the valleys; but the mountains are covered with such quantities, as in summer supply the country with innumerable rivulets, which produce the most extraordinary fertility; for here Indian and European corn, wine, and fruits, with all the necessaries of life, are produced in the utmost abundance and perfection.

Among the corn great quantities of excellent wheat are produced; the vines are of several kinds, and, with regard to the richness and flavour of their grapes, are esteemed beyond any produced in Peru. A sort of muscadell is made here, whose flavour far exceeds any wine of the kind made in Spain. The fruits which mostly abound in Chili are of the same kind as those known in Europe; its cherries in particular are large and of a fine taste. The strawberries, like those of Peru, are of two kinds; and in the gardens of the cities near the sea-coasts, orange trees are kept covered with blossoms and fruit all the year, and in the plains are a prodigious variety of beautiful flowers without cultivation.

Among the remarkable herbs, many of which are medicinal, and others applied to various uses, is the panque, which is of great service in tanning of leather.

Besides the rich variety of productions upon the surface of the earth, the country abounds with mines of gold and silver, copper, tin, and iron; and with quarries of lapis-lazuli and loadstone.

The chief use of the rich lands is the fattening of oxen, goats, and sheep, which is the principal employment of the greatest part of the inhabitants in the country. All other provisions are in equal plenty; turkeys, geese, and all kinds of poultry are sold at a very low price. Wild-fowl are also very common, and are of the same sorts as those found in the deserts of Quito; as are likewise wood-pigeons, partridges, woodcocks, and snipes. Among the singing birds is the goldfinch, which resembles those of Spain, except a small variation in its plumage. There are besides others proper to the country, particularly the piche, which is something larger than a sparrow, of a brown colour, spotted with black, except the breast, which is of a most beautiful red, and some feathers of the same colours in the wings intermixed with others of a bright yellow. Though some snakes are found in the fields and woods, their bite is not dangerous, neither are the country peasants under any apprehensions from ravenous beasts; whence if this country was not subject to earthquakes, nature might be said to pour her treasures on this country, without blending them with the usual inconveniences.

The number of inhabitants in this extensive country bears no proportion to its extent. All the Spaniards in Chili are said not to exceed twenty thousand, and these are dispersed in such a manner as hath given the free Indians the greatest advantages in all their wars with them. This was the great oversight of Valdivia, the first invader of Chili, who, upon his discovering gold, attempted to make so many establishments, as furnished the Indians whom he had treated very cruelly with an opportunity of recovering their liberty and expelling the Spaniards out of the mountains. The Europeans, Mestizos, mulattoes, and negroes, are reputed at a hundred and fifty thousand; but the Indians are much more numerous. The subjected Indians belong entirely to the Spaniards, live among them, and serve them in the same manner as the original natives of Peru and Mexico. For the better establishment of good order and a regular police, they are divided according to their habitations into small lordships, styled commanderies.

The Chileans are tall, robust, active, and courageous. No other Indian people have cost the Spaniards so much trouble; for they are dexterous in the use of the sword, pikes, bows, and arrows; and their discipline more regular and rational. They fight in squadrons, retire when broke, rally, fortify themselves with great address, and choose their ground either to engage, attack, or defend themselves, with admirable judgment.

The Indians in several parts of Chili are not governed by caciques like those of Peru, the only subordination among them being with regard to age; so that the oldest person of the family is respected as its governor. Those who inhabit the southern parts of the river Biobio, and those who live near the Cordillera, have hitherto eluded all attempts made for reducing them under the Spanish government; for when strongly pushed they abandon their huts, and retire into the more distant parts of the kingdom, where, being joined by other nations, they return in such numbers, that they easily take possession of their former habitations, the Spaniards being unable to oppose them. If at that time a few only call for a war against the Spaniards, the flame instantly spreads, and their measures are taken with such secrecy, that the first declaration of it is by attacking the neighbouring villages. When they are not already assembled, the first step, when a war is agreed on, is to summon the nations, which they term shooting the dart, the summons being sent from village to village with the utmost silence and rapidity, specifying the very night when the irruption is to be made; and though advice of it is sent to the Indians who reside among the Spaniards, nothing transpires; nor is there a single instance among all the Indians that have been taken up on suspicion, that one ever made a discovery. Thus their designs continue impenetrable, till their execution withdraws the veil.

The Indians of the several nations being assembled, choose a general; and when the night fixed upon for executing their designs arrives, the Indians who live near the Spaniards attack them by surprise; and having cut them off, divide into small parties, and destroy the seats, farm-houses, and villages, giving no quarter, and paying not the least regard to youth or age. These parties afterwards unite, and in a body attack the larger settlements of the Spaniards, besiege the forts, and, by the greatness of their numbers, frequently carry all before them. If at any time the Spaniards gain the superiority, the Indians retire several leagues, where concealing themselves a few days they suddenly attack a different part from that where they were encamped, and endeavour to carry the place by a sudden assault, in which they are frequently successful, unless the commandant's vigilance has provided against a sudden surprise; when, by the advantage of the Spanish discipline, they are generally repulsed with great slaughter.

These wars against the Spaniards usually continue some years, they being of little detriment to the Indians; for most of their occupations consist of cultivating a small spot of ground, and weaving a little cotton cloth for their apparel, and these are carried on by the women. Their huts are built in a day or two, and their food consists of roots, maize, and other grain.

The first advances towards a treaty of peace with these Indians are generally made by the Spaniards, and as soon as the proposals are agreed to a congress is held, at which the governor, major-general of Chili, and the principal officers, with the bishop of Concepcion, and other persons of eminence assist. On the part of the Indians, the general and captains of his army, as representatives of the communities, repair to the congress. These congresses are held with the Indians not only for concluding a peace, but on the arrival of a new president, and the same ceremonies are observed in both; so that an account of one will be sufficient to give a just idea of the other.

On holding a congress the president sends notice to the frontier Indians of the day and place, whither he repairs with the persons above-mentioned; and on the part of the Indians the heads of their several communities: both, for the greater splendor of the interview, being accompanied with an escort, consisting of a certain number previously agreed on. The president and his company lodge in tents, and the Indians encamp in their huts at a small distance. The elders, or chiefs of the Indians, pay the first visit to the president, who drinks their healths in wine, and himself gives them the glass that they may drink his; he then makes them a present of knives, scissars, and such toys as they most value. The treaty of peace is then brought on the carpet, and the manner of observing the several articles is settled: after which they return to their camp, and the president makes them a visit, carrying

carrying with him a quantity of wine sufficient for a moderate regale.

The chiefs of the communities who are not present at the first visit now go in a body to pay their respects to the president, who at the rising of the congress makes each a small present of wine, which they liberally return in horses, black cattle, calves, and fowls. After which both parties return to their respective habitations.

It ought not to be omitted, that the president, in order to gain more effectually the hearts of the Indians, invites several of them to his table, and, during the three or four days of the congress, neglects no means of ingratiating himself into the good graces of the whole body. On these occasions a kind of fair is held at both camps, great numbers of Spaniards repairing to the Indians with such goods as they know will please them, and the Indians come with cotton cloth and cattle to the Spanish camp. Both parties deal by exchange, and never fail of selling their whole stock, and of observing in their dealings the most exact candor and regularity, as a specimen of the manner in which their future commerce is to be conducted.

Amidst the utmost rage of the Indians in their hostilities against the Spaniards, they generally spare the white men, whom they carry to their huts, and use as their own; whence many Indians of those nations have the complexion of the Spaniards born in that country. In time of peace a number of them enter the Spanish territories, hiring themselves for a certain time to work at the farm-houses; and at the expiration of the term return home, after laying out their wages in the purchase of such goods as are valued in their country.

During peace the Spaniards sell the free Indians hardware, as bits, spurs, knives, and edge-tools, toys, and some wine. This is done by way of barter; for though the countries inhabited by the Indians are not destitute of gold, yet knowing the fondness of the Spaniards for that metal, and the miseries it has occasioned where it has been found, they cannot be prevailed upon to open mines; so that the returns consist in horses, horned cattle, and cotton cloth. The Spaniard begins his negociation with offering the chief of the nation a cup of wine, and then displays his wares, that the Indian may choose what he likes best, mentioning at the same time what he expects in return. If they agree, the Spaniard makes him a present of a little wine, and the chief informs the community that they are at liberty to trade with that Spaniard as his friend. Relying on his protection, the Spaniard goes from hut to hut, recommending himself by giving the head of every family a taste of his wine, after which they enter upon business, and the Indian having taken what he wants, the trader goes away without receiving any equivalent, and visits the other huts, as they lie dispersed over the country, till he has disposed of all his stock. He then returns to the cottage of the chief, calling on his customers in his way, and acquainting them that he is on his return home. Upon this not one fails of bringing to the chief's hut what had been agreed on. Here they take their leave with all the appearance of a sincere friendship, and the chief even orders some Indians to escort him to the frontiers, and assist him in driving the cattle he has received in exchange for his goods. The Spaniards acknowledge that the Indians are remarkable for the fairness of their dealings, that they are never known to recede from what has been agreed on, and are very punctual in their payments.

S E C T. II.

Of the Divisions of Chili; with a Description of the principal Cities, as St. Jago, Conception, Copiapo, Coquimbo, Valparaiso, and Baldivia; with whatever is most remarkable in each.

CHILI is divided into four governments, namely, the major-generalship of the kingdom of Chili, Valparaiso, Valdivia, and Chiloe. It is likewise subdivided into eleven jurisdictions; the limits of which are not exactly ascertained by any of the Spanish authors, and

we shall content ourselves with giving our readers a description of the principal cities, and of whatever appears to us most worthy of notice.

The city of St. Jago, or Sant Jago, the capital of Chili, was founded by captain Pedro de Valdivia in 1541 in the valley of Mapocho, in the thirty-third degree forty minutes south latitude, and in the seventy-seventh degree west longitude, about twenty leagues from the harbour of Valparaiso, the nearest port to it in the Pacific ocean. Its situation is one of the most convenient and delightful that can be imagined, it standing in a beautiful plain, sixty miles in extent, flowing in meanders through the middle of it, and called by the name of Mapocho. This river runs so near the city, that water is conveyed from it by conduits through the streets; and it also supplies the gardens, which few houses are without. The city is two thousand yards in length from east to west, and twelve hundred in breadth from north to south. On the opposite side of the river, which washes the north part of it, is a large suburb named Chimba, and on the east side is a mountain of a middling height called Santa Lucia. All the streets are of a handsome breadth, straight, and paved, running exactly east and west, while they are crossed by others at right angles, which run exactly north and south. Near the middle of the city is a grand square encompassed with piazzas, with a very beautiful fountain in the center. On the north side are the palace of the royal audience, where the presidents have their apartments, the town-house, and the public prison; on the west side is the cathedral and the bishop's palace; the south side consists of shops, each decorated with an arch; and on the east is a row of private houses.

The houses are in general built of unburnt brick, and very low, on account of the terrible devastation occasioned by the earthquakes with which this city has been often visited; particularly on the eighth of July, 1730, when the greatest part of the city was destroyed; and this catastrophe was succeeded by an epidemical distemper, which swept away even greater numbers than had before perished by the earthquake. But though the houses are low they make a handsome appearance, and are well contrived to answer the purposes of convenience and pleasure. Besides the cathedral, the chapter of which, besides the bishop, consists of a dean, archdeacon, chanter, and four canons, with other subordinate ecclesiastics; here are the parish-churches of Sagrario, St. Anne, and St. Isidoro; there are also three convents of Franciscans, two of Augustines, one of Dominicans, one of the fathers of Mercy, one of St. Juan de Dios, five colleges of Jesuits, St. Diego, a college for students, and without the city a convent of Recollects. Here are also two nunneries of St. Clare, two of Augustines, and one of Carmelites; and a religious sisterhood, under the rules of St. Augustine; all which have a great number of recluses, as is common in all the cities of this part of the world. The churches of the convents, besides being very spacious, are built either with brick or stone, and those of the Jesuits are distinguished by the beauty of their architecture. The parish-churches are in every respect greatly inferior to them, both within and without.

In this city is a royal audience, which consists of a president, four auditors, a fiscal, and a patron of the Indians. The determinations of this court are without appeal, except to the supreme council of the Indies, and this only in matters of notorious injustice or denial of redress. Though the president is in some particulars subordinate to the viceroy of Lima, he is governor and captain-general of the whole kingdom of Chili, and as such resides one half of the year at St. Jago and the other at Conception. During his absence from St. Jago the corregidor acts as his representative, and his jurisdiction on this occasion extends to all the other towns of the kingdom of Chili, except the military governments.

The office for the royal revenue is under the direction of a treasurer and accomptant. Here are paid the tributes of the Indians, and other parts of the revenue; the salaries of the officers within its department, and other assignments, are likewise paid here.

Here are also a tribunal of croisade, the members of which are a subdelegate commissary, a treasurer, and accomptant;

comptant: likewise a commission of inquisition, all the officers of which are appointed by the tribunal of inquisition at Lima.

The magistracy of this city, at the head of which is the corregidor, consists of regidores, and two ordinary alcaldes. In these are lodged the police and civil government of the city. During the time the president resides here, the jurisdiction of the corregidor is limited to the liberties of St. Jago.

The customs of the people differ but little from those already mentioned in large cities; but, instead of the ostentation of Lima, dress with great decency, without splendor; but all the families who can afford it keep a calash for driving about the city.

The men are robust, of a proper stature, well shaped, and of a good air. The women have all the charms of those of Peru, and are even more remarkable for the delicacy of their features, and the fineness of their complexions; but they disfigure their natural beauty by painting themselves in such a preposterous manner, as not only spoils the delicacy of their skins, but even their teeth; so that it is very uncommon to see a woman with a good set.

The city of Concepcion is seated in the thirty-sixth degree forty-three minutes fifteen seconds south latitude. It is built on the south-east shore of a beautiful bay, on an uneven sandy ground, and on a small declivity, having a little river running through it. The destruction it suffered in the terrible earthquake of 1730, occasioned all the houses to be built low. This dreadful event happened on the eighth of July: the first motions were felt at one in the morning, and the concussions increasing, the sea, as usual, retreated to a considerable distance; but soon returned so impetuously, and with such a swell, that it overflowed the whole city and the neighbouring countries. In this sudden calamity many of the inhabitants found an asylum on the adjacent eminencies. This inundation was soon succeeded by three or four shocks, and at about four in the morning, a little before break of day, the concussions returned with the most tremendous violence, demolishing the few buildings that remained.

The houses have either mud walls, or are built with unburnt brick, but are covered with tiles. The churches are small and mean, as are also the Franciscan, Dominican, and Augustine convents, as well as that belonging to the fathers of Mercy; but the college of Jesuits is well built.

The political government of this city consists of a corregidor nominated by the king, who is at the head of the ordinary alcaldes and regidores. During the vacancy of this post the duty is performed by the president of Chili, who is governor and captain-general of the whole kingdom, and president of the audience of St. Jago, on which Concepcion is dependent. The president is obliged to reside six months in the year at Concepcion, in order to attend to the military concerns of the frontiers, to see that the forts are in a good condition, and the troops well disciplined. Concepcion has all the courts and offices usual in the cities of South America.

As all the inhabitants of the towns, villages, and country within the jurisdiction of Concepcion form different bodies of militia, some of which are in pay, and all must be ready on any sudden alarm; there is, besides the corregidor, a camp-master, who commands in all military affairs without the city.

The inhabitants consist of Spaniards and Mestizos, which are here hardly to be distinguished by their complexion; both being very fair, and some have fresh complexions. The goodness of the climate, together with the fertility of the country, have drawn hither many Creoles and Europeans, who live together in that harmony and friendship which should be an example to the other parts of these provinces, where pride and jealousy occasion frequent feuds. The men, instead of a cloak, wear a poncho, which is made in the form of a quilt, about two yards and a half or three yards in length, and two in breadth, having an opening in the middle just sufficient to put their head through, the rest hanging down on all sides. This is their dress in all weathers, whether walking or riding; and the peasants never pull it off but when they go to rest, tucking it up in such a

manner that both their arms and whole body are at full liberty, either for labour or diversion. This is an universal garb among all ranks when they ride on horseback. Though so plain and uniform, it serves to distinguish the quality and rank of the wearer, some wearing it only as a covering, and others for show. Accordingly those of the common people cost only four or five dollars, while others are worth a hundred and fifty or two hundred. This difference arises partly from the fineness of the stuff, and partly from the laces and embroidery with which they are adorned. They are of a double woollen stuff manufactured by the Indians, and generally blue.

The people here are excellent horsemen, and the women are particularly famous for their great skill in horsemanship; they are equally skilled in throwing the noose with the people of Patagonia, just described, in catching of wild bulls and other animals; but this is used here on many other occasions, particularly on private quarrels, in which they use an amazing address in throwing the noose, and in avoiding it with a lance. It is the only method they take to satisfy their revenge, and in this case the only resource in an open country is for a man to throw himself on the ground, keeping his legs and arms as close to it as possible. A person may also save himself by standing close to a tree, and if in the street by placing himself against a wall.

Having described the two principal cities of Chili, we shall proceed with the rest in the order in which they are situated, proceeding from north to south.

Copiapo, the first port on this coast, stands in the twenty-seventh degree south latitude. The harbour is indeed properly called Caldera, but it is commonly known by the former name, on account of its contiguity. This, from its natural situation, is improperly said to be the richest town in the world, it being seated on a gold mine; which, however, is not wrought by the inhabitants, because a still richer mine of that metal has been discovered at six miles distance. The town is very irregularly built, and its inhabitants amount to about seven hundred; but there are no less than a thousand labourers employed in the mines. There are twelve mills constantly employed, which extract at the rate of a hundred and fifty ounces one day with another. There are here also other valuable articles of commerce; salt-petre lies on the ground in many places two feet deep, and under any other government than the Spanish would attract a considerable trade. To the south of the town are the rich lead mines of Copiapo, which lie neglected; yet several intelligent writers are of opinion they might be turned to more advantage than the gold, on account of the great quantities of lapis lazuli found on the surface.

Coquimbo, or La Serena, is seated in the twenty-ninth degree fifty-four minutes south latitude, about a mile from the coast of the Pacific ocean, in a most delightful situation, having an extensive prospect of the sea, of a river, and the country, which presents to the view a pleasing variety of fields of different kinds of grain, and woods of a very lively verdure. The town is pretty large, but not proportionably peopled; the number of families not amounting to above four or five hundred, consisting of Spaniards, Mestizos, and a few Indians. The streets are straight and of a convenient breadth, intersecting each other at right angles, some extending from north to south, and others from east to west, forming squares of buildings, as at St. Jago and other places of note in this part of America. Though the houses have mud walls, and are covered with leaves, none are without a large garden planted with fruit-trees, and the esculent vegetables, both of America and Spain; for the climate is happily adapted to a variety of both kinds, the heat not being excessive, nor the cold severe; so that both in the fertility of the earth, and the cheerful appearance of the country, the whole year wears an aspect of one perpetual spring. The streets, though regular and convenient, are not entirely formed by the houses, a part of the interval between the several squares of buildings being filled up with gardens; and most of them have so agreeable an appearance, as to atone for the mean aspect of the houses. On the north side of the town runs the river, after flowing in various meanders through the whole valley.

valley; and thus, by canals cut from it, furnishes the town with water, one great use of which is to preserve the beauty of their favourite gardens.

Besides the parish church here is an Augustine, a Dominican, and Franciscan convent, one belonging to the fathers of Mercy, another to the order of St. Juan de Dios, and a college of Jesuits. The churches of these religious fraternities are large and decent. The parish church takes up part of one side of the great square, and on the opposite side is the town-house, where the alcaldes and regidores meet, who, with a corregidor, form the corporation.

The whole trade of Coquimbo consists of sending three or four vessels annually to Lima, laden with wine, flour, and other provisions; in exchange for which they receive all kinds of European commodities, and these are carried from hence to all the other towns of Chili.

Valparaiso is seated in the thirty-third degree two minutes thirty-six seconds north latitude, and is at present both large and populous, it having the most considerable haven in those seas, constantly filled with ships from Callao and Panama; whence it would be still larger were it not for its inconvenient situation, it standing at the foot of a mountain, and a great part of the houses being built on its acclivity. The broadest and most convenient part is that along the coast; but this is very disagreeable in winter, it being so exposed to the north winds, that the waves beat against the walls of the houses, some of which are built with unburnt bricks, and some of chalk and pebbles. Besides its parish church, it has a convent of Augustines, and another of Franciscans; but they have few monks, and the churches belonging to them are small and mean. It is inhabited by Spaniards, Mulattoes, and Mestizoes. In its neighbourhood are several villages, and the great number of farm-houses give the country a cheerful appearance.

Here is a military governor nominated by the king, who having the command of the garrisons in the several ports, and of the militia of the town and its dependences, is to take care that they are properly disciplined.

The proximity of Valparaiso to St. Jago has drawn hither all the commerce formerly carried on at that city, and to this it owes its foundation, increase and prosperity. The cargoes brought hither by the Callao ships are indeed but small; but they take from hence wheat, dried fruits, Cordovan leather, tallow, and cordage; and with those return to Callao. A ship has been known to make three voyages in one summer, that is between November and June; during which the droves of mules and carriages from all the farms in the jurisdiction of St. Jago bring fresh supplies to the ware-houses. Thus the summer season may be termed the fair of Valparaiso; but on the approach of winter it becomes as remarkably desolate, the crowd of traders repairing to St. Jago, and none staying that are able to remove.

The fruits that grow in the neighbourhood of this town are admirable for their size and beauty, particularly a sort of apples called quillota, which greatly exceed the largest in Spain; and, besides their exquisite flavour, are so juicy that they melt in the mouth. Among the several kinds of game, there are here such numbers of partridges in their season, which begins in March, and lasts several of the following months, that the muleteers knock them down with their sticks, without going out of the road, and bring great numbers of them to Valparaiso: but few of these, or any other birds, are seen very near the town. It is the same with regard to fish, very little being to be caught either in the harbour or along the coast.

Baldivia, or Valdivia, a celebrated port, is seated at the bottom of a fine bay, in the thirty-ninth degree six minutes south latitude, and in the eightieth degree west longitude. It takes its name from Valdivia, the Spanish general, who conquered the country. A considerable sum is annually granted to keep the fortifications in repair, which consist of four strong castles, mounting above a hundred pieces of fine brass cannon, for which, however, it is said, there is never a sufficient number of gunners and carriages; nor ever a proper supply of ammunition: and the garrison is chiefly composed of malefactors transported from Spain. The governor is indeed

always a person of quality; but as he is promoted merely to repair his fortune, it is also expected that he should improve the opportunity. The inhabitants amount to about two thousand, who are chiefly Spaniards, Creoles, and Mestizos. Its trade is less considerable than formerly, because the gold mines in its neighbourhood are shut up; yet ten large ships are employed in the trade between this port and Lima, which chiefly consists in corn, salt provisions, gold, and hides, which are exchanged for slaves, sugar, chocolate, and European commodities and manufactures.

The island of Chiloe, the last of the governments, extends from the forty-second to the forty-fourth degree of south latitude, and is about a hundred and fifty miles in length, and seventeen in breadth. The coast is very subject to storms, especially in March, when winter begins. The island has a military governor, who resides at Chacao, the principal harbour of the island, which is well fortified, and capable of making a good defence. Besides Chacao, which has the title of a city, is a town called Calbuco, which is much larger, and is the residence of a corregidor, who is nominated by the president of Chili: it has also regidores and alcaldes annually chosen. It has a parish church, a college of Jesuits, a convent of Franciscans, and another of the fathers of Mercy. The island, which is extremely fertile and produces all the necessaries of life, is well peopled with Spaniards, Mestizos, and Christian Indians.

S E C T. III.

Of Terra Magellanica, the Islands of Terra del Fuego, and Staten Land.

THE country called Terra Magellanica is the last we have to describe on the continent of America. It takes its name from Ferdinand Magellan, a Portuguese, who first coasted the country before he discovered and passed the straits at its southern extremity, which bear his name. Its northern part borders on Chili, the east and west coast are washed by the Atlantic and Pacific ocean, as it is improperly called, and its southern extremity is washed by the straits of Magellan, the continent gradually lessening till it comes to those straits, where it is very narrow. It extends from the forty-fifth to the fifty-seventh degree thirty minutes north latitude, and from the seventieth to the eighty-fifth degree of west longitude.

Pigafetta, an Italian, the lying author of Magellan's voyage, pretends that in the forty-ninth degree thirty minutes they found people of such a gigantic stature, that a middle sized man could hardly reach their waist with his head; that they were clad with the skins of beasts as monstrous as themselves, and armed with huge bows and arrows of a strength proportionable to their bulk; and that one of them devoured a whole basket full of biscuits every day with his fish and raw flesh, and drank a pail full of wine or water at every meal. Later navigators have, however, entirely overthrown this improbable account: but few of the natives have ever been seen, and these were of the common height; indeed this country appears to be but thinly peopled. We have already given some account of it under the name of Patagonia, by which it is also distinguished, and shall therefore now proceed to the islands Terra del Fuego and Staten Land.

The islands that lie to the south of the straits of Magellan are commonly known by the name of Terra del Fuego, and are thus called from the fires and smoke perceived by the first discoverers of them, occasioned by a volcano in the largest island, the flame of which, tho' not seen in the day-time, is visible at a vast distance in the night, and sometimes throws up great quantities of stones and ashes. These islands, the far largest of which is that properly called Terra del Fuego, extend along the Magellanic coast from east to west about four hundred miles, and were thought contiguous to the continent, till Magellan discovered and sailed through the straits that part them from it. They were likewise then thought to be one continued island, till several navigators after-

wards discovered them to be divided by several narrow channels.

Terra del Fuego is mostly very mountainous and rough, with the tops of the mountains covered with snow; but it is said to have fertile valleys, plains, and pasture-grounds, watered by a multitude of fine springs that flow from the mountains. Between the several islands are capacious bays and roads, in which large fleets may ride in safety. The lands are said to abound with wood and stone, and to be inhabited by a people as white as the Europeans, who, notwithstanding the extreme severity of the climate, go naked, and paint their bodies of several colours.

The Spaniards, who are best acquainted with the straits of Magellan, say, that they are above a hundred leagues in length from the cape of the Virgins at the eastern entrance, to the cape of Desire at the opposite end. The breadth is very various, it being in some places but a league wide, and in others two or more; there are many safe harbours running into the continent, with narrow entrances, and bays that extend quite out of sight, encompassed with high mountains which shelter them on all sides; so that ships may safely ride in them upon the least anchor in any weather.

On the east side of the islands which form this strait is Staten Land, in about the fifty-fifth degree of south latitude; and between it and Terra del Fuego runs strait Le Maire, which is about seven or eight leagues in length.

"I cannot but remark, says the author of Lord Anson's Voyage, that though Terra del Fuego had an aspect extremely barren, yet this island of Staten Land far surpasses it, in the wildness and horror of its appearance; it seeming to be entirely composed of inaccessible rocks, without the least mixture of earth or mould between them. These rocks terminate in a vast number of ragged points, which spire up to a prodigious height, and are all of them covered with everlasting snow; the points themselves are on every side surrounded with frightful precipices, and often overhang in a most astonishing manner; and the hills which bear them are generally separated from each other by narrow clefts, which appear as if the country had been frequently rent by earthquakes; for these chasms are nearly perpendicular, and extend through the substance of the main rocks, almost to their very bottoms: so that nothing can be imagined more savage and gloomy than the whole aspect of this coast."

The passage into the South Sea, or Pacific Ocean, is now generally performed by running through strait Le Maire, by these inhospitable islands, and then doubling Cape Horn, the most southern promontory of Terra del Fuego.

There are several other islands about those just mentioned; but as they are of little consequence, and none of them planted by any European nation, we shall leave this inhospitable climate, and proceed to the small but fine island of Juan Fernandes.

S E C T. IV.

Of the Island of JUAN FERNANDES.

Its Situation, Extent, Soil, and Produce; the Face of the Country; the Courage of the Goats, and a particular Description of the Sea-Lion: with a concise Account of the Lesser Juan Fernandes, or Masa Fuero. Concluding with some Observations on America in general.

THE delightful island of Juan Fernandes is said to have received its name from a Spaniard who formerly procured a grant of it, and resided there some time with a view of settling it, but afterwards changed his mind. It lies in the thirty-third degree forty minutes south latitude, a hundred and ten leagues to the west of the continent of Chili. The island is of an irregular figure; its greatest extent does not exceed fifteen miles, and its greatest breadth is somewhat less than six. The only safe anchoring is on the north side, where are three bays; but the middlemost, known to the English by the name of Cumberland-bay, is the widest, deepest, and in all respects the best. The north part of the island is

composed of high craggy hills, many of them inaccessible, though generally covered with trees. The soil of this part is so loose and shallow, that very large trees on the hills soon perish for want of root, and are then easily overturned. Several of these hills have a peculiar sort of red earth exceeding vermilion in colour, and perhaps on examination might prove useful for many purposes. The trees of the woods on the northern side of the island are most of them aromatics, and of many different sorts: there are none of them so large as to yield any considerable timber, except the myrtle-trees, which are the biggest on the island; but even those will not work to a greater length than forty feet. The top of the myrtle is circular, and appears as uniform and regular as if it had been clipped by art: it bears on its bark an excrescence moss, which in taste and smell resembles the garlic. There is here also the pimento tree, and the cabbage tree, besides a great number of plants of various kinds, and almost all of those which are usually esteemed particularly adapted to the cure of those scorbutic disorders that are contracted by salt diet and long voyages, particularly great quantities of water-creffes and purslain, with excellent wild sorrel, and a vast profusion of turnips and Sicilian radishes. There are likewise many acres of ground covered with oats and clover.

The face of the country, at least of the north part of the island, is extremely singular: the woods that cover most of the steepest hills are free from bushes and underwood, and afford an easy passage through every part of them, and the irregularities of the hills and precipices trace out by their various combinations a great number of romantic valleys; most of which have a stream of the clearest water running through them, that falls in cascades from rock to rock, as the bottom of the valley, by the course of the neighbouring hills, is broken into a sudden sharp descent. In these valleys are some particular spots, where the shade and fragrance of the contiguous woods, the loftiness of the over-hanging rocks, and the transparency and frequent falls of the neighbouring streams, present scenes of such elegance and dignity as would with difficulty be rivalled in any other part of the globe; for here the simple productions of unassisted nature may be said to excel all the fictitious descriptions of the most animated imagination.

We cannot here forbear describing the spot where commodore Anson pitched his tent, which we shall take verbatim from the account of his voyage published under the name of his chaplain. "The piece of ground which he chose was a small lawn, that lay on a little ascent, at the distance of about half a mile from the sea. In the front of his tent there was a large avenue cut thro' the woods to the sea-side, which sloping to the water with a gentle descent, opened a prospect of the bay and the ships at anchor. This lawn was screened behind by a tall wood of myrtle sweeping round it, in the form of a theatre, the slope on which the wood stood rising with a much sharper ascent than the lawn itself, though not so much but that the hills and precipices within land towered up considerably above the tops of the trees, and added to the grandeur of the view. There were besides two streams of crystal water, which ran on the right and left of the tent, within an hundred yards distance, and were shaded by the trees which skirt the lawn on either side, and completed the symmetry of the whole."

With respect to the animals and provisions to be found on this island, it has been represented as abounding with a vast number of goats, which was doubtless true, it being the usual haunt of the Buccaneers and privateers, who formerly frequented those seas. There are two instances, one of a Musquito Indian, and the other of Alexander Selkirk, a Scotman, who were left by their respective ships, and lived for some years alone upon the island, and were consequently no strangers to its produce. Selkirk, who was the last, and from whom Daniel de Foe took the hint of writing his Robinson Crusoe living alone in an island, staid there between four and five years, and, during his continuance, frequently catching more goats than he wanted, sometimes marked their ears and let them go. This was about thirty-two years before com-
modore

modore Anson's arrival in the island; and it is remarkable, that the first goat that was killed by his people at their landing, had his ears slit; whence they concluded, that he had doubtless been formerly under the power of Selkirk. This was an animal of a most venerable aspect, with an exceeding majestic beard, and many other symptoms of antiquity. During their stay in the island, they met with others marked in the same manner, all the males being distinguished by an exuberance of beard, and every other characteristic of great age.

The number of goats are now, however, greatly diminished; for the Spaniards being informed of the advantages which the Buccaneers and privateers derived from the goats flesh, with which they were here furnished, endeavoured to deprive their enemies of this relief, by extirpating the breed. For this purpose they put on shore great numbers of large dogs, who have increased so fast, that they have destroyed all the goats in the accessible part of the country; so that there now remain only a few among the crags and precipices, where the dogs cannot follow them. These are divided into separate herds of twenty or thirty each, which inhabit distinct fastnesses, and never mingle with each other. The author of commodore Anson's voyage mentions a remarkable dispute between a herd of these animals and a number of dogs, which we cannot forbear repeating. Going in their boat into the eastern bay, they perceived some dogs running very eagerly upon the foot, and being willing to discover what game they were after, they lay upon their oars for some time to view them, and at last saw them take to a hill, where looking a little farther they observed upon the ridge of it an herd of goats, which seemed drawn up for their reception. There was a very narrow path skirted on each side by precipices, on which the master of the herd posted himself fronting the enemy, the rest of the goats being all behind, where the ground was more open. As this spot was inaccessible by any other path, except where this champion had placed himself, the dogs, though they ran up hill with great alacrity, yet when they came within about twenty yards of him did not dare to encounter him, as he would infallibly have driven them down the precipice; but giving over the chase quietly laid themselves down, panting at a great rate. As at present it is rare for goats to fall in their way, they are supposed to live principally upon young seals. Upon this island are found a great number of the last mentioned amphibious animals, which mariners usually eat with pleasure, and compare their flesh to lamb. But there is another animal of the same amphibious kind, called a sea-lion, that has some resemblance to a seal, but is much larger, and its flesh has some resemblance to that of beef. They are in size, when full grown, from twelve to twenty feet in length, and from eight to fifteen in circumference; and are so extremely fat, that having cut through the skin, which is about an inch in thickness, there is at least a foot of fat before you come at either lean or bones. They are likewise very full of blood; for if they are deeply wounded in a dozen places, there will instantly gush out as many fountains of blood, spouting to a considerable distance. Their skins are covered with short hair of a light dun colour; but their tails and their fins, which on shore serve them for feet, are almost black: their fins, or feet, are divided at the ends like fingers, the web which joins them not reaching to the extremities, and each of these fingers is furnished with a nail. The head is small in proportion to the rest of the body, and terminates in a snout. They have a row of large pointed teeth in each jaw, two-thirds of which are in sockets; but the others, being the most hard and solid, are without them. He has whiskers like those of a cat; has small eyes and ears; and the nostrils, which are also very small, are the only parts destitute of hair. They have a distant resemblance to an over-grown seal, though in some particulars there is a manifest difference between them, especially in the males: these have a large snout or trunk hanging down five feet six inches below the end of the upper jaw, which the females have not; and this renders the sexes easily to be distinguished from each other; and, besides, the males are of a much larger size. These animals divide their time equally between the land

and sea, continuing at sea all the summer, and coming on shore at the setting in of the winter, where they reside during that whole season. In this interval they engender, and bring forth their young, having generally two at a birth, which they suckle with their milk, they being at first about the size of a full-grown seal. While the sea-lions continue on shore they feed on the grass and verdure that grows near the banks of the fresh-water streams; and when not employed in feeding, sleep in herds in the most miry places they can find. As they seem of a very lethargic disposition, and are not easily awakened, each herd places some of their males at a distance, who never fail to alarm them, when any one attempts to molest, or even to approach them, which they do by making a very loud noise, sometimes grunting like hogs, and at others snorting like horses in full vigour. The males have often furious battles, when they gore each other with their teeth, and cover one another with blood: the author we have last quoted mentions one whom they named the bashaw, who generally lay surrounded with a seraglio of females, which no other male dared to approach, and who had not acquired that envied pre-eminence without many bloody contests, of which the marks still remained, in the numerous scars that were visible in every part of his body.

There are but few birds, and those chiefly hawks, blackbirds, owls, and humming-birds. But the bay is most plentifully stored with the greatest variety of fish, particularly cod of a prodigious size, which are in no less plenty than on the banks of Newfoundland, also cavallies, gopers, large breams, silver fish, maids, congers of a peculiar kind, and above all a black fish, much esteemed, called by some a chimney-sweeper, in shape resembling a carp, besides excellent cray fish that generally weigh eight or nine pounds, and are of an exquisite taste. There are likewise a great quantity of dog-fish, and large sharks.

The Spaniards have generally mentioned two islands under the name of Juan Fernandes, styling them the Greater and the Less; the Greater being the island just described; and the Less being still more distant from the continent, has been also called Maza Fuero, and is about twenty-two leagues west by south of the Greater Juan Fernandes. It is covered with trees, and has several fine falls of water pouring down its sides into the sea. This place has at present one advantage beyond the island of Juan Fernandes; for it abounds with goats who are far from being shy, and reside there in great tranquillity, the Spaniards not having thought the island considerable enough to be frequented by their enemies, and have not therefore been solicitous to destroy the provisions upon it. The island also abounds with sea-lions and seals.

We have now finished our description of America; in the parts subject to Great Britain, to France, and to the United Provinces, we have seen rich plantations abounding with the necessaries and even the luxuries of life, the source of an immense commerce, furnishing Europe with their superfluities and valuable productions, and employing not only a prodigious number of ships, and thereby promoting navigation and giving employment to many thousand hands, but producing an immense trade in the mother countries, by employing there an infinite number of people in different manufactures, to supply America with the goods of Europe. Thus giving life to trade, and spirit to industry, they produce a circulation that is of infinite advantage to both the mother country and its colonies, while their interests being reciprocal, ought to draw closely the knot of union which at such a distance subsists between them.

On the other hand, Portugal and Spain, and particularly the latter, with countries immensely rich, extensive, and capable of rendering those nations extremely powerful, have been far from answering that purpose. With respect to Spain, whatever may be said to the contrary, the discovery of America was the greatest misfortune that could have happened: it has drained, and continues still to drain Spain of its most useful inhabitants; while the preposterous conduct of that court in preventing the people of other nations freely settling in their American dominions, and the multitude of monas-

teries and nunneries in every city and every town prevent the increase of their own, and must render the regions of Spanish America thinly peopled. British America has made the manufactures of Great Britain flourish:

Spanish America, with all its gold and silver, has rendered the Spaniards too proud to apply themselves to manufactures, and consequently poor.

C H A P. XIII.

Of the New Discoveries made in the PACIFIC OCEAN.

S E C T. I.

North America found by the Russians to extend westward almost to the Coast of Tartary. A general Account of another Continent to the South.

WE have now, according to the plan we proposed in the beginning of this work, proceeded from east to west, described the countries of Asia, Africa, Europe, and America, and have entered the South Sea, or Pacific Ocean, which is of amazing extent, it being upwards of ten thousand miles in breadth, and washes at the same time the coast of Peru and Chili, and that of Japan, China, and Tartary. It had its name from being supposed free from storms and tempests; but very unjustly, for in particular seasons of the year they are perhaps more violent in this sea than in any other. It is also called the South Sea from the Spaniards discovering it by crossing the isthmus which divides North and South America, by passing from north to south.

Though this sea, after its first discovery, was imagined to extend from the north to the south pole, yet it has been found that it is in a manner encompassed by two continents, which were for a long time not known to have any existence, besides innumerable islands. The continent on the north is supposed to be that of America, which extends almost as far to the west as Kamtschatka. By the discoveries made by the Russians, this country has been coasted from the fifty-second to the sixtieth degree north latitude, and extends from the south-west to the north-east side about thirty-seven degrees in length; but whether it joins to the west side of North America, or is separated from it by a channel, or by one crossing through it into Hudson's-bay, has not yet been determined.

This part of America enjoys a much better climate than the coast of the north-east side of Asia, though equally near the sea, and every where full of high mountains continually covered with snow; for the mountains on the north-east of Asia are every where rocky and ragged, have no valuable metals, nor scarcely any trees or herbs, except in the valleys, where grows only some small shrubby wood and hardy plants. The American mountains, on the contrary, in the neighbourhood of Siberia are close, and their surface not like those covered with moss, but shaded from the bottom to their tops with thick and fine woods. In this new discovered part of America are found a sort of raspberries of a very extraordinary size and fine taste, besides honey-suckles, cranberries, blackberries, and bilberries in great plenty; but as the coast has only been visited, what fruits are to be found in the heart of the country is unknown. Among the birds have been discovered ten species different from the European, besides swans, quails, plovers, Greenland pigeons, cranes, sea-gulls, and magpies. The fish enter the rivers of America earlier than at Kamtschatka, and great plenty of them has been seen.

The natives who have been discovered by the Russians are plump, broad shouldered, of a middling size, with straight black hair that hangs loose; their faces are flat and swarthy, and they have black eyes and thick lips. They wear shirts which hang below the knee, and are girded about the waist with leather strings, and they have trowsers made of the skins of seals. In short, they

greatly resemble the Kamtschatdales; they use bows and arrows, and have boats twelve feet long and two broad, sharp both at the head and stern, and are formed of a frame of wood and skins, which seem to be those of seals, dyed of a cherry colour. They are made much in the same manner as those we have described in the treating of Greenland and Hudson's-bay; for the seat is round, two yards from the stern, and sewed about with guts, which, with the help of leather thongs laced round the edges, can be drawn together, and opened like a purse. The American sitting in this place, stretches out his legs, and draws the skin tight about his body. These boats will live in the most stormy weather, though they are so light that they may be easily carried by a single person. They receive strangers very kindly, converse in a friendly manner, with their eyes fixed upon them, treat them with much civility, and make them presents of whales fat.

Hence it is not improbable, that the northern parts of America were originally peopled from Siberia; for though it should be granted that America and Asia were never joined, yet these two parts of the globe lie so near each other that the impossibility of the inhabitants of Asia going over to America, especially as the number of islands lying between them made the passage more easy, cannot be maintained. The curious reader will soon see sufficient evidence of a southern continent sloping away from the Spice Islands towards the continent of South America, by which Mexico, Peru, and Chili, might probably be first peopled.

It has been observed by the judicious compiler of the improved edition of Harris's collection of Voyages, that Antony Van Deman's Land, New Holland, and Carpentaria make one continent, from which New Zealand appears to be separated by a strait, and is part of another continent, answering to Africa, as this of which we are now speaking, plainly does to America. This continent reaches from the equinoctial to the forty-fourth degree of south latitude, and sixty-six degrees from east to west; whence the longest day in the most northern part must be twelve hours, and in the southern about fifteen hours, or something more; extending from the first to the seventh climate, which shews its situation to be extremely happy; and as to the produce and commodities of this country in general, there is the greatest reason in the world to believe that they are extremely rich and valuable, because the finest and richest countries in the known world all lie within the same latitude, and indeed this is more than conjecture; for some part of it we are told by the first discoverers abound with gold, silver, pearls, nutmegs, mace, ginger, and sugar-canes of an extraordinary size.

It ought not to be omitted, that there are an infinite number of islands near the continent, and others scattered at a considerable distance from it, many of which are placed between that part which has been discovered and America.

It will be proper just to take notice of the several parts of this country that have been mentioned, and we shall begin with New Holland, a very extensive tract of land, which, as Dampier observes, joins neither to Asia, Africa, nor America, though it extends from the tenth to the thirty-first degree of south latitude, or above twelve thousand miles, and how much farther it stretches to the southward is not certainly known. The Dutch, who are

are much better acquainted with these countries than any other nation in Europe, from their possessing the Spice Islands in its neighbourhood; but have with great care endeavoured to conceal their discoveries, though they have given names to several parts of the country. New Holland has, however, been visited by several other Europeans, and particularly by Dampier, who observes, that part which he saw consists of low even land, with sandy banks next the sea. In one part most of the trees are dragon-trees, which are pretty large, the gum distilling from knots or cracks in the trunk. In another part were various other sorts of trees; but none of them above ten feet high, their bodies about three feet round, and five or six feet before you come to the branches. Some of the trees had a fragrant smell, and were red within the bark; most of them had blossoms or berries, the former of which were of several colours, as red, white, and yellow; but mostly blue, and these had generally a very fragrant smell. There were likewise flowers of several kinds growing on the ground, some of which were very beautiful, and of such kinds as he had never seen before.

The land-animals he saw here were only a sort of racoons, differing from those of the West Indies, and a kind of guanos that were extremely ugly. Of the land-fowls he saw none of the larger birds but eagles, and five or six sorts of small birds, which sung with a great variety of fine shrill notes. The water-fowl were ducks, curlews, crab-catchers, pelicans, and some which our author never saw before. The natives, according to Dampier, were tall, straight-bodied, with small long limbs, large heads, round foreheads, flat noses, pretty full lips, and wide mouths: their hair black, short and curled like those of the negroes, and the colour of their skins very black: they had no sort of cloaths, but the rhind of a tree tied like a girdle about their waist, and a bundle of long grass, or the bough of a tree full of leaves, fastened under their girdle to hide their nakedness. But the people of distant parts of the country are very differently described.

Van Diemen's land is a very extensive country, discovered by Abel Jansen Tasman, of which we have no other account worthy of notice but the extent of the coast, which he discovered in the forty-second degree twenty-five minutes south latitude, and in the hundred and thirty-third degree fifty minutes east from London; he steered east-south-east along the coast to the height of forty-four degrees south latitude, where the land runs away east and afterwards north-east-by-north. In the forty-third degree ten minutes south latitude, and in the longitude of a hundred and thirty-seven degrees fifty minutes east from London, he anchored in a bay to which he gave the name of Frederick Henry. The trees in this country where he observed them did not grow very close, nor were incumbered with bushes or under-wood. From these trees he gathered some gum and lac.

The land of Australia delle Spiritu Santo lies in about the fifteenth degree of south latitude, and according to Pedro Fernandez de Quiros, by whom it was discovered, extends from the hundred and fiftieth degree of longitude east from London to the hundred and thirtieth degree of west longitude from the same meridian, which is eighty degrees, or about four thousand six hundred miles. But with respect to this extent he seems to speak mostly from conjecture, he having not actually discovered the whole coast he mentions. In several memorials he presented to his Catholic majesty, he particularly describes the plants, trees, beasts, birds, and fishes of the country; mentions its producing a variety of spices, and excellent sugar-canes, with a great deal of gold and silver. He describes several commodious harbours, and extols the salubrity of the air, which he declares to be such, that notwithstanding he had a considerable body of men, who, like himself, were strangers to the climate, yet though they were exposed to continual labour in the open air, and often to the cold

dews, while hot, none of them were taken sick. As for the natives, he found them strong, healthy, and many of them of a great age.

New Guinea, the country we shall next describe, extends from Cape Mabo, in about fifty minutes south latitude, and a hundred and six degrees thirty minutes east longitude from London, to King William's Cape, in the sixth degree thirty minutes south latitude, and about a hundred and forty-three degrees of longitude: thus the coast extends from the north-west to the south-east; but how far it reaches to the southward is still unknown.

This country, which was discovered in 1529 by Saavedra, received from him the name of Terra de Papuas; but Van Schouten, the Dutch discoverer, gave it the name of New Guinea. Some distinguish it into three different parts; calling that which lies from the hundred and forty-third to the hundred and thirty-fifth degree of longitude New Guinea: to a narrow slip of land which extends from thence to Cape Mabo, they give the name of Terra de Papos; and that which lies on the south of it, round a large gulf, between the eighth and fifteenth degree of south latitude, they term Carpentaria, or Carpenter's Land, from a Dutch captain by whom it was discovered: but it is not certainly known whether what is here called a gulf is not a strait.

Commodore Roggewein observes, that the continent of New Guinea appeared to him very high land, extremely full of plants and trees; so that in sailing four hundred leagues along the coast he did not observe one barren spot; and from thence thinks it extremely probable, that it abounds with many rich commodities. He adds, that persons worthy of credit assured him, that some of the free burghesses in the Moluccas go annually to New Guinea, where they exchange small pieces of iron for nutmegs. But the best account of New Guinea in general is that published by Dampier, who first discovered it on New-year's-day 1700, in between the third and fourth degrees of south latitude, where it was high even land, well clothed with tall flourishing trees that appeared very green, and afforded a pleasant prospect. In the woods he found several sorts of fruit, such as he had never seen before; but he describes none of them. One of his men shot a stately fowl, as big as the largest dunghill cock, of a sky colour, with a white spot on the middle of each wing, about which were spots of red: its head was crowned with a bunch of long feathers that appeared very beautiful; it had strong legs with reddish claws, and its crop was filled with small berries. Its nest was in a tree, where was found an egg as large as that of a hen. The yawl, which was sent another way for water, returned at night, and brought a wooden fishig, very ingeniously made: this they found by a small barbecue, used for drying fish, where they also saw a shattered canoe; but saw none of the inhabitants.

A little to the northward of this place captain Dampier found a stream of good water, where a boat could come up to it, and a ship might anchor close to the shore. The captain going ashore here, found a small cove, where he beheld two barbecues, which appeared not to be above two months standing; and the spars being cut with some sharp instrument, it seemed as if the natives had iron.

Schouten, and other navigators, who visited different parts of this continent, conceived very high ideas of it, and have represented it as one of the richest in the world: but they were not able to penetrate far into it; for they found the country extremely populous, and the inhabitants of a martial disposition, and generally speaking, well armed.

Thus imperfect are the accounts of this continent, though a number of navigators of different nations have fallen in with it. We shall now conclude with mentioning some of the islands in the Pacific Ocean that have been best described.

SECT. II.

Of the most remarkable of those Islands in the Pacific Ocean that have been discovered by the Europeans, particularly Pasch Island, Nova Britannia, Gerrat Dennis's Isle, Anthony Cove's Island, Moa, Arimoo, the Thousand Islands, the Isle of Recreation, Bowman's Islands, Mischievous Island, the Brothers, the Sister, Cocoa, Hope, and Hoorn Islands: with some Account of their Inhabitants.

PASCHAL, or Easter Island, is situated in the twenty-eighth degree thirty minutes north latitude, and is supposed to be in about the hundred and second degree of west longitude from London; it received its name from commodore Roggewein, who discovered it on Easter-day 1722. The commodore, who had three ships with him, sent the smallest to examine the country, which brought word that it seemed very fertile and well inhabited, and the next day an Indian came off to them in his canoe. They made signs to him to come on board, which he readily did, and was well received; for as he was naked, they gave him a piece of cloth, pieces of coral, beads, and other toys, all which he hung about his neck. His body was painted all over with a variety of figures; his natural complexion appeared to be a dark brown, and his ears were excessively large and long. He was tall, robust, and had an agreeable countenance: he was brisk, active, and lively. They gave him a glass of wine to drink, which he threw away in a manner that surprized them. They next clothed him from head to foot, with which he was displeased, and appeared awkward and uneasy. They gave him victuals, but he could not be prevailed on to use either a knife or fork. As they found it impossible to come to an anchor that day, they resolved to send him ashore, allowing him to keep what he had got, in order to encourage others; but what is really surprizing, the poor creature had no mind to go, and they had much ado to get him into his canoe.

The next morning by break of day they entered a gulph, and many thousand of the inhabitants came down to receive them, bringing with them vast quantities of fowls and roots, with which many came on board, while the rest ran about on the shore. The next morning the Dutch prepared to land, when the friendly Indian who had been with them before came on board a second time, bringing with him many of his countrymen, who, to make themselves welcome, had loaded their canoes with plenty of live fowls, and roots dressed after their manner. Among them was a man perfectly white, in whose ears hung round white pendants as big as one's fist. He had an air extremely devout, and seemed to be one of their priests. An hundred and fifty Dutch seamen now landing, these innocent and inoffensive people, probably filled with curiosity, crowded thick upon them, and some of them took hold of their arms; on which the Dutch thinking themselves obliged to make way by force, had the rashness and cruelty to fire upon them, by which means many of them were killed, and among them the friendly Indian who had been twice on board. This dispersed the Indians, and frightened them almost out of their wits; yet in a few minutes they recovered from their astonishment and terror, and assembling again, did not approach nearer than ten yards, where they probably imagined they might be safe from the effects of that thunder and lightning they had seen discharged from the muskets; yet howled and made dismal lamentations. They now brought vast plenty of provisions, and that they might leave no means untried to pacify their invaders, we are told, that both the men, women, and children soon came before them holding branches of palm in sign of peace, and by the most humble postures expressed their desire of mollifying these strangers. They even shewed them their women, and made them understand that they were at their disposal. The Dutch, softened by these tokens of humility and deep submission, repented their rashness, and, instead of doing them any farther harm, made them a present of a piece of painted cloth sixty yards long; and of many beads, and small

looking-glasses, with which they were extremely pleased. As the Indians saw that the Dutch were now disposed to treat them like friends, they brought them five hundred live fowl at once, like the barn-door fowls of Europe, with a great quantity of red and white roots, and potatoes, which these people use instead of bread. They also gave them some hundreds of sugar-canes, and abundance of Indian figs, the pulp of which was as sweet as honey. The Dutch saw in this island no other animals than birds of all sorts; but thought it probable that in the heart of the country were cattle and beasts of various kinds; because when they shewed the Indians some hogs on board their ships, they let them know by signs that they had seen such animals before.

Every tribe or family seemed to have a separate village, composed of huts that were from forty to about sixty feet long, in which they had few moveables, and those of no great value, except some red and white coverlets that served them when walking for cloaths, and when sleeping for quilts: the stuff was as soft to the touch as silk, and to all appearance was of their own manufacture. They make use of earthen pots to dress their meat in, and have round their villages little plantations staked out, and very neatly divided.

Nova Britannia, or New Britain, was for some time thought to be contiguous to New Guinea, till captain Dampier found it to be an island. It lies forty miles to the eastward of the easternmost part of New Guinea. The northernmost point is in the second degree thirty minutes north latitude, and the southernmost in the sixth degree thirty minutes south latitude, and it extends about five degrees sixteen minutes in length; appearing to be for the most part high land mixed with valleys, and every where abounding with large and stately trees. The mountains and lowlands are pleasantly mixed with woodlands and savannas, and on the sides of the hills are many large plantations of cleared lands. The country is well inhabited by a strong well-limbed people, of a very dark complexion.

Round Nova Britannia are several smaller islands, some of them full of cocoa-nut trees, particularly on the north-east side; among these are Gerret Dennis's isle, which is about fourteen or fifteen leagues round, high, mountainous, and very woody; but the sides of the hills are thick set with plantations, and the bays by the sea-side well stored with cocoa-nut trees, intermixed with a few houses.

This island is very populous, the natives are like the former, black, strong, well-limbed, with large heads, and their hair, which curls naturally, is shaved into several forms, and dyed of various colours. They disfigure themselves by painting, and are represented as deforming their faces by thrusting something through the nose, which comes out on each side by the cheek bone. They have also great holes in their ears, stretched open by the same preposterous kind of fancied ornament as that in their noses. Their weapons are chiefly lances, swords, slings, and some bows and arrows. They use proas, somewhat resembling those we have described in treating of the island of Tinian; but the ends, which serve for the head and stern, are higher than the rest, and carved into many devices, as a fowl, a fish, or the head of a man; these they manage very dexterously with neat paddles.

Antony Cove's island, as it is called in the Dutch draughts, lies in the third degree twenty-five minutes south latitude, and is a high land about four or five leagues round, very woody; it is full of plantations upon the sides of the hills, and near the bays are abundance of cocoa-nut trees. On the south-east part of it are three or four small woody islands, one rising high, and others low and flat, all covered with cocoa-nut trees, and other wood. These are all well inhabited. On the north is another island of an indifferent height, and a little larger than Anthony Cove's island. Some canoes from this last island came aboard captain Dampier's ship; they had proas made of one tree, the hollow part cut out, and had out-layers on each side; the shore was covered with men, who went along as he steered by the coast. To three of the natives who came aboard he gave each a knife,

a knife, a small looking-glass, and a string of beads. He shewed them pompions and cocoa-nut shells, making signs to them to bring some on board, and they gave him three cocoa nuts out of one of the canoes. He shewed them nutmegs, and by their signs he guessed they had some on the island. He also shewed them some gold dust, which they seemed to be acquainted with, calling out, Maneel, maneel, and pointing toward the land.

The islands of Moa and Arimoa lie in the third degree of latitude. The latter is the biggest of the two, but they are both very well peopled, and abound with cocoanuts, Indian figs, and various kinds of roots. The inhabitants have a prodigious number of canoes, and go well armed with bows and arrows; and this is said to be the case even of the women and children. Moa is not so populous as Arimoa, though both islands are equally pleasant and fertile.

To the westward of the islands last described, the sea is so very full of islands, that commodore Roggewein and his people finding it difficult, if not impossible, to count them, gave them the name of the Thousand islands. The inhabitants are negroes, of a short squat make, and their heads covered with thick curled hair. They all go naked, except having a kind of belt, adorned with what they esteem ornaments, fastened round their waist; only some of them have bracelets, and others wear on their heads a kind of light straw-hats adorned with the feathers of the birds of Paradise. They are represented by commodore Roggewein as bold, mischievous, and untractable. They are said to have a bit of stick of the size of a tobacco-pipe, and of the length of one's finger, which they run through the gristle of the nose, and this they are said to look upon as a means of making them appear fierce and terrible to their enemies.

The isle of Recreation is in the sixteenth degree of south latitude, and about the hundred and forty-seventh degree of west longitude. It is about twelve leagues in extent, and extremely fertile, it producing great quantities of trees, but more especially palms, cocoas, and iron-wood. The Dutch thought they had reason to believe, that in the heart of the country were rich mines. The inhabitants are of a middle size, robust, and active; they are warlike, and have the character of being very treacherous, especially the women; for seizing an opportunity, they killed several Dutchmen. Their hair is black, long, and shining, which is chiefly owing to their anointing it with the oil of cocoas. They paint their bodies, like the natives of Pasch island, and the men fasten round the waist a kind of net-work, which they draw between their legs, and tuck up behind. But the women are covered with a kind of mantle of their own manufacture, which nearly resembles silk, and on their necks and wrists they wear strings of pearls.

Bowman's islands are situated in the twelfth degree south latitude, and in the hundred and fifty-second degree west longitude from London. They appear very beautiful at a distance, are well planted with fruit-trees of all sorts, and produce herbs, corn, and roots in great plenty; the land towards the coast being laid out in large and regular plantations. When commodore Roggewein approached these islands, the Indians, on seeing the ships, came in their boats, and brought them fish, cocoa-nuts, Indian figs, and other refreshments; in return for which the Dutch gave them, as usual, small looking-glasses, strings of beads, and other toys. They soon found that these islands were very populous; for many thousand men and women, the former generally armed with bows and arrows, came down to the shore to look at them. Among the rest they saw a majestic personage, who, from the dress he wore, and the honours that were paid him, they easily discovered to be the sovereign of the nation. He stepped into a canoe, accompanied by a young woman who sat close by his side. His canoe was instantly surrounded by a vast number of other vessels, that crowded about it, and seemed intended for a guard. All the inhabitants of these islands are whites, and of the same complexion as the Europeans, except their appearing sun-burnt. They seem to be a very innocent and harmless people; they are brisk and lively, and treat each

other with visible marks of civility, discovering nothing wild or savage in their behaviour. Instead of shewing the marks of terror at the arrival of the Dutch, they expressed the utmost joy and satisfaction, treating them with a kindness and respect not to be described; they even shewed a deep concern, when they perceived that in spite of all their care to oblige and serve those strangers, they could not prevail on them to stay among them. Their bodies were not painted like those of the other people the Dutch had seen before; but were handsomely clothed from the girdle downwards, with a sort of silk fringes, neatly folded. On their heads they wore hats of a handsome sort of stuff, which were very large, in order to keep off the heat of the sun, and about their necks they had strings of beautiful odoriferous flowers. The land appeared exquisitely charming, every one of the islands being agreeably diversified with hills and valleys, and seemed as beautiful as imagination can paint. Some of these islands were ten, some fifteen, and others twenty miles in compass. Each family, or tribe, seemed to have its particular district, and to form a separate government. The land in each was laid out in neat and regular plantations.

Between the fifteenth and sixteenth degrees of south latitude are four islands, each of them four or five leagues in compass, with a continued chain of steep rocks between them. These islands are so close together, that there is hardly room for a ship to pass between them; and there one of commodore Roggewein's ships was lost; whence the island on which it was wrecked was called Mischievous island; the two next to it were named the Brothers, and the fourth the Sister. All four were covered with a verdure inexpressibly charming, and abound with fine tall trees, especially cocoas. The herbs were so refreshing and salutary, that the ship's crew, many of whom were ill of the scurvy, were surprisingly recovered by them. They likewise found there a prodigious plenty of cockles, muscles, mother of pearl, and pearl oysters. These islands are extremely low, so that some parts of them must be frequently overflowed; but the inhabitants are well provided against such accidents, since they have not only good canoes, but stout barks, with cables and sails. The natives are said to be of an extraordinary size; their bodies are painted of various colours, and they are armed with long pikes or lances.

Cocoa island lies in the sixteenth degree ten minutes south latitude, and had its name from its abounding extremely in cocoa trees. It is properly a high mountain; and two leagues to the south of it is another long, but low island, to which Schouten, from the treachery of the inhabitants, gave the name of Traitors island. Each of them seems to be under the government of a particular chief, or king. Hope island is seated about fifty leagues to the west of these, and was thus called by the Dutch from their hoping to get fresh water there: but it being encompassed with rocks, against which the sea beats with great fury, they could not land there. It produces cocoa and other trees. The island is covered with hills, and there were seen a large village, with several houses on the coast.

Hoorn islands lie to the north-west in about the fourteenth degree of south latitude. The inhabitants, who are of a yellowish brown complexion, are tall, lusty, strong, well proportioned, swift of foot, and very expert at swimming and diving. They are very ingenious, and take a pride in adorning their hair. The women are, however, very homely, ill-shaped, and very short: their breasts are extremely disagreeable, and hang, like leathern bags, down to their bellies; yet they are very lascivious. These people are governed by a king, or chief, to whom they seem to pay very great respect. They have no notion of trade, and though they gave the Dutch many hogs, and other provisions, it proceeded merely from their humanity and good-nature; however, the Dutch proportioned the presents they made them to the provisions they received. These people are said neither to till, sow, nor perform any other labour; but gather only what the earth spontaneously produces, as cocoa-nuts, and some other fruits.

Besides the islands we have here mentioned, many others have been discovered, and a great number of them are scattered over the Pacific Ocean. To conclude, this great continent thus imperfectly discovered, and whose limits are unknown, with the numerous islands in this remote part of the globe, will, perhaps, in future ages become the settlements of some European or American power; and probably may in part become subject to Spanish America, if ever that should be separated from the dominions of Spain. Whenever that event, or any

2

other of a like nature, takes place, may the lives, the liberties, the possessions, and the happiness of the poor inhabitants be secured; and these now almost unknown parts of the earth unacquainted with the ravages, the murders, and desolation that great part of America has suffered! Mean while this continent, and the numerous islands in the Pacific Ocean, remain a fund of geographical knowledge and of natural history, concealed from the view of Europe; but which new and more perfect discoveries will at length reveal.

The END of the SECOND VOLUME.
